## Procedures

### D.1.PRG - Taxes Receivables (Net of Allowance)

*Procedure Step:* Summary & Conclusion  
*Prepared By:* BFW, 10/8/2024  
*Reviewed By:* CJG, 11/21/2024

Purpose/Conclusion.*
----------------------

**Purpose:**

# State of Washington

To evaluate risk assessments and the sufficiency and appropriateness of evidence obtained based on results of substantive work.

## **Conclusion:**

We determined that **no** modifications were necessary to inherent risk, control risk, or the risk of material misstatement as assessed in planning.

We also determined that evidence obtained was sufficient and appropriate in response to the risk of material misstatement.

## Testing Strategy:

Auditors are **required** to evaluate conclusions for substantive testing as follows:

*Auditors may wish to use the optional Lead Sheet available in the Store to summarize testing related to each balance and assertion.*

**1.** Determine whether the results of substantive testing indicate a need to modify the inherent risk assessment (IR), control risk assessment (CR), risk of material misstatement (RMM) or other aspects of planning (such as material balances or assertions). If so, document changes and consider the need for additional testing.

*If the results of substantive testing indicate a need to change control risk, auditors should also update the **Permanent File** by either correcting the documentation or by adding an update section describing changes to the top of the record of work done. For all changes to IR, CR, or RMM the **Material Balances** spreadsheet should be updated.*

*More significant changes to other aspects of planning (such as material balances or assertions) should be referenced in this step and documented in detail in the **Changes to FS Audit Plan** step.*

**2.** Evaluate whether the quality and quantity of evidence obtained is sufficient and appropriate in response to the risk of material misstatement. In making this determination, auditors should evaluate:

### Information to be used as audit evidence:

- Does evidence relate to the population, period of time and risk (assertion and “what could go wrong” from the Material Balance Spreadsheet)? If there are any gaps or uncertainties in the logical connection between the evidence and conclusions, is there a documented consideration and explanation?
- Are the sources of information sufficiently reliable and appropriate for the risk (whether internal to the government, external, or auditor developed)? If key information is not from a sufficiently reliable source (for example, inquiry), then is it corroborated by information that is?

## State of Washington

- Are there any concerns about accuracy, completeness, authenticity, or bias in information? If so, did the auditor perform sufficient procedures to confirm reliability of that information?
- Is information precise enough to catch if misstatements exceeded the tolerable level?
- Is information detailed enough to conclude on whether or not there were misstatements?
- Was there any information that appeared contradictory or inconsistent? If so, was there a documented response to the inconsistencies or doubts about the reliability of evidence?

### Results:

- How much misstatement was identified by testing, and the likelihood and magnitude of further potential misstatement?
- How did misstatements occur and how often might they occur again in the population?
- Were misstatements caused by control deficiencies or circumvention of controls?
  - If control deficiencies, is there a need to re-evaluate our understanding of controls in the [Permanent File](#) folder or assessment of control risk?
  - If circumvention, the [Management Override of Controls](#) step should address or reference this area. Auditors should also consider whether a fraud risk has been identified.
  - Did tests identify a different level or type of risk than the planned audit response was designed to address?
  - If likely misstatements are identified, are further procedures necessary to improve the precision of our estimate?

*To support the overall evaluation of audit risk and provide a basis for concluding on the overall sufficiency and appropriateness of evidence in the [FS Summary & Report](#) step, auditors should conclude in each area whether the auditor continues to believe that the tests performed and quality and quantity of evidence obtained are commensurate with RMM for all relevant risks (the "what could go wrong", in the [Material Balances](#) spreadsheet).*

If the auditor determines that evidence is not sufficient or appropriate, additional substantive testing should be done. If sufficient, appropriate evidence is not available for audit, the AIC should discuss the effect on our audit report with the AAM and AM.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6310](#) – Determining the Nature, Timing and Extent of Substantive Testing**

**SAO Audit Policy [3210](#) – Audit Evidence**

# State of Washington

## Record of Work Done:

Based on test results, we re-evaluated risk assessments, procedures, evidence obtained and conclusions as follows:

### **(1) Do the results of substantive tests indicate a need to modify our risk assessment (IR, CR and RMM)?**

The results of substantive tests do not indicate a need to modify our risk assessment.

### **(2) Was the quality and quantity of evidence obtained sufficient and appropriate?**

The quality and quantity of evidence obtained was sufficient and appropriate.

### **D.1.PRG - Taxes Receivables (Net of Allowance)**

*Procedure Step:* Understanding of Line Item

*Prepared By:* BFW, 5/21/2024

*Reviewed By:* SHW, 7/31/2024

## Purpose/Conclusion:

### **Purpose / Conclusion:**

To gain an understanding of the line item and confirm the scope of testing as documented in the Significant Account Matrix.

## Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

### **STEP 1: Prior Audit Exceptions**

Document any exceptions noted during the prior audit. Follow-up to determine how the agency has responded to or corrected the issue, unless this work is anticipated as part of the testing strategy.

### **STEP 2: Analyze Composition and Changes of Line Item**

## State of Washington

- Include link to the line item leadsheet. This will be completed at the end of the audit. Leadsheet analysis should be documented in this spreadsheet.
- Inquire with agency staff about the activities and transactions that make up the balance and any changes to those activities or transactions in relation to the prior year.
- Determine relevant classes of transactions or account balances within the line item to analyze (such as agencies, funds, programs, departments, accounts, and/or objects), and use AFRS to create trends of those elements. This step should not include any specific dollar amounts associated with the line item.
- Evaluate trends to identify:
  - (1) What classes of transactions or account balances are primary to the identified risk. Auditors should specifically consider what elements are primary to the line item (comprising a large percentage of the line item), and which elements the identified risk would apply to, and which elements might be most susceptible to the identified risk (having a high risk of non-trivial misstatement for a relevant assertion, considering likelihood and impact of potential for misstatement).
  - (2) What changes are primary to the identified risk, if applicable. Auditors should specifically consider whether the overall change to the line item from the prior year was significant, what elements were the primary drivers of overall change, whether any elements changed significantly from the prior year, and which changes (if any) might relate to the identified risk.
  - (3) Any unusual or unexpected elements, amounts, or changes that may indicate a risk, whether the one identified in planning or a new one that may need to be considered for a change to the plan.

**Consider** other procedures to gain an understanding of the line item, such as review of key policy documents, review of program information or reports, inquiry of staff, budget information, or other analytical procedures.

### **STEP 3: Update Significant Account Matrix**

Based on your understanding of the line item, update the Significant Account Matrix with final conclusions on the agencies covered, account description, significant accounting systems, and risk (what could go wrong and relevant assertions). The account description should reflect the significant transaction streams or account balances relevant to the risk.

*The description of agencies, significant accounting systems, and what could go wrong in the Significant Account Matrix constitute the overall scope of substantive testing.*

*A transaction stream is significant based on the potential for misstatement. This is often due in part to its size (ie: comprising a large percentage of the total line item), but is ultimately a judgment about the susceptibility to the identified risk (for example, when the risk is understatement a small or omitted account may hold the most potential for the largest misstatement).*

*Significant accounting system(s) are those that contain key controls over significant classes of transactions included in the line item. Control systems identified in this step must match the Significant Account Matrix and have a separate control understanding documented.*

*Talk with the AIC if you identify any changes to the Significant Account Matrix.*

# State of Washington

Guidance/Criteria:

Record of Work Done:

**(1) Prior Audit Exceptions:**

There were no prior year audit exceptions for this balance.

**(2) Composition & Change Analysis:**

Line Item Leadsheet: [[Line Item Lead Sheet](#)].

The Taxes Receivable (Net of Allowance) balance is the result of debit entries for year-end accrued and unavailable revenues (non-current) and is comprised primarily of the following taxes:

- Property taxes
- Retail sales taxes
- Business and Occupation taxes

Receivable balances are determined using the Automated Tax and Licensing Administration System (ATLAS). We met with Ayano Faasumalie, Revenue & Financial Reporting Coordinator, on April 10, 2024 to gain an understanding of receivable types in ATLAS and the applicable calculation for allowance for uncollectibles. She explained the types of receivables and calculation related to allowance for uncollectibles remains the same since the implementation of ATLAS in FY19. See the table below:

Receivable Type	Allowance Methodology
Return Receivables	Accounts in Deferred Status (Actual Amounts)
Estimated Returns	Discount Rate applied to locked returns; collection rate applied to unlocked returns to determine accrued revenue versus unavailable revenue
Audit Receivables	Uncollectible Allowance rate applied at FYE, determined from real time adjustments to audit receivables during FY
Lien Receivables	Lien accounts in deferred status (Actual amounts) plus additional allowance rate applied at FYE

## State of Washington

To determine how to apply the uncollectible rate to the different receivable types, DOR analyzes how much was moved into Deferred Status for each receivable type during the fiscal year. Based on this analysis performed by DOR, it was determined that return receivables and estimated receivables in deferred status do not need the uncollectible rate applied to them. Only the actual balance due amounts on the taxpayer accounts that are in Deferred Status for each of those receivable types will be recorded in Allowance for Uncollectibles.

It was also determined that Lien Receivables have a higher percentage of accounts that moved into Deferred status; therefore, DOR applies a 5 year average of a lien uncollectible rate to the Lien receivables. The amount recorded into Allowance for Uncollectibles for the Liens receivables is the uncollectible rate multiplied by the lien receivable balance and any taxpayers' accounts in deferred status. Additionally, an analysis of audit receivables was performed to determine what real dollar adjustments had been made to audit receivables for the year and an uncollectible rate was determined and applied for those accounts. The total adjustments and write-offs for audit receivables are divided by the beginning balance for audit receivables to determine the uncollectible rate to be applied. During testing, we will review the methodology that DOR uses to estimate uncollectible taxes for the Allowance for Uncollectibles amount.

Changes noted by DOR:

We requested Internal Audit's risk assessment related to revenues and receivables from Sandi Fairchild, Chief Financial Officer, to identify any significant changes to note for the taxes receivable balance. During our review, we did not note any changes in the composition or reporting of the taxes receivable balance. We inquired with Ayano who stated processes have remained the same for identifying and reporting taxes receivable. **No significant changes or risks identified.**

### **(3) Updates to Significant Account Matrix:**

We identified no changes that need to be made to the Significant Account Matrix.

### **D.1.PRG - Taxes Receivables (Net of Allowance)**

*Procedure Step:* Controls - ATLAS

*Prepared By:* BFW, 6/20/2024

*Reviewed By:* RKM, 10/11/2024

Purpose/Conclusion:
---------------------

**Purpose:**

# State of Washington

To gain an understanding of internal controls.

## **Conclusion:**

We gained an understanding of internal controls as documented in the record of work done.

Testing Strategy:

## **The following procedures are required for all material systems:**

1. List the financial statement balance(s) and relevant assertion(s) addressed by the understanding.
2. Gain an understanding of the internal control process, identify how transactions are recorded in AFRS, identify key controls over relevant assertion(s), and note any control weaknesses.
  - In gaining an understanding of controls, consider the overall understanding of State-Level control elements as documented in the "State-Level Controls" step as they relate to this particular system.
  - Identify controls systems covering all relevant assertions for all significant classes of transactions.
  - Standards require the auditor to gain an understanding of the significant accounting system(s) that contain key controls over significant classes of transactions included in the line item.
  - Control systems identified in this step must match the Material Account Matrix and have a separate control understanding documented.
  - Talk with the ACFR Specialist or AIC if you identify different systems than the ones anticipated in the Material Account Matrix.

For each material system, auditors must document:

- A brief outline of the transaction flow from beginning to end.
- An expanded description of key controls.
- Business processes relevant to financial reporting of the relevant assertion for the material balance. Processes should encompass automated and manual procedures by which transactions or events are identified or initiated, authorized as needed, recorded, processed and corrected as needed.
- Original accounting records and how records are rolled-up to intermediary ledgers and transferred to the general ledger (AFRS) or financial statements.
- Detailed descriptions of key controls. Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

The following is information to **consider** when identifying key controls and transaction flow.

## State of Washington

"Key controls" refer to the few controls that together provide reasonable assurance that material misstatements will be prevented or detected and corrected. This is contrasted with ancillary or supporting controls, which – although helpful and recommended – would provide less than reasonable assurance by themselves.

The focus of the write-up is on the key controls. Key controls should be specifically identified (as "key controls") in the write-up. This can be done in whatever way the auditor prefers, so long as it is obvious. Details that the auditor should document regarding key controls may include:

- Who or what initiates the control
- When (or how often) is the control applied
- Who performs the control
- As needed, the experience, knowledge and attitude of the person applying the control
- Detailed description of the control process or activity. For example, if the control is a review: what exactly is reviewed, what is the reviewer looking at or for and what are the reviewer's criteria?
- How the key control is documented or evidenced
- If not obvious from the description, how the control prevents or timely detects and corrects misstatements
- Any exceptions or alternative processing to the normal process
- What happens when misstatements or issues are identified by the control

The "transaction flow" refers to the process by which transactions are initiated, authorized, recorded, processed and reported (as applicable). Outlining the transaction flow gives context to key controls, especially how transactions become subject to controls in the first place. If a control inherently ensures that all applicable transactions are included (ex: bank reconciliation where the assertion is existence), the auditor may decide to just start the write-up with the initiation of the control procedure and go from there.

Elements of the transaction flow are defined informally as follows:

- *Initiation:* How are transactions initiated?
- *Authorization:* How are transactions and accounting record maintenance authorized?
- *Recording:* How are transactions or balances identified and recorded in financial accounting systems?
- *Processing:* How are the transactions or balances processed after they are recorded (if at all)? Processing may be manual or automated and may occur at a subsidiary system level or at the general ledger level.
- *Reporting:* How are records translated into the financial statements? This part of the transaction flow extends the understanding to the actual financial statements that the audit is opining on. Since we already document an understanding of the financial reporting process in general, it is usually enough to simply reference this overall understanding. However, if there are important steps unique to the covered balances, it may be more appropriate to mention them here.

# State of Washington

Although transaction flow is a good way to think about understanding and documenting a control system, auditors should not worry too much about documenting “each element, in order” because often elements may be combined, not noticeable, not applicable or occur in a different order.

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits](#) Planning Guide**

Record of Work Done:

Internal controls in the Automated Tax and Licensing Administration System (ATLAS) address the following balance(s):

- **Taxes Receivable (Net of Allowance)** - General Fund
- **Taxes Receivable (Net of Allowance)** - Government Activities

For the following assertions:

- **Existence** - There is a risk that recorded receivables are less than source records.
- **Valuation** - There is a risk that taxes receivables are incorrectly computed. There is a risk that the allowance is incorrectly estimated.
- **Completeness** - There is of incorrect timing of revenue recognition resulting in an under-accrual of revenue.

## **Gain an Understanding of Internal Controls**

We met with Ayano Faasumalie, Revenue & Financial Reporting Coordinator, in Business & Financial Services (B&FS) and Sandi Fairchild, CFO, on April 10, 2024 to gain an understanding of taxes receivable.

## **Background:**

### **Automated Tax and Licensing Administration System (ATLAS):**

Implemented on March 19, 2018, ATLAS replaced all of the Department’s legacy systems specific to taxpayer administration including the receivables system, TARIS. ATLAS is driven by the taxpayer return, which the majority of taxpayers file on-line through MYDOR, part of the State's SecureAccess Washington (SAW) single sign-on application gateway. This was created by the Washington State Department of Information

## State of Washington

Services (which in 2011 became part of Department of Enterprise Services) to simplify access to a list of government services accessible via the Internet. ATLAS's automated tax return form is hard coded with the appropriate codes for each of the tax types so the fund, tax revenue source, general ledger codes, etc. is properly recorded. Active taxpayers are required to submit returns either monthly, quarterly, or annually as determined by Taxpayer Account Administration Division.

The following are the four different types of receivables identified within ATLAS:

- **Return Receivables:** Tax returns submitted by taxpayers without payment or with partial payment leaving a balance due. ATLAS automatically records a return receivable (balance due) in the taxpayer's account the next day after the due date.
- **Audit Receivables:** Based on an assessment from an auditor. When the auditor identifies an adjustment is needed, a tax return in the system is posted to the taxpayer's account and becomes a receivable the next day.
- **Estimated Return Receivables:** Results from estimated tax returns for businesses that have failed to file a tax return on time. The system identifies an account that was expected to file a tax return and was not filed by the due date. ATLAS will automatically create a return, which estimates the amount of tax due based on up to 4 years prior filing history from the taxpayer's account or industry standards if the taxpayer does not have 4 years of history. This amount is multiplied by the hard coded tax rates in ATLAS to determine the amount due. The estimated return is posted to the taxpayer's account in ATLAS. The system will automatically put a CAS - HOLD (called "locked") on the estimated return so that the taxpayer will not be able to view the estimated amount. Locked returns are not recorded as a receivable until a Compliance Agent has reviewed the estimated return for reasonableness (or the business has paid the balance). Since the Agent is familiar with the taxpayer, the Agent may make adjustments to the estimated amount if deemed necessary. Changes are reviewed by a Supervisor. Once the Compliance Agent's review is completed, they will release/unlock the Hold and the estimated return amount will then be recorded as a receivable (and viewable by the taxpayer in their account).
- **Lien Receivables:** These were called Warrants, which result from Return, Estimated Returns, and Audit receivables that have had unsuccessful collection efforts. A taxpayer's delinquent account goes through a compliance assessment. All receivable types (Audit, Estimated, & Returns) for that taxpayer are assumed into one lien receivable. The lien (warrant) is filed in district court as a lien against the taxpayer's business. Once the lien is filed, it is in effect for 10 years, or until the outstanding balance is paid in full and DOR takes the lien off the property.

### **Calculation and Identification of Excise Tax Receivable:**

The monthly process of recording taxes receivable begins with tax returns that are overdue or underpaid. When a tax return is entered into ATLAS, the system will automatically review the tax return, looking for variances using built-in parameters for calculations and logic statements in order to flag errors or high risk items, including returns that do not have a payment or the payment does not match the return amount. Work items are created for returns that do not automatically post to a taxpayer's account in ATLAS until it is reviewed by a Taxpayer Account Administration (TAA) Examiner. If there is a balance due on the return, ATLAS will automatically create a receivable including penalties and interest based on the due date, which is automatically posted by ATLAS in the taxpayer account (**Key Control #1 – Automated – Completeness/Valuation**). If a tax return was not filed by the due date, ATLAS will automatically create an estimated tax return one week after the due date based on the account's reporting history, (or with specific amounts based on reporting frequency if the taxpayer has no past

## State of Washington

reporting), then multiply those amounts by the hard coded tax rates. Accounts in locked status are not posted until reviewed for reasonableness by Compliance Agents.

### **Calculations of Rates and Adjustments**

The process of determining the fiscal year-end taxes receivable balance includes the application of a discount rate, uncollectible rate, and accounts in deferred status to provide a reasonable estimate of the taxes receivable balance that will be collected. Therefore, Taxes Receivable is recorded in the financial statements net of the following three different types of adjustments:

**1. Discount Rates:** Discounts are an estimated amount that is based on the assumption that receivables have been overstated. The discount rate reduces the receivable amount but is not recorded in the Allowance for Uncollectible. Currently, the only receivable type considered by DOR to be overstated is the locked estimated return receivables and will have a discount rate applied to those receivables. DOR decided to discount the locked estimated returns because in some instances a business may have closed or had no activity in ATLAS during the period.

DOR performs an analysis to determine how much of the locked estimated returns at fiscal year end (FYE) were actual receivables. To calculate the discount rate, the actual receivables is divided by the total locked estimated returns at FYE. The remaining locked returns as of FYE have not been reviewed and are therefore, still locked at the end of the fiscal year. Also, additional estimated returns were generated by ATLAS during the current fiscal year. The discount rate is manually applied to the balance of the locked estimated returns when a Journal Voucher (JV) is created to record the Taxes Receivables for FYE estimated return receivables.

For all other receivable types (Audit, Returns, and Liens) DOR decided the other receivable types' balances are not overstated and are actual receivables; therefore, a discount rate is not applied.

**2. Uncollectible Rates:** DOR changed this methodology based on a discussion with OFM in FY19 and the process has remained the same since then. DOR's analysis showed that a low percentage of accounts were put into deferred status during FY19; therefore, the uncollectible rates are not applied to return receivables or estimated return receivables. For these receivable types, only taxpayer accounts in deferred status would be recorded into Allowance for Uncollectible, see below in #3. For lien receivables, taxpayer accounts in deferred status and estimated uncollectible amount are recorded in Allowance for Uncollectible. Audit receivables have an estimated uncollectible amount recorded in Allowance for Uncollectible based on an uncollectible rate.

**3. Accounts in Deferred Status:** Compliance is responsible for collecting the receivables from all revenue sources. When Compliance has exhausted their collection efforts, or it is not cost effective to continue, the account is put into deferred (or uncollectible) status. DOR analyzed how much was moved into Deferred Status for each receivable type during the year. Based on this analysis, DOR decided that due to the low percentage of accounts moved into deferred status for return receivables and estimated receivables, they will not have an uncollectible rate applied to them. Only the actual balance due amounts on the taxpayer accounts that are in Deferred Status for each of those receivable types will be recorded in Allowance for Uncollectible.

## State of Washington

DOR determined that Lien Receivables have a higher percentage of accounts that moved into Deferred status in the fiscal year; therefore, DOR applied a 5 year average of a lien uncollectible rate to the Lien receivables. The amount recorded into Allowance for Uncollectible for the Liens receivables is the uncollectible rate multiplied by the lien receivable balance and any taxpayers' accounts in deferred status. Additionally, an analysis of audit receivables was performed for FY19 to determine what real dollar adjustments had been made to audit receivables for the year and an uncollectible rate was determined and applied for those accounts. The total adjustments and write-offs during the fiscal year for audit receivables was divided by the beginning balance for audit receivables to determine the uncollectible rate to be applied. Ayano explained that DOR has maintained this process since the analysis performed in FY19.

Business & Financial Services recalculates rates and tests the rates (discount, collection and uncollectible) for accuracy.

### **How transactions are recorded in AFRS:**

#### **Monthly Journal Entries**

On the last business day of the month, ATLAS automatically prepares and posts Journal Vouchers (JV) by revenue source and receivable type to record the taxes receivable, accrued revenue, deferred inflows, and the allowance for uncollectible as well as interest and penalties (**Key Control #2 - Automated Interface – Existence**). Depending on the type of receivable, the allowance for uncollectible is calculated differently based on the analysis above. See summary of analysis in the table below:

<b>Receivable Type</b>	<b>Allowance Methodology</b>
Return Receivables	Reduced by Accounts in Deferred Status (Actual Amounts)
Estimated Returns	Discount Rate is applied to locked returns; collection rate applied to unlocked returns to determine accrued revenue versus deferred inflows
Audit Receivables	Reduced by Uncollectible Allowance rate applied at FYE, determined from real time adjustments to audit receivables during FY
Lien Receivables	Reduced by Lien accounts in deferred status (Actual amounts) plus additional allowance rate applied at FYE

After ATLAS prepares the JV, Revenue Accounting has 6 business days to review the JV before it is automatically released by ATLAS into AFRS to record the JV; this happens in ATLAS on the 6th business day. On the 7th business day of the following month, Revenue Accounting can see the JV in AFRS. ATLAS is able to separate out taxes receivable that relate to the dedicated funds and enter the taxes receivables directly into these funds instead of into Fund 001 - General Fund. The JV is recorded as a monthly balance, therefore ATLAS generates reversal JVs for the prior month's tax receivable JV amounts.

# State of Washington

## **Year End Gross Receipts Journal Entry**

This same process is performed at fiscal year-end (FYE) to record accrued and deferred inflows except for the Gross Receivables. To record the Gross Receivables at FYE, for monthly filers, excise tax returns for June activity are due July 25th and for quarterly filers, tax returns for the 4th fiscal quarter (April, May, and June) are due July 31st. In August, the ATLAS "gross receipts" report, which is programmed to pull all gross receipts for the period July 1-August 15, is downloaded to Excel and compared to the gross receipts from the prior five years to check that the values seem reasonable. Revenue Accounting will reconcile and review the year end JV to enter into AFRS to show the June returns received after June 30<sup>th</sup> as a receivable and accrued revenue for the FYE (**Key Control #3 - Manual - Existence/Completeness**).

## **Monthly ATLAS to AFRS reconciliation:**

At the end of each month, a reconciliation is performed by Revenue Accounting between ATLAS and AFRS to ensure all of the monthly revenue activity has been properly posted to AFRS. Andrew Arnold, Revenue Accounting Supervisor, runs a customized WebI report for taxes received during the month recorded in AFRS. Revenue Accounting will also run a monthly revenue activity report that includes receivables and revenues from all taxes. Most tax revenues are from ATLAS with the exception of property tax in Property Tax Receivable System (PTRS) and taxes recorded in the Cash Receipts Reporting System. Revenue Accounting uses an Excel worksheet to reconcile reports from Webi and ATLAS (**Key Control #4 - Manual - Existence/Completeness**).

To specifically review receivable and allowance for uncollectible balances, Alison Walker, one of Ayano's employees from the Financial Reporting & Systems Support team, pulls a monthly ATLAS report (by receivable type) into a spreadsheet and compares the Discounted receivables balance month-to-month and the Uncollectibles month to month comparison to prior months in the same FY for anomalies (**Key Control 5 - Existence/Valuation**). The comparison is done to ensure the allowance methodology described above is applied consistently. Any anomalies are investigated, and explanations are provided at the bottom of the worksheet with links to the source of the anomaly for easy investigation. There is no minimum threshold for an anomaly investigation.

## **Write Offs:**

By statute [RCW 82.32.340](#), tax debt is never "forgiven" until it is legally written off. The process is as follows:

The uncollectible write-off can be performed at any time by the Warrant Team Tax Administration Manager (TAM). The Adjustments report is generated in ATLAS. The report is generally ran twice a year.

The 12 year write-off report selection criteria (bill due transaction is 12 years or older with open balance):

1. No active liens. If there is a linked liability (TFAAs and successorships) or multiple taxpayers in a lien, the write off process evaluates each taxpayer separately.
2. The collection has to be in deferred stage (linked collections w/o deferred stages are excluded)
3. No payments within the last 2 years
4. No taxpayers with open adjustment requests

## State of Washington

A Prevent Write Off indicator is placed on the account if the taxpayer is paying restitution. The Warrant Team TAM and Excise Tax Examiner (ETE) 3s review the report and can Reject pending write-off adjustments if it is determined that an account should be removed from the list.

The Warrant TAM runs the 12 year write off request job stream in the production environment. This happens on a Friday, so the report will appear in the staging environment on Monday. After the report is reviewed by the TAM and the Warrant Team ETE3s, a 12 year write off approval job is completed in Staging. The Warrant TAM will then run a discrepancy report between the original request and approved request. This report is called Adjustments – Differences. After the report is reviewed and the write off report is adjusted; the Warrant TAM will run the 12 year write off approval job stream in Production. This will post and approve all the pending transactions based on the indicators and changes made in the real production environment.

### **Key controls are as follows:**

- **Key Control #1 – Automated – Completeness/Valuation** – ATLAS will automatically create a receivable including penalties and interest based on the due date, which is automatically posted by ATLAS in the taxpayer account. If a tax return was not filed by the due date, the day after the due date ATLAS will automatically create an estimated tax return based on the account's reporting history and tax rates.
- **Key Control #2 – Automated – Existence** – On the last business day of the month, ATLAS automatically prepares and posts Journal Vouchers (JV) by revenue source and receivable type to record the taxes receivable, accrued revenue, deferred inflows, and the allowance for uncollectible.
- **Key Control #3 - Manual - Existence/Completeness** - In August, the ATLAS "gross receipts" report, which is programmed to pull all gross receipts for the period July 1-August 15, is downloaded to Excel and compared to the gross receipts from the prior five years to check that the values seem reasonable. Revenue Accounting will reconcile and review the year end JV to enter into AFRS to show the June returns received after June 30<sup>th</sup> as a receivable and accrued revenue for the FYE.
- **Key Control #4 - Manual - Existence/Completeness** - At the end of each month, Revenue Accounting runs a revenue activity report (MRA) from ATLAS and downloads AFRS revenue and receivable data from Enterprise Reporting into Excel. A reconciliation is then performed between ATLAS and AFRS to ensure the reported revenue and receivable amounts are accurate and complete.
- **Key Control #5 - Manual - Existence/Valuation** - Financial Reporting & Systems Support pulls monthly ATLAS report (by receivable type) into a spreadsheet and compares prior months (in same FY) reviewing for anomalies in the receivables and allowance calculations.

### **Noted Weaknesses are as follows:**

None

### **D.1.PRG - Taxes Receivables (Net of Allowance)**

# State of Washington

*Procedure Step:* Key Control #1 (Automated)  
*Prepared By:* BFW, 6/25/2024  
*Reviewed By:* RKM, 8/20/2024

## Purpose/Conclusion:

### **Purpose:**

To determine whether ATLAS calculates the receivable, including penalties and interest (**Key Control 1 for ATLAS**) was in place in order to assess control risk.

### **Conclusion:**

Based on our understanding and test results, we concluded that the automated control **was** in place and operating effectively.

Based on our understanding, related general IT controls **were** in place and adequately designed to ensure that the control operated consistently during the audit period. However, we did not test the operating effectiveness of general IT controls.

Our understanding and control risk assessment, which incorporates these conclusions, is documented at [\[Controls - ATLAS\]](#).

## Testing Strategy:

The following procedures are **required** for all automated key controls for financial and single audits:

### **STEP 1: Understand Automated Key Control**

Gain an understanding of the automated key control. The understanding can either be documented in the control system step or could be documented here in this step. Auditors should consider the following aspects of the automated control when gaining an understanding:

#### **Software Calculation:**

- Is there written documentation of the calculation, and/or the source rates and factors used in the calculation?

*We would expect written documentation that defines the calculation and is an official, approved source for the formulas, rates and factors. This may be an approved policy or could be system documentation.*

- What formulas are used to make the calculation?

## State of Washington

- What values or factors are used to make the calculation? For example:
  - Rate tables used by the calculation
  - Profile fields (i.e., applicable transaction types)
  - Programmed/set formulas and/or values
  - Constraints (i.e., effective date, minimums/maximums, etc.)
- How is the calculation triggered or initiated?
- How is the calculation recorded in the accounting system (or used in an end result)?

### Automated Interfaces:

- Is data transferred in real time (immediately) or in a batch? If batched, how often does the interface occur (daily, monthly, quarterly, etc.)?
- What triggers the data transfer?

*Transfers could be manually initiated, could be hardcoded into either the sending or receiving system's programming, could be controlled by administrative menus (for integrated software modules), or could be run as automated jobs with third party software or programming.*

- Could the interface process fail? If so, how would the entity recognize that the process failed?

*This may not be a relevant risk for integrated software, but may be the case for custom interfaces designed outside the software which may be subject to various points of failure.*

- Will the interface process reject transactions or batches with errors? If so, who monitors rejections and follows up on rejected transactions to ensure correction (either in the sending or receiving systems) and how are corrections tracked and monitored?

*For example, information that could trigger a rejection or isolated transaction and batch can include: invalid data, duplicate data, or missing factors. If errors are possible, we would expect the isolated data is reviewed, tracked and corrected in a timely manner.*

- Are any reconciliations done to provide assurance that data transfer was complete and accurate?

*We would expect the local government to perform a reconciliation between source and destination systems to ensure the interfaced data is complete and accurate. This may be a manual reconciliation or spot-check, a system or dashboard report, or automated edit check. Depending on how often errors (if any) are expected, the reconciliation could be done each time the interface occurs, or on a monitoring basis, like annually.*

# State of Washington

## Edit Checks:

- Inquire if the entity has a written policy or documentation describing the approval process and protocols for reviewers?
- What is the approval process in the application?
  - What transactions, data, tasks, or documents are approved?
  - Who are the preparers? How do preparers submit for approval?
  - Who are the authorized approvers? Are there backup approvers?
  - What documents or information are required to make approval judgment?
  - What is the next step once a transaction/data/ task/document is approved or denied?
  - Is there any exception situations where approval can be by-passed or waived?
- Can the approver make changes to information during the approval stage? If so, is the preparer notified of the changes?
- Can anyone make changes to the approved information after the approval stage? If so, are changes captured in an audit trail and is the audit trail (log) regularly reviewed and monitored to detect any unauthorized changes?
- Does the application prevent users from approving their own work (self-approval)?

*Some applications have a feature preventing self-approval. If an application does not have a feature preventing self-approval, we would expect manual controls in place to ensure the segregation of duties between preparer and approver, if relevant to the risk.*

- Does the application have high-level users that can also approve?

*High-Level Users (aka Users with elevated privileges, system or application "Administrators", "Super Users", etc.) typically have full access to change system settings and may have extensive function rights of software applications. Depending on entity's size and complexity, different high-level users may be responsible for the network vs. application level. High-level users represent a heightened risk for overriding segregation of duties and normal control processes.*

*We would expect entities to have compensating monitoring controls if personnel are responsible for both application settings and transaction processing controls.*

## Computer Generated Reports:

- What information or exceptions is the report designed to identify (what is the purpose of the report)?
- How is the report used and by whom?
- For exception reports, who reviews the report and how do they follow up on exceptions?

*Auditors should consider whether the exception report reviewer has appropriate authority and information to effectively follow-up on report results. For fraud-related risks, also consider whether the review position is appropriately segregated from positions that can initiate transactions. For exception reports that regularly identify many transactions needing multi-step follow-up, the manual review and*

## State of Washington

*follow-up may be identified as a separate key control rather than documented and evaluated as an aspect of the automated exception report control.*

- What are the report parameters or criteria? Does the report have any calculated fields? If so, what are the calculations?

*The ideal method of documenting an understanding of a computer generated report is to get a screenshot or printout of the report parameters. If using a report writer, this may be printed with the report, or may be accessed from a design view or intermediary screen. For custom or complex reports, this may be the SQL code.*

*For exception reports, auditors should pay special attention to the definition of an exception embodied in the report parameters.*

*NOTE: observation of the report parameters will also count as a confirmation of the report and could also be used to test the report.*

### Electronic Approvals:

- Inquire if the entity has a written policy or documentation describing the approval process and protocols for reviewers?
- What is the approval process in the application?
  - What transactions, data, tasks, or documents are approved?
  - Who are the preparers? How do preparers submit for approval?
  - Who are the authorized approvers? Are there backup approvers?
  - What documents or information are required to make approval judgment?
  - What is the next step once a transaction/data/ task/document is approved or denied?
  - Is there any exception situations where approval can be by-passed or waived?
- Can the approver make changes to information during the approval stage? If so, is the preparer notified of the changes?
- Can anyone make changes to the approved information after the approval stage? If so, are changes captured in an audit trail and is the audit trail (log) regularly reviewed and monitored to detect any unauthorized changes?
- Does the application prevent users from approving their own work (self-approval)?

*Some applications have a feature preventing self-approval. If an application does not have a feature preventing self-approval, we would expect manual controls in place to ensure the segregation of duties between preparer and approver, if relevant to the risk.*

- Does the application have high-level users that can also approve?

*High-Level Users (aka Users with elevated privileges, system or application "Administrators", "Super Users", etc.) typically have full access to change system settings and may have extensive function rights of software applications. Depending on entity's size and complexity, different high-level users may be responsible for the network vs. application level. High-level users represent a heightened risk for*

# State of Washington

*overriding segregation of duties and normal control processes.*

*We would expect entities to have compensating monitoring controls if personnel are responsible for both application settings and transaction processing controls.*

## **STEP 2: Confirm and Test Automated Key Control**

Confirm and test the automated control. To test the automated control, consider the following procedures:

### **Software Calculation:**

- Re-perform the calculation for selected transactions.  
*Auditors would NOT normally use sampling for automated controls. Instead, auditors should judgmentally select one instance of each significant variation of the calculation. If the number of potential variations is large, auditors would judgmentally select based on risk factors (for example, the most common scenarios, or scenarios associated with identified risks, or scenarios that are not addressed by the entity's testing procedures).*
- *In some cases, it may be possible for the auditor to reperform the calculation for the entire population.*
- If any rate tables or values were updated during the period, view the current values (by observing the rate table or values in an admin menu or from a printed system report) and compare to approved sources.  
*If no updates were made or there are only a few values, this risk could be addressed by re-performing the calculation. However, if source rate tables or values are large or complex, it may be more efficient to test these values directly than to recalculate a larger number of transactions.*
- Consider the use of analytical procedures such as trends or descriptive statistics on the population (like average, minimum and maximum values, or a graph of values across the population) and follow up on any unexpected values or trends. *Analytical procedures would normally also count as a substantive test.*

### **Automated Interfaces:**

- Re-perform a reconciliation, comparison or analytical procedure between both systems to determine whether data interfaced completely and accurately. Alternatively, review the entity's reconciliation or comparison if they perform one.  
  
*For example, auditors could perform count totals and summarize the data to determine whether the same number of transactions reside in both systems, or the total amount from the sending system was posted to the receiving system. Whether this takes the form of a comparison (numbers expected to match exactly), reconciliation (when reconciling items are expected) or analytical procedure (if numerous adjustments or reconciling items are expected) will depend on the nature of the interface and client documentation.*

## State of Washington

*Note: these procedures would also provide substantive evidence.*

- Observe documentation, such as interface logs or email notifications, to determine whether interfaces complete per expected interval (daily, monthly, quarterly, etc.).

*We would expect the data transfer to be consistent based on the programmed schedule. If data is expected to be transferred on a weekly basis, we would expect to see some form of documentation showing the weekly transfer.*

- Observe evidence that batch jobs are monitored such as tracking spreadsheets or emails.
- When interfaces did not occur as expected, determine whether procedures were followed to resubmit job or that there was a logical reason no data was received/sent for the interval (for example, it was a holiday so there was no interface for that day).

### Edit Checks:

- Re-perform the edit check for selected transactions.

*Auditors would NOT normally use sampling for automated controls. Instead, auditors should judgmentally select one instance of each significant variation of the check. If the number of potential variations is large, auditors would judgmentally select based on risk factors (for example, the most common scenarios, or scenarios associated with identified risks, or scenarios that are not addressed by the entity's testing procedures).*

*In some cases, it may be possible for the auditor to reperform the edit check for the entire population.*

- Consider the use of analytical procedures such as trends or descriptive statistics on the population (like average, minimum and maximum values, or a graph of values across the population) and follow up on any unexpected values or trends. Analytical procedures would normally also count as a substantive test.

### Computer Generated Reports:

- For exception reports, inquire with the person assigned to review the report how frequently exceptions are noted by the report. Trace identified exceptions to documentation of correction or resolution.
- Re-perform the report by either (a) generating it yourself in the entity's system (if the auditor has direct access to the system), (b) recreating the report using CAATS, or (c) by observing the report be generated in your presence. If observing, note any user-entered values or parameters and determine whether entered parameters were appropriate. Compare re-performed report to the one being tested.

### Electronic Approvals:

## State of Washington

- Observe a transaction to see the approval process and verify any key aspects of the process or limits.
- If transaction data or reports include approval information, use CAATS to confirm that all transactions met authorization rules.

### **STEP 3: Understand General IT Controls**

Gain an understanding of the general IT controls that support the continued proper operation of the automated control. Identify key general IT controls and note any control weaknesses. Auditors should consider the following aspects of general IT controls when gaining an understanding:

#### **Software Calculation:**

- Inquire if the entity has experienced any errors or irregularities with the calculation. Also how often changes are made to the calculation, and how many changes (if any) were made during the year.
- How can the software calculation (formulas, rates/values, settings/configurations) be changed or customized?

*Software calculations will usually have one or more administrative menus that allow the government to modify rate tables or other calculation values, or to configure the calculation or apply settings.*

*In other cases, software calculation formulas and/or values may be hard-coded into the system and require programmers to make the changes. If the government has access to source code, then it needs internal procedures for program changes. If the program is controlled by vendors, we would expect program change procedures and expectations to be included in the contract.*

- What are the procedures to authorize and make program changes or configuration/setting changes to the software calculation?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

- What are the procedures to test that program changes are properly working?

*If utilizing a test environment, there should be controls to ensure that the live environment is updated and is consistent with the live production environment. As management is responsible for the accuracy of their automated controls (i.e., in the live environment), we would expect there to be a procedure to confirm each key automated control once it is in the live environment. This could be manually re-performing the calculation, reviewing reports against known expectations, etc.*

- How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables*

## State of Washington

*or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

- If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change programming, but they may be responsible for patch management, master table data, and/or configurations.*

### Automated Interfaces:

- Inquire if the entity has experienced any errors or irregularities with the interface. Also how often changes are made to the interface, and how many changes (if any) were made during the year.
- What are the procedures to authorize and make changes to the interface?

*Except for the most simple situations, we would normally expect update procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

- What are the procedures to test that program changes are properly working?  
*If the data transfer is already going to be checked or reconciled, then there may be less need for specific test procedures on program changes since any errors will be identified right away.*
- How are program changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

*If the program is controlled by a third-party, we would expect a process between the government and vendor that allows the government to make requests and receive communication at the completion of the request.*

- If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

## State of Washington

*For example, local governments may not have access to vendor developed/supported coding that controls how the system processes the interfaced data, but they may be responsible for working the interface error queues and reconciling the interfaced data.*

### Edit Checks:

- Inquire if the entity has experienced any errors or irregularities with the edit checks. Also how often changes are made to the checks, and how many changes (if any) were made during the year.
- How can the edit check be changed or customized?

*Edit checks may be hard-coded into the system and require programmers to make the changes. If the government has access to source code, then it needs internal procedures for program changes. If the program is controlled by vendors, we would expect program change procedures and expectations to be included in the contract.*

*In other cases, edit checks may be established or configured through one or more administrative menus.*

- What are the procedures to authorize and make program changes or configuration/setting changes?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

- What are the procedures to test that program changes are properly working?  
*If utilizing a test environment, there should be controls to ensure that the live environment is updated and is consistent with the live production environment. As management is responsible for the accuracy of their automated controls (i.e., in the live environment), we would expect there to be a procedure to confirm each key automated control once it is in the live environment. This could be manually re-performing the edit check, reviewing reports against known expectations, etc.*
- How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

- If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

## State of Washington

*For example, local governments may not have access to change programming, but they may be responsible for patch management, master table data, and/or configurations.*

### Computer Generated Reports:

- Inquire if the entity has experienced any errors or irregularities with the report. Also how often changes are made to the report, and how many changes (if any) were made during the year.
- How is the report triggered or initiated?

*For reports that are automatically triggered, the auditor would normally not identify job scheduling or monitoring as a general control since we would expect failure of the report to generate*

- Is the report hardcoded into the program, or is it a custom or ad hoc report? Also, what manual inputs (if any) are required to run the report?

*What parameters, criteria (date ranges, fund number, departments) or instructions are entered by the user to generate the exception report. The more options entity personnel have to customize or modify the report, the higher the risk of human error and inaccurate or incomplete reports. Pre-programmed reports provide less flexibility than ad-hoc reports; however, if program change controls are in place, they are more consistent.*

- If the report is hardcoded into the system, how are program changes made?
- If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change vendor developed reports, but they may be responsible for triggering, setting certain parameters, and/or following up on exception report results.*

- NOTE: if the auditor cannot identify sufficiently effective general IT controls, the automated control will need to be tested using the same methods as a manual control (ie: sampling throughout the period). For example, if the report is manually generated and highly dependent on a number of manual inputs each time, or if the report does not have formal change controls, such as an ad hoc report or excel-based report. In such cases, the automated report is controlled by limited access and the judgment of the report writer – that is, while the report is an automated component, there is also an integrated manual component to the control.

### Electronic Approvals:

## State of Washington

- How are users assigned preparer and approver roles? Are user accounts periodically checked for needed changes? See the [User Access](#) step in the Accountability folder for more control considerations.
- If configurations or settings relevant to the approval process are controlled by an admin menu, who has access to this menu?
- If the entity has access to source coding for approval controls, what are the procedures to authorize and make program changes?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

- What are the procedures to test that program changes are properly working?
- How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

- If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to vendor developed/supported coding that controls how the electronic approval works, but they may be responsible for approval configurations or settings and/or user account management.*

### **STEP 4: Confirm Key General IT Controls**

Confirm your understanding of key general IT controls to determine whether they have been placed in operation (*whether the entity has actually implemented key controls*).

### **STEP 5: Test Key General IT Controls**

Document whether general IT controls will be tested. Option 1 would result in control risk at MAX for the automated control. Either option 2 or 3 is necessary in order to set control risk at LOW. If general IT controls are tested, consider the following procedures:

#### **Software Calculation:**

- If program changes or setting/configuration changes are logged, review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

## State of Washington

- Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the calculation may also provide this evidence if the re-performance tests address all states of the calculation during the period.
- If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.
- If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) worksheet in the Store.

### Automated Interfaces:

- Review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

- Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, reconciling or comparing the data transfer (or reviewing the entity's reconciliation or comparison) may also provide this evidence if tests address all states of the interface during the period.
- Inspect job processing error logs/reports. Observe evidence that errors in processing were isolated and resolved. For example, select a sample of rejected transactions and observe evidence to determine whether errors were appropriately corrected and the corrections were timely.
- If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) worksheet in the Store.

### Edit Checks:

- If program changes or setting/configuration changes are logged, review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

- Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the edit check may also provide this evidence if the re-performance tests address all states of the edit check during the period.
- If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.

## State of Washington

- If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

### Computer Generated Reports:

- If the report is subject to program change controls (either due to being hardcoded or by being automatically triggered), review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

- If the report is subject to program change controls, review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the report may also provide this evidence if the re-performance tests address all states of the report during the period.
- If the report relies on manual inputs and report copies saved show the parameters entered, the auditor can check a selection or sample of reports to confirm that the report was run correctly.
- If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

### Electronic Approvals:

- Review user access report to verify that current users are appropriate. Also consider review of user access change logs (if available) to evaluate user account management throughout the period. See the User Access step in the Accountability folder for more testing considerations.
- If approvals are governed by significant settings/configurations, and such changes are logged, review the change log to verify the population of changes for the year.

*Verification that no configuration changes were made, along with the auditor's evaluation that no such changes are expected, would normally be sufficient evidence to conclude that no further testing is necessary.*

- If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.
- If the entity has access to source code, review the change log to verify the population of changes for the year. Then review programming change documentation or the entity's test documentation for selected or sampled changes.

*Verification that no program changes were made, along with the auditor's evaluation that no such changes are expected, would normally be sufficient evidence to conclude that no further testing is necessary.*

## State of Washington

- If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the SOC Report Reliance worksheet in the Store.

### **STEP 6: Final Control Risk**

Evaluate the results and document a final control risk assessment in the control system step. Consider whether any deficiencies identified with either the automated control or related general IT controls represent material weaknesses or significant deficiencies.

*Note: general IT control deficiencies do not necessarily mean the automated control is not properly functioning. General IT control deficiencies would normally be considered a significant deficiency or material weakness only if it caused an issue with the compliance requirement or assertion.*

### **Recommendation Review Requirement**

IT Security related information is considered category 3 data protected by Public Request Exemption RCW 42.56.420. Issues related to IT Security require the following special handling:

- [Instructions](#) are located in Team IT Audit's System's Sharepoint page.
- Details of IT Security related issues should NOT be included in any emails or helpdesks.
- Exit, ML and Findings should be separately communicated in an IT Security Results Document.
- Findings will be referenced, but not included in the audit report.
- All IT security-related recommendations must be reviewed by [Team IT Audit](#).
- Template language for common IT related recommendations can be found in [ARS Part 5 Chapter 8](#).

### **PUBLIC REQUEST EXEMPTION**

Some IT related information is protected by Public Request Exemption RCW 42.56.420 for cyber security purposes. The details documented in the record of work and support workpapers may qualify for this exemption. If so, auditors must include this statement in the record of work done and any related workpapers: **"This record contains information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited "**.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Information Technology](#) Planning Guide**

# State of Washington

Auditors may contact [Team IT Audit](#) with any testing strategy or control assessment questions or to request assistance from an IT Specialist.

**Software Calculation:** A **software calculation control** exists when the value of a transaction is determined by a software application. This process can be a key control when the entity relies on the system to generate calculations correctly to determine the amount of transactions (i.e., summarizing/account code allocation to post to general ledger, calculate student, utility, other charges, etc.).

**Automated Interfaces:** An interface is a process that moves information from one computer application to another. The interface can occur internally between systems maintained by a single agency, or between systems maintained by different agencies or private companies. The interface can also occur between modules within the same computer application.

The data transferred might be a file consisting of one or more records processed at a later time (batch), or it can be a real-time update. Risk associated with interfaces increases as the number of transactions or the number of other services and systems supported by the interfaced data increases.

Poor design or inadequate oversight can affect the transfer of transaction data among the systems. Interface controls are automated and/or manual processes designed to ensure transmission and processing of information is complete and accurate.

## Manual vs. Automated Interfaces

A "manual interface" is the transfer of data from one system or module to another system or module, initiated and controlled by a user. An example of a manual interface is when customer accounts are downloaded from a utility billing system to be used to perform meter readings. When complete, the file with meter readings may be uploaded and posted to the customer accounts.

An "automated interface" is the transfer of data from one system or module to another system or module that happens automatically based on a schedule, or other predefined criteria. A common example of an automated interface is the payroll module of a system. Typically, a payroll batch is created in the payroll module. Once approved, the batch is automatically sent by the system to the general ledger or other applicable modules, such as accounts payable.

Entities should have reconciliation controls between their various applications regardless of the method used for interfacing.

*Auditors should have determined whether system interfaces are automated as part of the Key Software Applications workpaper. **If not**, ask the following question to determine whether the system interface is manual or automated.*

*Is the data transferred from one system/module to another system/module by a user using an uploading and posting technique? For example, data is pulled from one system into a text file or other format, that is then uploaded into a different system or module by posting or in an upload feature of the module. If the answer to this question is yes, the interface would be considered "manual" since it is*

# State of Washington

*initiated and controlled by manually rather than through an automated process.*

**Edit Checks:** An **edit check** is a programmed routine designed to check input data or processing results for accuracy, compliance, or reasonableness. Types of edit checks include:

- Range Checks: ensure that numeric values fall within specified ranges, minimums and/or maximums. For example, ensuring that a capital asset can only be entered as a positive amount, or a purchase order can only be submitted without secondary approval for less than a certain threshold.
- Consistency Checks: verify that related data fields are consistent with each other. For example, ensuring that a patient's age matches their date of birth.
- Format Checks: validate data formats (for example, dates as MM/DD/YYYY or phone numbers as ###-###-####).
- Logical Checks: assess logical relationships between data fields. For instance, verifying that total debits equals total credits in a journal entry.
- Duplicate Checks: identify duplicate records or entries. For example, preventing the same invoice from being entered twice.
- Cross-Field Checks: compare data across different fields. For instance, ensuring that the start date of a project is before the end date.
- Required Field Checks: ensure that mandatory fields are filled out. For instance, making sure that a patient's name and date of birth are provided.
- Referential Integrity Checks: validate relationships between data tables. For example, confirming that a vendor number exists in the vendor master file as an active entity.
- Outlier Checks: detect extreme or unexpected values. For instance, flagging water meter reading values that are extreme outliers for the customer type or account history.
- Pattern Checks: look for specific patterns in data. For example, verifying that email addresses follow a valid format.

Edit checks may result in automatic rejection of a transaction, inability to proceed with a transaction, trigger for additional processing or review, or may simply result in a warning message to the user.

Edit checks may be identified as a key control when they are sufficiently relevant (ie: addressing the risk), precise (ie: able to catch all errors, rather than just being only reasonableness or limit check), and sufficiently strong (ie: prevent invalid transactions, rather than just generating a warning messages). Auditors may identify an individual edit or a group of edit checks together as a key control.

**Computer Generated Reports:** A **computer-generated report** is a report that is created by a computer program. The computer program, also referred to as a report generator or tool, takes data from a data source, such as a database, and displays it in a specified format. The process to generate a report often includes performing calculations on the data, such as summarizing, classifying, etc., before displaying, or can display the calculations on the report.

There are two types of computer-generated reports, pre-programmed and ad-hoc or customized reports.

## State of Washington

- Pre-programmed or canned reports are pre-defined reports where criteria and specifications are hard coded in the system. A canned report may allow limited parameters, (month/year, for example), but in general the information that will be displayed is pre-determined.
- Ad-hoc or customized reports allow the user to drill down and customize what information is displayed on the report based on some allowed criteria, such as account codes, dollar amounts minimum, etc).

In contrast, a **manual report** is one that is created outside the system using data exports or is created ad hoc by a user. An example of a manual report is one that is created by copying data from a data source and pasting the data in an Excel spreadsheet or Word document or Powerpoint presentation where it is then processed further. With manual reports, each time a report is created, the data could be incorrect due to user error, such as not copying all relevant data, or processing errors. Therefore, these types of reports should be understood and tested similar to manual controls.

**Electronic Approvals:** Electronic approvals, electronic signatures and digital signatures are technically different, although often these terms are used interchangeably by entities.

Auditors should have determined whether the electronic approval is an automated control as part of the overall understanding of controls. For automated control purposes, an electronic approval is a software system functionality that:

- Permits a user to approve transaction(s) within the software system
- The system automatically documents, or logs, the data approved by the user and any subsequent manipulation
- The acceptance or rejection of the transaction by the approver will trigger an additional software system process, such as posting of a transaction.

E-mail, scanned-in pictures of signatures, or font-changed signatures, etc. may be part of a control activity but are generally not considered an automated control and are not covered by this testing strategy.

### Electronic Signature vs Digital Signature

An “**electronic signature**” can look like a handwritten signature that has been scanned and then pasted into an electronic document. The reliability of this type of approval is variable. Recommend gaining an understanding of the process used to store and affix the signature to the document and then discuss the process with Team IT Audit before placing reliance on this control.

A “**digital signature**” is a legal signature with a formal certification process that documents who approved the document and ensures the document is not modified after certification. Reliability of this process is very high but has significant technical features. Recommend brainstorm with Team IT Audit before placing reliance on this control.

### **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

# State of Washington

**Statements on Auditing Standards [AU-C 315](#) Understanding the Entity and Its Environment and Assessing the Risks of Material Misstatement** - paragraphs .A106-.A109 describe general and application controls and how they relate to audit risks

**Statements on Auditing Standards [AU-C 330](#) Performaing Audit Procedures in Response to Assessed Risks and Evaluating the Audit Evidence Obtained** - paragraphs .10b and .A33-.A34 describe requirements and guidance for testing indirect controls in conjunction with tests of controls, that is, testing key general controls in conjunction with a test of a key automated control

Record of Work Done:

## **Taxes Receivable (Net of Allowance) - ATLAS**

### **Key Controls #1 as follows for the ATLAS:**

- **Key Control #1 – Automated Interface – Completeness/Valuation** - ATLAS will automatically create a receivable including penalties and interest based on the due date, which is automatically posted by ATLAS in the taxpayer account. If a tax return was not filed by the due date, the day after the due date ATLAS will automatically create an estimated tax return based on the account's reporting history and tax rates.

### **STEP 1: Understand Automated Key Control**

The understanding for this system is documented above in the "Controls - ATLAS" step.

### **STEP 2: Confirm and Test Automated Key Control:**

We met with Ayano Faasumalie, Revenue and Financial Reporting Coordinator, on June 20th, 2024 via TEAMS to discuss the process of ATLAS automatically creating a receivable for submitted returns and estimated returns.

### **Return Receivable**

We performed a walk through of an account in ATLAS with a submitted return with Ayano. She pulled up the tax return for taxpayer UBI No. 604-916-389, a quarterly filer, for the period of 7/1/2023-9/30/2023. The return was due 10/31/2023, however the taxpayer did not file until 11/3/2023 and has not yet paid, as of the date of this walkthrough. Based on information submitted in the return, ATLAS calculated the following taxes:

- Business & Occupation Tax - 195.38 (gross amount \$40,366.79 and a tax rate of 0.00484)
- Small business tax credit - 135.00

This resulted in a total tax balance of \$60.38. However, because the filer was late, ATLAS automatically calculated a penalty of \$20.53 and interest of \$2.02, bringing the total due to \$82.93.

We verified the tax rates used to calculate the above taxes using the DOR website:

- [Business & occupation tax classifications | Washington Department of Revenue](#)

# State of Washington

We determined the total amount of taxes due were correctly calculated.

Ayano showed us the receivable was posted in November in ATLAS for the balance due of \$82.93. The receivable was posted in the Receivable Accumulation General Ledger (GL) in ATLAS by revenue source until month end. If a payment or adjustment is made on the return, it will be subtracted out of the Accumulated Receivable GL. At the end of the month, the balance in the Accumulation GL is moved into the Receivables GL automatically by ATLAS. ***No issues noted.***

## **STEP 3: Understand General IT Controls**

We met with Lucas Kenall and Pavath Phommachanh on May 23, 2024 to gain an understanding of general IT controls over the creation of receivables and the calculating of interest and penalties.

Because calculations for receivables follow the same general IT controls as the calculations for local taxes. We gained our understanding of general IT controls in the Tax Collections for Other Governments section: [Key Control 2 (Automated)].

## **STEP 4: Confirm Key General IT Controls**

We confirmed our key general IT controls in the Tax Collections for Other Governments section: [Key Control 2 (Automated)].

## **STEP 5: Test Key General IT Controls**

Not applicable - we are not planning to rely on automated controls and therefore do not need to test general controls; control risk will be assessed at MAX.

## **D.1.PRG - Taxes Receivables (Net of Allowance)**

*Procedure Step:* Key Control #2 (Automated)

*Prepared By:* BFW, 6/26/2024

*Reviewed By:* RKM, 8/20/2024

Purpose/Conclusion:
---------------------

### **Purpose:**

To determine whether on the last business day of the month, ATLAS automatically prepares and posts Journal Vouchers (JV) by revenue source and receivable type to record the taxes receivable, accrued revenue, unavailable revenue, and the allowance for uncollectibles **(Key Control 2**

## State of Washington

for **ATLAS**) was in place in order to assess control risk.

### **Conclusion:**

Based on our understanding and test results, we concluded that the automated control **was** in place and operating effectively.

Based on our understanding, related general IT controls **were** in place and adequately designed to ensure that the control operated consistently during the audit period. However, we did not test the operating effectiveness of general IT controls.

Our understanding and control risk assessment, which incorporates these conclusions, is documented at [\[Controls - ATLAS\]](#).

Testing Strategy:

The following procedures are **required** for all automated key controls for financial and single audits:

### **STEP 1: Understand Automated Key Control**

Gain an understanding of the automated key control. The understanding can either be documented in the control system step or could be documented here in this step. Auditors should consider the following aspects of the automated control when gaining an understanding:

#### **Software Calculation:**

- Is there written documentation of the calculation, and/or the source rates and factors used in the calculation?

*We would expect written documentation that defines the calculation and is an official, approved source for the formulas, rates and factors. This may be an approved policy or could be system documentation.*

- What formulas are used to make the calculation?
- What values or factors are used to make the calculation? For example:
  - Rate tables used by the calculation
  - Profile fields (i.e., applicable transaction types)
  - Programmed/set formulas and/or values
  - Constraints (i.e., effective date, minimums/maximums, etc.)
- How is the calculation triggered or initiated?
- How is the calculation recorded in the accounting system (or used in an end result)?

#### **Automated Interfaces:**

## State of Washington

- Is data transferred in real time (immediately) or in a batch? If batched, how often does the interface occur (daily, monthly, quarterly, etc.)?
- What triggers the data transfer?

*Transfers could be manually initiated, could be hardcoded into either the sending or receiving system's programming, could be controlled by administrative menus (for integrated software modules), or could be run as automated jobs with third party software or programming.*

- Could the interface process fail? If so, how would the entity recognize that the process failed?

*This may not be a relevant risk for integrated software, but may be the case for custom interfaces designed outside the software which may be subject to various points of failure.*

- Will the interface process reject transactions or batches with errors? If so, who monitors rejections and follows up on rejected transactions to ensure correction (either in the sending or receiving systems) and how are corrections tracked and monitored?

*For example, information that could trigger a rejection or isolated transaction and batch can include: invalid data, duplicate data, or missing factors. If errors are possible, we would expect the isolated data is reviewed, tracked and corrected in a timely manner.*

- Are any reconciliations done to provide assurance that data transfer was complete and accurate?

*We would expect the local government to perform a reconciliation between source and destination systems to ensure the interfaced data is complete and accurate. This may be a manual reconciliation or spot-check, a system or dashboard report, or automated edit check. Depending on how often errors (if any) are expected, the reconciliation could be done each time the interface occurs, or on a monitoring basis, like annually.*

### Edit Checks:

- Inquire if the entity has a written policy or documentation describing the approval process and protocols for reviewers?
- What is the approval process in the application?
  - What transactions, data, tasks, or documents are approved?
  - Who are the preparers? How do preparers submit for approval?
  - Who are the authorized approvers? Are there backup approvers?
  - What documents or information are required to make approval judgment?
  - What is the next step once a transaction/data/ task/document is approved or denied?
  - Is there any exception situations where approval can be by-passed or waived?
- Can the approver make changes to information during the approval stage? If so, is the preparer notified of the changes?

## State of Washington

- Can anyone make changes to the approved information after the approval stage? If so, are changes captured in an audit trail and is the audit trail (log) regularly reviewed and monitored to detect any unauthorized changes?
- Does the application prevent users from approving their own work (self-approval)?

*Some applications have a feature preventing self-approval. If an application does not have a feature preventing self-approval, we would expect manual controls in place to ensure the segregation of duties between preparer and approver, if relevant to the risk.*

- Does the application have high-level users that can also approve?

*High-Level Users (aka Users with elevated privileges, system or application "Administrators", "Super Users", etc.) typically have full access to change system settings and may have extensive function rights of software applications. Depending on entity's size and complexity, different high-level users may be responsible for the network vs. application level. High-level users represent a heightened risk for overriding segregation of duties and normal control processes.*

*We would expect entities to have compensating monitoring controls if personnel are responsible for both application settings and transaction processing controls.*

### Computer Generated Reports:

- What information or exceptions is the report designed to identify (what is the purpose of the report)?
- How is the report used and by whom?
- For exception reports, who reviews the report and how do they follow up on exceptions?

*Auditors should consider whether the exception report reviewer has appropriate authority and information to effectively follow-up on report results. For fraud-related risks, also consider whether the review position is appropriately segregated from positions that can initiate transactions. For exception reports that regularly identify many transactions needing multi-step follow-up, the manual review and follow-up may be identified as a separate key control rather than documented and evaluated as an aspect of the automated exception report control.*

- What are the report parameters or criteria? Does the report have any calculated fields? If so, what are the calculations?

*The ideal method of documenting an understanding of a computer generated report is to get a screenshot or printout of the report parameters. If using a report writer, this may be printed with the report, or may be accessed from a design view or intermediary screen. For custom or complex reports, this may be the SQL code.*

*For exception reports, auditors should pay special attention to the definition of an exception embodied in the report parameters.*

# State of Washington

*NOTE: observation of the report parameters will also count as a confirmation of the report and could also be used to test the report.*

## Electronic Approvals:

- Inquire if the entity has a written policy or documentation describing the approval process and protocols for reviewers?
- What is the approval process in the application?
  - What transactions, data, tasks, or documents are approved?
  - Who are the preparers? How do preparers submit for approval?
  - Who are the authorized approvers? Are there backup approvers?
  - What documents or information are required to make approval judgment?
  - What is the next step once a transaction/data/ task/document is approved or denied?
  - Is there any exception situations where approval can be by-passed or waived?
- Can the approver make changes to information during the approval stage? If so, is the preparer notified of the changes?
- Can anyone make changes to the approved information after the approval stage? If so, are changes captured in an audit trail and is the audit trail (log) regularly reviewed and monitored to detect any unauthorized changes?
- Does the application prevent users from approving their own work (self-approval)?

*Some applications have a feature preventing self-approval. If an application does not have a feature preventing self-approval, we would expect manual controls in place to ensure the segregation of duties between preparer and approver, if relevant to the risk.*

- Does the application have high-level users that can also approve?

*High-Level Users (aka Users with elevated privileges, system or application "Administrators", "Super Users", etc.) typically have full access to change system settings and may have extensive function rights of software applications. Depending on entity's size and complexity, different high-level users may be responsible for the network vs. application level. High-level users represent a heightened risk for overriding segregation of duties and normal control processes.*

*We would expect entities to have compensating monitoring controls if personnel are responsible for both application settings and transaction processing controls.*

## **STEP 2: Confirm and Test Automated Key Control**

Confirm and test the automated control. To test the automated control, consider the following procedures:

## Software Calculation:

- Re-perform the calculation for selected transactions.

## State of Washington

*Auditors would NOT normally use sampling for automated controls. Instead, auditors should judgmentally select one instance of each significant variation of the calculation. If the number of potential variations is large, auditors would judgmentally select based on risk factors (for example, the most common scenarios, or scenarios associated with identified risks, or scenarios that are not addressed by the entity's testing procedures).*

*In some cases, it may be possible for the auditor to reperform the calculation for the entire population.*

- If any rate tables or values were updated during the period, view the current values (by observing the rate table or values in an admin menu or from a printed system report) and compare to approved sources.  
*If no updates were made or there are only a few values, this risk could be addressed by re-performing the calculation. However, if source rate tables or values are large or complex, it may be more efficient to test these values directly than to recalculate a larger number of transactions.*
- Consider the use of analytical procedures such as trends or descriptive statistics on the population (like average, minimum and maximum values, or a graph of values across the population) and follow up on any unexpected values or trends. *Analytical procedures would normally also count as a substantive test.*

### Automated Interfaces:

- Re-perform a reconciliation, comparison or analytical procedure between both systems to determine whether data interfaced completely and accurately. Alternatively, review the entity's reconciliation or comparison if they perform one.

*For example, auditors could perform count totals and summarize the data to determine whether the same number of transactions reside in both systems, or the total amount from the sending system was posted to the receiving system. Whether this takes the form of a comparison (numbers expected to match exactly), reconciliation (when reconciling items are expected) or analytical procedure (if numerous adjustments or reconciling items are expected) will depend on the nature of the interface and client documentation.*

*Note: these procedures would also provide substantive evidence.*

- Observe documentation, such as interface logs or email notifications, to determine whether interfaces complete per expected interval (daily, monthly, quarterly, etc.).

*We would expect the data transfer to be consistent based on the programmed schedule. If data is expected to be transferred on a weekly basis, we would expect to see some form of documentation showing the weekly transfer.*

- Observe evidence that batch jobs are monitored such as tracking spreadsheets or emails.

## State of Washington

- When interfaces did not occur as expected, determine whether procedures were followed to resubmit job or that there was a logical reason no data was received/sent for the interval (for example, it was a holiday so there was no interface for that day).

### Edit Checks:

- Re-perform the edit check for selected transactions.

*Auditors would NOT normally use sampling for automated controls. Instead, auditors should judgmentally select one instance of each significant variation of the check. If the number of potential variations is large, auditors would judgmentally select based on risk factors (for example, the most common scenarios, or scenarios associated with identified risks, or scenarios that are not addressed by the entity's testing procedures).*

*In some cases, it may be possible for the auditor to reperform the edit check for the entire population.*

- Consider the use of analytical procedures such as trends or descriptive statistics on the population (like average, minimum and maximum values, or a graph of values across the population) and follow up on any unexpected values or trends. Analytical procedures would normally also count as a substantive test.

### Computer Generated Reports:

- For exception reports, inquire with the person assigned to review the report how frequently exceptions are noted by the report. Trace identified exceptions to documentation of correction or resolution.
- Re-perform the report by either (a) generating it yourself in the entity's system (if the auditor has direct access to the system), (b) recreating the report using CAATS, or (c) by observing the report be generated in your presence. If observing, note any user-entered values or parameters and determine whether entered parameters were appropriate. Compare re-performed report to the one being tested.

### Electronic Approvals:

- Observe a transaction to see the approval process and verify any key aspects of the process or limits.
- If transaction data or reports include approval information, use CAATS to confirm that all transactions met authorization rules.

### **STEP 3: Understand General IT Controls**

Gain an understanding of the general IT controls that support the continued proper operation of the automated control. Identify key general IT controls and note any control weaknesses. Auditors should consider the following aspects of general IT controls when gaining an understanding:

### Software Calculation:

## State of Washington

- Inquire if the entity has experienced any errors or irregularities with the calculation. Also how often changes are made to the calculation, and how many changes (if any) were made during the year.
- How can the software calculation (formulas, rates/values, settings/configurations) be changed or customized?

*Software calculations will usually have one or more administrative menus that allow the government to modify rate tables or other calculation values, or to configure the calculation or apply settings.*

*In other cases, software calculation formulas and/or values may be hard-coded into the system and require programmers to make the changes. If the government has access to source code, then it needs internal procedures for program changes. If the program is controlled by vendors, we would expect program change procedures and expectations to be included in the contract.*

- What are the procedures to authorize and make program changes or configuration/setting changes to the software calculation?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

- What are the procedures to test that program changes are properly working?

*If utilizing a test environment, there should be controls to ensure that the live environment is updated and is consistent with the live production environment. As management is responsible for the accuracy of their automated controls (i.e., in the live environment), we would expect there to be a procedure to confirm each key automated control once it is in the live environment. This could be manually re-performing the calculation, reviewing reports against known expectations, etc.*

- How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

- If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change programming, but they may be responsible for patch management, master table data, and/or configurations.*

# State of Washington

## Automated Interfaces:

- Inquire if the entity has experienced any errors or irregularities with the interface. Also how often changes are made to the interface, and how many changes (if any) were made during the year.
- What are the procedures to authorize and make changes to the interface?

*Except for the most simple situations, we would normally expect update procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

- What are the procedures to test that program changes are properly working?  
*If the data transfer is already going to be checked or reconciled, then there may be less need for specific test procedures on program changes since any errors will be identified right away.*
- How are program changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

*If the program is controlled by a third-party, we would expect a process between the government and vendor that allows the government to make requests and receive communication at the completion of the request.*

- If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to vendor developed/supported coding that controls how the system processes the interfaced data, but they may be responsible for working the interface error queues and reconciling the interfaced data.*

## Edit Checks:

- Inquire if the entity has experienced any errors or irregularities with the edit checks. Also how often changes are made to the checks, and how many changes (if any) were made during the year.
- How can the edit check be changed or customized?

## State of Washington

*Edit checks may be hard-coded into the system and require programmers to make the changes. If the government has access to source code, then it needs internal procedures for program changes. If the program is controlled by vendors, we would expect program change procedures and expectations to be included in the contract.*

*In other cases, edit checks may be established or configured through one or more administrative menus.*

- What are the procedures to authorize and make program changes or configuration/setting changes?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

- What are the procedures to test that program changes are properly working?  
*If utilizing a test environment, there should be controls to ensure that the live environment is updated and is consistent with the live production environment. As management is responsible for the accuracy of their automated controls (i.e., in the live environment), we would expect there to be a procedure to confirm each key automated control once it is in the live environment. This could be manually re-performing the edit check, reviewing reports against known expectations, etc.*
- How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

- If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change programming, but they may be responsible for patch management, master table data, and/or configurations.*

### Computer Generated Reports:

- Inquire if the entity has experienced any errors or irregularities with the report. Also how often changes are made to the report, and how many changes (if any) were made during the year.
- How is the report triggered or initiated?

## State of Washington

*For reports that are automatically triggered, the auditor would normally not identify job scheduling or monitoring as a general control since we would expect failure of the report to generate*

- Is the report hardcoded into the program, or is it a custom or ad hoc report? Also, what manual inputs (if any) are required to run the report?

*What parameters, criteria (date ranges, fund number, departments) or instructions are entered by the user to generate the exception report. The more options entity personnel have to customize or modify the report, the higher the risk of human error and inaccurate or incomplete reports. Pre-programmed reports provide less flexibility than ad-hoc reports; however, if program change controls are in place, they are more consistent.*

- If the report is hardcoded into the system, how are program changes made?
- If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change vendor developed reports, but they may be responsible for triggering, setting certain parameters, and/or following up on exception report results.*

- NOTE: if the auditor cannot identify sufficiently effective general IT controls, the automated control will need to be tested using the same methods as a manual control (ie: sampling throughout the period). For example, if the report is manually generated and highly dependent on a number of manual inputs each time, or if the report does not have formal change controls, such as an ad hoc report or excel-based report. In such cases, the automated report is controlled by limited access and the judgment of the report writer – that is, while the report is an automated component, there is also an integrated manual component to the control.

### Electronic Approvals:

- How are users assigned preparer and approver roles? Are user accounts periodically checked for needed changes? See the [User Access](#) step in the Accountability folder for more control considerations.
- If configurations or settings relevant to the approval process are controlled by an admin menu, who has access to this menu?
- If the entity has access to source coding for approval controls, what are the procedures to authorize and make program changes?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

## State of Washington

- What are the procedures to test that program changes are properly working?
- How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

- If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to vendor developed/supported coding that controls how the electronic approval works, but they may be responsible for approval configurations or settings and/or user account management.*

### **STEP 4: Confirm Key General IT Controls**

Confirm your understanding of key general IT controls to determine whether they have been placed in operation (*whether the entity has actually implemented key controls*).

### **STEP 5: Test Key General IT Controls**

Document whether general IT controls will be tested. Option 1 would result in control risk at MAX for the automated control. Either option 2 or 3 is necessary in order to set control risk at LOW. If general IT controls are tested, consider the following procedures:

#### **Software Calculation:**

- If program changes or setting/configuration changes are logged, review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

- Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the calculation may also provide this evidence if the re-performance tests address all states of the calculation during the period.
- If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.
- If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the **SOC Report Reliance** worksheet in the Store.

# State of Washington

## Automated Interfaces:

- Review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

- Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, reconciling or comparing the data transfer (or reviewing the entity's reconciliation or comparison) may also provide this evidence if tests address all states of the interface during the period.
- Inspect job processing error logs/reports. Observe evidence that errors in processing were isolated and resolved. For example, select a sample of rejected transactions and observe evidence to determine whether errors were appropriately corrected and the corrections were timely.
- If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

## Edit Checks:

- If program changes or setting/configuration changes are logged, review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

- Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the edit check may also provide this evidence if the re-performance tests address all states of the edit check during the period.
- If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.
- If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

## Computer Generated Reports:

- If the report is subject to program change controls (either due to being hardcoded or by being automatically triggered), review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

## State of Washington

- If the report is subject to program change controls, review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the report may also provide this evidence if the re-performance tests address all states of the report during the period.
- If the report relies on manual inputs and report copies saved show the parameters entered, the auditor can check a selection or sample of reports to confirm that the report was run correctly.
- If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) worksheet in the Store.

### Electronic Approvals:

- Review user access report to verify that current users are appropriate. Also consider review of user access change logs (if available) to evaluate user account management throughout the period. See the User Access step in the Accountability folder for more testing considerations.
- If approvals are governed by significant settings/configurations, and such changes are logged, review the change log to verify the population of changes for the year.

*Verification that no configuration changes were made, along with the auditor's evaluation that no such changes are expected, would normally be sufficient evidence to conclude that no further testing is necessary.*

- If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.
- If the entity has access to source code, review the change log to verify the population of changes for the year. Then review programming change documentation or the entity's test documentation for selected or sampled changes.

*Verification that no program changes were made, along with the auditor's evaluation that no such changes are expected, would normally be sufficient evidence to conclude that no further testing is necessary.*

- If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the SOC Report Reliance worksheet in the Store.

### **STEP 6: Final Control Risk**

Evaluate the results and document a final control risk assessment in the control system step. Consider whether any deficiencies identified with either the automated control or related general IT controls represent material weaknesses or significant deficiencies.

*Note: general IT control deficiencies do not necessarily mean the automated control is not properly functioning. General IT control deficiencies would normally be considered a significant deficiency or material weakness only if it caused an issue with the compliance*

# State of Washington

*requirement or assertion.*

## **Recommendation Review Requirement**

IT Security related information is considered category 3 data protected by Public Request Exemption RCW 42.56.420. Issues related to IT Security require the following special handling:

- [Instructions](#) are located in Team IT Audit's System's Sharepoint page.
- Details of IT Security related issues should NOT be included in any emails or helpdesks.
- Exit, ML and Findings should be separately communicated in an IT Security Results Document.
- Findings will be referenced, but not included in the audit report.
- All IT security-related recommendations must be reviewed by [Team IT Audit](#).
- Template language for common IT related recommendations can be found in [ARS Part 5 Chapter 8](#).

## **PUBLIC REQUEST EXEMPTION**

Some IT related information is protected by Public Request Exemption RCW 42.56.420 for cyber security purposes. The details documented in the record of work and support workpapers may qualify for this exemption. If so, auditors must include this statement in the record of work done and any related workpapers: **"This record contains information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited "**.

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

## **Information Technology Planning Guide**

Auditors may contact [Team IT Audit](#) with any testing strategy or control assessment questions or to request assistance from an IT Specialist.

**Software Calculation:** A **software calculation control** exists when the value of a transaction is determined by a software application. This process can be a key control when the entity relies on the system to generate calculations correctly to determine the amount of transactions (i.e., summarizing/account code allocation to post to general ledger, calculate student, utility, other charges, etc.).

**Automated Interfaces:** An interface is a process that moves information from one computer application to another. The interface can occur internally between systems maintained by a single agency, or between systems maintained by different agencies or private companies. The interface can also occur between modules within the same computer application.

## State of Washington

The data transferred might be a file consisting of one or more records processed at a later time (batch), or it can be a real-time update. Risk associated with interfaces increases as the number of transactions or the number of other services and systems supported by the interfaced data increases.

Poor design or inadequate oversight can affect the transfer of transaction data among the systems. Interface controls are automated and/or manual processes designed to ensure transmission and processing of information is complete and accurate.

### Manual vs. Automated Interfaces

A "manual interface" is the transfer of data from one system or module to another system or module, initiated and controlled by a user. An example of a manual interface is when customer accounts are downloaded from a utility billing system to be used to perform meter readings. When complete, the file with meter readings may be uploaded and posted to the customer accounts.

An "automated interface" is the transfer of data from one system or module to another system or module that happens automatically based on a schedule, or other predefined criteria. A common example of an automated interface is the payroll module of a system. Typically, a payroll batch is created in the payroll module. Once approved, the batch is automatically sent by the system to the general ledger or other applicable modules, such as accounts payable.

Entities should have reconciliation controls between their various applications regardless of the method used for interfacing.

*Auditors should have determined whether system interfaces are automated as part of the Key Software Applications workpaper. **If not**, ask the following question to determine whether the system interface is manual or automated.*

*Is the data transferred from one system/module to another system/module by a user using an uploading and posting technique? For example, data is pulled from one system into a text file or other format, that is then uploaded into a different system or module by posting or in an upload feature of the module. If the answer to this question is yes, the interface would be considered "manual" since it is initiated and controlled by manually rather than through an automated process.*

**Edit Checks:** An **edit check** is a programmed routine designed to check input data or processing results for accuracy, compliance, or reasonableness. Types of edit checks include:

- Range Checks: ensure that numeric values fall within specified ranges, minimums and/or maximums. For example, ensuring that a capital asset can only be entered as a positive amount, or a purchase order can only be submitted without secondary approval for less than a certain threshold.
- Consistency Checks: verify that related data fields are consistent with each other. For example, ensuring that a patient's age matches their date of birth.
- Format Checks: validate data formats (for example, dates as MM/DD/YYYY or phone numbers as ###-###-####).

## State of Washington

- Logical Checks: assess logical relationships between data fields. For instance, verifying that total debits equals total credits in a journal entry.
- Duplicate Checks: identify duplicate records or entries. For example, preventing the same invoice from being entered twice.
- Cross-Field Checks: compare data across different fields. For instance, ensuring that the start date of a project is before the end date.
- Required Field Checks: ensure that mandatory fields are filled out. For instance, making sure that a patient's name and date of birth are provided.
- Referential Integrity Checks: validate relationships between data tables. For example, confirming that a vendor number exists in the vendor master file as an active entity.
- Outlier Checks: detect extreme or unexpected values. For instance, flagging water meter reading values that are extreme outliers for the customer type or account history.
- Pattern Checks: look for specific patterns in data. For example, verifying that email addresses follow a valid format.

Edit checks may result in automatic rejection of a transaction, inability to proceed with a transaction, trigger for additional processing or review, or may simply result in a warning message to the user.

Edit checks may be identified as a key control when they are sufficiently relevant (ie: addressing the risk), precise (ie: able to catch all errors, rather than just being only reasonableness or limit check), and sufficiently strong (ie: prevent invalid transactions, rather than just generating a warning messages). Auditors may identify an individual edit or a group of edit checks together as a key control.

**Computer Generated Reports:** A **computer-generated report** is a report that is created by a computer program. The computer program, also referred to as a report generator or tool, takes data from a data source, such as a database, and displays it in a specified format. The process to generate a report often includes performing calculations on the data, such as summarizing, classifying, etc., before displaying, or can display the calculations on the report.

There are two types of computer-generated reports, pre-programmed and ad-hoc or customized reports.

- Pre-programmed or canned reports are pre-defined reports where criteria and specifications are hard coded in the system. A canned report may allow limited parameters, (month/year, for example), but in general the information that will be displayed is pre-determined.
- Ad-hoc or customized reports allow the user to drill down and customize what information is displayed on the report based on some allowed criteria, such as account codes, dollar amounts minimum, etc).

In contrast, a **manual report** is one that is created outside the system using data exports or is created ad hoc by a user. An example of a manual report is one that is created by copying data from a data source and pasting the data in an Excel spreadsheet or Word document or Powerpoint presentation where it is then processed further. With manual reports, each time a report is created, the data could be incorrect due to user error, such as not copying all relevant data, or processing errors. Therefore, these types of reports should be understood and tested similar to manual controls.

# State of Washington

**Electronic Approvals:** Electronic approvals, electronic signatures and digital signatures are technically different, although often these terms are used interchangeably by entities.

Auditors should have determined whether the electronic approval is an automated control as part of the overall understanding of controls. For automated control purposes, an electronic approval is a software system functionality that:

- Permits a user to approve transaction(s) within the software system
- The system automatically documents, or logs, the data approved by the user and any subsequent manipulation
- The acceptance or rejection of the transaction by the approver will trigger an additional software system process, such as posting of a transaction.

E-mail, scanned-in pictures of signatures, or font-changed signatures, etc. may be part of a control activity but are generally not considered an automated control and are not covered by this testing strategy.

## Electronic Signature vs Digital Signature

An “**electronic signature**” can look like a handwritten signature that has been scanned and then pasted into an electronic document. The reliability of this type of approval is variable. Recommend gaining an understanding of the process used to store and affix the signature to the document and then discuss the process with Team IT Audit before placing reliance on this control.

A “**digital signature**” is a legal signature with a formal certification process that documents who approved the document and ensures the document is not modified after certification. Reliability of this process is very high but has significant technical features. Recommend brainstorm with Team IT Audit before placing reliance on this control.

## **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

**Statements on Auditing Standards [AU-C 315](#) Understanding the Entity and Its Environment and Assessing the Risks of Material Misstatement** - paragraphs .A106-.A109 describe general and application controls and how they relate to audit risks

**Statements on Auditing Standards [AU-C 330](#) Performing Audit Procedures in Response to Assessed Risks and Evaluating the Audit Evidence Obtained** - paragraphs .10b and .A33-.A34 describe requirements and guidance for testing indirect controls in conjunction with tests of controls, that is, testing key general controls in conjunction with a test of a key automated control

Record of Work Done.:

**Taxes Receivable (Net of Allowance) - ATLAS**

# State of Washington

## **Key Controls #2 as follows for the ATLAS:**

- **Key Control #2 – Automated Interface – Existence** – On the last business day of the month, ATLAS automatically prepares and posts Journal Vouchers (JV) by revenue source and receivable type to record the taxes receivable, accrued revenue, unavailable revenue, and the allowance for uncollectible.

## **STEP 1: Understand Automated Key Control**

The understanding for this system is documented above in the "Controls - ATLAS" step.

## **STEP 2: Confirm and Test Automated Key Control:**

We met with Ayano Faasumalie, Revenue and Financial Reporting Coordinator, on June 20, 2024 via TEAMS to discuss the process of ATLAS automatically creating a receivable for balance dues and estimated returns.

On the last business day of the month from the Receivables GL, ATLAS automatically prepares and posts a Journal Voucher (JV) by Revenue Source and Receivable type to record receivables into AFRS. Ayano showed us the month end batch JV #140E4493 created in ATLAS to record the return receivables as of 11/30/2023, in the amount of \$13,253,358.50 and the uncollectible amount of \$798,030.46 based on the deferred revenue. Ayano showed us the reconciliation of the JV created by ATLAS to the amounts expected by Revenue Accounting and the amounts tied without exception. *No issues noted.*

## **STEP 3: Understand General IT Controls**

On May 23, 2024 we met with Lucas Kennal, IT APP Development Manager, and Pavath Phommachanh, IT Audit Manager, to gain an understanding of general IT controls relating to the interface between ATLAS and AFRS. Lucas informed us that batches process automatically overnight. ATLAS has a Batch Manager function within the Production Manager tab that is used to track all batches that are processed. Any batch that had an error or failure in processing would be flagged here. Every morning, the Batch Manager is reviewed for files that were flagged with errors or failures and immediately addressed (**General IT Control**). Email verification is also sent out automatically by ATLAS to notify that the transfer was complete and whether errors or failures occurred.

## **STEP 4: Confirm Key General IT Controls**

**Every morning, the Batch Manager is reviewed for files that were flagged with errors or failures and immediately addressed -** Lucas displayed batch file number 2065578 from the previous evening (5/22/2024) with the following details: File Type - FTP (file transfer protocol), Destination - AFRS, Destination File - 62626, Begin - May 22, 2024 21:15:49, End - May 22, 2024 21:15:49, to show us it had been flagged with two items that needed attention. When the file was opened, we could see the two errors had be "cleared out" or remedied by a member of his team already. *No issues noted.*

## **STEP 5: Test Key General IT Controls**

Not applicable - we are not planning to rely on automated controls and therefore do not need to test general controls; control risk will be assessed

# State of Washington

at MAX.

## D.1.PRG - Taxes Receivables (Net of Allowance)

*Procedure Step:* Key Control #3 (Manual)

*Prepared By:* BFW, 9/23/2024

*Reviewed By:* RKM, 9/26/2024

Purpose/Conclusion:

### **Purpose:**

To confirm the year-end JV to record June 2024 returns received after June 30, 2024 as a receivable and accrued revenue for FYE, noted in Key Control 3 for ATLAS, in order to assess control risk.

### **Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

## State of Washington

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency.*

***All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.***

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

## State of Washington

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

**Key Control #3 - Manual - Existence/Completeness** - In August, the ATLAS "gross receipts" report, which is programmed to pull all gross receipts for the period July 1-August 15, is downloaded to Excel and compared to the gross receipts from the prior five years to check that the values seem reasonable. Revenue Accounting will reconcile and review the year end JV to enter into AFRS to show the June returns received after June 30<sup>th</sup> as a receivable and accrued revenue for the FYE.

The understanding for this system is documented above in the "Controls - ATLAS" step.

# State of Washington

## **1. Confirmation of Key Manual Control:**

We confirmed the key control as part of our understanding of retail sales and use taxes and B&O. See confirmation at [[Key Control # 3 \(Manual\)](#)]. ***No issues noted.***

### **Noted Weaknesses are as follows:**

- None.

## **2. Preliminary Control Risk Assessment**

Based on our understanding and anticipated audit strategy, we assessed preliminary control risk as follows:

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

## **3. Control Risk at LOW - Test of Key Manual Control:**

Not applicable - we are not planning to rely on controls and therefore do not need to test controls; control risk will be assessed at maximum.

### **D.1.PRG - Taxes Receivables (Net of Allowance)**

*Procedure Step:* Key Control #4 (Manual)

*Prepared By:* BFW, 5/21/2024

*Reviewed By:* RKM, 7/4/2024

Purpose/Conclusion.*
----------------------

### **Purpose:**

To confirm monthly reconciliation between ATLAS and AFRS (key control 4 for ATLAS) in order to assess control risk.

### **Conclusion:**

- We noted **no** material weaknesses or significant deficiencies in internal controls.

## State of Washington

### Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

# State of Washington

## SAO Audit Policy [2310](#) - Reporting Identified Audit Issues

## SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk

Record of Work Done:

**Key Control #4 - Manual - Existence/Completeness for ATLAS** - At the end of each month, Revenue accounting runs a monthly revenue activity report (MRA) from ATLAS and AFRS revenue report from Enterprise Reporting System. A reconciliation is then performed between ATLAS and AFRS to ensure the reported revenue and receivables amounts are accurate and complete.

The understanding for this system is documented above in the "Controls - ATLAS" step.

### **1. Confirmation of Key Manual Control:**

We confirmed this control as part of our review of controls related to retail sales and use taxes and B&O taxes at [[Key Control # 4 \(Manual\)](#)]. *No issues noted.*

### **Noted Weaknesses are as follows:**

- None

### **2. Preliminary Control Risk Assessment**

Based on our understanding and anticipated audit strategy, we assessed preliminary control risk as follows:

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **3. Control Risk at LOW - Test of Key Manual Control:**

Not applicable - we are not planning to rely on controls and therefore do not need to test controls; control risk will be assessed at maximum.

### **D.1.PRG - Taxes Receivables (Net of Allowance)**

## State of Washington

*Procedure Step:* Key Control #5 (Manual)  
*Prepared By:* BFW, 6/25/2024  
*Reviewed By:* RKM, 8/5/2024

### Purpose/Conclusion:

#### **Purpose:**

To confirm Revenue Accounting pulls the monthly ATLAS report into a spreadsheet and compares prior months reviewing for anomalies (key control 5 for ATLAS) in order to assess control risk.

#### **Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

### Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

**Key Control #5 - Manual - Existence/Valuation** - Financial Reporting & Systems Support pulls monthly ATLAS report (by receivable type) into a spreadsheet and compares prior months (in same FY) reviewing for anomalies in the receivables and allowance calculations.

The understanding for this system is documented above in the "Controls - ATLAS" step.

### **1. Confirmation of Key Manual Control:**

We met with Ayano Faasumalie, Revenue & Financial Reporting Coordinator in Business & Financial Services, on April 24th, 2023 to discuss the receivable type monthly comparison related to allowance for uncollectible accounts. She walked us through the process for running the ATLAS report showing monthly JV excise tax receivables by GL amounts by receivable type (returns, estimated returns, audit, and lien receivables). From the ATLAS transaction tab in the ledger, she is able to export the data in an excel spreadsheet that Allison Walker (one of her staff) uses to compare monthly balances.

## State of Washington

We reviewed the month to month comparison from Ayano on 6/24/2024. The workbook was titled "Fiscal Year 2024 Excise Taxes Receivables". It contained the four types of receivables:

- Return Receivables
- Estimated Return Receivables
- Audit Receivables
- Lien Receivables

Each receivable type had each month summarized. For each month, the sheet detailed balance, uncollectibles, net, local tax, FY24 estimated collections, and unavailable revenue (deferred inflows of resources). The spreadsheet then calculated the balance of the month to month comparison, then used the balance to calculate the percent change.

### Return Receivables as of May 2024

Balance	Uncollectibles	Net Receivables	Local Tax Portion	FY 24 Estimated Collection Accrued Revenue	Unavailable Revenue	Discounted Balance Month-to-month comparisons	Uncollectibles Month-to-month comparisons	Uncollectible/Discounted Balance
GL 1311/1312	GL 1341/1342	Net Receivables	GL 5152	GL 3205	GL 5192	% Change/ \$ Increase (Decrease) from prior month	% Change/ \$ Increase/(Decrease) from prior month	Uncollectible/Discounted Balance % Change
118,737,190.64	(5,661,852.46)	113,075,338.18	(21,097,263.96)	(56,226,202.41)	(35,751,871.81)	0.3% 388,089.78	6.1% (327,309.78)	-4.8%

Thirteen large anomalies were identified and listed on the bottom of the worksheet. Each anomaly listed the amount, the source, account number (so it can be investigated in ATLAS), and when the source occurred.

1) Large audits issued - ADT LLC, 603-190-246 for \$13M (\$14.7M Tax, \$2M P&I, -\$3.6K audit credit). Exotic Metals, 602-223-975, \$2.5M (\$2.4M tax, \$246K P&I). Also includes audit issued to 604-877-765 Qtr. 4, 2021 – Tax for \$4.9 M and P&I for \$2.1 M. This audit was reversed on 10/27/23.

## State of Washington

Also reduction in deferred audit: 12-year write-off included account # 602-635-596 Qtr. 3, 2009 period for \$3.8 million for an audit in deferred collection

2) Uncollectible write-off was done on 7/11/2023 for a total of \$27,974,550.52. Plus some large liens were issued as well.

604-107-324, lien 38837 for \$1.7M on 7/31/2023. 604-042-280, lien 53784 for \$415k on 7/26/23."

3) Audit for \$4M issued with \$500k for P&I to account # 601-959-741 12/2020 period in September. Audit for \$3.6 M issued to account # 601-246-974 6/2022 period in September 2023.

4) a) Audit Allowance for Uncollectible – Uncollectible rate was updated with SQR 14963 from 0.0426 to 0.0477 in ATLAS to reflect corrections made for calculations errors. The receivable JVs for June 2023 was manually updated in FY 2023 FM 25. This changed the audit allowance for - September from \$78.1 million to \$87.2 million.

4) b) Lien Allowance for Uncollectible - Uncollectible rate was updated with SQR 14963 from 0.1573 to 0.1712 in ATLAS to reflect corrections made for calculations errors. The receivable JVs for June 2023 was manually updated in FY 2023 FM 25. This changed the lien allowance for September from \$442.2 million to \$445.8 million.

5) Audit issued in July 2023 for 604-877-765 Qtr. 4, 2021 – Tax for \$4.9 M and P&I for \$2.1 M was reversed on 10/27/23.

6) Due to the implementation of Managed Payments in ATLAS, we encountered some issues with receivable timing. The big issue is when returns are posted before due date, receivables are posting before the return due date. The large increase in January is because of the quarter returns due that month.

We also noted some strange instances where the timing of receivable reduction is off from when the revenue is posted. It gets reduced properly in the end but because of these timing changes, we are seeing fluctuations in the receivable balance at the end of the month when the JVs are generated.

SQR 16186 is being worked on to correct these issues.

7) Compliance Assessments issued for 604-519-175 for 10/23, 11/23, 12/23, 1/24, 2/24 period in total of \$2.2 million. 604-176-001 for 10/2020 period to 12/31/2023 period for \$325k.

8) \$4.5 M payment applied to an audit on account # 602-996-887 Qtr 4 2016 period. \$2.3 M payment applied to an audit on account # 602-759-741 Qtr 4, 2021. \$1.9 M payment applied to an audit on account # 048-006-501 7/2022 period.

9) Uncollectible write-off on 2/2/24 for the amount of \$24 million.

10) Lien issued to a collection with audit on account # 603-115-427 03/2023 period in February 2024. The total of \$6.4 million in audit receivable (\$3.6 M in tax & 2.8 M in P&I) was transferred to \$7.2 million lien receivable (\$3.6 M in tax & \$3.6 M in P&I).

11) Lien issued to a collection on account # 602-230-841 in March. The collection covers period 1/2019 - 12/31/2019 period with balances of \$7.4 million.

12) Audit issued for \$3.4M (\$2.9M tax, \$579k P&I) for 603-398-768, 12/2022 period. Audit issued for \$3.4M (\$3.4M tax \$543k P&I) for 603-064-508 12/2022 period.

13) Lien 67858 issued Excise Tax 604-519-175 on 4/17/24 for \$2,895,256.82.

14) Large audit adjustment for closing agreement 5766653, excise tax, 178-005-030, 12/31/2018 period. Adjustments for \$21,317,845.89 (Audit tax \$14.5M, P&I \$4M, \$2.7M payment)

# State of Washington

Ayano informed us that all anomalies noted are confirmed as legitimate prior to being noted on the spreadsheet, this is their way of tracking items.  
***No issues noted.***

## **Noted Weaknesses are as follows:**

- None

## **2. Preliminary Control Risk Assessment**

Based on our understanding and anticipated audit strategy, we assessed preliminary control risk as follows:

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

## **3. Control Risk at LOW - Test of Key Manual Control:**

Not applicable - we are not planning to rely on controls and therefore do not need to test controls; control risk will be assessed at maximum.

## **D.1.PRG - Taxes Receivables (Net of Allowance)**

*Procedure Step:* Risk Assessment

*Prepared By:* BFW, 8/1/2024

*Reviewed By:* CJG, 11/21/2024

Purpose/Conclusion.\*

### **Purpose / Conclusion:**

To assess inherent risk, control risk, and the risk of material misstatement in order to design an initial testing strategy for each assertion.

Testing Strategy.\*

Auditors are **required** to perform the following procedures for each line item:

1. Assess inherent risk for each relevant assertion. This assessment is based on understanding of the entity and the nature of the account balance

## State of Washington

or class of transactions.

*Inherent risk is the susceptibility of an assertion to a material misstatement, assuming that there are no related controls. Inherent risk can be thought of as the "threat" of misstatement. Inherent risk exists independently of control risk (the level of threat exists independent of the level of vulnerability to threats). Consider the following factors as your basis for this assessment:*

- *General Considerations*
  - *Does the balance include transactions that are difficult to audit or involve complex accounting issues?*
  - *Were there significant misstatements identified in previous audits or prior-period adjustments in the account balance or transaction class? If so, analyzing the cause of prior period misstatements will help in analyzing inherent risk.*
  - *Are there any inherent risk factors at the entity or industry level, such as changes in regulation or accounting rules, unique transactions or accounting practices, use of information technology, etc that affect the balance?*
- *Inherent Risk due to Error*
  - *How large are the transactions making up the balance? If the balance has only a few large transactions, even a single error may mean a significant misstatement.*
  - *Have there been changes in the transactions making up the balance that may increase risk? For example, significantly different composition, nature or volume of transactions may inherently disrupt established controls.*
  - *Are financial events originated or identified by accounting personnel or non-accounting personnel? This consideration is mainly for the completeness assertion.*
  - *Does the process to account for transactions involve judgment or estimation, complex calculations, numerous steps or significant manual steps?*
  - *Do transactions have widely varying attributes that need to be manually identified? For example, grant loans that are accounted for in one of several ways depending on the terms of the agreement.*
- *Inherent Risk due to Fraudulent Reporting (intentional misstatements)*
  - *Are there substantial pressures or motivations to misstate the balance?*
- *Inherent Risk due to Misappropriation*
  - *Is the account balance or transaction class susceptible to sizable misappropriation?*
- *Inherent Risk due to Non-Compliance*
  - *Are there any laws, contracts or grant agreements affecting the balance? If so, would non-compliance lead to sizable misstatements?*

## State of Washington

- *Are compliance requirements complex, hard to understand, subject to judgment or otherwise difficult to comply with?*
- *Are there any motivations or pressures to not comply?*

2. Assess control risk by system and assertion. This assessment should be based on the results of the control understanding, confirmation, and testing (if applicable). If applicable, auditors will evaluate any control deficiencies and determine whether those deficiencies, individually or in combination, are significant deficiencies or material weaknesses.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. Control risk could be thought of as the "vulnerability" of an entity to misstatements. Control risk exists independently of the inherent risk (the level of vulnerability exists independent of the level of threat).*

*In order to set control risk to LOW, general controls would also need to be tested to provide evidence of the consistent operation of automated controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*

*A material weakness exists when the design or operation of controls results in a reasonable possibility a material misstatement will not be prevented or detected and corrected in a timely manner. A significant deficiency is less severe than a material weakness, yet important enough to merit the attention of the governing body.*

***All potential material weaknesses and significant deficiencies should be discussed with the AIC, since they must be reported as findings.***

- 3. Assess the risk of material misstatement for each relevant assertion for each material line item. The risk of material misstatement is a combination of the auditor's separate assessment of inherent and control risk.

*The Risk of Material Misstatement is a combined assessment of inherent and control risk based on auditor's judgment. If inherent and control risk are assessed differently, it is a matter of professional judgment as to whether the combined assessment is moderate or if one factor outweighs the other.*

4. Design a substantive testing strategy that addresses the relevant assertion in all significant transaction streams included within the material line item.

*In addition to identifying what to audit (material balances) and what to audit for (relevant assertions), planning has also identified how much to audit (risk of material misstatement). The quantity and quality of evidence obtained by substantive tests needs to match the level of risk. The higher the risk of material misstatement, the greater evidence needed. "Greater evidence" could either be greater quantity of evidence, greater quality of evidence, or some combination of greater quality and quantity.*

# State of Washington

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6210](#) – Planning Financial Statement Audits**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits](#) Planning Guide**

Record of Work Done:

### **(1) Inherent Risk (IR):**

Based on our understanding of the line item, we assessed inherent risk as follows for each relevant assertion and significant class of transactions:

- **Existence - Moderate**
- **Valuation - Moderate**
- **Completeness - Moderate**

### **(2) Control Risk (CR):**

We assessed control risk as follows for each system and relevant assertion:

- **ATLAS - Existence, Valuation, and Completeness**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **(3) Risk of Material Misstatement (RMM):**

We considered both inherent and control risk and assessed the risk of material misstatement as follows for each relevant assertion and significant class of transactions:

- **Existence - Moderate**
- **Valuation - Moderate**

# State of Washington

- **Completeness - Moderate**

## **(4) Testing Strategy:**

We designed our substantive testing strategy based on our assessment of the risk of material misstatement.

### **Valuation**

- We will recalculate taxes assessed for a sample of registered taxpayers to ensure rates are being applied appropriately and therefore tax revenue and receivables are recorded at proper amounts. We will test these tax rates as part of the tax revenue testing.
- To determine if the allowance for uncollectible accounts for excise taxes was valued at proper amounts, we will use the FYE ATLAS Summary report to determine the deferred receivable balance in ATLAS. We will vouch the deferred balances for all receivable types to the ATLAS GL ledger report for GL 1341 and 1348 and compare the balances to amounts recorded in AFRS. We will compare the FY24 balance for allowance for uncollectible to the prior two years to determine if the amount for FY24 appears reasonable, including comparing the entity's estimate to the entity's actual historical experience of collecting or writing-off receivables.

### **Existence/Valuation/Completeness**

- We will test a sample of sales, use, and business and occupation taxes receivable recorded in ATLAS at FYE to ensure they exist and the value is properly supported by verifying the transactions match corresponding tax returns and were included in an accumulation GL within ATLAS. We will trace the GL amount to a batch posted in AFRS. Additionally, we will verify each batch ties to AFRS.
- We will select a sample of sales, use, and business & occupation accrual transactions from the gross receipts accrual JV and verify that the transactions were recorded for the correct amount and in the proper period. We will test the accrual JV as part of the tax revenue testing.
- We will review the A8 from each county for each of the months selected by the JV selection process during deferred inflows. We will ensure the total remitted to OST by all the counties matched the total remitted by OST to DOR.

We anticipate that these tests will provide sufficient appropriate audit evidence to address the assessed risk of material misstatement for relevant assertions in significant classes of transactions.

### **D.1.PRG - Taxes Receivables (Net of Allowance)**

*Procedure Step:* Substantive Test

*Prepared By:* BFW, 10/3/2024

*Reviewed By:* SHW, 11/6/2024

# State of Washington

## Purpose/Conclusion:

### **Purpose:**

To determine whether:

Reported receivables represent amounts uncollected as of the end of the period (Existence).

Receivables were reported at properly valued or calculated amounts (Valuation).

All receivables were reported as of the end of the period (Completeness).

### **Conclusion:**

We determined that reported receivables represent amounts uncollected as of the end of the period (Existence); receivables were reported at properly valued or calculated amounts (Valuation); and that all receivables were reported as of the end of the period (Completeness). **No issues noted.**

## Testing Strategy:

### **Existence:**

The following is a list of **considerations** for testing the existence assertion for other assets. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

### **Receivables**

- Confirm receivables with the obligated party.
- Confirm intergovernmental receivables with the other agency.
- Confirm trade receivables using negative or positive confirmations to customers. *NOTE: if trade receivables were not confirmed, auditors should document the reasons for not following the audit requirement (see policy/criteria tab).*
- Verify receivables to source billing documents, reimbursement requests or other documentation.
- If receivables are sent to an external collection agency or trigger an action that affects the obligated party (ie: water shut-off) within a reasonably short time period, trace or reconcile from the A/R Aging report to the collection agency's report or evidence of a confirming action.
- Verify receivables through subsequent receipt of funds (remittance documentation should evidence the period to which it applies).
- For the period following balance sheet date, scan the accounts receivable general ledger control account for material charge-off and unusual transactions, and investigate.

## State of Washington

Perform analytical procedures to determine the reasonableness of receivable balances and follow-up on any unexpected results. For example, trend analysis of aged A/R, trend of beginning balance, billings, adjustments, payments and ending balance, inventory/volume usage reconciliation, etc.

### Valuation:

The following is a list of **considerations** for testing the valuation assertion for other assets. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

- Review the entity's calculation of the value of intangible assets.
- Review the entity's calculation of write-off of inventory or other assets due to obsolescence or damage.

### **Calculation or Realizable Value of Receivables**

- Re-calculate a sample or selection of billings. If billings are calculated by software, the auditor could test and substantiate the automated control and also consider any risks associated with manual inputs used by software.
- Evaluate the entity's calculation of the allowance amount for reasonableness. This evaluation should include comparing the entity's estimate to the entity's actual historical experience of collecting or writing-off receivables.
- Trace the amount of bad debt approved by the governing body (per minutes) to reductions of receivables and bad debt expense to verify it was properly accounted for. *Note: approvals may be slightly more, as customers may pay after the bad debt has been approved but before it is written off.*

### Completeness:

The following is a list of **considerations** for testing the completeness assertion for other assets. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

### **Receivables**

- Inquire regarding whether amounts earned but not yet received as of year-end were accrued. Consider follow-up review of documentation to verify inquiry.
- Consider entity activities and follow-up on activities where receivables would be expected, but none are recorded.
- Verify that interest and penalties are being billed to delinquent accounts in accordance with entity policy.

Guidance/Criteria:

Record of Work Done:

# State of Washington

## **Taxes Receivable Testing Coverage**

To ensure testing provided a sufficient amount of coverage of the taxes receivable balance, we received a breakdown of the taxes receivable balance from Ayano Faasumalie, Revenue & Financial Reporting Coordinator, and reconciled the breakdown to ACFR balances included in the lead sheet at [\[Line Item Lead Sheet\]](#). We determined the breakdown was representative of the ACFR balance. We identified the following taxes as the most significant:

- Property Tax - 31.40%
- Gross Receipts - 38.39%
- Sales, Use, and B&O Taxes Receivable - 20.46%

We noted procedures performed as part of our deferred inflows of resources testing at [\[Property Tax Collection Testing\]](#) provided sufficient coverage of property tax receivable and procedures performed as part of our retail sales and use and B&O tax revenues testing at [\[Accrual JV Testing\]](#) provided sufficient coverage over the gross receipts portion of the balance. We tested a sample of sales, use, and business and occupation taxes receivable recorded in ATLAS at FYE to ensure they exist and the value is properly supported by verifying the transactions match corresponding tax returns and were included in an accumulation GL within ATLAS. We traced the GL amount to a batch posted in AFRS. Additionally, we verified each batch ties to AFRS, see testing here: [\[Tax Revenue Testing\]](#). Based on the work performed as part of other steps within the ACFR, we determined testing the Sales, Use, and B&O Taxes Receivable would provide sufficient coverage over the entire taxes receivable balance. In total, the testing procedures noted above cover 90% of the taxes receivable balance. See our testing summary and lead sheet reconciliation at [\[Taxes Receivable Testing\]](#) in the tab, "Testing Summary". ***No issues noted.***

We obtained a list of all general fund sales, use, and business and occupation (B&O) taxes receivable from ATLAS as of June 30, 2024 from Ayano Faasumalie, Revenue & Financial Reporting Coordinator in Business and Financial Services. The testing population is all of the receivable transactions that make up the FYE 2024 taxes receivable JV pulled from ATLAS. We reconciled the testing population to AFRS entries as part of the spreadsheet at [\[Taxes Receivable Testing\]](#), see tab "Testing Summary". We determined the population to be complete and used the testing population to select samples for the substantive tests to meet the existence/completeness/valuation assertions below.

## **Substantive tests performed to meet the Existence assertion:**

We haphazardly selected a sample of 30 transactions from the testing population. To ensure existence for the selected transactions we performed the following substantive tests:

- Receivable ties to supporting documentation (tax return or audit working paper) in ATLAS?
- Documentation (Collection Notes) supports deferred status in ATLAS?

For each selection, we reviewed the revenue tab within the taxpayer's account and tied recorded amounts to tax returns for the applicable filing period. For deferred taxpayers, we reviewed collection notes to ensure the taxpayer's deferred status was supported to be uncollectible. We determined selected transactions existed in the current audit period. ***No issues noted.*** See testing performed at [\[Taxes Receivable Testing\]](#) in the "FS Substantive Sample" tab.

## State of Washington

### **Substantive tests performed to meet the Completeness assertion:**

Using the above mentioned haphazardly selected sample of 30 transactions, to ensure completeness for the selected transactions, we performed the following substantive tests:

- Receivable processed in receivable accumulation in ATLAS?
- Receivable included in June 30, 2024 month end batch receivable recorded in AFRS?

For each selection, we reviewed the revenue tab within the taxpayer's account and the history sub tab which was navigated to the revenue account spring board page. Within ATLAS, a hyper link for the ATLAS receivable accumulation that the transaction was included could be followed from there. We traced each taxpayer account to the ATLAS accumulation and further traced the ATLAS accumulation to the year end entry to AFRS using additional hyperlinks to ensure transactions were included as receivables. For selected taxpayers in deferred status, we reviewed the transaction type posted in the year end receivables JV to ensure amounts were properly included as allowance for uncollectible accounts. We determined taxes receivable were complete. ***No issues noted.*** See testing performed at [[Taxes Receivable Testing](#)] in the "FS Substantive Sample" tab.

### **Substantive tests performed to meet the Valuation assertion:**

Using the above mentioned haphazardly selected sample of 30 transactions, to ensure accurate valuation for the selected transactions, we performed the following substantive tests:

- Receivable ties to supporting documentation (tax return or audit working paper) in ATLAS?
- Receivable processed in GL accumulation in ATLAS?
- Documentation (collection notes) supports deferred status in ATLAS?

For each selection, we reviewed the revenue tab within the taxpayer's account and tied recorded amounts to tax returns/audit working paper. We ensured deferred status taxpayers were supported by collection notes and traced all selected transactions to the ATLAS accumulation GL and AFRS year end entry to ensure deferred accounts were recorded as uncollectible and the other receivable types were accurately valued within AFRS based on support. We determined receivables were properly valued. ***No issues noted.*** See testing performed at [[Taxes Receivable Testing](#)] in the "FS Substantive Sample" tab.

### **Allowance for Uncollectible Testing:** [[Allowance for Uncollectible](#)]

We also performed a review of the allowance for uncollectible accounts related to fund 001 - Excise Taxes. We obtained the ATLAS summary report of all receivable types at FYE 2024 and tied the amounts to year end entries within AFRS from Webi to ensure amounts were properly valued for the ACFR. We noted immaterial differences for GL 1341 (Allowance for Uncollectible Account for Return, estimated, audit receivable type) between AFRS and the ATLAS summary ledger report. We compared the FY24 balance for allowance for uncollectible to the prior two years and determined the amount for FY24 appears reasonable, based on expectations, including comparing the entity's estimate to the entity's actual historical experience of collecting or writing-off receivables. We determined allowance for uncollectible amounts were properly valued. ***No issues noted.***

# State of Washington

## D.2.PRG - Retail Sales and Use and B&O Taxes

*Procedure Step:* Summary & Conclusion

*Prepared By:* BFW, 10/15/2024

*Reviewed By:* CJG, 11/21/2024

Purpose/Conclusion:

**Purpose:**

To evaluate risk assessments and the sufficiency and appropriateness of evidence obtained based on results of substantive work.

**Conclusion:**

We determined that **no** modifications were necessary to inherent risk, control risk, or the risk of material misstatement as assessed in planning.

We also determined that evidence obtained was sufficient and appropriate in response to the risk of material misstatement.

Testing Strategy:

Auditors are **required** to evaluate conclusions for substantive testing as follows:

*Auditors may wish to use the optional Lead Sheet available in the Store to summarize testing related to each balance and assertion.*

**1.** Determine whether the results of substantive testing indicate a need to modify the inherent risk assessment (IR), control risk assessment (CR), risk of material misstatement (RMM) or other aspects of planning (such as material balances or assertions). If so, document changes and consider the need for additional testing.

*If the results of substantive testing indicate a need to change control risk, auditors should also update the **Permanent File** by either correcting the documentation or by adding an update section describing changes to the top of the record of work done. For all changes to IR, CR, or RMM the **Material Balances** spreadsheet should be updated.*

*More significant changes to other aspects of planning (such as material balances or assertions) should be referenced in this step and documented in detail in the **Changes to FS Audit Plan** step.*

## State of Washington

2. Evaluate whether the quality and quantity of evidence obtained is sufficient and appropriate in response to the risk of material misstatement. In making this determination, auditors should evaluate:

### Information to be used as audit evidence:

- Does evidence relate to the population, period of time and risk (assertion and “what could go wrong” from the Material Balance Spreadsheet)? If there are any gaps or uncertainties in the logical connection between the evidence and conclusions, is there a documented consideration and explanation?
- Are the sources of information sufficiently reliable and appropriate for the risk (whether internal to the government, external, or auditor developed)? If key information is not from a sufficiently reliable source (for example, inquiry), then is it corroborated by information that is?
- Are there any concerns about accuracy, completeness, authenticity, or bias in information? If so, did the auditor perform sufficient procedures to confirm reliability of that information?
- Is information precise enough to catch if misstatements exceeded the tolerable level?
- Is information detailed enough to conclude on whether or not there were misstatements?
- Was there any information that appeared contradictory or inconsistent? If so, was there a documented response to the inconsistencies or doubts about the reliability of evidence?

### Results:

- How much misstatement was identified by testing, and the likelihood and magnitude of further potential misstatement?
- How did misstatements occur and how often might they occur again in the population?
- Were misstatements caused by control deficiencies or circumvention of controls?
  - If control deficiencies, is there a need to re-evaluate our understanding of controls in the **Permanent File** folder or assessment of control risk?
  - If circumvention, the **Management Override of Controls** step should address or reference this area. Auditors should also consider whether a fraud risk has been identified.
  - Did tests identify a different level or type of risk than the planned audit response was designed to address?
  - If likely misstatements are identified, are further procedures necessary to improve the precision of our estimate?

*To support the overall evaluation of audit risk and provide a basis for concluding on the overall sufficiency and appropriateness of evidence in the **FS Summary & Report** step, auditors should conclude in each area whether the auditor continues to believe that the tests performed and quality and quantity of evidence obtained are commensurate with RMM for all relevant risks (the “what could go wrong”, in the **Material Balances** spreadsheet).*

If the auditor determines that evidence is not sufficient or appropriate, additional substantive testing should be done. If sufficient, appropriate

## State of Washington

evidence is not available for audit, the AIC should discuss the effect on our audit report with the AAM and AM.

Guidance/Criteria.:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6310](#) – Determining the Nature, Timing and Extent of Substantive Testing**

**SAO Audit Policy [3210](#) – Audit Evidence**

Record of Work Done.:

Based on test results, we re-evaluated risk assessments, procedures, evidence obtained and conclusions as follows:

### **(1) Do the results of substantive tests indicate a need to modify our risk assessment (IR, CR and RMM)?**

The results of substantive tests do not indicate a need to modify our risk assessment.

### **(2) Was the quality and quantity of evidence obtained sufficient and appropriate?**

The quality and quantity of evidence obtained was sufficient and appropriate.

### **D.2.PRG - Retail Sales and Use and B&O Taxes**

*Procedure Step:* Understanding of Line Item

*Prepared By:* BFW, 5/16/2024

*Reviewed By:* RKM, 5/29/2024

Purpose/Conclusion.:

### **Purpose / Conclusion:**

To gain an understanding of the line item and confirm the scope of testing as documented in the Significant Account Matrix.

# State of Washington

## Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

### **STEP 1: Prior Audit Exceptions**

Document any exceptions noted during the prior audit. Follow-up to determine how the agency has responded to or corrected the issue, unless this work is anticipated as part of the testing strategy.

### **STEP 2: Analyze Composition and Changes of Line Item**

- Include link to the line item leadsheet. This will be completed at the end of the audit. Leadsheet analysis should be documented in this spreadsheet.
- Inquire with agency staff about the activities and transactions that make up the balance and any changes to those activities or transactions in relation to the prior year.
- Determine relevant classes of transactions or account balances within the line item to analyze (such as agencies, funds, programs, departments, accounts, and/or objects), and use AFRS to create trends of those elements. This step should not include any specific dollar amounts associated with the line item.
- Evaluate trends to identify:

(1) What classes of transactions or account balances are primary to the identified risk. Auditors should specifically consider what elements are primary to the line item (comprising a large percentage of the line item), and which elements the identified risk would apply to, and which elements might be most susceptible to the identified risk (having a high risk of non-trivial misstatement for a relevant assertion, considering likelihood and impact of potential for misstatement).

(2) What changes are primary to the identified risk, if applicable. Auditors should specifically consider whether the overall change to the line item from the prior year was significant, what elements were the primary drivers of overall change, whether any elements changed significantly from the prior year, and which changes (if any) might relate to the identified risk.

(3) Any unusual or unexpected elements, amounts, or changes that may indicate a risk, whether the one identified in planning or a new one that may need to be considered for a change to the plan.

**Consider** other procedures to gain an understanding of the line item, such as review of key policy documents, review of program information or reports, inquiry of staff, budget information, or other analytical procedures.

### **STEP 3: Update Significant Account Matrix**

Based on your understanding of the line item, update the Significant Account Matrix with final conclusions on the agencies covered, account description, significant accounting systems, and risk (what could go wrong and relevant assertions). The account description should reflect the significant transaction streams or account balances relevant to the risk.

## State of Washington

*The description of agencies, significant accounting systems, and what could go wrong in the Significant Account Matrix constitute the overall scope of substantive testing.*

*A transaction stream is significant based on the potential for misstatement. This is often due in part to its size (ie: comprising a large percentage of the total line item), but is ultimately a judgment about the susceptibility to the identified risk (for example, when the risk is understatement a small or omitted account may hold the most potential for the largest misstatement).*

*Significant accounting system(s) are those that contain key controls over significant classes of transactions included in the line item. Control systems identified in this step must match the Significant Account Matrix and have a separate control understanding documented.*

*Talk with the AIC if you identify any changes to the Significant Account Matrix.*

Guidance/Criteria.:

Record of Work Done.:

### **(1) Prior Audit Exceptions:**

There were no prior year audit exceptions for this balance.

### **(2) Composition & Change Analysis:**

Line Item Leadsheet: [[Line Item Lead Sheet](#)]

The Department of Revenue collects and administers a majority of Washington's General Fund-State (GF-S) revenue, accounting for 95% of the total GF-S revenue forecasted for 2023-25 biennium in February 2024. Some of the largest tax sources include:

- Retail sales and use tax
- Business and occupation tax
- Property tax

The state closely monitors DOR revenues, which are significant to the state's budgeting and spending decisions. Because these revenues are connected with business activities (sales and business revenues), the balances for Sales tax, Use Tax and Business & Occupation Tax fluctuate with how the economy in general is doing. The Economic and Revenue Forecast Council provide forecasts of the State's revenues [[Publications | Washington State Economic and Revenue Forecast Council](#)], factoring in known changes in the economy, see the February 2024 quarterly forecast at [ERFC February 2024](#).

Based on prior ACFR audit work, we determined the Forecast Council is fairly accurate at projecting Retail Sales and Business and Occupation tax receipts. The February 2024 quarterly report summarizes that GF-S revenue collections since the November 2023 forecast are \$70.8 million (0.9%) above the forecasted amount. The forecasted increase for the rest of the 2023-25 biennium is \$121.8 million.

# State of Washington

## **Retail Sales and Use Taxes**

Retail sales and use taxes (collectively referred to as retail sales tax) is the largest source of general fund revenue and accounted for approximately 51% of general fund revenues in FY23, excluding Federal Grants-in-Aid. The state's share of retail sales tax is 6.5% of the sales prices. Counties and local jurisdictions impose sales tax percentages on top of the retail sales tax. See our understanding of collections and payments of local tax for other governments at [\[Summary & Conclusion\]](#) and [\[Controls - ATLAS\]](#). Retail sales tax revenue increased from \$14.90 billion in FY22 to \$15.81 billion in FY23 and is projected to be \$15.92 billion in FY24 (per Forecast Council projections, see ERFC table 3.9 - GF-S forecast detail at [ERFC February 2024](#)). The revenue source code for retail sales tax is 101/102 and for use tax 110/111.

## **Business and Occupation Taxes**

The Business and Occupation Tax is the second largest source of non-exchange revenue for the general fund and accounted for approximately 20% of general fund revenues in FY23, excluding Federal Grants-in-Aid. This line item balance is made up of business and occupation tax (Source Code 105) and business and occupation tax credits (Source Code 106), which is tax on the gross receipts of all businesses operating in Washington. Business and occupation tax revenue increased from \$5.67 billion in FY22 to \$6.23 billion in FY23 and is further projected to increase to be \$6.39 billion in FY24 (Per Forecast Council projections, see ERFC table 3.9 - GF-S forecast detail at [ERFC February 2024](#)).

### **Change Analysis:**

We obtained the Internal Audit risk assessment for revenues and receivables for FY2023 from Sandi Fairchild, Chief Financial Officer, and inquired with Ayano Faasumalie, Revenue & Financial Reporting Coordinator, and noted no significant changes to retail sales and use and B&O Taxes.

### **(3) Updates to Significant Account Matrix:**

We identified no changes that need to be made to the Significant Account Matrix.

## **D.2.PRG - Retail Sales and Use and B&O Taxes**

*Procedure Step:* Controls - ATLAS

*Prepared By:* BFW, 5/16/2024

*Reviewed By:* RKM, 10/11/2024

Purpose/Conclusion:

### **Purpose:**

# State of Washington

To gain an understanding of internal controls.

## **Conclusion:**

We gained an understanding of internal controls as documented in the record of work done.

Testing Strategy:

## **The following procedures are required for all material systems:**

1. List the financial statement balance(s) and relevant assertion(s) addressed by the understanding.
2. Gain an understanding of the internal control process, identify how transactions are recorded in AFRS, identify key controls over relevant assertion(s), and note any control weaknesses.
  - In gaining an understanding of controls, consider the overall understanding of State-Level control elements as documented in the "State-Level Controls" step as they relate to this particular system.
  - Identify controls systems covering all relevant assertions for all significant classes of transactions.
  - Standards require the auditor to gain an understanding of the significant accounting system(s) that contain key controls over significant classes of transactions included in the line item.
  - Control systems identified in this step must match the Material Account Matrix and have a separate control understanding documented.
  - Talk with the ACFR Specialist or AIC if you identify different systems than the ones anticipated in the Material Account Matrix.

For each material system, auditors must document:

- A brief outline of the transaction flow from beginning to end.
- An expanded description of key controls.
- Business processes relevant to financial reporting of the relevant assertion for the material balance. Processes should encompass automated and manual procedures by which transactions or events are identified or initiated, authorized as needed, recorded, processed and corrected as needed.
- Original accounting records and how records are rolled-up to intermediary ledgers and transferred to the general ledger (AFRS) or financial statements.
- Detailed descriptions of key controls. Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

The following is information to **consider** when identifying key controls and transaction flow.

## State of Washington

"Key controls" refer to the few controls that together provide reasonable assurance that material misstatements will be prevented or detected and corrected. This is contrasted with ancillary or supporting controls, which – although helpful and recommended – would provide less than reasonable assurance by themselves.

The focus of the write-up is on the key controls. Key controls should be specifically identified (as "key controls") in the write-up. This can be done in whatever way the auditor prefers, so long as it is obvious. Details that the auditor should document regarding key controls may include:

- Who or what initiates the control
- When (or how often) is the control applied
- Who performs the control
- As needed, the experience, knowledge and attitude of the person applying the control
- Detailed description of the control process or activity. For example, if the control is a review: what exactly is reviewed, what is the reviewer looking at or for and what are the reviewer's criteria?
- How the key control is documented or evidenced
- If not obvious from the description, how the control prevents or timely detects and corrects misstatements
- Any exceptions or alternative processing to the normal process
- What happens when misstatements or issues are identified by the control

The "transaction flow" refers to the process by which transactions are initiated, authorized, recorded, processed and reported (as applicable). Outlining the transaction flow gives context to key controls, especially how transactions become subject to controls in the first place. If a control inherently ensures that all applicable transactions are included (ex: bank reconciliation where the assertion is existence), the auditor may decide to just start the write-up with the initiation of the control procedure and go from there.

Elements of the transaction flow are defined informally as follows:

- *Initiation:* How are transactions initiated?
- *Authorization:* How are transactions and accounting record maintenance authorized?
- *Recording:* How are transactions or balances identified and recorded in financial accounting systems?
- *Processing:* How are the transactions or balances processed after they are recorded (if at all)? Processing may be manual or automated and may occur at a subsidiary system level or at the general ledger level.
- *Reporting:* How are records translated into the financial statements? This part of the transaction flow extends the understanding to the actual financial statements that the audit is opining on. Since we already document an understanding of the financial reporting process in general, it is usually enough to simply reference this overall understanding. However, if there are important steps unique to the covered balances, it may be more appropriate to mention them here.

# State of Washington

Although transaction flow is a good way to think about understanding and documenting a control system, auditors should not worry too much about documenting “each element, in order” because often elements may be combined, not noticeable, not applicable or occur in a different order.

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits](#) Planning Guide**

Record of Work Done:

- Internal controls in the Automated Tax and Licensing Administration System (ATLAS) address the following balance(s):
  - **Taxes, net of available credits: Sales and Use** - Governmental Activities
  - **Retail sales and use taxes** - General Fund
  - **Taxes, net of available credits: Business and Occupation** - Governmental Activities
  - **Business and Occupation Taxes** - General Fund

For the following assertions:

- **Occurrence** - There is a risk of improper revenue recognition resulting in the year-end accrual being overstated. There is a risk that recorded revenue is more than source records.
- **Completeness** - There is a risk that certain revenues are not reported or accrued.
- **Valuation** - There is a risk that tax revenues are incorrectly calculated.

## **Background**

In March 2018, DOR implemented the Automated Tax and Licensing Administration System (ATLAS), which replaced all other systems and streamlined the process for recording tax return payments received into AFRS. Electronic filing (E-file) is the preferred method for tax return filing and the majority of taxpayers are required to file electronically. The payment methods available to taxpayers did not change with the implementation of ATLAS and the payment methods are EFT, E-check, Credit Card, and physical check.

## **Gain an Understanding of Internal Controls**

# State of Washington

We met with Ayano Faasumalie, Revenue & Financial Reporting Coordinator, on April 10, 2024 to gain an understanding of controls over retail sales and use and B&O taxes.

## **Tax Returns**

The majority of tax returns are received electronically and filed through the online taxpayer system, My DOR, which is part of the State's Secure Access Washington (SAW) application created by the Washington Technology Solutions (WaTech). Returns filed in My DOR are sent directly into ATLAS, which is coded to automatically calculate taxes due based on the information entered by the taxpayer on the return.

When a taxpayer logs into their My DOR account and selects to file a return, ATLAS automatically calculates taxes due from pre-programmed rates based on return information entered by the taxpayer (**Key Control #1- Automated- Valuation**). When the taxpayer submits the return, taxes due and the payment amount are recorded in the transactions tab of ATLAS. Additionally, information such as the date filed, the date paid, and any changes or adjustments made to the return or the taxpayer's account will also be recorded in the transactions tab of ATLAS. My DOR and ATLAS only allow a return to be filed once and ATLAS will create a work item for duplicate return received if the taxpayer attempts to submit a paper return for the same return period received. Logic checks are run when the return is processed. If there is an error, the return is flagged and sent to a work queue for an Examiner to review. Returns flagged for review do not get recorded to the appropriate revenue source until errors are resolved and released from the queue.

## **How transactions are recorded in AFRS:**

### **Cash Journal Entries**

When payments are received via ACH/debit, ACH/credit, wire transfer, and cash/check from field offices, ATLAS automatically generates an A8 cash journal (CJ) to record the cash receipts. For payments received by credit card, lockbox and via mail/FedEx/UPS, a manual CJ is created in ATLAS by Treasury Management in Business & Financial Services (B&FS). Treasury Management staff batch the documents and prepare the deposits assuring they both balance. Once they are entered, the Batch Control System (BCS) compares the total of the individual batches to what was deposited for the day. The A8s are sent to the State Treasurer's Office (OST) for deposit entry into the Treasury Management System and verification that all funds have been received. If the payment amount received by the OST does not match DOR's A8, they will contact DOR and inform them of the out of balance condition. Treasury Management will follow up on the difference by totaling and comparing the documents and payments. The Batch Sheet which contains the batch amount totals, document count, batch date, and batch number is placed on top, and the batch is forwarded to Taxpayer Account Administration (TAA). Treasury Management then reconciles the ATLAS cash journal report totals to the total deposit recorded in the OST's concentration account to ensure they match.

DOR's Revenue Accounting section in B&FS verifies the CJ batches are error free and releases for processing in AFRS at the end of each day. ATLAS initially records the deposit in Fund 01P (Suspense Account) and then distributes from suspense to the proper revenue source codes once the returns and payments are applied to the taxpayers' accounts. If the payment is identified as Excise Tax but not applied to a tax return, the fund is transferred to the general fund Revenue Act revenue source (01-99 – Tax Revenue Suspense). If tax payments are not applied to the taxpayer's account due to mismatched returns or errors that need to be resolved, the funds will remain in the suspense account until issues are

## State of Washington

resolved by Tax Examiners. Once the payment has been applied to the taxpayer's account, ATLAS will automatically create a journal voucher to move the funds to the appropriate revenue sources (**Key Control #2- Automated- Valuation/Occurrence/Completeness**). Batches are created and transmitted to AFRS in the evening. Revenue Accounting reviews the batch the following day and releases them in AFRS.

One business day after the tax return is due, ATLAS will automatically create a receivable on the taxpayer's account if there is a balance due (no payment or partial payment with a return). If no return has been filed, one week after the due date, ATLAS will automatically estimate the tax amount due based on historical information in the taxpayer's account. Compliance is responsible for collecting the receivables from all revenue sources, which account for a majority of the agency's debt. DOR does not use an external collection agency to aid in the collection process. The Compliance staff does not receipt any payments on the delinquent accounts. Electronic delinquency notices are sent automatically to taxpayers. For monthly and quarterly filers, DOR sends the electronic notice 10 days from the return's statutory due date. For annual filers, DOR sends them 20 days from the return's statutory due date. We gained an understanding of taxes receivable at [[Controls - ATLAS](#)].

### Gross Receipts Accrual Entry

For monthly filers, excise tax returns for June activity are due July 25th and for quarterly filers, tax returns for the 4th fiscal quarter (April, May, and June) are due July 31st. In August, the ATLAS "gross receipts" report, which is programmed to pull all gross receipts for the period July 1 - August 15, is downloaded to Excel and compared to the gross receipts from the prior five years to check that the values seem reasonable. Revenue Accounting will prepare a JV to enter into AFRS to show the June returns received after June 30<sup>th</sup> as a receivable and accrued revenue for the FYE.

We met with Jerry Tilson, Revenue Accounting Manager, on April 10, 2024 to discuss the gross receipts accrual entry. Jerry explained that towards the end of August, he runs the "gross receipts" report from ATLAS for receipts received between July 1 - August 15 for the tax filing period of June 30 and exports the data to Excel. Once the data is exported into Excel, he sorts by fund and revenue source. The data is then automatically pulled into the "taxpayer assessed taxes (tat) worksheet" tab where the gross receipts are summarized by tax type. Jerry then reviews the report for any errors or major changes and compares the amounts to the prior 5 years for reasonableness. Any significant changes are noted and documented at the bottom of the taxpayer assessed taxes report. After reviewing the report, Jerry verifies that the total gross receipts amount on the "taxpayer assessed taxes report" tab matches the total on the "combined gross receipts adj" tab to ensure that the data from the gross receipts report was pulled in correctly. The JV is then created by pulling the data from the "taxpayer assessed taxes report" tab and input into AFRS by a Revenue Accounting Fiscal Analyst and reviewed and released by Jerry. Additionally, Binh Vu, Accounting Manager, reviews all fiscal-year end JVs. A fiscal analyst reviews the AFRS daily transaction report the next business day to ensure that the accruals were recorded in AFRS accurately and occurred in the correct period (**Key Control #3 - Manual - Valuation/Occurrence/Completeness**).

### Reconciliation Process

ATLAS receives a daily reconciliation file from AFRS and performs an automatic reconciliation between the data recorded in AFRS and ATLAS to ensure revenues recorded are accurate and complete. OFM sends an AFRS download into a SFT folder daily that is picked up by ATLAS. ATLAS then automatically performs a reconciliation between the journal voucher batches in ATLAS from the prior day to the revenues recorded in AFRS.

## State of Washington

Once the reconciliation is complete, ATLAS will update the batch with the reconciliation date under the "reconciled" column. There have been a few issues where the AFRS file was not received and some batches did not go through the automatic reconciliation. Revenue Accounting reviews each batch in ATLAS for a "reconciliation date" to ensure the reconciliation took place. If the AFRS file is not received, Revenue Accounting will contact OFM for the file. However, if the request is made 10 days or more after the date the batches were processed in AFRS, the AFRS data is no longer available for transmission. If the batch does not go through the automatic reconciliation, Revenue Accounting will perform a manual reconciliation.

At the beginning of the month, Jerry Tilson, Revenue Accounting Manager, runs the Revenue GL Monthly Revenue Activity report (MRA) from ATLAS for the previous month. Jerry prints the report from ATLAS and then inputs all of the data into the Monthly Revenue Activity spreadsheet. A reconciliation is then performed between ATLAS and AFRS to ensure the reported amounts are accurate and complete (**Key Control #4 - Manual - Occurrence/Completeness**). Jerry uses a Webi report that runs data based on funds and sources that are applicable to DOR and allows him to link the report directly to the monthly revenue activity spreadsheet. The monthly receivables in ATLAS are reversed out on the Accrued Revenue tab and the new monthly receivable amounts are entered. The receivables are included as part of the monthly activity and netted against cash revenues in the reconciliation of the balance. Jerry maintains a Monthly Revenue Activity spreadsheet to reconcile ATLAS and AFRS using reports from ATLAS and Webi. The spreadsheet is broken down by GL and split into the following tabs:

- **CASH** - Includes GL 4310
- **CASH REVENUE** - Includes GL 3210
- **ACCRUED REVENUE** - Includes GL 3205

Within each tab, the GL data is separated by fund/revenue source. Totals from each tab for the fund/source links to the "Balance" tab on the spreadsheet under the "spreadsheet monthly activity" column. The Webi report is linked directly to the "Balance" tab of the spreadsheet under the "AFRS monthly activity" column.

Once all of the data from both reports has been input into the spreadsheet, Jerry scrolls through the "Balance" tab and checks for any differences between ATLAS and AFRS in the "difference" column. If there is a difference between ATLAS and AFRS, Jerry will highlight the number to be reviewed and researched to determine why there is a difference. In addition to checking for differences for the month, Jerry also compares biennium-to-date balances for ATLAS and AFRS to help check for formula or data errors in the monthly data. Once Jerry has completed the reconciliation and researched any discrepancies or differences, he e-mails relevant parties, including the Economic and Revenue Forecast Council and the Research and Fiscal Analysis Division of DOR, to let them know the report is complete and saved on the J Drive for their forecasts and analysis. In this report, only "Cash", "Accrued revenue", and "Local dist" tabs are viewable. The rest of the back-up tabs are hidden.

### **Key controls are as follows:**

**Key Control #1 - (Automated) - Valuation** - When a taxpayer logs into their My DOR account and selects to file a return, ATLAS automatically calculates taxes due from pre-programmed rates based on return information entered by the taxpayer.

## State of Washington

**Key Control #2 - (Automated) - Valuation/Occurrence/Completeness** - Once the payment has been applied to the taxpayer's account, ATLAS will automatically create a journal voucher to record the funds to the appropriate revenue source. Batches are created and transmitted to AFRS in the evening. Revenue Accounting releases and reviews the batch in AFRS the following day to ensure amounts applied are accurate, complete and assigned to the proper revenue source.

**Key Control #3 - (Manual) - Valuation/Occurrence/Completeness** - In August, the ATLAS "gross receipts" report, which is programmed to pull all gross receipts for the period July 1-August 15, is downloaded to Excel and compared to the gross receipts from the prior five years to check that the values seem reasonable. Revenue Accounting will reconcile and review the year end JV to enter into AFRS to show the June returns received after June 30<sup>th</sup> as a receivable and accrued revenue for the FYE.

**Key Control #4 - (Manual) - Occurrence/Completeness** - At the end of each month, Revenue Accounting runs a monthly revenue activity report (MRA) from ATLAS and AFRS revenue report from Enterprise Reporting System. A reconciliation is then performed between ATLAS and AFRS to ensure the reported amounts are accurate and complete.

**Noted Weaknesses are as follows:**

- None

### D.2.PRG - Retail Sales and Use and B&O Taxes

*Procedure Step:* Key Control #1 (Automated)

*Prepared By:* BFW, 9/30/2024

*Reviewed By:* RKM, 10/11/2024

Purpose/Conclusion.*
----------------------

**Purpose:**

To determine whether ATLAS calculates the taxes due based on information entered by the taxpayer (Key Control 1 for ATLAS) was in place in order to assess control risk.

**Conclusion:**

Based on our understanding and test results, we concluded that the automated control **was** in place and operating effectively.

# State of Washington

Based on our understanding, related general IT controls **were** in place and adequately designed to ensure that the control operated consistently during the audit period. However, we did not test the operating effectiveness of general IT controls.

Our understanding and control risk assessment, which incorporates these conclusions, is documented at [\[Risk Assessment\]](#).

Testing Strategy:

The following procedures are **required** for all automated key controls for financial and single audits:

## **STEP 1: Understand Automated Key Control**

Gain an understanding of the automated key control. The understanding can either be documented in the control system step or could be documented here in this step. Auditors should consider the following aspects of the automated control when gaining an understanding:

### **Software Calculation:**

- Is there written documentation of the calculation, and/or the source rates and factors used in the calculation?

*We would expect written documentation that defines the calculation and is an official, approved source for the formulas, rates and factors. This may be an approved policy or could be system documentation.*

- What formulas are used to make the calculation?
- What values or factors are used to make the calculation? For example:
  - Rate tables used by the calculation
  - Profile fields (i.e., applicable transaction types)
  - Programmed/set formulas and/or values
  - Constraints (i.e., effective date, minimums/maximums, etc.)
- How is the calculation triggered or initiated?
- How is the calculation recorded in the accounting system (or used in an end result)?

### **Automated Interfaces:**

- Is data transferred in real time (immediately) or in a batch? If batched, how often does the interface occur (daily, monthly, quarterly, etc.)?
- What triggers the data transfer?

*Transfers could be manually initiated, could be hardcoded into either the sending or receiving system's programming, could be controlled by administrative menus (for integrated software modules), or could be run as automated jobs with third party software or programming.*

## State of Washington

- Could the interface process fail? If so, how would the entity recognize that the process failed?

*This may not be a relevant risk for integrated software, but may be the case for custom interfaces designed outside the software which may be subject to various points of failure.*

- Will the interface process reject transactions or batches with errors? If so, who monitors rejections and follows up on rejected transactions to ensure correction (either in the sending or receiving systems) and how are corrections tracked and monitored?

*For example, information that could trigger a rejection or isolated transaction and batch can include: invalid data, duplicate data, or missing factors. If errors are possible, we would expect the isolated data is reviewed, tracked and corrected in a timely manner.*

- Are any reconciliations done to provide assurance that data transfer was complete and accurate?

*We would expect the local government to perform a reconciliation between source and destination systems to ensure the interfaced data is complete and accurate. This may be a manual reconciliation or spot-check, a system or dashboard report, or automated edit check. Depending on how often errors (if any) are expected, the reconciliation could be done each time the interface occurs, or on a monitoring basis, like annually.*

### Edit Checks:

- Inquire if the entity has a written policy or documentation describing the approval process and protocols for reviewers?
- What is the approval process in the application?
  - What transactions, data, tasks, or documents are approved?
  - Who are the preparers? How do preparers submit for approval?
  - Who are the authorized approvers? Are there backup approvers?
  - What documents or information are required to make approval judgment?
  - What is the next step once a transaction/data/ task/document is approved or denied?
  - Is there any exception situations where approval can be by-passed or waived?
- Can the approver make changes to information during the approval stage? If so, is the preparer notified of the changes?
- Can anyone make changes to the approved information after the approval stage? If so, are changes captured in an audit trail and is the audit trail (log) regularly reviewed and monitored to detect any unauthorized changes?
- Does the application prevent users from approving their own work (self-approval)?

*Some applications have a feature preventing self-approval. If an application does not have a feature preventing self-approval, we would expect manual controls in place to ensure the segregation of duties between preparer and approver, if relevant to the risk.*

## State of Washington

- Does the application have high-level users that can also approve?

*High-Level Users (aka Users with elevated privileges, system or application "Administrators", "Super Users", etc.) typically have full access to change system settings and may have extensive function rights of software applications. Depending on entity's size and complexity, different high-level users may be responsible for the network vs. application level. High-level users represent a heightened risk for overriding segregation of duties and normal control processes.*

*We would expect entities to have compensating monitoring controls if personnel are responsible for both application settings and transaction processing controls.*

### Computer Generated Reports:

- What information or exceptions is the report designed to identify (what is the purpose of the report)?
- How is the report used and by whom?
- For exception reports, who reviews the report and how do they follow up on exceptions?

*Auditors should consider whether the exception report reviewer has appropriate authority and information to effectively follow-up on report results. For fraud-related risks, also consider whether the review position is appropriately segregated from positions that can initiate transactions. For exception reports that regularly identify many transactions needing multi-step follow-up, the manual review and follow-up may be identified as a separate key control rather than documented and evaluated as an aspect of the automated exception report control.*

- What are the report parameters or criteria? Does the report have any calculated fields? If so, what are the calculations?

*The ideal method of documenting an understanding of a computer generated report is to get a screenshot or printout of the report parameters. If using a report writer, this may be printed with the report, or may be accessed from a design view or intermediary screen. For custom or complex reports, this may be the SQL code.*

*For exception reports, auditors should pay special attention to the definition of an exception embodied in the report parameters.*

*NOTE: observation of the report parameters will also count as a confirmation of the report and could also be used to test the report.*

### Electronic Approvals:

- Inquire if the entity has a written policy or documentation describing the approval process and protocols for reviewers?
- What is the approval process in the application?

## State of Washington

- What transactions, data, tasks, or documents are approved?
- Who are the preparers? How do preparers submit for approval?
- Who are the authorized approvers? Are there backup approvers?
- What documents or information are required to make approval judgment?
- What is the next step once a transaction/data/ task/document is approved or denied?
- Is there any exception situations where approval can be by-passed or waived?
- Can the approver make changes to information during the approval stage? If so, is the preparer notified of the changes?
- Can anyone make changes to the approved information after the approval stage? If so, are changes captured in an audit trail and is the audit trail (log) regularly reviewed and monitored to detect any unauthorized changes?
- Does the application prevent users from approving their own work (self-approval)?

*Some applications have a feature preventing self-approval. If an application does not have a feature preventing self-approval, we would expect manual controls in place to ensure the segregation of duties between preparer and approver, if relevant to the risk.*

- Does the application have high-level users that can also approve?

*High-Level Users (aka Users with elevated privileges, system or application "Administrators", "Super Users", etc.) typically have full access to change system settings and may have extensive function rights of software applications. Depending on entity's size and complexity, different high-level users may be responsible for the network vs. application level. High-level users represent a heightened risk for overriding segregation of duties and normal control processes.*

*We would expect entities to have compensating monitoring controls if personnel are responsible for both application settings and transaction processing controls.*

### **STEP 2: Confirm and Test Automated Key Control**

Confirm and test the automated control. To test the automated control, consider the following procedures:

#### **Software Calculation:**

- Re-perform the calculation for selected transactions.  
*Auditors would NOT normally use sampling for automated controls. Instead, auditors should judgmentally select one instance of each significant variation of the calculation. If the number of potential variations is large, auditors would judgmentally select based on risk factors (for example, the most common scenarios, or scenarios associated with identified risks, or scenarios that are not addressed by the entity's testing procedures).*

*In some cases, it may be possible for the auditor to reperform the calculation for the entire population.*

## State of Washington

- If any rate tables or values were updated during the period, view the current values (by observing the rate table or values in an admin menu or from a printed system report) and compare to approved sources.  
*If no updates were made or there are only a few values, this risk could be addressed by re-performing the calculation. However, if source rate tables or values are large or complex, it may be more efficient to test these values directly than to recalculate a larger number of transactions.*
- Consider the use of analytical procedures such as trends or descriptive statistics on the population (like average, minimum and maximum values, or a graph of values across the population) and follow up on any unexpected values or trends. *Analytical procedures would normally also count as a substantive test.*

### Automated Interfaces:

- Re-perform a reconciliation, comparison or analytical procedure between both systems to determine whether data interfaced completely and accurately. Alternatively, review the entity's reconciliation or comparison if they perform one.

*For example, auditors could perform count totals and summarize the data to determine whether the same number of transactions reside in both systems, or the total amount from the sending system was posted to the receiving system. Whether this takes the form of a comparison (numbers expected to match exactly), reconciliation (when reconciling items are expected) or analytical procedure (if numerous adjustments or reconciling items are expected) will depend on the nature of the interface and client documentation.*

*Note: these procedures would also provide substantive evidence.*

- Observe documentation, such as interface logs or email notifications, to determine whether interfaces complete per expected interval (daily, monthly, quarterly, etc.).

*We would expect the data transfer to be consistent based on the programmed schedule. If data is expected to be transferred on a weekly basis, we would expect to see some form of documentation showing the weekly transfer.*

- Observe evidence that batch jobs are monitored such as tracking spreadsheets or emails.
- When interfaces did not occur as expected, determine whether procedures were followed to resubmit job or that there was a logical reason no data was received/sent for the interval (for example, it was a holiday so there was no interface for that day).

### Edit Checks:

- Re-perform the edit check for selected transactions.

*Auditors would NOT normally use sampling for automated controls. Instead, auditors should judgmentally select one instance of each*

## State of Washington

*significant variation of the check. If the number of potential variations is large, auditors would judgmentally select based on risk factors (for example, the most common scenarios, or scenarios associated with identified risks, or scenarios that are not addressed by the entity's testing procedures).*

*In some cases, it may be possible for the auditor to reperform the edit check for the entire population.*

- Consider the use of analytical procedures such as trends or descriptive statistics on the population (like average, minimum and maximum values, or a graph of values across the population) and follow up on any unexpected values or trends. Analytical procedures would normally also count as a substantive test.

### Computer Generated Reports:

- For exception reports, inquire with the person assigned to review the report how frequently exceptions are noted by the report. Trace identified exceptions to documentation of correction or resolution.
- Re-perform the report by either (a) generating it yourself in the entity's system (if the auditor has direct access to the system), (b) recreating the report using CAATS, or (c) by observing the report be generated in your presence. If observing, note any user-entered values or parameters and determine whether entered parameters were appropriate. Compare re-performed report to the one being tested.

### Electronic Approvals:

- Observe a transaction to see the approval process and verify any key aspects of the process or limits.
- If transaction data or reports include approval information, use CAATS to confirm that all transactions met authorization rules.

### **STEP 3: Understand General IT Controls**

Gain an understanding of the general IT controls that support the continued proper operation of the automated control. Identify key general IT controls and note any control weaknesses. Auditors should consider the following aspects of general IT controls when gaining an understanding:

### Software Calculation:

- Inquire if the entity has experienced any errors or irregularities with the calculation. Also how often changes are made to the calculation, and how many changes (if any) were made during the year.
- How can the software calculation (formulas, rates/values, settings/configurations) be changed or customized?

*Software calculations will usually have one or more administrative menus that allow the government to modify rate tables or other calculation values, or to configure the calculation or apply settings.*

*In other cases, software calculation formulas and/or values may be hard-coded into the system and require programmers to make the*

## State of Washington

*changes. If the government has access to source code, then it needs internal procedures for program changes. If the program is controlled by vendors, we would expect program change procedures and expectations to be included in the contract.*

- What are the procedures to authorize and make program changes or configuration/setting changes to the software calculation?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

- What are the procedures to test that program changes are properly working?  
*If utilizing a test environment, there should be controls to ensure that the live environment is updated and is consistent with the live production environment. As management is responsible for the accuracy of their automated controls (i.e., in the live environment), we would expect there to be a procedure to confirm each key automated control once it is in the live environment. This could be manually re-performing the calculation, reviewing reports against known expectations, etc.*
- How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

- If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change programming, but they may be responsible for patch management, master table data, and/or configurations.*

### Automated Interfaces:

- Inquire if the entity has experienced any errors or irregularities with the interface. Also how often changes are made to the interface, and how many changes (if any) were made during the year.
- What are the procedures to authorize and make changes to the interface?

*Except for the most simple situations, we would normally expect update procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for*

## State of Washington

*requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

- What are the procedures to test that program changes are properly working?  
*If the data transfer is already going to be checked or reconciled, then there may be less need for specific test procedures on program changes since any errors will be identified right away.*
- How are program changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

*If the program is controlled by a third-party, we would expect a process between the government and vendor that allows the government to make requests and receive communication at the completion of the request.*

- If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to vendor developed/supported coding that controls how the system processes the interfaced data, but they may be responsible for working the interface error queues and reconciling the interfaced data.*

### Edit Checks:

- Inquire if the entity has experienced any errors or irregularities with the edit checks. Also how often changes are made to the checks, and how many changes (if any) were made during the year.
- How can the edit check be changed or customized?

*Edit checks may be hard-coded into the system and require programmers to make the changes. If the government has access to source code, then it needs internal procedures for program changes. If the program is controlled by vendors, we would expect program change procedures and expectations to be included in the contract.*

*In other cases, edit checks may be established or configured through one or more administrative menus.*

- What are the procedures to authorize and make program changes or configuration/setting changes?

## State of Washington

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

- What are the procedures to test that program changes are properly working?  
*If utilizing a test environment, there should be controls to ensure that the live environment is updated and is consistent with the live production environment. As management is responsible for the accuracy of their automated controls (i.e., in the live environment), we would expect there to be a procedure to confirm each key automated control once it is in the live environment. This could be manually re-performing the edit check, reviewing reports against known expectations, etc.*
- How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

- If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change programming, but they may be responsible for patch management, master table data, and/or configurations.*

### Computer Generated Reports:

- Inquire if the entity has experienced any errors or irregularities with the report. Also how often changes are made to the report, and how many changes (if any) were made during the year.
- How is the report triggered or initiated?

*For reports that are automatically triggered, the auditor would normally not identify job scheduling or monitoring as a general control since we would expect failure of the report to generate*

- Is the report hardcoded into the program, or is it a custom or ad hoc report? Also, what manual inputs (if any) are required to run the report?

*What parameters, criteria (date ranges, fund number, departments) or instructions are entered by the user to generate the exception*

## State of Washington

*report. The more options entity personnel have to customize or modify the report, the higher the risk of human error and inaccurate or incomplete reports. Pre-programmed reports provide less flexibility than ad-hoc reports; however, if program change controls are in place, they are more consistent.*

- If the report is hardcoded into the system, how are program changes made?
- If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change vendor developed reports, but they may be responsible for triggering, setting certain parameters, and/or following up on exception report results.*

- NOTE: if the auditor cannot identify sufficiently effective general IT controls, the automated control will need to be tested using the same methods as a manual control (ie: sampling throughout the period). For example, if the report is manually generated and highly dependent on a number of manual inputs each time, or if the report does not have formal change controls, such as an ad hoc report or excel-based report. In such cases, the automated report is controlled by limited access and the judgment of the report writer – that is, while the report is an automated component, there is also an integrated manual component to the control.

### Electronic Approvals:

- How are users assigned preparer and approver roles? Are user accounts periodically checked for needed changes? See the [User Access](#) step in the Accountability folder for more control considerations.
- If configurations or settings relevant to the approval process are controlled by an admin menu, who has access to this menu?
- If the entity has access to source coding for approval controls, what are the procedures to authorize and make program changes?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

- What are the procedures to test that program changes are properly working?
- How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

## State of Washington

- If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to vendor developed/supported coding that controls how the electronic approval works, but they may be responsible for approval configurations or settings and/or user account management.*

### **STEP 4: Confirm Key General IT Controls**

Confirm your understanding of key general IT controls to determine whether they have been placed in operation (*whether the entity has actually implemented key controls*).

### **STEP 5: Test Key General IT Controls**

Document whether general IT controls will be tested. Option 1 would result in control risk at MAX for the automated control. Either option 2 or 3 is necessary in order to set control risk at LOW. If general IT controls are tested, consider the following procedures:

#### **Software Calculation:**

- If program changes or setting/configuration changes are logged, review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

- Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the calculation may also provide this evidence if the re-performance tests address all states of the calculation during the period.
- If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.
- If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the **SOC Report Reliance** workpaper in the Store.

#### **Automated Interfaces:**

- Review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

## State of Washington

- Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, reconciling or comparing the data transfer (or reviewing the entity's reconciliation or comparison) may also provide this evidence if tests address all states of the interface during the period.
- Inspect job processing error logs/reports. Observe evidence that errors in processing were isolated and resolved. For example, select a sample of rejected transactions and observe evidence to determine whether errors were appropriately corrected and the corrections were timely.
- If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

### Edit Checks:

- If program changes or setting/configuration changes are logged, review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

- Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the edit check may also provide this evidence if the re-performance tests address all states of the edit check during the period.
- If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.
- If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

### Computer Generated Reports:

- If the report is subject to program change controls (either due to being hardcoded or by being automatically triggered), review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

- If the report is subject to program change controls, review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the report may also provide this evidence if the re-performance tests address all states of the report during the period.
- If the report relies on manual inputs and report copies saved show the parameters entered, the auditor can check a selection or sample of reports to confirm that the report was run correctly.

## State of Washington

- If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) worksheet in the Store.

### Electronic Approvals:

- Review user access report to verify that current users are appropriate. Also consider review of user access change logs (if available) to evaluate user account management throughout the period. See the User Access step in the Accountability folder for more testing considerations.
- If approvals are governed by significant settings/configurations, and such changes are logged, review the change log to verify the population of changes for the year.

*Verification that no configuration changes were made, along with the auditor's evaluation that no such changes are expected, would normally be sufficient evidence to conclude that no further testing is necessary.*

- If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.
- If the entity has access to source code, review the change log to verify the population of changes for the year. Then review programming change documentation or the entity's test documentation for selected or sampled changes.

*Verification that no program changes were made, along with the auditor's evaluation that no such changes are expected, would normally be sufficient evidence to conclude that no further testing is necessary.*

- If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the SOC Report Reliance worksheet in the Store.

### **STEP 6: Final Control Risk**

Evaluate the results and document a final control risk assessment in the control system step. Consider whether any deficiencies identified with either the automated control or related general IT controls represent material weaknesses or significant deficiencies.

*Note: general IT control deficiencies do not necessarily mean the automated control is not properly functioning. General IT control deficiencies would normally be considered a significant deficiency or material weakness only if it caused an issue with the compliance requirement or assertion.*

### **Recommendation Review Requirement**

IT Security related information is considered category 3 data protected by Public Request Exemption RCW 42.56.420. Issues related to IT Security require the following special handling:

- [Instructions](#) are located in Team IT Audit's System's Sharepoint page.

## State of Washington

- Details of IT Security related issues should NOT be included in any emails or helpdesks.
- Exit, ML and Findings should be separately communicated in an IT Security Results Document.
- Findings will be referenced, but not included in the audit report.
- All IT security-related recommendations must be reviewed by [Team IT Audit](#).
- Template language for common IT related recommendations can be found in [ARS Part 5 Chapter 8](#).

### **PUBLIC REQUEST EXEMPTION**

Some IT related information is protected by Public Request Exemption RCW 42.56.420 for cyber security purposes. The details documented in the record of work and support workpapers may qualify for this exemption. If so, auditors must include this statement in the record of work done and any related workpapers: **"This record contains information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited "**.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

### **Information Technology Planning Guide**

Auditors may contact [Team IT Audit](#) with any testing strategy or control assessment questions or to request assistance from an IT Specialist.

**Software Calculation:** A **software calculation control** exists when the value of a transaction is determined by a software application. This process can be a key control when the entity relies on the system to generate calculations correctly to determine the amount of transactions (i.e., summarizing/account code allocation to post to general ledger, calculate student, utility, other charges, etc.).

**Automated Interfaces:** An interface is a process that moves information from one computer application to another. The interface can occur internally between systems maintained by a single agency, or between systems maintained by different agencies or private companies. The interface can also occur between modules within the same computer application.

The data transferred might be a file consisting of one or more records processed at a later time (batch), or it can be a real-time update. Risk associated with interfaces increases as the number of transactions or the number of other services and systems supported by the interfaced data increases.

## State of Washington

Poor design or inadequate oversight can affect the transfer of transaction data among the systems. Interface controls are automated and/or manual processes designed to ensure transmission and processing of information is complete and accurate.

### Manual vs. Automated Interfaces

A "manual interface" is the transfer of data from one system or module to another system or module, initiated and controlled by a user. An example of a manual interface is when customer accounts are downloaded from a utility billing system to be used to perform meter readings. When complete, the file with meter readings may be uploaded and posted to the customer accounts.

An "automated interface" is the transfer of data from one system or module to another system or module that happens automatically based on a schedule, or other predefined criteria. A common example of an automated interface is the payroll module of a system. Typically, a payroll batch is created in the payroll module. Once approved, the batch is automatically sent by the system to the general ledger or other applicable modules, such as accounts payable.

Entities should have reconciliation controls between their various applications regardless of the method used for interfacing.

*Auditors should have determined whether system interfaces are automated as part of the Key Software Applications workpaper. **If not**, ask the following question to determine whether the system interface is manual or automated.*

*Is the data transferred from one system/module to another system/module by a user using an uploading and posting technique? For example, data is pulled from one system into a text file or other format, that is then uploaded into a different system or module by posting or in an upload feature of the module. If the answer to this question is yes, the interface would be considered "manual" since it is initiated and controlled by manually rather than through an automated process.*

**Edit Checks:** An **edit check** is a programmed routine designed to check input data or processing results for accuracy, compliance, or reasonableness. Types of edit checks include:

- Range Checks: ensure that numeric values fall within specified ranges, minimums and/or maximums. For example, ensuring that a capital asset can only be entered as a positive amount, or a purchase order can only be submitted without secondary approval for less than a certain threshold.
- Consistency Checks: verify that related data fields are consistent with each other. For example, ensuring that a patient's age matches their date of birth.
- Format Checks: validate data formats (for example, dates as MM/DD/YYYY or phone numbers as ###-###-####).
- Logical Checks: assess logical relationships between data fields. For instance, verifying that total debits equals total credits in a journal entry.
- Duplicate Checks: identify duplicate records or entries. For example, preventing the same invoice from being entered twice.
- Cross-Field Checks: compare data across different fields. For instance, ensuring that the start date of a project is before the end date.

## State of Washington

- Required Field Checks: ensure that mandatory fields are filled out. For instance, making sure that a patient's name and date of birth are provided.
- Referential Integrity Checks: validate relationships between data tables. For example, confirming that a vendor number exists in the vendor master file as an active entity.
- Outlier Checks: detect extreme or unexpected values. For instance, flagging water meter reading values that are extreme outliers for the customer type or account history.
- Pattern Checks: look for specific patterns in data. For example, verifying that email addresses follow a valid format.

Edit checks may result in automatic rejection of a transaction, inability to proceed with a transaction, trigger for additional processing or review, or may simply result in a warning message to the user.

Edit checks may be identified as a key control when they are sufficiently relevant (ie: addressing the risk), precise (ie: able to catch all errors, rather than just being only reasonableness or limit check), and sufficiently strong (ie: prevent invalid transactions, rather than just generating a warning messages). Auditors may identify an individual edit or a group of edit checks together as a key control.

**Computer Generated Reports:** A **computer-generated report** is a report that is created by a computer program. The computer program, also referred to as a report generator or tool, takes data from a data source, such as a database, and displays it in a specified format. The process to generate a report often includes performing calculations on the data, such as summarizing, classifying, etc., before displaying, or can display the calculations on the report.

There are two types of computer-generated reports, pre-programmed and ad-hoc or customized reports.

- Pre-programmed or canned reports are pre-defined reports where criteria and specifications are hard coded in the system. A canned report may allow limited parameters, (month/year, for example), but in general the information that will be displayed is pre-determined.
- Ad-hoc or customized reports allow the user to drill down and customize what information is displayed on the report based on some allowed criteria, such as account codes, dollar amounts minimum, etc).

In contrast, a **manual report** is one that is created outside the system using data exports or is created ad hoc by a user. An example of a manual report is one that is created by copying data from a data source and pasting the data in an Excel spreadsheet or Word document or Powerpoint presentation where it is then processed further. With manual reports, each time a report is created, the data could be incorrect due to user error, such as not copying all relevant data, or processing errors. Therefore, these types of reports should be understood and tested similar to manual controls.

**Electronic Approvals:** Electronic approvals, electronic signatures and digital signatures are technically different, although often these terms are used interchangeably by entities.

## State of Washington

Auditors should have determined whether the electronic approval is an automated control as part of the overall understanding of controls. For automated control purposes, an electronic approval is a software system functionality that:

- Permits a user to approve transaction(s) within the software system
- The system automatically documents, or logs, the data approved by the user and any subsequent manipulation
- The acceptance or rejection of the transaction by the approver will trigger an additional software system process, such as posting of a transaction.

E-mail, scanned-in pictures of signatures, or font-changed signatures, etc. may be part of a control activity but are generally not considered an automated control and are not covered by this testing strategy.

### Electronic Signature vs Digital Signature

An “**electronic signature**” can look like a handwritten signature that has been scanned and then pasted into an electronic document. The reliability of this type of approval is variable. Recommend gaining an understanding of the process used to store and affix the signature to the document and then discuss the process with Team IT Audit before placing reliance on this control.

A “**digital signature**” is a legal signature with a formal certification process that documents who approved the document and ensures the document is not modified after certification. Reliability of this process is very high but has significant technical features. Recommend brainstorm with Team IT Audit before placing reliance on this control.

### **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

**Statements on Auditing Standards [AU-C 315](#) Understanding the Entity and Its Environment and Assessing the Risks of Material Misstatement** - paragraphs .A106-.A109 describe general and application controls and how they relate to audit risks

**Statements on Auditing Standards [AU-C 330](#) Performing Audit Procedures in Response to Assessed Risks and Evaluating the Audit Evidence Obtained** - paragraphs .10b and .A33-.A34 describe requirements and guidance for testing indirect controls in conjunction with tests of controls, that is, testing key general controls in conjunction with a test of a key automated control

Record of Work Done.
----------------------

**Key Control #1 - (Automated) - Valuation** When a taxpayer logs into their myDOR account and selects to file a return, ATLAS automatically calculates taxes due from pre-programmed rates based on return information entered by the taxpayer.

### **STEP 1: Understand Automated Key Control**

The understanding for this system is documented above in the "Controls - ATLAS" step.

# State of Washington

## **STEP 2: Confirm and Test Automated Key Control:**

To confirm the automated control, we re-performed the tax calculations for a sample of tax returns at [[Tax Revenue Testing](#)]. See "IT Control Testing - Valuation" tab.

## **STEP 3: Understand General IT Controls**

We gained an understanding of general controls in the Tax Collections for Other Governments section, as the processes are identical regardless of the type of tax being calculated, see here: [[Key Control 2 \(Automated\)](#)].

## **STEP 4: Confirm Key General IT Controls**

We confirmed general IT controls in the Tax Collections for Other Governments section, as the processes are identical regardless of the type of tax being calculated, see here: [[Key Control 2 \(Automated\)](#)].

## **STEP 5: Test Key General IT Controls**

Not applicable - we are not planning to rely on automated controls and therefore do not need to test general controls; control risk will be assessed at MAX.

## **D.2.PRG - Retail Sales and Use and B&O Taxes**

*Procedure Step:* Key Control #2 (Automated)

*Prepared By:* BFW, 9/24/2024

*Reviewed By:* RKM, 9/30/2024

Purpose/Conclusion:
---------------------

### **Purpose:**

To determine whether ATLAS will automatically create a journal voucher to record the funds to the appropriate revenue source. Batches are created and transmitted to AFRS in the evening. Revenue Accounting releases and reviews the batch in AFRS the following day to ensure amounts applied are accurate, complete and assigned to the proper revenue source.

### **Conclusion:**

Based on our understanding and test results, we concluded that the automated control **was** in place and operating effectively.

Based on our understanding, related general IT controls **were** in place and adequately designed to ensure that the control operated consistently

## State of Washington

during the audit period. However, we did not test the operating effectiveness of general IT controls.

Our understanding and control risk assessment, which incorporates these conclusions, is documented at [\[Risk Assessment\]](#).

Testing Strategy:

The following procedures are **required** for all automated key controls for financial and single audits:

### **STEP 1: Understand Automated Key Control**

Gain an understanding of the automated key control. The understanding can either be documented in the control system step or could be documented here in this step. Auditors should consider the following aspects of the automated control when gaining an understanding:

#### **Software Calculation:**

- Is there written documentation of the calculation, and/or the source rates and factors used in the calculation?

*We would expect written documentation that defines the calculation and is an official, approved source for the formulas, rates and factors. This may be an approved policy or could be system documentation.*

- What formulas are used to make the calculation?
- What values or factors are used to make the calculation? For example:
  - Rate tables used by the calculation
  - Profile fields (i.e., applicable transaction types)
  - Programmed/set formulas and/or values
  - Constraints (i.e., effective date, minimums/maximums, etc.)
- How is the calculation triggered or initiated?
- How is the calculation recorded in the accounting system (or used in an end result)?

#### **Automated Interfaces:**

- Is data transferred in real time (immediately) or in a batch? If batched, how often does the interface occur (daily, monthly, quarterly, etc.)?
- What triggers the data transfer?

*Transfers could be manually initiated, could be hardcoded into either the sending or receiving system's programming, could be controlled by administrative menus (for integrated software modules), or could be run as automated jobs with third party software or programming.*

## State of Washington

- Could the interface process fail? If so, how would the entity recognize that the process failed?

*This may not be a relevant risk for integrated software, but may be the case for custom interfaces designed outside the software which may be subject to various points of failure.*

- Will the interface process reject transactions or batches with errors? If so, who monitors rejections and follows up on rejected transactions to ensure correction (either in the sending or receiving systems) and how are corrections tracked and monitored?

*For example, information that could trigger a rejection or isolated transaction and batch can include: invalid data, duplicate data, or missing factors. If errors are possible, we would expect the isolated data is reviewed, tracked and corrected in a timely manner.*

- Are any reconciliations done to provide assurance that data transfer was complete and accurate?

*We would expect the local government to perform a reconciliation between source and destination systems to ensure the interfaced data is complete and accurate. This may be a manual reconciliation or spot-check, a system or dashboard report, or automated edit check. Depending on how often errors (if any) are expected, the reconciliation could be done each time the interface occurs, or on a monitoring basis, like annually.*

### Edit Checks:

- Inquire if the entity has a written policy or documentation describing the approval process and protocols for reviewers?
- What is the approval process in the application?
  - What transactions, data, tasks, or documents are approved?
  - Who are the preparers? How do preparers submit for approval?
  - Who are the authorized approvers? Are there backup approvers?
  - What documents or information are required to make approval judgment?
  - What is the next step once a transaction/data/ task/document is approved or denied?
  - Is there any exception situations where approval can be by-passed or waived?
- Can the approver make changes to information during the approval stage? If so, is the preparer notified of the changes?
- Can anyone make changes to the approved information after the approval stage? If so, are changes captured in an audit trail and is the audit trail (log) regularly reviewed and monitored to detect any unauthorized changes?
- Does the application prevent users from approving their own work (self-approval)?

*Some applications have a feature preventing self-approval. If an application does not have a feature preventing self-approval, we would expect manual controls in place to ensure the segregation of duties between preparer and approver, if relevant to the risk.*

## State of Washington

- Does the application have high-level users that can also approve?

*High-Level Users (aka Users with elevated privileges, system or application "Administrators", "Super Users", etc.) typically have full access to change system settings and may have extensive function rights of software applications. Depending on entity's size and complexity, different high-level users may be responsible for the network vs. application level. High-level users represent a heightened risk for overriding segregation of duties and normal control processes.*

*We would expect entities to have compensating monitoring controls if personnel are responsible for both application settings and transaction processing controls.*

### Computer Generated Reports:

- What information or exceptions is the report designed to identify (what is the purpose of the report)?
- How is the report used and by whom?
- For exception reports, who reviews the report and how do they follow up on exceptions?

*Auditors should consider whether the exception report reviewer has appropriate authority and information to effectively follow-up on report results. For fraud-related risks, also consider whether the review position is appropriately segregated from positions that can initiate transactions. For exception reports that regularly identify many transactions needing multi-step follow-up, the manual review and follow-up may be identified as a separate key control rather than documented and evaluated as an aspect of the automated exception report control.*

- What are the report parameters or criteria? Does the report have any calculated fields? If so, what are the calculations?

*The ideal method of documenting an understanding of a computer generated report is to get a screenshot or printout of the report parameters. If using a report writer, this may be printed with the report, or may be accessed from a design view or intermediary screen. For custom or complex reports, this may be the SQL code.*

*For exception reports, auditors should pay special attention to the definition of an exception embodied in the report parameters.*

*NOTE: observation of the report parameters will also count as a confirmation of the report and could also be used to test the report.*

### Electronic Approvals:

- Inquire if the entity has a written policy or documentation describing the approval process and protocols for reviewers?
- What is the approval process in the application?
  - What transactions, data, tasks, or documents are approved?

## State of Washington

- Who are the preparers? How do preparers submit for approval?
- Who are the authorized approvers? Are there backup approvers?
- What documents or information are required to make approval judgment?
- What is the next step once a transaction/data/ task/document is approved or denied?
- Is there any exception situations where approval can be by-passed or waived?
- Can the approver make changes to information during the approval stage? If so, is the preparer notified of the changes?
- Can anyone make changes to the approved information after the approval stage? If so, are changes captured in an audit trail and is the audit trail (log) regularly reviewed and monitored to detect any unauthorized changes?
- Does the application prevent users from approving their own work (self-approval)?

*Some applications have a feature preventing self-approval. If an application does not have a feature preventing self-approval, we would expect manual controls in place to ensure the segregation of duties between preparer and approver, if relevant to the risk.*

- Does the application have high-level users that can also approve?

*High-Level Users (aka Users with elevated privileges, system or application "Administrators", "Super Users", etc.) typically have full access to change system settings and may have extensive function rights of software applications. Depending on entity's size and complexity, different high-level users may be responsible for the network vs. application level. High-level users represent a heightened risk for overriding segregation of duties and normal control processes.*

*We would expect entities to have compensating monitoring controls if personnel are responsible for both application settings and transaction processing controls.*

### **STEP 2: Confirm and Test Automated Key Control**

Confirm and test the automated control. To test the automated control, consider the following procedures:

#### **Software Calculation:**

- Re-perform the calculation for selected transactions.  
*Auditors would NOT normally use sampling for automated controls. Instead, auditors should judgmentally select one instance of each significant variation of the calculation. If the number of potential variations is large, auditors would judgmentally select based on risk factors (for example, the most common scenarios, or scenarios associated with identified risks, or scenarios that are not addressed by the entity's testing procedures).*

*In some cases, it may be possible for the auditor to reperform the calculation for the entire population.*

## State of Washington

- If any rate tables or values were updated during the period, view the current values (by observing the rate table or values in an admin menu or from a printed system report) and compare to approved sources.  
*If no updates were made or there are only a few values, this risk could be addressed by re-performing the calculation. However, if source rate tables or values are large or complex, it may be more efficient to test these values directly than to recalculate a larger number of transactions.*
- Consider the use of analytical procedures such as trends or descriptive statistics on the population (like average, minimum and maximum values, or a graph of values across the population) and follow up on any unexpected values or trends. *Analytical procedures would normally also count as a substantive test.*

### Automated Interfaces:

- Re-perform a reconciliation, comparison or analytical procedure between both systems to determine whether data interfaced completely and accurately. Alternatively, review the entity's reconciliation or comparison if they perform one.

*For example, auditors could perform count totals and summarize the data to determine whether the same number of transactions reside in both systems, or the total amount from the sending system was posted to the receiving system. Whether this takes the form of a comparison (numbers expected to match exactly), reconciliation (when reconciling items are expected) or analytical procedure (if numerous adjustments or reconciling items are expected) will depend on the nature of the interface and client documentation.*

*Note: these procedures would also provide substantive evidence.*

- Observe documentation, such as interface logs or email notifications, to determine whether interfaces complete per expected interval (daily, monthly, quarterly, etc.).

*We would expect the data transfer to be consistent based on the programmed schedule. If data is expected to be transferred on a weekly basis, we would expect to see some form of documentation showing the weekly transfer.*

- Observe evidence that batch jobs are monitored such as tracking spreadsheets or emails.
- When interfaces did not occur as expected, determine whether procedures were followed to resubmit job or that there was a logical reason no data was received/sent for the interval (for example, it was a holiday so there was no interface for that day).

### Edit Checks:

- Re-perform the edit check for selected transactions.

*Auditors would NOT normally use sampling for automated controls. Instead, auditors should judgmentally select one instance of each*

## State of Washington

*significant variation of the check. If the number of potential variations is large, auditors would judgmentally select based on risk factors (for example, the most common scenarios, or scenarios associated with identified risks, or scenarios that are not addressed by the entity's testing procedures).*

*In some cases, it may be possible for the auditor to reperform the edit check for the entire population.*

- Consider the use of analytical procedures such as trends or descriptive statistics on the population (like average, minimum and maximum values, or a graph of values across the population) and follow up on any unexpected values or trends. Analytical procedures would normally also count as a substantive test.

### Computer Generated Reports:

- For exception reports, inquire with the person assigned to review the report how frequently exceptions are noted by the report. Trace identified exceptions to documentation of correction or resolution.
- Re-perform the report by either (a) generating it yourself in the entity's system (if the auditor has direct access to the system), (b) recreating the report using CAATS, or (c) by observing the report be generated in your presence. If observing, note any user-entered values or parameters and determine whether entered parameters were appropriate. Compare re-performed report to the one being tested.

### Electronic Approvals:

- Observe a transaction to see the approval process and verify any key aspects of the process or limits.
- If transaction data or reports include approval information, use CAATS to confirm that all transactions met authorization rules.

### **STEP 3: Understand General IT Controls**

Gain an understanding of the general IT controls that support the continued proper operation of the automated control. Identify key general IT controls and note any control weaknesses. Auditors should consider the following aspects of general IT controls when gaining an understanding:

### Software Calculation:

- Inquire if the entity has experienced any errors or irregularities with the calculation. Also how often changes are made to the calculation, and how many changes (if any) were made during the year.
- How can the software calculation (formulas, rates/values, settings/configurations) be changed or customized?

*Software calculations will usually have one or more administrative menus that allow the government to modify rate tables or other calculation values, or to configure the calculation or apply settings.*

*In other cases, software calculation formulas and/or values may be hard-coded into the system and require programmers to make the*

## State of Washington

*changes. If the government has access to source code, then it needs internal procedures for program changes. If the program is controlled by vendors, we would expect program change procedures and expectations to be included in the contract.*

- What are the procedures to authorize and make program changes or configuration/setting changes to the software calculation?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

- What are the procedures to test that program changes are properly working?  
*If utilizing a test environment, there should be controls to ensure that the live environment is updated and is consistent with the live production environment. As management is responsible for the accuracy of their automated controls (i.e., in the live environment), we would expect there to be a procedure to confirm each key automated control once it is in the live environment. This could be manually re-performing the calculation, reviewing reports against known expectations, etc.*
- How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

- If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change programming, but they may be responsible for patch management, master table data, and/or configurations.*

### Automated Interfaces:

- Inquire if the entity has experienced any errors or irregularities with the interface. Also how often changes are made to the interface, and how many changes (if any) were made during the year.
- What are the procedures to authorize and make changes to the interface?

*Except for the most simple situations, we would normally expect update procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for*

## State of Washington

*requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

- What are the procedures to test that program changes are properly working?  
*If the data transfer is already going to be checked or reconciled, then there may be less need for specific test procedures on program changes since any errors will be identified right away.*
- How are program changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

*If the program is controlled by a third-party, we would expect a process between the government and vendor that allows the government to make requests and receive communication at the completion of the request.*

- If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to vendor developed/supported coding that controls how the system processes the interfaced data, but they may be responsible for working the interface error queues and reconciling the interfaced data.*

### Edit Checks:

- Inquire if the entity has experienced any errors or irregularities with the edit checks. Also how often changes are made to the checks, and how many changes (if any) were made during the year.
- How can the edit check be changed or customized?

*Edit checks may be hard-coded into the system and require programmers to make the changes. If the government has access to source code, then it needs internal procedures for program changes. If the program is controlled by vendors, we would expect program change procedures and expectations to be included in the contract.*

*In other cases, edit checks may be established or configured through one or more administrative menus.*

- What are the procedures to authorize and make program changes or configuration/setting changes?

## State of Washington

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

- What are the procedures to test that program changes are properly working?  
*If utilizing a test environment, there should be controls to ensure that the live environment is updated and is consistent with the live production environment. As management is responsible for the accuracy of their automated controls (i.e., in the live environment), we would expect there to be a procedure to confirm each key automated control once it is in the live environment. This could be manually re-performing the edit check, reviewing reports against known expectations, etc.*
- How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

- If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change programming, but they may be responsible for patch management, master table data, and/or configurations.*

### Computer Generated Reports:

- Inquire if the entity has experienced any errors or irregularities with the report. Also how often changes are made to the report, and how many changes (if any) were made during the year.
- How is the report triggered or initiated?

*For reports that are automatically triggered, the auditor would normally not identify job scheduling or monitoring as a general control since we would expect failure of the report to generate*

- Is the report hardcoded into the program, or is it a custom or ad hoc report? Also, what manual inputs (if any) are required to run the report?

*What parameters, criteria (date ranges, fund number, departments) or instructions are entered by the user to generate the exception*

## State of Washington

*report. The more options entity personnel have to customize or modify the report, the higher the risk of human error and inaccurate or incomplete reports. Pre-programmed reports provide less flexibility than ad-hoc reports; however, if program change controls are in place, they are more consistent.*

- If the report is hardcoded into the system, how are program changes made?
- If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change vendor developed reports, but they may be responsible for triggering, setting certain parameters, and/or following up on exception report results.*

- NOTE: if the auditor cannot identify sufficiently effective general IT controls, the automated control will need to be tested using the same methods as a manual control (ie: sampling throughout the period). For example, if the report is manually generated and highly dependent on a number of manual inputs each time, or if the report does not have formal change controls, such as an ad hoc report or excel-based report. In such cases, the automated report is controlled by limited access and the judgment of the report writer – that is, while the report is an automated component, there is also an integrated manual component to the control.

### Electronic Approvals:

- How are users assigned preparer and approver roles? Are user accounts periodically checked for needed changes? See the [User Access](#) step in the Accountability folder for more control considerations.
- If configurations or settings relevant to the approval process are controlled by an admin menu, who has access to this menu?
- If the entity has access to source coding for approval controls, what are the procedures to authorize and make program changes?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

- What are the procedures to test that program changes are properly working?
- How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

## State of Washington

- If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to vendor developed/supported coding that controls how the electronic approval works, but they may be responsible for approval configurations or settings and/or user account management.*

### **STEP 4: Confirm Key General IT Controls**

Confirm your understanding of key general IT controls to determine whether they have been placed in operation (*whether the entity has actually implemented key controls*).

### **STEP 5: Test Key General IT Controls**

Document whether general IT controls will be tested. Option 1 would result in control risk at MAX for the automated control. Either option 2 or 3 is necessary in order to set control risk at LOW. If general IT controls are tested, consider the following procedures:

#### **Software Calculation:**

- If program changes or setting/configuration changes are logged, review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

- Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the calculation may also provide this evidence if the re-performance tests address all states of the calculation during the period.
- If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.
- If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the **SOC Report Reliance** workpaper in the Store.

#### **Automated Interfaces:**

- Review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

## State of Washington

- Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, reconciling or comparing the data transfer (or reviewing the entity's reconciliation or comparison) may also provide this evidence if tests address all states of the interface during the period.
- Inspect job processing error logs/reports. Observe evidence that errors in processing were isolated and resolved. For example, select a sample of rejected transactions and observe evidence to determine whether errors were appropriately corrected and the corrections were timely.
- If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

### Edit Checks:

- If program changes or setting/configuration changes are logged, review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

- Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the edit check may also provide this evidence if the re-performance tests address all states of the edit check during the period.
- If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.
- If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

### Computer Generated Reports:

- If the report is subject to program change controls (either due to being hardcoded or by being automatically triggered), review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

- If the report is subject to program change controls, review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the report may also provide this evidence if the re-performance tests address all states of the report during the period.
- If the report relies on manual inputs and report copies saved show the parameters entered, the auditor can check a selection or sample of reports to confirm that the report was run correctly.

## State of Washington

- If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) worksheet in the Store.

### Electronic Approvals:

- Review user access report to verify that current users are appropriate. Also consider review of user access change logs (if available) to evaluate user account management throughout the period. See the User Access step in the Accountability folder for more testing considerations.
- If approvals are governed by significant settings/configurations, and such changes are logged, review the change log to verify the population of changes for the year.

*Verification that no configuration changes were made, along with the auditor's evaluation that no such changes are expected, would normally be sufficient evidence to conclude that no further testing is necessary.*

- If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.
- If the entity has access to source code, review the change log to verify the population of changes for the year. Then review programming change documentation or the entity's test documentation for selected or sampled changes.

*Verification that no program changes were made, along with the auditor's evaluation that no such changes are expected, would normally be sufficient evidence to conclude that no further testing is necessary.*

- If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the SOC Report Reliance worksheet in the Store.

### **STEP 6: Final Control Risk**

Evaluate the results and document a final control risk assessment in the control system step. Consider whether any deficiencies identified with either the automated control or related general IT controls represent material weaknesses or significant deficiencies.

*Note: general IT control deficiencies do not necessarily mean the automated control is not properly functioning. General IT control deficiencies would normally be considered a significant deficiency or material weakness only if it caused an issue with the compliance requirement or assertion.*

### **Recommendation Review Requirement**

IT Security related information is considered category 3 data protected by Public Request Exemption RCW 42.56.420. Issues related to IT Security require the following special handling:

- [Instructions](#) are located in Team IT Audit's System's Sharepoint page.

## State of Washington

- Details of IT Security related issues should NOT be included in any emails or helpdesks.
- Exit, ML and Findings should be separately communicated in an IT Security Results Document.
- Findings will be referenced, but not included in the audit report.
- All IT security-related recommendations must be reviewed by [Team IT Audit](#).
- Template language for common IT related recommendations can be found in [ARS Part 5 Chapter 8](#).

### **PUBLIC REQUEST EXEMPTION**

Some IT related information is protected by Public Request Exemption RCW 42.56.420 for cyber security purposes. The details documented in the record of work and support workpapers may qualify for this exemption. If so, auditors must include this statement in the record of work done and any related workpapers: **"This record contains information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited "**.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

### **Information Technology Planning Guide**

Auditors may contact [Team IT Audit](#) with any testing strategy or control assessment questions or to request assistance from an IT Specialist.

**Software Calculation:** A **software calculation control** exists when the value of a transaction is determined by a software application. This process can be a key control when the entity relies on the system to generate calculations correctly to determine the amount of transactions (i.e., summarizing/account code allocation to post to general ledger, calculate student, utility, other charges, etc.).

**Automated Interfaces:** An interface is a process that moves information from one computer application to another. The interface can occur internally between systems maintained by a single agency, or between systems maintained by different agencies or private companies. The interface can also occur between modules within the same computer application.

The data transferred might be a file consisting of one or more records processed at a later time (batch), or it can be a real-time update. Risk associated with interfaces increases as the number of transactions or the number of other services and systems supported by the interfaced data increases.

## State of Washington

Poor design or inadequate oversight can affect the transfer of transaction data among the systems. Interface controls are automated and/or manual processes designed to ensure transmission and processing of information is complete and accurate.

### Manual vs. Automated Interfaces

A "manual interface" is the transfer of data from one system or module to another system or module, initiated and controlled by a user. An example of a manual interface is when customer accounts are downloaded from a utility billing system to be used to perform meter readings. When complete, the file with meter readings may be uploaded and posted to the customer accounts.

An "automated interface" is the transfer of data from one system or module to another system or module that happens automatically based on a schedule, or other predefined criteria. A common example of an automated interface is the payroll module of a system. Typically, a payroll batch is created in the payroll module. Once approved, the batch is automatically sent by the system to the general ledger or other applicable modules, such as accounts payable.

Entities should have reconciliation controls between their various applications regardless of the method used for interfacing.

*Auditors should have determined whether system interfaces are automated as part of the Key Software Applications workpaper. **If not**, ask the following question to determine whether the system interface is manual or automated.*

*Is the data transferred from one system/module to another system/module by a user using an uploading and posting technique? For example, data is pulled from one system into a text file or other format, that is then uploaded into a different system or module by posting or in an upload feature of the module. If the answer to this question is yes, the interface would be considered "manual" since it is initiated and controlled by manually rather than through an automated process.*

**Edit Checks:** An **edit check** is a programmed routine designed to check input data or processing results for accuracy, compliance, or reasonableness. Types of edit checks include:

- Range Checks: ensure that numeric values fall within specified ranges, minimums and/or maximums. For example, ensuring that a capital asset can only be entered as a positive amount, or a purchase order can only be submitted without secondary approval for less than a certain threshold.
- Consistency Checks: verify that related data fields are consistent with each other. For example, ensuring that a patient's age matches their date of birth.
- Format Checks: validate data formats (for example, dates as MM/DD/YYYY or phone numbers as ###-###-####).
- Logical Checks: assess logical relationships between data fields. For instance, verifying that total debits equals total credits in a journal entry.
- Duplicate Checks: identify duplicate records or entries. For example, preventing the same invoice from being entered twice.
- Cross-Field Checks: compare data across different fields. For instance, ensuring that the start date of a project is before the end date.

## State of Washington

- Required Field Checks: ensure that mandatory fields are filled out. For instance, making sure that a patient's name and date of birth are provided.
- Referential Integrity Checks: validate relationships between data tables. For example, confirming that a vendor number exists in the vendor master file as an active entity.
- Outlier Checks: detect extreme or unexpected values. For instance, flagging water meter reading values that are extreme outliers for the customer type or account history.
- Pattern Checks: look for specific patterns in data. For example, verifying that email addresses follow a valid format.

Edit checks may result in automatic rejection of a transaction, inability to proceed with a transaction, trigger for additional processing or review, or may simply result in a warning message to the user.

Edit checks may be identified as a key control when they are sufficiently relevant (ie: addressing the risk), precise (ie: able to catch all errors, rather than just being only reasonableness or limit check), and sufficiently strong (ie: prevent invalid transactions, rather than just generating a warning messages). Auditors may identify an individual edit or a group of edit checks together as a key control.

**Computer Generated Reports:** A **computer-generated report** is a report that is created by a computer program. The computer program, also referred to as a report generator or tool, takes data from a data source, such as a database, and displays it in a specified format. The process to generate a report often includes performing calculations on the data, such as summarizing, classifying, etc., before displaying, or can display the calculations on the report.

There are two types of computer-generated reports, pre-programmed and ad-hoc or customized reports.

- Pre-programmed or canned reports are pre-defined reports where criteria and specifications are hard coded in the system. A canned report may allow limited parameters, (month/year, for example), but in general the information that will be displayed is pre-determined.
- Ad-hoc or customized reports allow the user to drill down and customize what information is displayed on the report based on some allowed criteria, such as account codes, dollar amounts minimum, etc).

In contrast, a **manual report** is one that is created outside the system using data exports or is created ad hoc by a user. An example of a manual report is one that is created by copying data from a data source and pasting the data in an Excel spreadsheet or Word document or Powerpoint presentation where it is then processed further. With manual reports, each time a report is created, the data could be incorrect due to user error, such as not copying all relevant data, or processing errors. Therefore, these types of reports should be understood and tested similar to manual controls.

**Electronic Approvals:** Electronic approvals, electronic signatures and digital signatures are technically different, although often these terms are used interchangeably by entities.

## State of Washington

Auditors should have determined whether the electronic approval is an automated control as part of the overall understanding of controls. For automated control purposes, an electronic approval is a software system functionality that:

- Permits a user to approve transaction(s) within the software system
- The system automatically documents, or logs, the data approved by the user and any subsequent manipulation
- The acceptance or rejection of the transaction by the approver will trigger an additional software system process, such as posting of a transaction.

E-mail, scanned-in pictures of signatures, or font-changed signatures, etc. may be part of a control activity but are generally not considered an automated control and are not covered by this testing strategy.

### Electronic Signature vs Digital Signature

An “**electronic signature**” can look like a handwritten signature that has been scanned and then pasted into an electronic document. The reliability of this type of approval is variable. Recommend gaining an understanding of the process used to store and affix the signature to the document and then discuss the process with Team IT Audit before placing reliance on this control.

A “**digital signature**” is a legal signature with a formal certification process that documents who approved the document and ensures the document is not modified after certification. Reliability of this process is very high but has significant technical features. Recommend brainstorm with Team IT Audit before placing reliance on this control.

### **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

**Statements on Auditing Standards [AU-C 315](#) Understanding the Entity and Its Environment and Assessing the Risks of Material Misstatement** - paragraphs .A106-.A109 describe general and application controls and how they relate to audit risks

**Statements on Auditing Standards [AU-C 330](#) Performaing Audit Procedures in Response to Assessed Risks and Evaluating the Audit Evidence Obtained** - paragraphs .10b and .A33-.A34 describe requirements and guidance for testing indirect controls in conjunction with tests of controls, that is, testing key general controls in conjunction with a test of a key automated control

Record of Work Done.:
-----------------------

**Key Control #2 - (Automated) - Valuation/Occurrence/Completeness** - Once the payment has been applied to the taxpayer’s account, ATLAS will automatically create a journal voucher to record the funds to the appropriate revenue source. Batches are created and transmitted to AFRS in the evening. Revenue Accounting releases and reviews the batch in AFRS the following day to ensure amounts applied are accurate, complete and assigned to the proper revenue source.

# State of Washington

## **STEP 1: Understand Automated Key Control**

The understanding for this system is documented above in the "Controls - ATLAS" step.

## **STEP 2: Confirm and Test Automated Key Control:**

We met with Ayano Faasumalie, Revenue & Financial Reporting Coordinator in Business & Financial Services, on April 16, 2024 via teams to walkthrough the daily JV creation in ATLAS.

We requested Ayano provide the taxpayer account information for North Spokane Women's Health. We noted North Spokane Women's Health filed a monthly tax return for the period of February 2024 on March 25, 2024. Total tax due of \$4,277.37 was made up of the following:

- B&O - \$4,277.37

We performed a recalculation of this account as part of testing at [Tax Revenue Testing] and confirmed rates were applied accurately. We reviewed the history tab for the account within ATLAS and noted the return payment was received on 3/27/2024. The following day, 3/28/2024, the daily JV created by ATLAS was prepared and released. JV #140E1015 with a batch total amount of \$400,473,619.71 was automatically recorded from ATLAS to AFRS. Revenue Accounting reviewed and released the batch on 3/28/2024. ***No issues noted.***

## **STEP 3: Understand General IT Controls**

We gained an understanding of general IT controls as part of the Taxes Receivable (Net of Allowance) section: [Key Control #2 (Automated)].

## **STEP 4: Confirm Key General IT Controls**

We confirmed general IT controls as part of the Taxes Receivable (Net of Allowance) section: [Key Control #2 (Automated)].

## **STEP 5: Test Key General IT Controls**

Not applicable - we are not planning to rely on automated controls and therefore do not need to test general controls; control risk will be assessed at MAX.

## **D.2.PRG - Retail Sales and Use and B&O Taxes**

*Procedure Step:* Key Control # 3 (Manual)

*Prepared By:* BFW, 9/19/2024

*Reviewed By:* RKM, 9/25/2024

## State of Washington

Purpose/Conclusion:

**Purpose:**

To confirm the year-end JV to record June 2024 returns received after June 30, 2024 as a receivable and accrued revenue for FYE, noted in Key Control 3 for ATLAS, in order to assess control risk.

**Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

## State of Washington

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency.*

***All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.***

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all*

## State of Washington

*control testing.*

*D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

**Key Control #3 - (Manual) - Valuation/Occurrence/Completeness** - The ATLAS "gross receipts" report, which is programmed to pull all gross receipts for the period July 1-August 15, is downloaded to Excel and compared to the gross receipts from the prior five years to ensure completeness. Revenue Accounting will prepare a JV to enter into AFRS to show the June returns received after June 30<sup>th</sup> as a receivable and accrued revenue for the FYE.

The understanding for this system is documented above in the "Controls - ATLAS" step.

### **1. Confirmation of Key Manual Control:**

We obtained the Gross Receipts 2024 Worksheets from Jerry, which included the gross receipts year-end accrual JV, see [[YE Accrual JV](#)], the gross receipts ATLAS report for filing period 6/30/24, see [[Accrual JV Testing](#)] (tab: ATLAS Gross Receipts Adj. 2024), and the taxpayer assessed taxes report, see [[Accrual JV Testing](#)] (tab: taxpayer assessed taxes) as well as detailed reports of gross receipts by taxpayer. We reviewed the gross receipts ATLAS report and noted that the amount for Sales tax (\$1,337,356,750.90), Use tax (\$64,085,813.64) and Business & Occupation (B&O) tax (\$560,782,602.91) tied to the taxpayer assessed taxes report. We reviewed the gross receipts year-end JV and tied the Sales, Use, and B&O tax amounts from the taxpayer assessed taxes report to the JV and ensured they occurred in the correct period. We noted that the JV was prepared by Andrew Arnold, Management Analyst, on 08/20/24 and approved by Melissa Russell, Accounting Manager, on 08/21/24. **No issues noted.**

**Noted Weaknesses are as follows:**

## State of Washington

- None.

### **2. Preliminary Control Risk Assessment**

Based on our understanding and anticipated audit strategy, we assessed preliminary control risk as follows:

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **3. Control Risk at LOW - Test of Key Manual Control:**

Not applicable - we are not planning to rely on controls and therefore do not need to test controls; control risk will be assessed at maximum.

### **D.2.PRG - Retail Sales and Use and B&O Taxes**

*Procedure Step:* Key Control # 4 (Manual)

*Prepared By:* BFW, 5/16/2024

*Reviewed By:* RKM, 8/5/2024

Purpose/Conclusion:

#### **Purpose:**

To confirm monthly reconciliation between ATLAS and AFRS noted in Key Control #4 for ATLAS in order to assess control risk.

#### **Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

# State of Washington

Record of Work Done:

## **Key Control #4 - Manual - Occurrence/Completeness for ATLAS**

At the end of each month, Revenue Accounting runs a monthly revenue activity report (MRA) from ATLAS and AFRS revenue report from Enterprise Reporting System. A reconciliation is then performed between ATLAS and AFRS to ensure the reported revenue and receivables amounts are accurate and complete.

The understanding for this system is documented above in the "Controls - ATLAS" step.

### **1. Confirmation of Key Manual Control:**

We met with Jerry Tilson, Revenue Accounting Manager, on April 10, 2024 via Teams to review the month-end reconciliation process performed between ATLAS and AFRS. We reviewed the February 2024 Monthly Revenue Activity spreadsheet. We noted the balances reported for the 1) Retail Sales tax \$1,111,963,612.59 2) Use tax \$75,835,876.76 and 3) Business and Occupation tax \$504,206,350.51 from each GL (Cash and Accrued Revenue) tabs from the ATLAS data and that the totals tied to the total under the "spreadsheet monthly activity" column on the "balance" tab. We also tied amounts included in the balance tab for the 1) Retail Sales tax 2) Use tax and 3) Business and Occupation tax directly to the WebI report without exception. There were no differences noted on the MRA spreadsheet between the ATLAS and AFRS data. ***No issues noted.***

### **Noted Weaknesses are as follows:**

- None

### **2. Preliminary Control Risk Assessment**

Based on our understanding and anticipated audit strategy, we assessed preliminary control risk as follows:

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **3. Control Risk at LOW - Test of Key Manual Control:**

Not applicable - we are not planning to rely on controls and therefore do not need to test controls; control risk will be assessed at maximum.

## **D.2.PRG - Retail Sales and Use and B&O Taxes**

*Procedure Step:* Risk Assessment

# State of Washington

*Prepared By:* BFW, 8/1/2024

*Reviewed By:* RKM, 8/5/2024

Purpose/Conclusion:

**Purpose / Conclusion:**

To assess inherent risk, control risk, and the risk of material misstatement in order to design an initial testing strategy for each assertion.

Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

**STEP 1: Inherent Risk (IR)**

Assess inherent risk for each relevant assertion. This assessment is based on understanding of the entity and the nature of the account balance or class of transactions.

*Inherent risk is the susceptibility of an assertion to material misstatement. It is our assessment of "total threat", which includes both "natural risk" and identified risk indicators, without any regard to any potential control activities. As inherent risk is fully independent of control risk, any understanding of controls cannot be used to increase/decrease the assessment of inherent risk. Consider the following factors as your basis for this assessment:*

- *General Considerations*
  - *Does the balance include transactions that are difficult to audit or involve complex accounting issues?*
  - *Were there significant misstatements identified in previous audits or prior-period adjustments in the account balance or transaction class? If so, analyzing the cause of prior period misstatements will help in analyzing inherent risk.*
  - *Are there any inherent risk factors at the entity or industry level, such as changes in regulation or accounting rules, unique transactions or accounting practices, use of information technology, etc that affect the balance?*
- *Inherent Risk due to Error*
  - *How large are the transactions making up the balance? If the balance has only a few large transactions, even a single error may mean a significant misstatement.*
  - *Have there been changes in the transactions making up the balance that may increase risk? For example, significantly different composition, nature or volume of transactions may inherently disrupt established controls.*
  - *Are financial events originated or identified by accounting personnel or non-accounting personnel? This consideration is mainly for the completeness assertion.*

## State of Washington

- *Does the process to account for transactions involve judgment or estimation, complex calculations, numerous steps or significant manual steps?*
- *Do transactions have widely varying attributes that need to be manually identified? For example, grant loans that are accounted for in one of several ways depending on the terms of the agreement.*
- *Inherent Risk due to Fraudulent Reporting (intentional misstatements)*
  - *Are there substantial pressures or motivations to misstate the balance?*
- *Inherent Risk due to Misappropriation*
  - *Is the account balance or transaction class susceptible to sizable misappropriation?*
- *Inherent Risk due to Non-Compliance*
  - *Are there any laws, contracts or grant agreements affecting the balance? If so, would non-compliance lead to sizable misstatements?*
  - *Are compliance requirements complex, hard to understand, subject to judgment or otherwise difficult to comply with?*
  - *Are there any motivations or pressures to not comply?*

### **STEP 2: Control Risk (CR)**

Assess control risk by system and assertion. This assessment should be based on the results of the control understanding, confirmation, and (if setting control risk to LOW) testing. If applicable, auditors will evaluate any control deficiencies and determine whether those deficiencies, individually or in combination, are significant deficiencies or material weaknesses.

*Control risk is the risk that material misstatements would not be prevented or detected timely by the system of internal control. Control risk could be thought of as the "vulnerability" of an entity to misstatements. Control risk exists independently of the inherent risk (the level of vulnerability exists independent of the level of threat).*

*Control risk is MAX in both of the following situations: (1) controls aren't tested or (2) controls are problematic and cannot be relied upon. In order to set control risk to LOW, the auditor must test that controls operated effectively throughout the period.*

*A material weakness exists when the design or operation of controls results in a reasonable possibility a material misstatement will not be prevented or detected and corrected in a timely manner. A significant deficiency is less severe than a material weakness, yet important enough to merit the attention of the governing body. **All potential material weaknesses and significant deficiencies should be discussed with the AIC, since they must be reported as findings.***

### **STEP 3: Risk of Material Misstatement (RMM)**

Assess the risk of material misstatement for each relevant assertion for each significant line item. The risk of material misstatement (RMM) is a combination of the auditor's separate assessment of inherent and control risk.

## State of Washington

*In practice, the RMM is the amount of substantive evidence that's needed, and the only way to reduce the amount of needed substantive evidence (equal to the inherent risk) is to test controls. As such, when control risk is MAX, the RMM must always equal the inherent risk (IR).*

*When controls are tested & can be relied upon (are determined to be effective) it is a matter of professional judgment how much the RMM should be set lower than inherent risk (1 or 2 steps).*

*Auditors should assess RMM by assertion, if different. For example, if RMM is assessed at MOD for the existence assertion, but LOW for the rights & obligations assertion, then document "MOD – existence and LOW – rights & obligations".*

### **STEP 4: Design Substantive Testing**

Design a substantive testing strategy that addresses the relevant assertion (identified risk) in the portion of the line item that relates to that risk.

*Planning identifies where to audit (significant balances, classes of transactions & disclosures) what to audit for (relevant assertions), and how much to audit (RMM). The quantity and quality of evidence obtained by substantive tests needs to match the level of risk. The higher the risk of material misstatement, the greater evidence needed. "Greater evidence" could either be greater quantity of evidence, greater quality of evidence, or some combination of greater quality and quantity.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6210](#) – Planning Financial Statement Audits**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits](#) Planning Guide**

Record of Work Done:

### **(1) Inherent Risk (IR):**

Based on our understanding of the line item, we assessed inherent risk as follows for each relevant assertion and significant class of transactions:

- **Occurrence - Moderate**
- **Completeness - Moderate**
- **Valuation - Moderate**

# State of Washington

## **(2) Control Risk (CR):**

We assessed control risk as follows for each system and relevant assertion:

- **Automated Tax and Licensing Administration System (ATLAS) - MAX - Occurrence, Completeness, Valuation**

We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

## **(3) Risk of Material Misstatement (RMM):**

We considered both inherent and control risk and assessed the risk of material misstatement as follows for each relevant assertion and significant class of transactions:

- **Occurrence - Moderate**
- **Completeness - Moderate**
- **Valuation - Moderate**

## **(4) Testing Strategy:**

We designed our substantive testing strategy based on our assessment of the risk of material misstatement.

- **Occurrence/Completeness/Valuation** - We will perform analytical procedures and follow up on any significant variances.
- **Occurrence/Completeness** - We will select a sample of registered taxpayers, review ATLAS for a filed return, and tie return to AFRS to ensure revenue occurred in the current year and is complete.
- **Occurrence/Completeness** - We will select a sample of sales, use, and business and occupation accrual transactions from the gross receipts accrual JV and verify that the transactions were recorded for the correct period.
- **Valuation** - We will recalculate taxes paid for the same sample of taxpayers noted above to ensure taxes are recorded at proper values

We anticipate that these tests will provide sufficient appropriate audit evidence to address the assessed risk of material misstatement for relevant assertions in significant classes of transactions.

## **D.2.PRG - Retail Sales and Use and B&O Taxes**

*Procedure Step:* Substantive Test

# State of Washington

*Prepared By:* BFW, 10/15/2024

*Reviewed By:* SHW, 2/12/2025

## Purpose/Conclusion:

### **Purpose:**

To determine whether reported revenues represent actual amounts relating to the period.

To determine whether all revenues relating to the period were reported.

To determine whether revenues were reported at properly valued or calculated amounts.

### **Conclusion:**

We determined reported revenues represent actual amounts relating to the period, all revenues relating to the period were reported, and revenues were reported at properly valued or calculated amounts. ***No issues noted.***

## Testing Strategy:

The following is a list of **considerations** for testing the occurrence assertion for revenues. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

- Confirm intergovernmental revenues with the other government or grantor or by reviewing appropriate correspondence.

*Note: intergovernmental revenues received from the State Treasurer should be addressed as part of the State Treasurer Distributions baseline test.*

- If revenue is receipted into a specific clearing account, or if third-party lockbox or receipting services are used, compare recorded revenue to a sum of monthly totals from bank, lockbox or service organization reports.
- Trace selected or sampled revenues from the GL to supporting billings or subsequent receipts.
- Develop sufficiently precise expectations for a substantive analytical to compare to reported revenue amounts.
- Search for manual journal entries that credit (increase) revenues. Consider testing if any risk indicators are noted.

### **Cut-Off / Revenue Recognition**

- Test transactions recorded in the current period to verify the revenue occurred during the period.

*Transactions recorded at the beginning and end of the current period would generally be considered at highest risk of being improperly recorded in the current period. Consider scanning and selecting transactions if high risk transactions can be identified by description or*

# State of Washington

*date fields.*

- If revenue is billed at a constant rate, calculate an expectation based on the average monthly billing or re-calculate the year-end accrual journal entry and compare to the reported receivable.
- Evaluate revenue recognition against GAAP criteria for selected transactions or revenue streams.

## **Interfund Revenues**

For internal service fund charges, see testing strategies for internal service funds in the Accountability folder. For other types of internal charges, see testing strategies for Internal Activities.

## **Detail Roll-up**

- Compare year-end totals from general ledger to subsidiary software modules for selected revenues.
- Review the government's reconciliation of general ledger to subsidiary ledgers.

*Detail roll-up testing is not sufficient audit evidence by itself since it only entails comparing different sets of the entity's own accounting records. However, it may be combined with other substantive tests to address identified risks. For example, if substantive testing is performed at the subledger level, it may be combined with a test that the subledger detail accurately rolls up to the general ledger or financial statements.*

The following is a list of **considerations** for testing the completeness assertion for revenues. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

- Identify expected revenue streams based on understanding of fund activities and scan to see if revenue is reported for all such streams. Follow up on any unexpectedly missing streams.
- Identify new revenues (ex: new grants or programs) and follow up to verify that expected revenues have been reported.
- Confirm intergovernmental revenues with the other government or grantor or by reviewing appropriate correspondence.

*Note: intergovernmental revenues received from the State Treasurer should be addressed as part of the State Treasurer Distributions baseline test.*

- If revenue is receipted into a specific clearing account, or if third-party lockbox or receipting services are used, compare recorded revenue to a sum of monthly totals from bank, lockbox or service organization reports.
- Trace selected or sampled revenues from source documents to accounting records.

*Source documents may consist of billing, fine, or fee records. Or it may consist of service records that imply a billing, such as license or permit issuance.*

## State of Washington

- Perform a multi-year trend of revenues and follow up on unexpected decreases.
- Search for manual journal entries that debit (decrease) revenues. Consider testing if any risk indicators are noted.

### Cut-Off

- Test transactions recorded in the next period to determine whether the revenue should have been recorded in the current period.

*Transactions recorded at the beginning of the next period would generally be considered at highest risk of being improperly shifted to that future period. Consider scanning and selecting transactions if high risk transactions can be identified by description or date fields. If the population is large, consider stratifying to either scan and select or test 100% of all large value transactions combined with a lower assurance sample for small dollar transactions.*

### Detail Roll-up

- Compare year-end totals from general ledger to subsidiary software modules for selected revenues.
- Review the government's reconciliation of general ledger to subsidiary ledgers.

*Detail roll-up testing is not sufficient audit evidence by itself since it only entails comparing different sets of the entity's own accounting records. However, it may be combined with other substantive tests to address identified risks. For example, if substantive testing is performed at the subledger level, it may be combined with a test that the subledger detail accurately rolls up to the general ledger or financial statements.*

The following is a list of **considerations** for testing the valuation assertion for revenues. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

### Calculation

- Recalculate billed revenues on a check (one of each variation), CAATS or sample basis.
- For large populations of standard billings, perform CAATS tests to identify unexpected or outlier transactions for further review.
- Review related-party transactions to determine whether revenue transactions were correctly calculated.

### Realizable Value

- Re-calculate a sample or selection of billings. If billings are calculated by software, the auditor could test and substantiate the automated control and also consider any risks associated with manual inputs used by software.
- Evaluate the entity's calculation of the allowance amount for reasonableness. This evaluation should include comparing the entity's estimate to the entity's actual historical experience of collecting or writing-off receivables.
- Trace the amount of bad debt approved by the governing body (per minutes) to reductions of receivables and bad debt expense to verify it was properly accounted for. *Note: approvals may be slightly more, as customers may pay after the bad debt has been approved but before it is written off.*

# State of Washington

## Estimation / Recognition

- Review calculation and support for assumptions of any estimated revenues.
- Accounting research to verify that revenues were reported in conformity with revenue recognition policies reported in the financial statement notes.

**Property Tax Revenues** - see separate step

Guidance/Criteria:

### **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

### **BARS [3.6.9](#) Revenue Accruals in Governmental Funds**

**BARS [3.6.13](#) Utility Tax (*applies only to cities*)** - should be accounted for as a revenue in the general fund (3164000) and expenditure in the utility fund (53P0040), if the utility passes the tax on to its customers then the additional charges should be recognized as revenue (343P000) directly in the utility fund not in the general fund

### **BARS [3.6.11](#) Suspense Funds**

Record of Work Done:

### **Retail Sales and Use and B&O Taxes Testing Coverage**

#### **Analytical Procedures**

We compared reported retail sales and use tax and B&O tax revenues against forecasted amounts to determine if amounts were within our expectations [[Tax Revenue Analytical](#)]. Based on historical experience, we expect the ERFC's June forecast to be within 3% of reported revenue for Sales tax and B&O tax.

Forecasted amounts were developed by the [Economic and Revenue Forecast Council \(ERFC\)](#), published on their public website, and used in the state's budget and operating processes. We determined that the forecast was sufficiently reliable to use as an expectation for our audit purposes. In making this determination, we noted the following about the competence, capabilities, and objectivity of ERFC staff and the objectives, intended use and methodology of ERFC forecasts:

## State of Washington

- ERFC is organized as a separate administrative board (S104) and is governed by both legislative and executive members and the State Treasurer. ERFC is organized and governed to be free from undue pressures or bias to ensure reliability of forecasts.
- The ERFC executive director is a Ph.D. in economics and staff consist of a group of economists. ERFC data and methodology is published on their website for transparency. ERFC is staffed to have the competence and capabilities to ensure production of consistently reliable forecasts.
- Four times a year the organization adopts a bipartisan revenue forecast that is then used to build the state operating budget. ERFC has demonstrated its reliability over time for this purpose. In prior state ACFR audits, we have found ERFC forecasts to be an accurate prediction of retail Sales, Use and B&O tax revenues.

We obtained the June quarterly revenue forecasts from the ERFC for FY 2024 and found that reported revenue was within 0.4% for both Sales and B&O taxes, which met our expectations. ***No issues noted.***

In addition to our analytical procedures, we also tested a sample of tax returns to obtain further evidence. Results of analytical procedures did not identify any needed adjustments or expansion to our sample or any further audit procedures.

### **Population**

To ensure testing provided a sufficient amount of coverage of the retail sales and use and B&O Taxes balance, we obtained our population for selection and broke out the taxes by fund and sources to ensure amounts we tested represented the whole balance. We obtained a query from ATLAS from Ayano Faasumalie, Revenue & Financial Reporting Coordinator, that included all payments applied to taxpayer accounts for excise taxes for the Fiscal year 2024, excluding those for local taxes. We tied the totals directly to the monthly revenue activity (MRA) spreadsheet prepared by Revenue Accounting at DOR and provided by Jerry Tilson, Revenue Accounting Supervisor. We used the MRA spreadsheet to break out each tax type by fund and source and tied amounts to the ACFR line item lead sheet [[Line Item Lead Sheet](#)]. See our reconciliation as part of testing at [[Tax Revenue Testing](#)], in tab 'Testing Summary.' Amounts tied without exception. We considered the population complete and provided coverage over the whole ACFR balance. ***No issues noted.***

Using the revenue query ran from ATLAS noted above, we haphazardly selected a sample of 30 transactions (payments made to a taxpayer account for a single filing period) and used the same sample to ensure amounts reported in AFRS occurred in the current year, are complete, and accurately valued. See more details for each assertion below.

### **Substantive tests performed to meet the Occurrence assertion:**

To ensure reported revenues represent actual amounts relating to the period, we performed the following substantive tests:

- Ensured return was filed for taxpayer
- Ensured tax revenue was recorded to batch processed in ATLAS for the correct period
- Ensured batch total processed in ATLAS ties to batch total recorded in AFRS

## State of Washington

For each selection, we reviewed the revenue tab within the taxpayer's account and history sub tab to identify the tax return for the correct filing period. Within ATLAS, a hyper link for the ATLAS receivable accumulation that the transaction was included could be followed from there. We traced each taxpayer account to the ATLAS accumulation and matched the batch total in ATLAS to the year end entry to AFRS using additional hyperlinks. Based on the tax type, we ensured the revenue was included in the correct balance. ***No issues noted.*** See testing performed at [[Tax Revenue Testing](#)] in the "Tax Revenue Testing" tab.

We also performed testing over the fiscal year end gross receipts accrual JV. See: [[Accrual JV Testing](#)]. No issues were noted during testing. We used the gross receipts detail report of taxpayer accounts to test the following:

- Did reported revenues actually occur during the fiscal year?

We selected a sample of 30 gross receipt transactions to ensure amounts reported in the current year were for revenues collected for the current year. We obtained tax returns and payment history tabs from ATLAS to ensure amounts were paid for taxes due in the current year. All taxpayers had a filing period of 6/30/2024. We determined all reported revenues occurred during the fiscal year. ***No issues noted.***

### **Substantive tests performed to meet the Completeness assertion:**

To determine whether all revenues relating to the period were reported, we performed the following substantive tests:

- Ensured return was filed for taxpayer
- Ensured tax revenue was recorded to batch processed in ATLAS for the correct period
- Ensured batch total processed in ATLAS ties to batch total recorded in AFRS

For each selection, we reviewed the revenue tab within the taxpayer's account and history sub tab to identify the tax return for the correct filing period. Within ATLAS, a hyper link for the ATLAS receivable accumulation that the transaction was included could be followed from there. We traced each taxpayer account to the ATLAS accumulation and matched the batch total in ATLAS to the year end entry to AFRS using additional hyperlinks. Based on the tax type, we ensured the revenue was included in the correct balance. ***No issues noted.*** See testing performed at [[Tax Revenue Testing](#)] in the "Tax Revenue Testing" tab.

We also performed testing over the fiscal year end gross receipts accrual JV. We reconciled the taxpayer accounts in gross receipts detail reports and the gross receipts revenue allocation work sheets, which allocates the funds held in the suspense account 01-99-020000 to the general fund revenue sources, to the year end accrual JVs for sales, use and business & occupation tax. See reconciliation of gross receipts detail report and the accrual JV as part of the testing at [[Accrual JV Testing](#)] in the "JV Accrual Summary" tab.

Amounts tied without exception and we determined the gross receipts recorded for sales, use and B&O taxes from the accrual JVs were complete. We used the gross receipts detail report of taxpayer accounts to test the following:

- Accrual recorded ties to tax return in ATLAS
- Accrual was recorded in the proper period

## State of Washington

We selected a sample of 30 random taxpayers to ensure amounts reported in the accrual JV were complete based on tax returns due. We tied all selected accrual transactions to tax returns without exception and noted payments were made in July and August for 2024 taxes due. We determined the accrual JV transactions were complete. ***No issues noted.***

### **Substantive tests performed to meet the Valuation assertion:**

To determine whether tax revenues were reported at properly valued or calculated amounts, we performed the following substantive tests:

- Recalculated retail sales, use, and B&O taxes for the selected taxpayer

During review of controls, we noted ATLAS automatically applies tax rates for retail sales, use, and B&O taxes and automatically calculates taxes due. To test the IT control, we re-performed calculations for a sample of 30 taxpayers as documented at [Tax Revenue Testing] in the "IT Control Testing - Valuation." We noted that all taxes recalculated tied to the taxes owed and paid in ATLAS and determined that revenues were reported at properly valued and calculated amounts. ***No issues noted.***

### **D.3.PRG - Deferred Inflows of Resources**

***Procedure Step:*** Summary & Conclusion

***Prepared By:*** BFW, 10/8/2024

***Reviewed By:*** RKM, 11/21/2024

Purpose/Conclusion:

#### **Purpose:**

To evaluate risk assessments and the sufficiency and appropriateness of evidence obtained based on results of substantive work.

#### **Conclusion:**

We determined that **no** modifications were necessary to inherent risk, control risk, or the risk of material misstatement as assessed in planning.

We also determined that evidence obtained was sufficient and appropriate in response to the risk of material misstatement.

Testing Strategy:

# State of Washington

Auditors are **required** to evaluate conclusions for substantive testing as follows:

*Auditors may wish to use the optional Lead Sheet available in the Store to summarize testing related to each balance and assertion.*

**1.** Determine whether the results of substantive testing indicate a need to modify the inherent risk assessment (IR), control risk assessment (CR), risk of material misstatement (RMM) or other aspects of planning (such as material balances or assertions). If so, document changes and consider the need for additional testing.

*If the results of substantive testing indicate a need to change control risk, auditors should also update the **Permanent File** by either correcting the documentation or by adding an update section describing changes to the top of the record of work done. For all changes to IR, CR, or RMM the **Material Balances** spreadsheet should be updated.*

*More significant changes to other aspects of planning (such as material balances or assertions) should be referenced in this step and documented in detail in the **Changes to FS Audit Plan** step.*

**2.** Evaluate whether the quality and quantity of evidence obtained is sufficient and appropriate in response to the risk of material misstatement. In making this determination, auditors should evaluate:

Information to be used as audit evidence:

- Does evidence relate to the population, period of time and risk (assertion and “what could go wrong” from the Material Balance Spreadsheet)? If there are any gaps or uncertainties in the logical connection between the evidence and conclusions, is there a documented consideration and explanation?
- Are the sources of information sufficiently reliable and appropriate for the risk (whether internal to the government, external, or auditor developed)? If key information is not from a sufficiently reliable source (for example, inquiry), then is it corroborated by information that is?
- Are there any concerns about accuracy, completeness, authenticity, or bias in information? If so, did the auditor perform sufficient procedures to confirm reliability of that information?
- Is information precise enough to catch if misstatements exceeded the tolerable level?
- Is information detailed enough to conclude on whether or not there were misstatements?
- Was there any information that appeared contradictory or inconsistent? If so, was there a documented response to the inconsistencies or doubts about the reliability of evidence?

Results:

- How much misstatement was identified by testing, and the likelihood and magnitude of further potential misstatement?
- How did misstatements occur and how often might they occur again in the population?

## State of Washington

- Were misstatements caused by control deficiencies or circumvention of controls?
  - If control deficiencies, is there a need to re-evaluate our understanding of controls in the [Permanent File](#) folder or assessment of control risk?
  - If circumvention, the [Management Override of Controls](#) step should address or reference this area. Auditors should also consider whether a fraud risk has been identified.
  - Did tests identify a different level or type of risk than the planned audit response was designed to address?
  - If likely misstatements are identified, are further procedures necessary to improve the precision of our estimate?

*To support the overall evaluation of audit risk and provide a basis for concluding on the overall sufficiency and appropriateness of evidence in the [FS Summary & Report](#) step, auditors should conclude in each area whether the auditor continues to believe that the tests performed and quality and quantity of evidence obtained are commensurate with RMM for all relevant risks (the "what could go wrong", in the [Material Balances](#) spreadsheet).*

If the auditor determines that evidence is not sufficient or appropriate, additional substantive testing should be done. If sufficient, appropriate evidence is not available for audit, the AIC should discuss the effect on our audit report with the AAM and AM.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6310](#) – Determining the Nature, Timing and Extent of Substantive Testing**

**SAO Audit Policy [3210](#) – Audit Evidence**

Record of Work Done:

Based on test results, we re-evaluated risk assessments, procedures, evidence obtained and conclusions as follows:

### **(1) Do the results of substantive tests indicate a need to modify our risk assessment (IR, CR and RMM)?**

The results of substantive tests do not indicate a need to modify our risk assessment.

### **(2) Was the quality and quantity of evidence obtained sufficient and appropriate?**

The quality and quantity of evidence obtained was sufficient and appropriate.

# State of Washington

## D.3.PRG - Deferred Inflows of Resources

*Procedure Step:* Understanding of Line Item

*Prepared By:* BFW, 5/22/2024

*Reviewed By:* CJG, 11/25/2024

Purpose/Conclusion:

### **Purpose / Conclusion:**

To gain an understanding of the line item and confirm the scope of testing as documented in the Significant Account Matrix.

Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

### **STEP 1: Prior Audit Exceptions**

Document any exceptions noted during the prior audit. Follow-up to determine how the agency has responded to or corrected the issue, unless this work is anticipated as part of the testing strategy.

### **STEP 2: Analyze Composition and Changes of Line Item**

- Include link to the line item leadsheet. This will be completed at the end of the audit. Leadsheet analysis should be documented in this spreadsheet.
- Inquire with agency staff about the activities and transactions that make up the balance and any changes to those activities or transactions in relation to the prior year.
- Determine relevant classes of transactions or account balances within the line item to analyze (such as agencies, funds, programs, departments, accounts, and/or objects), and use AFRS to create trends of those elements. This step should not include any specific dollar amounts associated with the line item.
- Evaluate trends to identify:

(1) What classes of transactions or account balances are primary to the identified risk. Auditors should specifically consider what elements are primary to the line item (comprising a large percentage of the line item), and which elements the identified risk would apply to, and

## State of Washington

which elements might be most susceptible to the identified risk (having a high risk of non-trivial misstatement for a relevant assertion, considering likelihood and impact of potential for misstatement).

(2) What changes are primary to the identified risk, if applicable. Auditors should specifically consider whether the overall change to the line item from the prior year was significant, what elements were the primary drivers of overall change, whether any elements changed significantly from the prior year, and which changes (if any) might relate to the identified risk.

(3) Any unusual or unexpected elements, amounts, or changes that may indicate a risk, whether the one identified in planning or a new one that may need to be considered for a change to the plan.

**Consider** other procedures to gain an understanding of the line item, such as review of key policy documents, review of program information or reports, inquiry of staff, budget information, or other analytical procedures.

### STEP 3: Update Significant Account Matrix

Based on your understanding of the line item, update the Significant Account Matrix with final conclusions on the agencies covered, account description, significant accounting systems, and risk (what could go wrong and relevant assertions). The account description should reflect the significant transaction streams or account balances relevant to the risk.

*The description of agencies, significant accounting systems, and what could go wrong in the Significant Account Matrix constitute the overall scope of substantive testing.*

*A transaction stream is significant based on the potential for misstatement. This is often due in part to its size (ie: comprising a large percentage of the total line item), but is ultimately a judgment about the susceptibility to the identified risk (for example, when the risk is understatement a small or omitted account may hold the most potential for the largest misstatement).*

*Significant accounting system(s) are those that contain key controls over significant classes of transactions included in the line item. Control systems identified in this step must match the Significant Account Matrix and have a separate control understanding documented.*

*Talk with the AIC if you identify any changes to the Significant Account Matrix.*

Guidance/Criteria.:

Record of Work Done.:

#### **(1) Prior Audit Exceptions:**

There was a verbal recommendation in the prior year for DOR to record a review by DOR staff of each County's acceptance for the calculated Levy balance. During our understanding of contorts, we noted this was remedied by DOR documenting who from each County accepted and when this occurred.

#### **(2) Composition & Change Analysis:**

Line Item Leadsheet: [[Line Item Lead Sheet](#)].

# State of Washington

Deferred Inflows of Resources arise when a potential revenue does not meet both the "measurable" and the "available" criteria for revenue recognition in the current period. "Available" meaning the financial resources would be collectible within the current period or within 60 days. The Deferred Inflows balance is primarily from property taxes which make up approximately 67% of the line item, with the next largest amount composed of other taxes (33%) that will not be collected within 12 months.

## **Property Tax**

Property taxes are levied in December for the following calendar year. The first half-year collections are due by April 30 and the second half-year collections are due by October 31. Since the state is on a fiscal year ending June 30, the first half-year collections are recognized as revenue if collectible within 60 days of the fiscal year end. The second half-year collections are recognized as receivables offset by deferred inflows. The lien date on property taxes is January 1 of the tax levy year.

The legislature sets the rates of property tax amounts and DOR is responsible for calculating the amounts, but not setting them. DOR calculates the total amount due by all 39 counties by taking last year's levy amount and adding the mandatory increases. These include a base 1% or inflation (whichever is less), new construction value increases and any remaining balances.

## **Other Taxes**

We discussed the composition of the remaining balance with Ayano Faasumalie, DOR Revenue & Financial Reporting Coordinator, which is other taxes. She explained the unavailable reported under other taxes are based on receivable tax types from ATLAS. This includes: Return Receivables, Estimated Returns, Audit Receivables, and Lien Receivables. Based on collection rates identified by Revenue Accounting, DOR determines how much of the receivables will be collected within a year and the remainder would be recorded as unavailable for the current year. We gained an understanding of controls over receivables and collectible/uncollectible rates at [\[Controls - ATLAS\]](#).

We reviewed internal audit risk assessment documents for any significant changes in the processes and composition of the balance and noted no changes. We inquired with Jerry Tilson, Revenue and Accounting Manager, of any other changes he identified. He explained that the balance had no significant changes. **No significant changes or risks identified.**

## **(3) Updates to Significant Account Matrix:**

We identified no changes that need to be made to the Significant Account Matrix.

## **D.3.PRG - Deferred Inflows of Resources**

*Procedure Step:* Controls - PTRS

*Prepared By:* BFW, 5/22/2024

# State of Washington

*Reviewed By:* CJG, 11/25/2024

Purpose/Conclusion:

**Purpose:**

To gain an understanding of internal controls.

**Conclusion:**

We gained an understanding of internal controls as documented in the record of work done.

Testing Strategy:

**The following procedures are required for all significant systems:**

1. List the financial statement balance(s) and relevant assertion(s) addressed by the understanding.
2. Gain an understanding of the internal control process, identify how transactions are recorded in AFRS, identify key controls over relevant assertion(s), and note any control weaknesses.
  - In gaining an understanding of controls, consider the overall understanding of State-Level control elements as documented in the "State-Level Controls" step as they relate to this particular system.
  - Identify controls systems covering all relevant assertions for all significant classes of transactions.
  - Standards require the auditor to gain an understanding of the significant accounting system(s) that contain key controls over significant classes of transactions included in the line item.
  - Control systems identified in this step must match the Material Account Matrix and have a separate control understanding documented.
  - Talk with the ACFR Specialist or AIC if you identify different systems than the ones anticipated in the Material Account Matrix.

For each material system, auditors must document:

- A brief outline of the transaction flow from beginning to end.
- An expanded description of key controls.
- Business processes relevant to financial reporting of the relevant assertion for the material balance. Processes should encompass automated and manual procedures by which transactions or events are identified or initiated, authorized as needed, recorded, processed and corrected as needed.
- Original accounting records and how records are rolled-up to intermediary ledgers and transferred to the general ledger (AFRS) or financial statements.

## State of Washington

- Detailed descriptions of key controls. Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

The following is information to **consider** when identifying key controls and transaction flow.

“Key controls” refer to the few controls that together provide reasonable assurance that material misstatements will be prevented or detected and corrected. This is contrasted with ancillary or supporting controls, which – although helpful and recommended – would provide less than reasonable assurance by themselves.

The focus of the write-up is on the key controls. Key controls should be specifically identified (as “key controls”) in the write-up. This can be done in whatever way the auditor prefers, so long as it is obvious. Details that the auditor should document regarding key controls may include:

- Who or what initiates the control
- When (or how often) is the control applied
- Who performs the control
- As needed, the experience, knowledge and attitude of the person applying the control
- Detailed description of the control process or activity. For example, if the control is a review: what exactly is reviewed, what is the reviewer looking at or for and what are the reviewer’s criteria?
- How the key control is documented or evidenced
- If not obvious from the description, how the control prevents or timely detects and corrects misstatements
- Any exceptions or alternative processing to the normal process
- What happens when misstatements or issues are identified by the control

The “transaction flow” refers to the process by which transactions are initiated, authorized, recorded, processed and reported (as applicable). Outlining the transaction flow gives context to key controls, especially how transactions become subject to controls in the first place. If a control inherently ensures that all applicable transactions are included (ex: bank reconciliation where the assertion is existence), the auditor may decide to just start the write-up with the initiation of the control procedure and go from there.

Elements of the transaction flow are defined informally as follows:

- *Initiation:* How are transactions initiated?
- *Authorization:* How are transactions and accounting record maintenance authorized?
- *Recording:* How are transactions or balances identified and recorded in financial accounting systems?

## State of Washington

- *Processing:* How are the transactions or balances processed after they are recorded (if at all)? Processing may be manual or automated and may occur at a subsidiary system level or at the general ledger level.
- *Reporting:* How are records translated into the financial statements? This part of the transaction flow extends the understanding to the actual financial statements that the audit is opining on. Since we already document an understanding of the financial reporting process in general, it is usually enough to simply reference this overall understanding. However, if there are important steps unique to the covered balances, it may be more appropriate to mention them here.

Although transaction flow is a good way to think about understanding and documenting a control system, auditors should not worry too much about documenting “each element, in order” because often elements may be combined, not noticeable, not applicable or occur in a different order.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits](#) Planning Guide**

Record of Work Done:

### **Significant Balance(s) and Assertions**

Internal controls in Property Tax Receivable System (PTRS) address the following balance(s):

- **Deferred Inflows of Resources** - General Fund

For the following assertions:

- **Classification** - Revenue may be recorded as earned when it is actually unearned (availability criteria is not met).

### **Gain an Understanding of Internal Controls**

We identified property tax as the majority of the deferred inflows of resources balance (67% of the prior year balance) and will be focusing our understanding of controls over this area. We met with Mark Studer, Tax Policy Specialist, Research and Fiscal Analysis (RFA), on May 15, 2024 to gain an understanding over property tax certified levy calculation.

# State of Washington

For fiscal years 2018 through 2021, the agency used rate based levy calculations to determine levy amounts for counties. This change was a direct result of the McCleary ruling which required the State of Washington to fund schools. In a rate based system, the rate is set and multiplied by the assessed values of property to result in the levy amount. In fiscal year 2022, the agency returned to the budget based system for both part 1 and part 2 state school levies and this remained the case for FY24. In the budget based system, the amount of levy collections is limited and set by the State and allocated to counties based on the market value of all taxable property in the county.

## **State Property Tax Levy Calculation:**

Mark explained that levies are increased on an annual basis but are limited by a few things. These increase limits include the following:

- The lesser of 1% or inflation
- The value of new construction multiplied by the prior year rate
- The value of state assessed properties (properties owned by utilities such as airline, railroad, and electric) multiplied by the prior year rate

Research and Fiscal Analysis (RFA) will use the prior year levy limit and add the above increases to result in the current year state levy limit. The new levy limit is the amount used and proportioned to counties.

In October/November, counties submit assessed value reports to DOR which the RFA division inputs in an excel sheet to use in their calculation of the levy rates for the current year. However, DOR does not use the unadjusted assessed values from the county, instead, the property tax division will perform a ratio analysis to identify ratios for each county's real and personal property. These ratios are used to adjust the assessed values to actual (market value) for both local and state assessed properties. RFA divides the current year state levy limit (described above) by the actual value for all counties to determine the new rate to be used for the calculation of levy amounts.

Each year, RFA will have to make adjustments to county levy amounts for changes identified in the prior year. Most of the changes stem from differences in assessed value from the time they are submitted to the time that the counties distribute the levies. These changes are included in the next year's calculation to reduce the amount of adjustments made throughout the year. All adjustments are the following:

- Fifth Preceding Year Adjustment - The remaining balance not collected from the fifth preceding year is rolled into the current levy amount. For example, 2019 is the fifth preceding year for fiscal year 2024; therefore, any amounts remaining in 2019 will be "rolled" over and counties will not be required to pay on the remaining balance for 2019 as it will have been rolled over/included in the total state levy amount to be collected for fiscal year 2024.
- Refund Levy Adjustment - When a taxpayer pays while in dispute with amounts owed and the court rules in their favor, amounts are refunded. DOR increases the next year's levy amount to ensure the total levy balance from the prior year is collected.
- Previous Year's Levy Adjustment - Due to changes in assessed value from the point they are submitted to DOR to the point the levies are distributed by the county (April-May). The counties will send an update of assessed values when the levies are distributed. DOR uses these updated assessed values to calculate adjustments for the next year.

RFA has several review processes to ensure calculations are accurate for the state levy. First, RFA creates an assessor review tab within the state

## State of Washington

levy calculation spreadsheet that includes the assessed values of all counties that were submitted. To ensure the amounts input and used for calculations are accurate, RFA asks the counties to verify the assessed values to their own records. Mark Studer, Tax Policy Specialist, prepares the entire state levy calculation spreadsheet. He explained that a secondary reviewer will ensure calculations are consistent with prior years and are allocated appropriately.

In December of each year, county assessors receive a letter from DOR regarding the state property tax levy amount due in the upcoming year for part 1 and part 2. The letter is automatically generated to include the calculations and adjustments noted above. Before the letters are sent, 2 separate members of the Property Tax Division select a random sample of letters to ensure amounts sent to the county agree to the calculations. The most important figure, the total state levy owed by the county, is bold and circled in red so the counties are aware of their allocated amount. The county will determine its own levy rate by dividing the state levy amount by their own assessed value of property. Since the assessed value is less than the market value used by DOR in their calculations of the levy rate, the county's levy rate will be slightly higher. Once the county agrees no changes need to be made, DOR records the review by each county in the "review" tab of the "State Levy Documents Received" spreadsheet and stores the email in a communal mailbox. The valuation control for Deferred Inflows of Resources consists of each county verifying the calculated amount of Levy due is consistent with previous years and county changes in valuation. When the county agrees to the total calculated, it is generally sent in an email and added to a communal inbox that can be reviewed by members of DOR. However, it is not a requirement that the acceptance be submitted in writing as some counties prefer to communicate over the phone. DOR keeps track of county acceptance in their "State Levy Documents Received" spreadsheet, noting who from each County confirmed and accepted and when this occurred.

### **Property Tax Collections:**

We met with Jerry Tilson, Revenue Accounting Manager, on May 22, 2024 to gain an understanding over Deferred Inflows reporting. The 39 counties, not DOR, are responsible for collecting property taxes; however, the tax revenue and cash received are recorded by DOR in AFRS. Per Andrew, DOR uses the Property Tax Receivable System, a web-based database, to track property tax collections by county. The web-based database is a more practical means for running summary reports rather than AFRS.

Counties remit taxes they collect to the Office of the State Treasurer (OST) using a cash journal (CJ). OST summarizes these individual CJ's into a JV and records the cash into AFRS. Using the county cash journal (CJ), the Revenue section of DOR's Business and Financial Services records the information into spreadsheets and the Property Tax Receivable System to track collections by county. Expected collections (the State Property Tax Levy of 2023 expected to be collected in 2024) are input into the Property Tax Receivable System (PTRS) by a Fiscal Analyst 2 and verified by Jerry Tilson, Revenue Accounting Manager. Using the OST JV, DOR's Revenue Accounting prepares a JV and records the revenues into AFRS by revenue source. A Cash Receipts Journal Summary is prepared for each county's total deposits and sent to the Office of the State Treasurer, this is done prior to any adjustments.

### **How transactions are recorded in AFRS (Year-end JV):**

At year end, a Property Tax Accounts Receivable summary report is run of the total Property Tax Receivable System as of June 30 (GL 1311). It is a running total of taxes due by county for the preceding five years 2017-2021. Estimated collections for July and August are provided by the

# State of Washington

Forecast Council and are included in the year-end adjusting entry. The forecasted amounts are based on the June forecast and total approximately 2% of the total receivables.

A year-end journal voucher for unavailable property tax revenue is prepared by a Fiscal Analyst 3 by subtracting the estimated collectible amounts for July-August (as received from the Forecast Council) from the year end property tax account receivable report. This Journal Voucher is reviewed by a fiscal analyst 5 to ensure deferred inflows of resources is properly calculated. The supervisor/manager reviews all the supporting documentation that was used by the fiscal analyst in preparing the JV to ensure the amount reported is accurate and classified correctly based on forecast information **(Key Control 1- Classification)**.

## **Monthly Reconciliations:**

A monthly reconciliation of AFRS to the web-based data base for property taxes is performed each month. An Exception Ending Balance report is used to track differences between the Accounts Receivable amount and the Ending Balances. The expectation is previous month's ending balance minus the current month's payments, plus or minus adjustments (typically corrections to sub source) is what is recorded. Any negative balance for an individual levy year does not reduce the amount of the receivable for the combined levy years. In addition, reconciliations are performed by Andrew each month of cash payments made per the PTRS and the monthly balance per AFRS. Monthly Journal Vouchers are received from OST documenting the transfer of monies remitted by the counties to DOR during the month. A spreadsheet is prepared to document and reconcile the cash receipts journal summary to OST's monthly JVs to ensure collections are classified appropriately **(Key Control 2 - Classification)**.

## **Key controls are as follows:**

- **Key Control 1 - Classification - The Fiscal Analyst 3 prepares the year end entry to record deferred inflows of resources using PTRS accounts receivable reports and Forecasts from the Forecast council. The Fiscal Analyst 5 reviews supporting documentation to ensure amounts are accurate and classified correctly based on forecast information.**
- **Key Control 2 - Classification - Jerry Tilson, Revenue Accounting Manager, reconciles Property Tax Receivable System (PTRS), AFRS, and OST JVs on a monthly basis to ensure collections are classified appropriately.**

## **Noted Weaknesses are as follows:**

- none

## **D.3.PRГ - Deferred Inflows of Resources**

*Procedure Step:* Key Control #1 (Manual)

*Prepared By:* BFW, 10/7/2024

# State of Washington

*Reviewed By:* CJG, 11/25/2024

Purpose/Conclusion:

**Purpose:**

To confirm the year end JV to record the unavailable tax revenue in order to assess control risk.

**Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

## State of Washington

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency.*

***All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.***

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*

## State of Washington

*B. Controls are not related to a "significant risk" identified in the audit plan.*

*C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*

*D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

**Key Control 1 - Classification - The Fiscal Analyst 3 prepares the year end entry to record deferred inflows of resources using PTRS accounts receivable reports and Forecasts from the Forecast council. The Fiscal Analyst 5 reviews supporting documentation to ensure amounts are accurate and classified correctly based on forecast information.**

The understanding for this system is documented above in the "Controls - PTRS" step.

### **1. Confirmation of Key Manual Control:**

Jerry Tilson, Revenue Accounting Supervisor, provided the AFRS journal voucher and Property Tax Receivable System report and taxes receivable forecast used to record the year end JV.

There is a one month delay between when counties collect the taxes and when they are submitted to DOR, so DOR's taxes receivable balance as of June 30th is the counties balance as of May 30th. Jerry provided the Counties May Accounts receivable balances through screenshots of PTRS for Part I and Part II. He also provided the forecast council's excel sheet that tracks all receivables "Forecast Allotment\_2325\_2024\_06" as of June 30th. Property taxes are listed on the "2325 Cash Jun 2024" tab, in lines 11 and 12 (source code 50, subsource code 02: Property Tax) for parts I and II respectively. Columns 01 and 02 are the first two fiscal months. Altogether, there are four balances pulled from this spreadsheet for the two parts of the levy in the first two fiscal months, that all together makes the estimated available property tax revenue. Jerry provided the

# State of Washington

property tax estimates in a simplified table "Property Tax Forecast for FY25"

We reviewed the JV 14030885 and noted \$2,237,257,889.58 was recorded as unavailable revenue (deferred inflows of resources) 5192. The JV was prepared by Andrew Arnold, Fiscal Analyst, on July 23, 2024 and reviewed by Jerry Tilson, Revenue Accounting Supervisor on July 23, 2024. We vouched the recorded JV amount to Property Tax Receivable system reports less the estimated collections for the current year for both part 1 and part 2 of the levies. ***No issues noted.***

## **Noted Weaknesses are as follows:**

- None.

## **2. Preliminary Control Risk Assessment**

Based on our understanding and anticipated audit strategy, we assessed preliminary control risk as follows:

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

## **3. Control Risk at LOW - Test of Key Manual Control:**

Not applicable - we are not planning to rely on controls and therefore do not need to test controls; control risk will be assessed at maximum.

## **D.3.PRG - Deferred Inflows of Resources**

*Procedure Step:* Key Control #2 (Manual)

*Prepared By:* BFW, 5/22/2024

*Reviewed By:* CJG, 11/25/2024

Purpose/Conclusion:
---------------------

## **Purpose:**

To confirm monthly reconciliations between OST JVs and the cash receipts journal summary in order to assess control risk.

# State of Washington

## **Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

# State of Washington

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

**Key Control 2 - Classification -Jerry Tilson, Revenue Accounting Manager, reconciles Property Tax Receivable System (PTRS), AFRS, and OST JVs on a monthly basis to ensure collections are classified appropriately.**

The understanding for this system is documented above in the "Controls - PTRS" step.

### **1. Confirmation of Key Manual Control:**

Monthly journal vouchers are received from OST documenting the transfer of monies remitted by the counties to DOR during the month. A spreadsheet is prepared to document and reconcile cash receipts journal summary to OST's monthly JVs.

Jerry Tilson, Revenue Accounting Manager, provided the March 2024 reconciliation. We reviewed the Property tax part 1 March reconciliation and tied the Property Tax Receivable System (PTRS) ending balance for Clallam County to PTRS accounts receivable reports. Per PTRS the ending balance was \$21,214,147. The OST cash journal entries totalled \$2,998,537 for the month. The prior month ending balance of \$24,212,684 less the March cash receipts resulted in an ending balance of \$21,214,147 per the source documents from OST. No variance was noted for any of the counties between PTRS and OST JVs. ***No issues noted.***

Revenue Accounting performs a reconciliation between PTRS and AFRS to ensure that payments received are accurately reported and classified appropriately. We noted the total payments for all counties for March were \$140,263,300.23 as documented in PTRS. We tied this amount to AFRS using an ER report for General Fund source 50 - property tax. Amounts tied without exception. ***No issues noted.***

### **Noted Weaknesses are as follows:**

- None.

# State of Washington

## **2. Preliminary Control Risk Assessment**

Based on our understanding and anticipated audit strategy, we assessed preliminary control risk as follows:

## **Noted Weaknesses are as follows:**

- None.

## **2. Preliminary Control Risk Assessment**

Based on our understanding and anticipated audit strategy, we assessed preliminary control risk as follows:

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

## **3. Control Risk at LOW - Test of Key Manual Control:**

Not applicable - we are not planning to rely on controls and therefore do not need to test controls; control risk will be assessed at maximum.

# State of Washington

## D.3.PRG - Deferred Inflows of Resources

*Procedure Step:* Substantive Test

*Prepared By:* BFW, 10/8/2024

*Reviewed By:* CJG, 11/25/2024

Purpose/Conclusion:

**Purpose:**

To determine whether financial statements properly classify deferred inflows of resources in conformity with generally accepted accounting principles (GAAP).

**Conclusion:**

We determined reported deferred inflows were correctly classified. ***No issues noted.***

Testing Strategy:

Auditors are **required** to evaluate conclusions for substantive testing as follows:

*Auditors may wish to use the optional Lead Sheet available in the Store to summarize testing related to each balance and assertion.*

**1.** Determine whether the results of substantive testing indicate a need to modify the inherent risk assessment (IR), control risk assessment (CR), risk of material misstatement (RMM) or other aspects of planning (such as material balances or assertions). If so, document changes and consider the need for additional testing.

*If the results of substantive testing indicate a need to change control risk, auditors should also update the **Permanent File** by either correcting the documentation or by adding an update section describing changes to the top of the record of work done. For all changes to IR, CR, or RMM the **Material Balances** spreadsheet should be updated.*

*More significant changes to other aspects of planning (such as material balances or assertions) should be referenced in this step and documented in detail in the **Changes to FS Audit Plan** step.*

## State of Washington

2. Evaluate whether the quality and quantity of evidence obtained is sufficient and appropriate in response to the risk of material misstatement. In making this determination, auditors should evaluate:

### Information to be used as audit evidence:

- Does evidence relate to the population, period of time and risk (assertion and “what could go wrong” from the Material Balance Spreadsheet)? If there are any gaps or uncertainties in the logical connection between the evidence and conclusions, is there a documented consideration and explanation?
- Are the sources of information sufficiently reliable and appropriate for the risk (whether internal to the government, external, or auditor developed)? If key information is not from a sufficiently reliable source (for example, inquiry), then is it corroborated by information that is?
- Are there any concerns about accuracy, completeness, authenticity, or bias in information? If so, did the auditor perform sufficient procedures to confirm reliability of that information?
- Is information precise enough to catch if misstatements exceeded the tolerable level?
- Is information detailed enough to conclude on whether or not there were misstatements?
- Was there any information that appeared contradictory or inconsistent? If so, was there a documented response to the inconsistencies or doubts about the reliability of evidence?

### Results:

- How much misstatement was identified by testing, and the likelihood and magnitude of further potential misstatement?
- How did misstatements occur and how often might they occur again in the population?
- Were misstatements caused by control deficiencies or circumvention of controls?
  - If control deficiencies, is there a need to re-evaluate our understanding of controls in the **Permanent File** folder or assessment of control risk?
  - If circumvention, the **Management Override of Controls** step should address or reference this area. Auditors should also consider whether a fraud risk has been identified.
  - Did tests identify a different level or type of risk than the planned audit response was designed to address?
  - If likely misstatements are identified, are further procedures necessary to improve the precision of our estimate?

*To support the overall evaluation of audit risk and provide a basis for concluding on the overall sufficiency and appropriateness of evidence in the **FS Summary & Report** step, auditors should conclude in each area whether the auditor continues to believe that the tests performed and quality and quantity of evidence obtained are commensurate with RMM for all relevant risks (the “what could go wrong”, in the **Material Balances** spreadsheet).*

If the auditor determines that evidence is not sufficient or appropriate, additional substantive testing should be done. If sufficient, appropriate

## State of Washington

evidence is not available for audit, the AIC should discuss the effect on our audit report with the AAM and AM.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6310](#) – Determining the Nature, Timing and Extent of Substantive Testing**

**SAO Audit Policy [3210](#) – Audit Evidence**

Record of Work Done:

### **Substantive tests performed to meet the Classification assertion:**

To ensure deferred inflows of resources were classified correctly within PTRS, we selected a sample of monthly cash journals prepared by the Office of State Treasury to review. To determine whether the property taxes were correctly classified, we recalculated the year-end JV and tied totals to the source codes.

### **Classification Testing Results:**

To determine whether the property taxes were correctly classified, we obtained the year end JV. We deducted the collections expected within 60 days and identified the unavailable revenue as the receivables that will not be collected within that time, see testing here: [[FY24 Year End JV Testing](#)]. Our determination tied to the year end JV without exception. *No issues noted.*

To ensure deferred inflows of resources were classified correctly within PTRS, we selected a sample of monthly cash journals prepared by the Office of State Treasury. We selected five journal vouchers and two individually significant vouchers that represented 97.97% of all collections for the year, to review for the following:

- Property Tax Collections are recorded in proper revenue source codes in PTRS (Property Tax Receivable System)
- Property Tax Collections recorded by OST cash receipt journal summaries into AFRS are coded correctly.

We reviewed the source coding on the county's A8s and the compiled OST monthly JVs to ensure the balances remitted were entered into the correct codes; Fund 001, Source 0150, Subsource 020000 and 020001. We determined the the OST JVs and the PTRS records were coded correctly without exception. See testing here [[Property Tax Collection Testing](#)] on the JV Testing tab.

**In addition, we addressed the existence/completeness assertion in this area as this testing will be used for part of the coverage of the taxes receivable balance testing.**

**Substantive tests to meet the Existence assertion (Relevant to the Taxes Receivable testing only):**

## State of Washington

We traced each of the counties in the selected cash journals from OST to their A8s and their acceptance of the balance.

### **Existence Testing Results:**

We reviewed the A8 from each county for each of the months selected by the JV selection process. The A8s listed all the taxes collected by the county to be remitted to DOR through OST. We added the taxes collected from Fund 001, Source 0150, subsources 020000 and 020001 only for the amount of property tax collected. We added the totals of all 39 counties for the property taxes collected, and compared to the amount remitted to DOR through OST in the relevant JV under the same subsource codes. The total remitted to OST by all the counties matched the total remitted by OST to DOR. See testing here [[Property Tax Collection Testing](#)] on the JV Testing tab.

### **Substantive tests to meet the Completeness assertion (Relevant to the Taxes Receivable testing only):**

We added all the levy totals given to the counties and the total matched what the original total was (the same as last year plus 1% and adjustments)

### **Completeness Testing Results:**

Jerry Tilson, Revenue Accounting Manager, provided the letters sent to each of the 39 counties, which outlined the amount of property taxes due for Parts I and II in 2024. We totaled the amounts due from each of the counties for both parts. We compared the total of the letter amounts, to the total of all county levies as calculated in the State Levy spreadsheet. Both Parts I and II balanced. See testing here [[Property Tax Collection Testing](#)].

### **D.4.PRG - Human Services**

*Procedure Step:* Summary & Conclusion

*Prepared By:* AMG, 11/15/2024

*Reviewed By:* RKM, 11/20/2024

Purpose/Conclusion.*
----------------------

### **Purpose:**

To evaluate risk assessments and the sufficiency and appropriateness of evidence obtained based on results of substantive work.

### **Conclusion:**

We determined that **no** modifications were necessary to inherent risk, control risk, or the risk of material misstatement as assessed in planning.

# State of Washington

We also determined that evidence obtained was sufficient and appropriate in response to the risk of material misstatement.

## Testing Strategy:

Auditors are **required** to evaluate conclusions for substantive testing as follows:

*Auditors may wish to use the optional Lead Sheet available in the Store to summarize testing related to each balance and assertion.*

**1.** Determine whether the results of substantive testing indicate a need to modify the inherent risk assessment (IR), control risk assessment (CR), risk of material misstatement (RMM) or other aspects of planning (such as material balances or assertions). If so, document changes and consider the need for additional testing.

*If the results of substantive testing indicate a need to change control risk, auditors should also update the **Permanent File** by either correcting the documentation or by adding an update section describing changes to the top of the record of work done. For all changes to IR, CR, or RMM the **Material Balances** spreadsheet should be updated.*

*More significant changes to other aspects of planning (such as material balances or assertions) should be referenced in this step and documented in detail in the **Changes to FS Audit Plan** step.*

**2.** Evaluate whether the quality and quantity of evidence obtained is sufficient and appropriate in response to the risk of material misstatement. In making this determination, auditors should evaluate:

### Information to be used as audit evidence:

- Does evidence relate to the population, period of time and risk (assertion and “what could go wrong” from the Material Balance Spreadsheet)? If there are any gaps or uncertainties in the logical connection between the evidence and conclusions, is there a documented consideration and explanation?
- Are the sources of information sufficiently reliable and appropriate for the risk (whether internal to the government, external, or auditor developed)? If key information is not from a sufficiently reliable source (for example, inquiry), then is it corroborated by information that is?
- Are there any concerns about accuracy, completeness, authenticity, or bias in information? If so, did the auditor perform sufficient procedures to confirm reliability of that information?
- Is information precise enough to catch if misstatements exceeded the tolerable level?
- Is information detailed enough to conclude on whether or not there were misstatements?
- Was there any information that appeared contradictory or inconsistent? If so, was there a documented response to the inconsistencies or doubts about the reliability of evidence?

# State of Washington

## Results:

- How much misstatement was identified by testing, and the likelihood and magnitude of further potential misstatement?
- How did misstatements occur and how often might they occur again in the population?
- Were misstatements caused by control deficiencies or circumvention of controls?
  - If control deficiencies, is there a need to re-evaluate our understanding of controls in the [Permanent File](#) folder or assessment of control risk?
  - If circumvention, the [Management Override of Controls](#) step should address or reference this area. Auditors should also consider whether a fraud risk has been identified.
  - Did tests identify a different level or type of risk than the planned audit response was designed to address?
  - If likely misstatements are identified, are further procedures necessary to improve the precision of our estimate?

*To support the overall evaluation of audit risk and provide a basis for concluding on the overall sufficiency and appropriateness of evidence in the [FS Summary & Report](#) step, auditors should conclude in each area whether the auditor continues to believe that the tests performed and quality and quantity of evidence obtained are commensurate with RMM for all relevant risks (the "what could go wrong", in the [Material Balances](#) spreadsheet).*

If the auditor determines that evidence is not sufficient or appropriate, additional substantive testing should be done. If sufficient, appropriate evidence is not available for audit, the AIC should discuss the effect on our audit report with the AAM and AM.

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6310](#) – Determining the Nature, Timing and Extent of Substantive Testing**

**SAO Audit Policy [3210](#) – Audit Evidence**

Record of Work Done:

Based on test results, we re-evaluated risk assessments, procedures, evidence obtained and conclusions as follows:

### **(1) Do the results of substantive tests indicate a need to modify our risk assessment (IR, CR and RMM)?**

Results of substantive tests do not indicate a need to modify our risk assessment.

### **(2) Was the quality and quantity of evidence obtained sufficient and appropriate?**

# State of Washington

The quality and quantity of evidence obtained was sufficient and appropriate.

## D.4.PRG - Human Services

*Procedure Step:* Understanding of Line Item

*Prepared By:* AMG, 7/8/2024

*Reviewed By:* BM2, 11/20/2024

Purpose/Conclusion:

### **Purpose / Conclusion:**

To gain an understanding of the line item and confirm the scope of testing as documented in the Significant Account Matrix.

Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

### **STEP 1: Prior Audit Exceptions**

Document any exceptions noted during the prior audit. Follow-up to determine how the agency has responded to or corrected the issue, unless this work is anticipated as part of the testing strategy.

### **STEP 2: Analyze Composition and Changes of Line Item**

- Include link to the line item leadsheet. This will be completed at the end of the audit. Leadsheet analysis should be documented in this spreadsheet.
- Inquire with agency staff about the activities and transactions that make up the balance and any changes to those activities or transactions in relation to the prior year.
- Determine relevant classes of transactions or account balances within the line item to analyze (such as agencies, funds, programs, departments, accounts, and/or objects), and use AFRS to create trends of those elements. This step should not include any specific dollar amounts associate with the line item.

## State of Washington

- Evaluate trends to identify:

(1) What classes of transactions or account balances are primary to the identified risk. Auditors should specifically consider what elements are primary to the line item (comprising a large percentage of the line item), and which elements the identified risk would apply to, and which elements might be most susceptible to the identified risk (having a high risk of non-trivial misstatement for a relevant assertion, considering likelihood and impact of potential for misstatement).

(2) What changes are primary to the identified risk, if applicable. Auditors should specifically consider whether the overall change to the line item from the prior year was significant, what elements were the primary drivers of overall change, whether any elements changed significantly from the prior year, and which changes (if any) might relate to the identified risk.

(3) Any unusual or unexpected elements, amounts, or changes that may indicate a risk, whether the one identified in planning or a new one that may need to be considered for a change to the plan.

**Consider** other procedures to gain an understanding of the line item, such as review of key policy documents, review of program information or reports, inquiry of staff, budget information, or other analytical procedures.

### STEP 3: Update to Significant Account Matrix

Based on your understanding of the line item, update the Significant Account Matrix with final conclusions on the agencies covered, account description, significant accounting systems, and risk (what could go wrong and relevant assertions). The account description should reflect the significant transaction streams or account balances relevant to the risk.

*The description of agencies, significant accounting systems, and what could go wrong in the Significant Account Matrix constitute the overall scope of substantive testing.*

*A transaction stream is significant based on the potential for misstatement. This is often due in part to its size (ie: comprising a large percentage of the total line item), but is ultimately a judgment about the susceptibility to the identified risk (for example, when the risk is understatement a small or omitted account may hold the most potential for the largest misstatement).*

*Significant accounting system(s) are those that contain key controls over significant classes of transactions included in the line item. Control systems identified in this step must match the Significant Account Matrix and have a separate control understanding documented.*

*Talk with the AIC if you identify any changes to the Significant Account Matrix.*

Guidance/Criteria.:

Record of Work Done.:

#### **(1) Prior Audit Exceptions:**

We reviewed the most recent audits or in-process audits for the agencies for accountability, SWSA, and ACFR for exceptions related to the Medicaid program:

## State of Washington

- ACFR Audits: Prior finding/management letters related to the general IT control deficiencies due to the lack of a SOC II type 2 report that addresses an entire year (even fiscal years have six months of coverage) or at all (odd fiscal years).
  - We will be reviewing the controls and follow up on this issue during the audit.**Impact:** This impacts our assessment of control risk for all assertions by increasing it to MAX as necessary.
- Single Audit: We reviewed the FY23 SWSA (S1Medicaid-SA23) for issues that directly correlate with our tested management assertions:
  - Provider Eligibility - Both agencies did not have adequate controls to ensure provider eligibility requirements for the Medicaid Program.
    - HCA relied on automated systems to assist in the revalidation of providers (required every five years); however, we noted that out 347 providers that should have been revalidated or deactivated: None were revalidated before the due date.
      - HCA subsequently revalidated 127 providers which were backdated
      - The remaining 192 providers should have been deactivated, but HCA did not take effort to deactivate or revalidate them
    - DSHS relied on automated systems to confirm the identify and exclusion status of providers, which is required monthly. A management decision was made to only screen providers on an annual basis. There was additionally missing documentation related to enrollment determinations.**Impact:** This impacts the Rights and Obligations assertion to ensure claims are paid to eligible providers at the time of service. When we met with SA for coordination [[ACFR / SWSA Brainstorm](#)], Stephanie Garza and Ronni Copeland mentioned that our methodology of testing eligibility was appropriate due to HCA's ability to backdate revalidations. We will continue to clarify with the Single Audit team during testing to ensure that our work addresses the requirements of the Medicaid portion of the single audit.
- Accountability/IT Audit: In FY23, we did not preform an accountability audit. There are no potential impacts to effect the audit.

### **(2) Composition & Change Analysis:**

Line Item Leadsheet: [[Line Item Lead Sheet](#)].

Final Coverage Analysis [[FY24 Human Services Breakdown](#)]

### **Expenditure Analysis**

We analyzed expenditures\* in the following manner [[FY24 Human Services Breakdown](#)].

- By Origin Code:
  - 83.99% of the expenditures for HCA were from ProviderOne (OC P1), presenting the most significant origin system. This is expected as ProviderOne is the Medicaid MMIS.
  - 43.22% of the expenditures for DSHS were from ProviderOne and 13.97% were from payroll (OC PR, which is addressed in other testing procedures in the ACFR).

## State of Washington

- By Subobject:
  - **HCA:** 94.43% were from NB (direct payments to providers)
  - **DSHS:** 81.52% were from NA/NB (direct payments to providers and clients)
- By GL Account
  - The only item related to the GL accounts is for GL 6525 for DSHS. This account is used for SNAP expenditures. This represented 23.29% of their expenditures.

These expenditures sources are all in line with our expectations due to the significance of the Medicaid program.

Based upon the quantitative and qualitative aspects of the Medicaid program, we do not consider identified changes to the expenditures significant which fluctuate year-to-year based upon actual services rendered and demand.

\*Note: The amounts within the analysis are interim and based upon the funds, GL accounts, and subobjects from FY23 ACFR queries which provide information between the income statement sort codes and AFRS transaction detail. We anticipate these are similar year-to-year and sufficient for preliminary analysis purposes. Additionally, based upon historical testing, we expect HCA and DSHS (followed by DCYF) to contribute the most to the Human Services line item as they are the primary agencies responsible for human services.

### **Amendment Updates**

The State Plan which describes the nature and scope of Washington's Medicaid Program is changed with plan changes (State Plan Amendments, SPA) submitted to the Department of Health and Human Services, to be approved by the Centers for Medicare and Medicaid Services (CMS) to determine whether it meets federal requirements and policies. The State Plan is updated when CMS issues final approval of an SPA.

We reviewed approved SPAs with approval dates within FY24 documented at [\[FY24 SPA Review\]](#). During our review, we noted general updates including extending/increasing of existing rates, technical changes and updates, and exceptions to existing procedures.

### **Testing impact assessment:**

- **Valuation** - We identified multiple rate and effective date updates within the SPAs. Correct rates are an attribute for testing and a sample of rate updates for accuracy and review and upload process is tested as part of control testing [\[Key Controls #1 - 4 Edit Checks \(Automated\)\]](#).
- **Completeness** - We identified SPAs that would increase the number of eligible clients through various means. This has no impact on our testing as we test for "negative" attributes, i.e. if the client was eligible at the time of service, rather than should more clients have been registered as eligible. There is no financial impact for "potentially eligible" clients as they do not submit claims if they are not registered.

### **Public Health Emergency End [\[WAH Guide to Unwinding\]](#)**

During the Public Health Emergency (PHE), CMS provided guidance that allowed for relaxed eligibility determinations and redeterminations, known

## State of Washington

as the continuous enrollment provision. Essentially, enrollees were allowed to self-attest to their conditions and income levels for their eligibility into their recipient aid groups. Those that had coverage were able to retain their coverage throughout the PHE. The PHE ended on 5/11/2023, but the Consolidated Appropriation Act of 2023 ended the provision. HCA and DSHS resumed normal operations for eligibility redeterminations 4/1/2023, with terminations for those that did not renew eligibility resuming on 5/31/2023.

During this time period, HCA began its efforts to reach clients, including phone calls, text messages, mail/enhanced envelopes, and updated correspondence for clients to respond to renewals and eligibility reviews to determine if they were still eligible for Apple Health coverage or other insurance through the Washington Healthplanfinder. Depending upon the coverage group (Classic Apple Health coverage through DSHS, MAGI Apple Health through Washington Healthplanfinder, etc.) the redetermination process can either be automatic (comparing self-reported income through the Healthplanfinder to various sources) or a manual process.

One key takeaway, however, is that terminated clients have 90 days from their termination date to complete their renewal and have **retroactive reinstatement** from their termination date without a gap in coverage (**pg. 15**).

### **Testing impact assessment:** Potential impact

- **Rights and Obligations** - For those individuals who may be ineligible to receive services due to termination between the time frame of 6/1/2023 through 6/30/2023. As noted above and in the wind down guide, those terminated clients have an additional 90 days from termination to complete their renewal process for retroactive reinstatement. Eligibility of clients are still updated through batches from ACES to ProviderOne; we will take additional consideration for those TCNs that do not meet client eligibility on a service date to consider retroactive reinstatement.
- **Valuation** - HCA should potentially have a Expenditure Accrual estimate, with a corresponding Accounts Payable entry, for those clients (and their transactions) that are initially deemed ineligible due to the renewal lapse, but receive retroactive eligibility within the 90 day window. Per inquiry with HCA we determined this is not a new process in eligibility and has been in place since the enactment of the ACA. A client has up to 90 days to be reconsidered for their renewal and HCA can reinstate coverage back to termination. Once eligibility is established, claims can be submitted.

We identified during FY24 the Authority is still in the wind down period. The testing impacts that are assessed for FY24 would be considered an Eligibility risk however, this has trivial impact on financials due to the 90 day window for terminations.

### **SAO Risk Register**

We reviewed the Medicaid Task Force's Risk Register for topics that may impact the ACFR for our selected management assertions. We noted that the risks topics identified could more adequately be covered in other audits such as accountability and performance audits, rather than for financial reporting purposes.

### **(3) Updates to Significant Account Matrix:**

## State of Washington

We made a slight change to the DSHS line item risk to also include "A lack of service organization's internal control audit for the ProviderOne system could lead to inaccurate payments, misuse, loss of misuse, loss or misappropriation of public funds, or payments not properly made only to eligible recipients for allowable (authorized) services". The risks now match HCA.

No other updates to the Significant Account Matrix are necessary. Expenditures for the line items are in expected agencies and sub-objects. We did not identify significant changes in the expenditures from year to year.

### D.4.PRG - Human Services

*Procedure Step:* Controls - ProviderOne

*Prepared By:* AMG, 8/8/2024

*Reviewed By:* RKM, 12/2/2024

Purpose/Conclusion:

**Purpose:**

To gain an understanding of internal controls.

**Conclusion:**

We gained an understanding of internal controls as documented in the record of work done.

Testing Strategy:

**The following procedures are required for all material systems:**

1. List the financial statement balance(s) and relevant assertion(s) addressed by the understanding.
2. Gain an understanding of the internal control process, identify how transactions are recorded in AFRS, identify key controls over relevant assertion(s), and note any control weaknesses.
  - In gaining an understanding of controls, consider the overall understanding of State-Level control elements as documented in the "State-Level Controls" step as they relate to this particular system.
  - Identify controls systems covering all relevant assertions for all significant classes of transactions.

## State of Washington

- Standards require the auditor to gain an understanding of the significant accounting system(s) that contain key controls over significant classes of transactions included in the line item.
- Control systems identified in this step must match the Material Account Matrix and have a separate control understanding documented.
- Talk with the ACFR Specialist or AIC if you identify different systems than the ones anticipated in the Material Account Matrix.

For each material system, auditors must document:

- A brief outline of the transaction flow from beginning to end.
- An expanded description of key controls.
- Business processes relevant to financial reporting of the relevant assertion for the material balance. Processes should encompass automated and manual procedures by which transactions or events are identified or initiated, authorized as needed, recorded, processed and corrected as needed.
- Original accounting records and how records are rolled-up to intermediary ledgers and transferred to the general ledger (AFRS) or financial statements.
- Detailed descriptions of key controls. Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

The following is information to **consider** when identifying key controls and transaction flow.

“Key controls” refer to the few controls that together provide reasonable assurance that material misstatements will be prevented or detected and corrected. This is contrasted with ancillary or supporting controls, which – although helpful and recommended – would provide less than reasonable assurance by themselves.

The focus of the write-up is on the key controls. Key controls should be specifically identified (as “key controls”) in the write-up. This can be done in whatever way the auditor prefers, so long as it is obvious. Details that the auditor should document regarding key controls may include:

- Who or what initiates the control
- When (or how often) is the control applied
- Who performs the control
- As needed, the experience, knowledge and attitude of the person applying the control
- Detailed description of the control process or activity. For example, if the control is a review: what exactly is reviewed, what is the reviewer looking at or for and what are the reviewer’s criteria?
- How the key control is documented or evidenced
- If not obvious from the description, how the control prevents or timely detects and corrects misstatements

## State of Washington

- Any exceptions or alternative processing to the normal process
- What happens when misstatements or issues are identified by the control

The “transaction flow” refers to the process by which transactions are initiated, authorized, recorded, processed and reported (as applicable). Outlining the transaction flow gives context to key controls, especially how transactions become subject to controls in the first place. If a control inherently ensures that all applicable transactions are included (ex: bank reconciliation where the assertion is existence), the auditor may decide to just start the write-up with the initiation of the control procedure and go from there.

Elements of the transaction flow are defined informally as follows:

- *Initiation:* How are transactions initiated?
- *Authorization:* How are transactions and accounting record maintenance authorized?
- *Recording:* How are transactions or balances identified and recorded in financial accounting systems?
- *Processing:* How are the transactions or balances processed after they are recorded (if at all)? Processing may be manual or automated and may occur at a subsidiary system level or at the general ledger level.
- *Reporting:* How are records translated into the financial statements? This part of the transaction flow extends the understanding to the actual financial statements that the audit is opining on. Since we already document an understanding of the financial reporting process in general, it is usually enough to simply reference this overall understanding. However, if there are important steps unique to the covered balances, it may be more appropriate to mention them here.

Although transaction flow is a good way to think about understanding and documenting a control system, auditors should not worry too much about documenting “each element, in order” because often elements may be combined, not noticeable, not applicable or occur in a different order.

Guidance/Criteria.7
---------------------

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits](#) Planning Guide**

# State of Washington

Record of Work Done:

## **Significant Balance(s) and Assertions**

Internal controls in ProviderOne address the following balance(s):

- Statement of Activities - Government Wide - Human Services - Expenses
- Statement of Revenues, Expenditures, and Changes in Fund Balances - Governmental Funds - Human Services

For the following assertions:

- Rights and Obligations - Medicaid / social service payments may not be made to eligible providers, for eligible recipients, or for allowable services
- Valuation - Medicaid / social service payments may not be made at correct rates.
- Completeness - Payments may not be completely rolled-up to AFRS from P1.
- General Risk - ProviderOne is the Medicaid payments system. A lack of service organization's internal control audit for the ProviderOne system could lead to inaccurate payments, misuse, loss of misuse, loss or misappropriation of public funds, or payments not properly made only to eligible recipients for allowable (authorized) services.

## **Gain an Understanding of Internal Controls**

We met with the following to discuss ProviderOne and controls:

- Will Sogge, Audit Liaison
- Ed Hicks, IT System Administrator - Senior
- Heidi DeVries, IT Quality Assurance

### *Background:*

The Social Security Amendments of 1965 created Medicaid by adding Title XIX to the Social Security Act, 42 USC 1396 et seq. Under the program, the federal government provides matching funds to States to enable them to provide medical assistance to residents who meet certain eligibility requirements. The objective is to help States provide medical assistance to residents whose incomes and resources are insufficient to meet the costs of necessary medical services. Medicaid serves as the nation's primary source of health coverage for low-income populations.

Services are provided to Medicaid eligible enrollees either through enrollment in the managed care program or on a fee-for-service basis. Most medical services are provided by Medicaid providers. Medicaid providers can be any person, group of people, or health care facility that supplies medical services to Medicaid recipients. Providers include doctors, medical equipment companies, podiatrists, dentists, licensed professional counselors, hospitals, adult day care centers, nursing homes, clinics, pharmacies, ambulance companies, case management centers, home health care workers, and others.

### *Managed Care*

# State of Washington

Managed care is a prepaid, comprehensive system of medical and health care delivery. It includes preventive, primary, specialty and ancillary health services. The term "managed care" is used to describe a variety of techniques intended to reduce the cost of providing health benefits, improve the quality of care and deliver health care organized around managed care techniques and concepts. HCA administers the following managed care programs:

## *1. Apple Health (formerly known as "Healthy Options") managed care*

The majority of Medicaid clients are enrolled in the Apple Health program. The state pays a fixed rate (capitation rate) to licensed health insurance carriers to provide a defined set of services to enrolled members. Thus, these carriers are paid a negotiated capitation monthly premium without regard to the actual medical services utilized by each beneficiary. Clients in Apple Health managed care must see only providers who are in their plan's provider network, unless prior authorization is given or to treat urgent or emergent care.

Currently, the following five plans are available through the Apple Health managed care program:

- Wellpoint Washington (previously Amerigroup)
- Community Health Plan of Washington
- Coordinated Care of Washington
- Molina Healthcare of Washington
- United Healthcare Community Plan

## *2. Integrated Managed Care (known as "Fully Integrated Managed Care (FIMC)")*

FIMC coordinates physical health, mental health, and substance use disorder treatment services to help provide whole-person care under one health plan. Integrated managed care is available in all regions.

## *3. Apple Health Foster Care (AHFC)*

The Apple Health Foster Care (AHFC) program provides integrated managed physical and behavioral health coverage statewide to Apple Health children in foster care. Care coordination for all Washington State foster care enrollees is provided through a single, statewide managed care plan called Apple Health Core Connections administered by Coordinated Care of Washington (CCW). Apple Health children in foster care (out of home placement) are auto-enrolled to Coordinated Care of Washington.

## *4. Primary Care Case Management (PCCM)*

The Primary Care Case Management (PCCM) program is available for American Indians or Alaska Natives. The State's PCCM program is provided only through tribal clinics and Urban Indian Centers.

# State of Washington

## Fee-for-service

Under the fee-for-service delivery system, HCA pays providers directly for each service, using the ProviderOne payment system. Regardless whether a Medicaid client is enrolled in a managed care plan, the following services are always covered as fee-for-service (FFS):

- Dental Care
- Vision hardware (children only)
- Long-term care
- Inpatient psychiatric care for physician services.

Fee-for-service providers have agreed to accept the rates established by HCA as total payment for services. They are not permitted to bill clients for any amount above that which it received from HCA. For services in which there has been no designated rate, prior approval must be obtained before the service can be provided. HCA maintains several toll free lines for such approvals.

## **ProviderOne**

ProviderOne (P1) is the state's Medicaid Management Information System (MMIS). P1 is critical to the Medicaid program, processing claims transactions and payments for Medical, Social Services, Dental, and Pharmaceutical claims. The Health Care Authority relies on P1 for compliance with the Health Insurance Portability and Accountability Act of 1996 (HIPAA) and Medicaid (Title XIX). The Health Care Authority (HCA) contracted with a vendor, Client Network Services, Inc. (CNSI), to develop ProviderOne to process state Medicaid payments.

- Since May 9, 2010, P1 has been processing payments for managed care, hospital, medical, dental, medical supplies, vision, and nursing home claims in "Phase 1".
- Since January 15, 2015, social service provider payments, such as adult family home, assisted living home and home care agency claim payments, have been processed through ProviderOne instead of the Department of Social and Health Services' (DSHS's) Social Services Payment System (SSPS) in "Phase 2". Additionally, W2 social service provider payments were transferred from SSPS to IPOne, a new online billing system for W2 providers, as of March 2016. W2 provider payments, such as self-employed individual provider payments, have been processed through IPOne instead of the Social Services Payment System (SSPS) since March 2016.

The P1 system comprises the following subsystems:

- **Client** - Client information. Interfaces with DSHS's Automated Client Eligibility System (ACES), DSHS's Comprehensive Assessment Reporting Evaluation (CARE) system for Social Services Claims, and Department of Corrections' (DOC's) OMNI system for incarcerated individuals.
- **Provider** – Provider enrollment and validation. Interfaces with LexisNexis for provider screening and DSHS's Agency Contract Database (ACD).
- **Third Party Liability** - This subsystem is used when a client has other medical coverage and Medicaid is not the primary payer of the claim.
- **Prior Authorization** - This subsystem contains prior authorizations that are required for some medical services.

## State of Washington

- **Social Services** - This subsystem includes services provided by Home and Community Services Providers (individual and agency providers) and Residential Care Providers (adult family homes, nursing homes, etc.) who contract with DSHS. Almost all of the expenditures processed in this subsystem are recorded as DSHS expenditures because they fall under programs administered by DSHS. All social services should be pre-authorized. A social services' case worker will evaluate each client and determine what services will be provided to the specific client and will pre-authorize the services. P1 will not pay for social services that are not pre-authorized. The adjudication process is the same as other claims.
  - Prior to 6/1/2022, DSHS was the legal employer of and submitted claims information for individual providers. As of 6/1/2022, the Consumer Direct Care Network Washington (CDWA) is the legal employer of all Individual Providers (IP) in the state of Washington and is responsible for submitting claims for the individual home care providers.
- **Claims** – facilitates submission of claims, payment of claims, managed care payments/encounters, adjustments.
  - FFS and Managed Care claims
  - Edit processing
- **OFIN (Oracle Financials)** - used to store GL, A/P, A/R and other financial information.
- **Rate Setting** - HCA's Managed Care unit contracts with actuaries to determine rate. The actuary determines base rate for MCO and adjustment factors based on gender, age, location. P1 calculates actual rate based on the base rate and relevant actuary factors.

### Claims:

Payments initiated from ProviderOne can originate from two different subsystems: Claims and Managed Care. Medical or social service claim payments to providers are processed through Claims, managed care monthly premiums are paid to Managed Care Organizations through Managed Care. Premium assistance is paid to insurance organizations or clients through TPL.

P1 has hard coded edits to adjudicate medical/social service claims and managed care monthly premium payments. Using the details included in a claim, system edits will verify eligibility and allowability of the claim based upon related information included in P1 subsystems, such as Client, Provider, etc. Payment will not be made unless claims pass the hard edits. The adjudication process can be seen as summarized by the following flow chart: [\[Claims Adjudication Flow Chart\]](#).

Some of the key attributes of a claim that are checked by the edits include:

- The provider is eligible to provide the specific service covered by the plan to the specific beneficiary (**Key Control #1 (Automated) - Provider Eligibility, Rights and Obligations**)
- The beneficiary is eligible for the particular category of service at the time it was rendered (**Key Control #2 (Automated) - Beneficiary Eligibility, Rights and Obligations**)
- ProviderOne Verifies that the allowed amount is within reasonable and acceptable limits or if it differs from the allowable fee schedule amount by more than a certain percentage (**Key Control #3 (Automated) - Valuation**)
- The procedure codes are within the valid code set HIPAA Transactions and Code Sets (TCS) and are covered by the State Plan (**Key Control #4 (Automated) - Valid Codes, Rights and Obligations**)

# State of Washington

The ProviderOne system automatically provides daily reports to both the CNSI operations staff and HCA regarding the previous day's adjudication and processing results. In addition, weekly and monthly reports are provided to HCA. These reports provide indicators that processing is completed successfully and the results are within normal operating parameters. For example, claims denied percentage should not typically exceed paid percentage. Any usual variances in values would provide indications to the CNSI and HCA claims team that a possible problem may exist.

## Managed Care:

HCA contracts with managed care organizations (MCOs) to pay providers for Medicaid services to eligible Washingtonians. MCOs deliver defined benefit packages to eligible clients for fixed monthly rates determined by an independent actuary. ProviderOne pays the MCOs premiums for clients enrolled in Managed Care Programs (MCP).

Managed Care (MC) transaction flows include the following:

- Encounter data is sent to P1 by MCOs. This data is processed through P1 edit adjudication process to determine whether claims are allowable. Encounter data is subsequently sent to an actuary to calculate base premium rates for the MCO's.
- Rates (upload process)
- Adjustment factors (risk, age, gender, location) - These are adjustments made to the base rate. The adjustment factors are determined by the actuaries and entered in P1.
- Portal for clients to request change in MC plan.

## Client

For a client's claims to be paid through the P1 system, they must reside in the Client subsystem. Client data is entered in the Client subsystem through various sources including:

- DSHS's Automated Client Eligibility System (ACES)
- DSHS's Comprehensive Assessment Reporting Evaluation (CARE) system
- DOC's OMNI system
- Direct entry by HCA staff

## Provider

For a provider to be paid, providers must reside in the Provider subsystem. Provider data is entered in the Provider Subsystem through various sources including:

- OneHealthPort
- Agency Contracts Database (ACD)
- Enrolled providers can update certain information in the Provider Portal.
- Direct entry by HCA staff.

# State of Washington

CNSI contracts with LexisNexis contracts for provider integrity screening. P1 provider information is sent to LexisNexis. LexisNexis looks up provider data in multiple public data sources to verify/validate provider is able to provide Medicaid services and sends information back which is updated in the P1 system.

## Third Party Liability

Third Party Liability (TPL) refers to the legal obligation of third parties (for example, certain individuals, entities, insurers, or programs) to pay part or all of the expenditures for medical assistance under Medicaid. All other available third party resources must meet their legal obligation to pay claims before the Medicaid program pays for the care of an individual eligible. TPL information is communicated to HCA from various sources, such as client disclosure, claims, information obtained from the Support Enforcement Management System (SEMS) and outside vendors. TPL data is entered in ProviderOne including insurance company information, updating TPL invoices, and applying cash receipts to paid claims. TPL data is entered in ProviderOne through:

- Manual entry from Coordination of Benefits Unit
- SEMS interface

## **Rate Adjustment (Valuation)**

Fee-for-service and managed care premium payment rate factors are uploaded into ProviderOne. Ed Hicks' team is responsible for the fee-for-service rate uploads and Sam Trimble's, IT Business Analyst, area operates the managed care capitation rate factors.

For managed care, HCA pays a monthly premium rate to manage care organizations (MCOs) based on a rate per member per month (PMPM). There are about ten different rate templates for various medical and behavioral contracts as well as three rate templates for different foundational community support (FCS) contracts. There are five factors used to calculate the rates: base rate factor (BRF), age group factor (AGF), geographic region factor (GRF), risk adjust factor (ADF), and qualitative adjust factor (ADF). Pending on the managed care program they may use all or some of the rate factors. Ideally, HCA would like two months from the time a rate change is requested before it is uploaded and executed in ProviderOne. This time is required to adequately review changes, test for errors, receive proper approvals, and update ProviderOne. For fee-for-service, HCA directly pays providers for services rendered on qualified Medicaid members. The number of items to review is not as complicated as managed care so rate turnaround time is usually about 48 hours (target rate for quality control).

The rate change process begins with the System Operations and Implementation Unit (SOIU) receiving a rate update request via a ticket through a shared inbox and are triaged for assignment to Information Technology Specialist (ITS) staff within SOIU. Each ticket has a number that is used to track the progress of these requests. ITS staff first review the information provided to ensure it is complete. The review is only limited to data validation such as number formats and date ranges, etc. The ITS staff member then uploads the provided file into the ProviderOne User Acceptance Testing (UAT) environment. This allows them to verify that the file uploads appropriately before attempting to upload the file into production.

## State of Washington

ProviderOne has processing controls to help ensure the rate data uploaded is complete and valid. Updates that do not meet programmed edits will suspend to an error file that is reviewed by the ITS. If errors are identified, ITS staff notify the business area to make corrections and submit a new file attachment to the ticket.

Prior to uploading, Sam will also provide the business unit with a computed Rate Report for review. Once correct and successfully uploaded, ITS reviews the data and additionally compares the number of records in the source data to the number of records uploaded to ProviderOne. If everything processes appropriately, ITS then uploads the file into the production environment and the data goes through the same processing controls as in the UAT. When successfully uploaded, all rate updates will have an "In Review" status listed. ITS then updates and sends the ticket to Heidi DeVries, IT Specialist, who acts as an internal quality assurance for ProviderOne Operations (P1O). She reviews the rate data for accuracy and to ensure the requested changes conforms to medical related coding information which was provided to HCA from the Centers for Medicare and Medicaid Services (CMS).

HCA's vendor for ProviderOne, CNSI, obtains these types of files from the CMS website and then uploads them to ProviderOne. HCA will also upload reference data based upon decisions made by its own Policy Division. Heidi reviews all relevant information and determines whether to approve or reject the changes. Each rate's status reflects her decision. She then updates the ticket and sends it back to the ITS for closure, or closes the ticket herself.

Once approved, the system attaches dates to the rates data, including the effective date (when the rate was approved), the start date (when the new rate takes effect), and the end date. ProviderOne also has internal edits which will cause the claim calculation to fail out if data is invalid. After confirming the test runs produced correct results, P1O will push the rate changes to production **(Key Control #5 (manual), Rate upload review prior to production - Valuation)**.

### **How Transactions are Recorded in AFRS:**

Using the details included in a claim, system edits will verify eligibility and allowability of the claim based upon related information included in each of the above subsystems. This also allows the system to determine the type of claim. In this way, ProviderOne adjudicates all claims and assigns AFRS account codes to each transaction. When all the account codes are assigned, the Claims subsystem validates the assignment which includes checks for blank values, valid account codes, and AFRS table edits. As account code and table edits are updated in AFRS, there is an automated interface between AFRS and ProviderOne to update them in ProviderOne. If the transaction passes the edits in the subsystem, it is put into an Available for OFIN (Oracle Financials) status. OFIN stores general ledger, accounts payable, accounts receivable, and other financial information.

On a weekly basis, the Claims and Managed Care subsystems transactions are imported into the OFIN subsystem. It is within this subsystem that the Accounts Payable and Accounts Receivable netting and other processes occur to prepare the financial portion of the transactions to be sent to AFRS in batches. Transactions are sent via interface to AFRS for payment. AFRS and OST issue payments and sends a Warrant Wrap file to ProviderOne where OFIN and the original transactions are updated with the Warrant/EFT Number and Paid Date.

## State of Washington

HCA Accounting staff perform daily reconciliation between ProviderOne Batch Reconciliation Report 1280 and the AFRS Batch Interface log to verify the batches sent from ProviderOne are received and processed in AFRS (**Key Control #6 P1 to AFRS Reconciliation, Completeness**). Payment will not be made unless hard edits in ProviderOne are satisfied for validity of the claim and the provider based on the information in ProviderOne.

Transactions other than Managed Care or Claim payments, are sent to AFRS daily. These daily files include PHIPP/ESI payments and cash applications in TPL and Drug Rebate.

### **DSHS**

DSHS primarily relies on HCA for **rights and obligations (see Automated controls #1-4)** and **valuation (Key Control #5)** as HCA is the owner of ProviderOne. DSHS fiscal staff perform a similar daily reconciliation (**Key Control #6 P1 to AFRS Reconciliation, Completeness**) between ProviderOne report 1280 and AFRS Batch Interface log reports to ensure that batches are sent from ProviderOne to AFRS in their entirety.

To track the reconciliation process, an Excel workbook is created at the beginning of the month to document this process daily. The reconciliation process begins with Jesrie Beane, Fiscal Analyst, accessing the ProviderOne system and running a ProviderOne batch reconciliation report (Financial Report #1280). The P1 batch report specifies agency, batch date, batch type, batch number, batch count (count of all batched transactions), and batch amount. The ProviderOne batch type is categorized as "AH" (ProviderOne warrant payment) or "AI" (ProviderOne warrant cancellation).

Jesrie will take a screen shot of this report and paste it into the Excel workbook noted above with a new worksheet for each day of the month. The Fiscal Analyst then accesses the AFRS - Batch Interface (BI) system and then runs an AFRS batch interface report. The AFRS batch report also specifies agency, batch type, batch number, batch count, and batch amount. The Fiscal Analyst will take a screen shot of this AFRS report and paste it to the same worksheet as the ProviderOne batch reconciliation report. The Fiscal Analyst verifies on the AFRS batch report that the batch date, batch number, batch count, and batch amount shown in the AFRS report matches to the ProviderOne batch report. If the batch item on both reports match, the Fiscal Analyst will electronically sign the top of the worksheet where it says "Reviewer" for this batch date.

If there is a discrepancy between the two reports, Jesrie will send a copy of the worksheet with the two compared reports to Cheri Gullekson, Medicaid Accounting Manager, or Tanya Daymon, Fiscal Analyst 3, at HCA to resolve the issue. Documentation of the communication and resolution is also stored on the tab for the daily reconciliation.

### **Key Controls are as Follows:**

- Key Control #1 (Automated): ProviderOne verifies that the provider is eligible to provide the specific service covered by the plan to the specific Beneficiary. (**Rights and Obligations**)

## State of Washington

- Key Control #2 (Automated): ProviderOne verifies that the Beneficiary was eligible for the service at the time it was rendered. **(Rights & Obligations)**
- Key Control #3 (Automated): ProviderOne only pays up to the maximum claim procedure amount. If the claim's requested amount is less than the maximum amount, the requested amount is paid. **(Valuation)**
- Key Control #4 (Automated): ProviderOne verifies all procedure codes are within the valid HIPAA Transactions and Code Sets (TCS) and are covered by the State Plan. **(Rights & Obligations)**
- Key Control #5 (Manual): Health Care Authority reviews and approves the input of fee schedules into ProviderOne prior to being available for payment in processing in the system **(Valuation)**
- Key Control #6 (Manual): Fiscal analysts at both HCA and DSHS perform a daily reconciliation of amounts for batch interface uploads between the ProviderOne system and AFRS for AH (Payments and adjustments) and AI (Warrant cancelations or reissuances) batches **(Completeness)**

### Noted Weaknesses are as Follows:

HCA confirms that general controls are in place at CNSI by requiring a biennial Statement on Standards for Attestation Engagements (SSAE) No. 16 Type II audit to occur at the vendor, which occurs on even fiscal years in a biennium. During FY24, the Authority had 6 months of coverage for the SOC report. See audit issue at: [\[V: HCA Confidential IT Controls SOC Audit \(Part of ML\)\]](#). To support this finding, IT Audit identified the total dollars and number of records included in the ProviderOne data for all state and federal programs (see queries at [ProviderOne Summary Totals Queries](#)). Total dollars included in the data are **\$18,011,679,805.59** and total transactions are **140,740,691**.

**Additional testing will be preformed to determine if the general controls are sufficient, see [\[Key Controls #1 - 4 Edit Checks \(Automated\)\]](#).**

### D.4.PRG - Human Services

*Procedure Step:* Key Controls #1 - 4 Edit Checks (Automated)

*Prepared By:* DRR, 11/26/2024

*Reviewed By:* BM2, 11/20/2024

Purpose/Conclusion.*
----------------------

### **Purpose:**

To determine whether the following automated key controls for ProviderOne were in place and operating effectively:

## State of Washington

- Key Control #1: ProviderOne verifies that the provider is eligible to provide the specific service covered by the plan to the specific Beneficiary. (Rights and Obligations)
- Key Control #2: ProviderOne verifies that the Beneficiary was eligible for the particular category of service at the time it was rendered. (Rights & Obligations)
- Key Control #3: ProviderOne only pays the maximum claim procedure amount. If the claim's requested amount is less than the maximum amount, the requested amount is paid. (Valuation)
- Key Control #4: ProviderOne verifies that all coded data items consisting of procedure codes are within the valid HIPAA Transactions and Code Sets (TCS) and are covered by the State Plan. (Rights & Obligations)

### **Conclusion:**

Based on our understanding and test results, we concluded that the automated control was in place and operating effectively at the time of our testing. IT General controls related to the automated controls were adequate to ensure that the control operated consistently for six months of the audit period. However, we were unable to evaluate whether related IT general controls were adequate to ensure that the control operated consistently for six months of the audit period. See IT General Control understanding and testing at [IT General Controls](#).

Our understanding and control risk assessment, which incorporates these conclusions, is documented at [Risk Assessment](#).

Testing Strategy:

The following procedures are **required** for all automated key controls for financial and single audits:

### **STEP 1: Understand Automated Key Control**

Gain an understanding of the automated key control. The understanding can either be documented in the control system step or could be documented here in this step.

Auditors should consider the following aspects of the automated control when gaining an understanding:

- Is there written documentation of the edit check?

*We would expect written system documentation that defines the edit check, including any formulas or logic or sources for comparison.*

- What transactions or data is subject to the edit check? How is the edit check triggered?
- What happens if the edit check is not passed?

*For example, some edit checks result in automatic rejection of a transaction or inability to post or proceed with a transaction. Other edit checks may flag a transaction for additional review or additional steps.*

# State of Washington

*Other edit checks may only result in a warning to the user, which the user could choose to ignore – in which case this would not normally be strong enough to be identified as a key control.*

- Is there any exception situations where the edit check can be by-passed or manually cleared or waived? If so, does edit check waiving or clearing generate any notifications, logs or exception reports? Also, what are procedures to review and follow up as needed on exceptions?

## **STEP 2: Confirm and Test Automated Key Control**

Confirm and test the automated control.

To test the automated control, consider the following procedures:

- Re-perform the edit check for selected transactions.

*Auditors would NOT normally use sampling for automated controls. Instead, auditors should judgmentally select one instance of each significant variation of the check. If the number of potential variations is large, auditors would judgmentally select based on risk factors (for example, the most common scenarios, or scenarios associated with identified risks, or scenarios that are not addressed by the entity's testing procedures).*

*In some cases, it may be possible for the auditor to reperform the edit check for the entire population.*

- Consider the use of analytical procedures such as trends or descriptive statistics on the population (like average, minimum and maximum values, or a graph of values across the population) and follow up on any unexpected values or trends. Analytical procedures would normally also count as a substantive test.

Guidance/Criteria.:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**  
**[Information Technology](#) Planning Guide**

Auditors may contact [Team IT Audit](#) with any testing strategy or control assessment questions or to request assistance from an IT Specialist.

Record of Work Done.:

## **STEP 1: Understand Automated Key Control**

The following automated key controls were identified:

# State of Washington

- Key Control #1 (Automated): ProviderOne verifies that the provider is eligible to provide the specific service covered by the plan to the specific Beneficiary. **(Rights and Obligations)**
- Key Control #2 (Automated): ProviderOne verifies that the Beneficiary was eligible for the service at the time it was rendered. **(Rights & Obligations)**
- Key Control #3 (Automated): ProviderOne only pays up to the maximum claim procedure amount. If the claim's requested amount is less than the maximum amount, the requested amount is paid. **(Valuation)**
- Key Control #4 (Automated): ProviderOne verifies all procedure codes are within the valid HIPAA Transactions and Code Sets (TCS) and are covered by the State Plan. **(Rights & Obligations)**

See Team FA control understanding at [Controls - ProviderOne](#).

On March 22<sup>nd</sup>, 2024, we met with Ed Hicks, IT System Admin, Angela Skinner, IT System Admin, and Kari Summerour, External Audit and Compliance Manager and Audit Liaison, to gain an understanding of the four automated controls over eligibility and allowability of claims. The automated controls cover **Provider and Beneficiary Eligibility, Payment Reasonableness, and Valid Codes**.

## Claims Background:

The ProviderOne (P1) system was created by Acentra (CNSI merged with Kepro and are now Acentra Health) who specializes in health information technology enterprise solutions. P1 adjudicates all claims and MCO encounters in the Claims subsystem. There are 120 data elements from a claim (also known as claim attributes or Domains) that are available to be used in the assignment process. Examples of attributes (or Domains) include Transaction Code Number (TCN), Claim Type, Procedure Code, Provider Enrollment Type, and Managed Care Transaction Type. Account coding has multiple elements: Agency, AFRS Program Code, Allocation Code, Appropriation Index, Fund, Organization Index, Program Index, Proj/SubProj/Phase, and SubObj/SubSubObj. Claims are identified by the Transaction Control Numbers (TCN) in ProviderOne. The tables containing the crosswalk between claim attributes and account coding reside in the P1 Reference subsystem. Using the details included in a claim, system edits will verify eligibility and allowability of the claim based upon related information included in P1 subsystems, such as Client, Provider, etc. Payment will not be made unless claims pass the hard edits. If a claim does not pass the hard edit, an error code will post on the claim indicating the reason it was suspended or denied. Each edit has a disposition when a claim is successfully validated of 'paid'. If a claim does trigger a validation edit, the validation edit is configured with a disposition either to 'suspend' or 'deny'. Claims that are suspended are reviewed manually by claims processing. Claims that are denied are automatically sent back to the provider unless in the rare instance the provider did not input any information that identifies them on the claim. In this case, the claim is denied and no action is taken. More details on this topic can be seen under Key Control #1 below.

## Overriding edits (Forcing edits)

- P1 allows for edits to be overridden. In the ProviderOne edit profile screen, each edit has a field named 'forcible' with a selection of 'yes' or 'no':
- If a claim edit forcible function is set to 'yes', this means that claims processing staff (adjudicators) can "force" the edit. There is guidance for adjudicating claims within P1 to help ensure claims are adjudicated correctly.

## State of Washington

- If a claim edit forcible function is set to 'no', claims processing staff cannot force the edit.

*Note: HCA has a process to override an edit, which occurs when a claim is NOT forcible but after research determines the edit should be **overridden** in a specific instance. In this case, the Systems Operation and Implementation Unit (SOIU), who configures edits, can switch the forcible field to 'yes' and push the claim through a triggered edit and determine the specific exception route the claim needs to follow. Further discussion regarding overriding edits through this process can be seen in the General IT section at [IT General Controls](#).*

See additional understanding of the automated controls in Team FA workpapers at: [Controls - ProviderOne](#).

### Important definitions:

- **Beneficiary:** The individual eligible for Medicaid benefits. Also referred to as the client. Beneficiary eligibility is determined by the Agency and Client Eligibility System (ACES) and the Comprehensive Assessment Reporting Evaluation (CARE) system managed and owned by the Department of Social and Health Services (DSHS). If eligible for care, the beneficiary will be covered by one of many health insurance providers that are Medicaid funded (for example Molina). Medicaid eligible enrollees that are receiving health care benefits.
- **Provider:** A licensed health care professional that provides services to beneficiaries.
- **Taxonomy:** Taxonomy codes are used to identify provider specialty/line of services. The Health Care Provider Taxonomy code set is a collection of unique alphanumeric codes, ten characters in length. The code set is structured into three distinct "levels" including Provider Grouping, Classification, and Area of Specialization. These classifications and designations detail the services providers can provide by procedure codes and modifiers to the Medicaid client. Providers may have multiple taxonomies. The taxonomy must be included in the claim. Taxonomies may be listed in multiple Benefit Service Plans.
- **Transaction Code Number:** The ProviderOne system assigns an 18-digit Transaction Control Number ([TCN](#)), also referred to as a claim number, to each claim received. When a claim is denied, the resubmission is considered a new claim and is assigned a new TCN. Suspended claims retain their original TCN. On all claims, the original and new TCN are available.
- **NPI:** A National Provider Identifier or NPI is a Health Insurance Portability and Accountability Act (HIPAA) Administrative Simplification Standard. It is a unique, intelligence-free numeric identifier used to identify health care providers in standard transactions, such claims, eligibility inquiries and responses, claim status inquiries and responses, referrals, and remittance advices. *Note: If providers submit electronic files without a National Provider Identifier (NPI) and HCA doesn't know who to send them back to and they fall into what is known as "the black hole." The direct data entry system will not let a provider submit a file without an NPI, however, some providers choose to use their own software for billings and therefore submit electronic files. When electronic files are submitted, HCA doesn't control whether an NPI is input.*

### Key Control #1: ProviderOne verifies that the provider is eligible to provide the specific service covered by the plan to the specific Beneficiary. (Rights and Obligations)

As discussed above, the taxonomy code assigned to a provider determines the services the provider is eligible to provide. The Department of Health issues provider licenses. The license determines what taxonomy code numbers (services) the provider can provide. (For example:

## State of Washington

behaviorial specialists are not able to request payment for heart surgery based on their taxonomy.) ProviderOne verifies that the provider is eligible to provide the specific service requested for reimbursement based on their taxonomy. ProviderOne also compares the provided service to the beneficiary's Recipient Aid Category within the client's benefit service packages (BSP) and to the designated services that can be provided for the Taxonomy to determine whether the Provider can provide the service to that client. In addition, P1 will identify unallowed combinations of data such as an invalid taxonomy and modifier combination.

### **Key Control #2: ProviderOne verifies that the Beneficiary was eligible for the service at the time it was rendered. (Rights & Obligations)**

On May 20, 2024, we met with Lorena Delgado, IT System Admin, Ed Hicks, IT System Admin, and Kari Summerour, External Audit and Compliance Manager, and Audit Liaison to discuss key control #2.

Individuals are determined eligible for Medicaid primarily based on financial situation. Each eligible beneficiary is assigned to a 'RAC' (Recipient Aid Category) that designates what care they can receive. All RACs are assigned to a Benefit Service Plan (such as Take Charge Family Planning, Categorically needy). When a provider bills for a service, P1 will verify whether the service is covered under the beneficiary's plan. P1 also verifies beneficiary was eligible based on other factors, such as beneficiary is deceased, service was provided on a date that was before beneficiary was determined eligible for Medicaid or after eligibility ended.

### **Key Control #3: ProviderOne only pays up to the maximum claim procedure amount. If the claim's requested amount is less than the maximum amount, the requested amount is paid. (Valuation)**

If the claim is submitted that is at or above the allowed rate, the allowed amount will be paid. If the claim is less than the allowed rate, the claim amount will be paid.

There are instances where the allowed rate is overridden and manually priced. An example could be that a procedure wasn't priced as it should have been. When this occurs a help desk ticket is created approving the manually priced claims and an explanation is entered in the system.

### **Key Control #4: ProviderOne verifies all procedure codes are within the valid HIPAA Transactions and Code Sets (TCS) and are covered by the State Plan. (Rights & Obligations)**

The Center for Medicare and Medicaid Services (CMS) create the codes sets. The State Plan is the officially recognized statement describing the nature and scope of Washington State's Medicaid Program. Each state, through legislative and DHHS approval has state plan amendments they request to amend the state plan and potentially cover additional services. Approved services are detailed in State plan amendments for reimbursement purposes. ProviderOne compares all reimbursement claim's procedure codes to the configured HIPAA Transactions and Code Sets (TCS) to ensure procedures are allowed.

### **Summary of key automated controls**

## State of Washington

- Key Control #1: ProviderOne verifies that the provider is eligible to provide the specific service covered by the plan to the specific Beneficiary. (Rights and Obligations)
- Key Control #2: ProviderOne verifies that the Beneficiary was eligible for the service at the time it was rendered. (Rights & Obligations)
- Key Control #3: ProviderOne only pays up to the maximum claim procedure amount. If the claim's requested amount is less than the maximum amount, the requested amount is paid. (Valuation)
- Key Control #4: ProviderOne verifies all procedure codes are within the valid HIPAA Transactions and Code Sets (TCS) and are covered by the State Plan. (Rights & Obligations)

### **STEP 2: Confirm and Test Automated Key Control:**

See [Edit Selection Methodology Confidential](#) for edit selection methodology.

To gain a better understanding of the edit completeness monitoring controls in place, on 10/11/2024, Jon Howard, Team System Audit AAM, and Diana Evans, IT Auditor, met with the follow HCA staff:

Dineen Kilmer, P1 Section Manager

Ed Hicks, Systems

Angie Skinner,

Kari Summerour, Audit Liaison

There are several monitoring and control activities in place to help ensure the completeness and effectiveness of edits. The following is a summary of our discussion:

#### Collaboration and Expertise of Staff Requesting and Maintaining Edits

Edits are requested and monitored by different HCA Departments, such as Policy, Rates, Finance, etc., depending on the type of edit. Ed's group who create and maintain the edits similarly specialize by edit area to gain the extensive knowledge and expertise to maintain the edits and work with program staff. When creating or maintaining edits, updating rates, etc. Ed's SIOU staff work closely and communicate with the relevant program staff. We observed the communication between program staff and SIOU staff during our IT general control testing.

#### Daily Monitoring reports

Dineen informed us that the ProviderOne system automatically provides a daily Internal Daily Operational Dashboard report to both the Acentra operations staff and HCA regarding the previous day's adjudication and processing results. This report is used by HCA and Acentra staff to determine whether edits are functioning as intended. These reports provide indicators that processing is completed successfully and the results are within normal operating parameters. We observed the daily monitoring reports include suspended, denied, and paid claim percentages by source. See [DailyDashboardReport client](#) for example of the report.

## State of Washington

We inquired how staff are using the reports to determine whether edits are functioning as expected. Dineen stated that the monitoring reports are a job status report and they typically expect a paid/denied ratio of about 80/20. If the ratio is off for only a day, Dineen will not follow-up, however, if the ratio is off persistently for several days, she will follow up with Acentra. Acentra will provide a report of the top 10 edits that were posted during the time frame that HCA requests. Dineen will work with the System Administrators and look for irregular patterns of a specific edit paid/denied ratio to identify the root cause of the issue. Once they identify the edit(s) that are denying more claims, the System Administrator team will investigate and make the correction needed. Ed stated that he is looking for spikes up or down in the edit hitting. If he notices a spike in either direction, his group would research to determine whether an edit is not functioning properly.

We received a copy of the email that was sent 10/10/2024 and confirmed that 17 HCA staff received the email including Dineen, Ed, Angie, Jerry Britcher, Chief Information Officer, Todd Emans, P1 Operations Senior Manager, Michelle Osborne, P1 Operations Business Analyst, and Rebecca Carrell, Deputy Assistant Director, Medicaid Program Division, as well as four Teams/Groups at Acentra.

### Program Integrity

In addition to general IT controls, the Program Integrity group looks across claim history and compares amounts paid for services to policies and looks for overpayments. If an overpayment is identified, the funds will be recouped. Program Integrity consults with the System Administrators on an as needed basis if edits were causing overpayments. During an update meeting, we communicated the activity of program integrity to Team FA. Team FA will determine if they will gain any additional information related to Program Integrity.

### Provider Notification

Ed also mentioned that if providers were paid incorrectly, the provider usually notifies HCA quickly as they do not want to be underpaid and if they were overpaid, HCA recoups overpayments.

Based on inquiry and observations during our testing of edit changes and rate updates at Edit configuration and rate change testing confidential we determined that HCA has controls to monitor completeness and accuracy of edits. We did not perform further testing at this time. We determined the risk is low that missing (incomplete) edits would be significant to the ACFR.

**Testing:** We performed Rules Engine Testing and Edit Scenario Testing to test automated controls.

### Rules Engine Testing

P1 edits are performed through a series of rules. These rules are added and updated through a subsystem called the Rules Engine. HCA and Acentra developers use the RuleIT Composer component of RuleIT product to develop the rules. The RuleIT Composer compiles the rules and stores them in the database. The TraceTool contains descriptions in plain talk of what would cause the edit to post.

On May 17th, 2024, we met with Ed Hicks, IT System Admin, Angela Skinner, IT System Admin, and Kari Summerour, External Audit Liaison and Compliance Manager, to perform our rules engine testing. Prior to our meetings, Ed sent us the TraceTool information for each edit which

## State of Washington

described in plain talk what would cause the edit to post. Due to the rules engine having proprietary information within, Ed mentioned the vendor does not want to release this information and therefore Ed requested that we do not take screen prints.

- **Testing:** During our meeting, Angela presented her screen and we viewed the logic code in RuleIt for each error code selected. We compared the provided TraceTool information to the RuleIt code or configuration settings within the ProviderOne system and saw that either the RuleIt included code covering each item described in the TraceTool logic or it was covered by a ProviderOne configuration setting. See "Rules Engine Testing 2024" Tab here: [Edit population, selection and testing client confidential](#). During testing, Angela mentioned that there are times that notes within the rule engine in green font and could indicate if the edit needed to be updated. Being mindful of this, we reviewed the green font notes during each rule engine test to ensure no selected edits needed updated. We also inquired with Angela whether each edit's Rule Engine logic was current or if the edit's Rule Engine logic needed updated.
- **Results:** Of the 20 selections reviewed, 19 selections edit logic from TraceTool for the edit type agreed to the programming in the RuleIT rules engine and were current and did not need any updates. For one of the 20 selections, during testing, we were informed that edit 2255 was actually a configuration created many years ago by a former employee of HCA's and since it was not created correctly, it was never used. Edit 2255 is not a valid edit and should be identified as such within population of edits. We verified in ProviderOne that edit 2255 was not active. We removed this edit from our testing selections leaving us with 19 edits to test. While this does reduce our testing by one selection, we determined we still have an adequate amount of edits to test along with the work our Data Analysis team is performing. Ed informed us that the edit didn't have a zero in front and so it didn't match their error codes categories. With that, we reviewed the error code population again to determine if there were more edits without a zero. There was one, edit 2190, which was listed as obsolete. We searched for Obsolete edits and noted there were 191 obsolete edits in total. We followed up with Ed and asked why obsolete edits were still in ProviderOne. Ed stated that they were retained for auditing purposes. Kari informed us that Dineen Kilmer, IT Section Manager, stated that these edits take a substantial amount of work to develop and so they don't delete them in the case it could be used as a reference when creating new edits. There are also rare instances where an edit will have been removed and then implemented again in a later year. We inquired if all obsolete edits were set as inactive. Ed mentioned that he would need to look in ProviderOne to determine if obsolete edits are active. We inquired and were informed there is no review of obsolete edits. We also inquired if obsolete edits ever suspended or denied claims and showed up in the daily monitoring reports as being frequently triggered and Ed mentioned that he wasn't aware of an instance where they ever needed to force a real claim through an obsolete edit. Ed reviewed a few edits quickly during our meeting and mentioned that they were all set to inactive. I requested that Ed share his screen and we randomly selected obsolete edit 12965. We then verified the disposition was set to 'ignore' or inactive. We further inquired and were informed that because obsolete edits have inactive dispositions, the end dates being indefinite do not matter. Based on our understanding, obsolete errors are kept for a business purpose and are inactive. **No exception.**
- We were also informed that edit 09025 is currently posting because the system has already calculated an Allowed Amount for the claim based on loaded rates or Crossover payment methodology but the calculated Allowed Amount is higher than what Rates unit instructed SOIU to enter into the system as the high end for the posting logic. Per Ed, "These Suspend with Claims Processing and are sent to the

## State of Washington

SOIU unit to analyze per the error code text file based on the Claim Type. The Systems Operation Implementation Unit then reviews to see why this is posting. Normally it is a Medicare Crossover claim that has a very large Allowed Amount because of the severity of the care needed. If it is a Crossover and it looks correct we would force it through. Other issues our Rates department gets involved to verify if it is correct and can be forced and have the dollar amounts that cause the edit to post updated if needed." On June 6, 2024, we discussed this issue with Joel Todd, IT Auditor who performs the data analysis to further test P1 edits. Joel mentioned that his review does include reviewing claim over payments where the rate has been reduced, however, his review only covered paid claims, and does not include claim under payments where the claim was suspended/denied due to the maximum amount needing increased. We do not consider this to be an exception because the claims are suspended and adjudicated to ensure correct payment amount is made.

### Edit Scenario Testing

To conduct Edit Scenario testing, meetings were held on May, 20, 24, and 31, 2024 with Brandon Diltz, IT System Administrator, Ed Hicks, IT System Administrator, Angela Skinner, IT System Administrator, Lorena Delgado, IT System Administrator, and Kari Summerour, External Audit and Compliance Manager.

All tests were conducted in the test environment using real claims. The testing database contains the prior years claims and is brought in at the end of each year. Ed informed us that because all security patches are tested in the test environment prior to being loaded into production, he believes that the test environment does have the same security posture as the live environment. Ed also mentioned that there are much fewer users in the test environment. Note: Lorena performed the scenario test for Edit 00545 only because she is more familiar with Provider portals. Brandon performed the other 18 out of 19 scenario tests because he is more familiar with the validation edits and claims processing. To identify claims to test, Ed looked across the current data set of claims in the test environment for claims that had the error codes selected posted. For error codes that were not identified as already posting on claims, Ed identified claims that could be modified to trigger the error.

- Testing(Edit population, selection and testing client confidential) Edit Scenario Testing 2024): During each of our meetings, Brandon shared his screen and walked us through the scenario test for each edit error code to trigger. **Note: Transaction Code Number:** The ProviderOne system assigns an 18-digit Transaction Control Number (TCN), also referred to as a claim number, to each claim received. When a claim is denied, the resubmission is considered a new claim and is assigned a new TCN. Suspended claims' TCNs do not change.
- **Results:** During scenario testing, all error codes either activated when the claim testing scenario triggered the validation edit, or deactivated when the issue that triggered the error code was resolved. We did not identify any automated control deficiencies during edit scenario testing.

### Additional Data Analysis Testing (Documented by and Reviewed by Team DA staff):

We also determined we would complete some in-house CAATs (computer assisted audit techniques) work, which will allow us to look at the actual payments made during the audit period, and determine if ProviderOne processed payments as expected based upon our understanding. This will be a re-performance of the controls on a large scale, which will provide us with much more assurance if the controls are working as described.

## State of Washington

Additionally, since we are reviewing actual payments, we consider this dual purpose testing as it will provide us with a great deal of substantive evidence as well. This is in addition to the more detailed substantive work to be completed by the ACFR team. If any particular exceptions are identified during our testing, we will inform the line team so they can increase the sample size of their substantive work.

To complete our testing, we began by analyzing the population to determine what our testing population should include [see [FY24 Dual Purpose Procedure Code Testing](#)]. Based on this analysis, we determined we would consider all FY24 paid claims paid at the service line level. We then summarized this population by procedure code and claim type in order to identify specific procedure codes for testing [see [FY24 Dual Purpose Procedure Code Testing](#)]. Not all payments made through ProviderOne contain a procedure code, but we will concentrate on the population that does based upon the key controls identified. In order to get as much coverage of dollars spent during FY24 as we can, we initially determined we would select all procedure codes with more than \$3 million in paid claims for testing, which were not tested in our prior year reviews between FY14 and FY23. We would also exclude the OPPS claim type (testing OPPS claims requires more information than what is available in the ProviderOne data) from our selections. Following this criteria, we identified a minimal number of new codes to test, so we expanded our selection to include additional codes not tested since FY17 and FY18 [see [FY24 Dual Purpose Procedure Code Testing](#)]. This provided us with 10 procedure codes for testing, which included \$83,761,913.91 related to 833,438 claims [see [FY24 Dual Purpose Procedure Code Testing](#)]. This makes up 1.24% of the total population. Each year we try to focus on codes that have not been tested before in order to test as many codes as possible over the years of testing. Our queries to analyze and create the testing population for the procedure code testing can be seen at [[ProcedureCode Population Queries](#)].

The following provides the details of our data analysis testing as related to key controls #3 and #4:

**Key Control #3:** ProviderOne only pays up to the maximum claim procedure amount. If the claim's requested amount is less than the maximum amount, the requested amount is paid. **(Valuation)**

Based on our selection of procedure codes as described above, we identified the approved rates based on HCA and DSHS fee schedules available on their websites. We then analyzed associated medical and social service claims from the ProviderOne system and compared the paid amounts to these rates to ensure claims were paid at the appropriate amounts. We performed the testing with SQL queries [see [FY24 ProcedureCode Testing Queries](#)] and documented the results at [[FY24 Dual Purpose Procedure Code Testing](#)] (the testing of each procedure code is included in the last 10 tabs of the spreadsheet after the "Testing PSC" tab). Records tested included \$83,761,913.91 from 833,438 paid claims, which makes up 1.24% of the population of FY24 ProviderOne claims paid at the service line level with procedure codes [see [FY24 Dual Purpose Procedure Code Testing](#)]. The service line level payments with procedure codes make up over 81% of the total population of dollars paid in ProviderOne and over 89% of all records [see [FY24 Dual Purpose Procedure Code Testing](#)].

For the procedure codes included in our testing, we have determined the ProviderOne system is paying claims at or below the appropriate rates included in the identified fee schedules and reports. No exceptions identified.

**Key Control #4:** ProviderOne verifies all procedure codes are within the valid HIPAA Transactions and Code Sets (TCS) and are covered by the

# State of Washington

## State Plan. (Rights & Obligations)

During our testing of procedure codes [see [FY24 Dual Purpose Procedure Code Testing](#)], we found all procedure codes tested were part of the agency's plan for covered procedures. We did this by identifying each selected procedure code in its corresponding provider billing guide and fee schedules available publicly on the HCA and DSHS websites. We saw no evidence of claims paid through the ProviderOne system for services not covered by the agency. No exceptions noted.

### **Conclusion:**

Based on our understanding and test results, we concluded that the automated control was in place and operating effectively.

## D.4.PRG - Human Services

*Procedure Step:* IT General Controls

*Prepared By:* DLE, 10/17/2024

*Reviewed By:* SHW, 11/7/2024

Purpose/Conclusion.

**Purpose:** To determine whether IT general controls related to the claims edits were in place and adequately designed to ensure the edits operated consistently during the audit period.

### **Conclusion:**

General controls related to the automated controls were adequate to ensure that the control operated consistently for six months of the audit period.

**We identified the following weaknesses related to the Acentra Health, LLC Provider One System and Organization Controls (SOC) 2 Type 2 audit:**

V: HCA Confidential IT Controls SOC Audit (Part of ML)

- The ProviderOne vendor's SOC 2 Type 2 audit did not cover the entire fiscal year 2024. The audit did not include the first six months of the fiscal year, July 1, 2023 - December 31, 2023.
- The Authority receives and reviews the Acentra Health ProviderOne SOC 2 Type 2 audit report to determine whether there are exceptions that require corrective action. However, there are no documented procedures for receiving and reviewing the report to ensure the review is adequately and consistently performed.
- The Authority did not maintain documentation to support there was a review of the SOC 2 Type 2 audit report.

# State of Washington

In addition, we noted the following insignificant weaknesses:

We identified the following weaknesses related to the process of forcing edits through the override process:

- Separation of duties between changing edits to forcible and forcing claims through edits was not system enforced. (Weakness #2) E: HCA ProviderOne Override IT Controls Confidential
  - The Authority did not have a monitoring process in place to ensure that all claims that were forced through the override process were authorized. (Weakness #2) E: HCA ProviderOne Override IT Controls Confidential
- There were no documented procedures for performing rate changes in ProviderOne. (Weakness #3) E: HCA Non-Confidential Provider One IT Controls

We noted no material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

## **STEP 3: Understand General IT Controls**

Gain an understanding of the general IT controls that support the continued proper operation of the automated control. Identify key general IT controls and note any control weaknesses.

- Who or what initiates program changes? (i.e. users, changes in legislation, special projects due to unexpected emergencies)
- Are changes requested in writing?
- How are program changes assigned to programming staff?
- Are changes to the program documented? How?
- Are there controls in place to ensure change requests are documented, authorized and appropriately assigned?
- Changes should be made in a development/test environment. Are changes adequately tested in a test environment before they are put into production? Who tests? Is the testing documented?
- What version control software is used?
- Does the version control software adequately control access to code, and provide for separation of duties between programmers, approvers, testers, and those moving code into production?
- Are there controls to prohibit multiple copies of the same program from being checked out at the same time?
- Could a programmer make unauthorized changes and put a program back into production without anyone knowing? What prevents them from doing so?
- Is the approval of an independent individual required before the program change is moved into production?

## **STEP 4: Confirm Key General IT Controls**

Confirm your understanding of key general IT controls to determine whether they have been placed in operation (*whether the entity has actually implemented key controls*).

# State of Washington

## **STEP 5: Test Key General IT Controls**

Document whether general IT controls will be tested. Option 1 would result in control risk at MAX for the automated control. Either option 2 or 3 is necessary in order to set control risk at LOW.

Auditors should list and test each key program change control identified in the related "Gain an Understanding" step.

If tests are performed in a test environment, the auditor should ensure that the test environment has the same patch management controls as the live environment. If tests are performed in the live environment, the entity should be able to identify and correct any errors caused.

## **STEP 6: Final Control Risk**

Evaluate the results and document a final control risk assessment in the control system step. Consider whether any deficiencies identified with either the automated control or related general IT controls represent material weaknesses or significant deficiencies.

*Note: general IT control deficiencies do not necessarily mean the automated control is not properly functioning. General IT control deficiencies would normally be considered a significant deficiency or material weakness only if it caused an issue with the compliance requirement or assertion.*

## **Recommendation Review Requirement**

IT Security related information is considered category 3 data protected by Public Request Exemption RCW 42.56.420. Issues related to IT Security require the following special handling:

- [Instructions](#) are located in Team IT Audit's System's Sharepoint page.
- Details of IT Security related issues should NOT be included in any emails or helpdesks.
- Exit, ML and Findings should be separately communicated in an IT Security Results Document.
- Findings will be referenced, but not included in the audit report.
- All IT security-related recommendations must be reviewed by [Team IT Audit](#).
- Template language for common IT related recommendations can be found in [ARS Part 5 Chapter 8](#).

## **PUBLIC REQUEST EXEMPTION**

Some IT related information is protected by Public Request Exemption RCW 42.56.420 for cyber security purposes. The details documented in the record of work and support workpapers may qualify for this exemption. If so, auditors must include this statement in the record of work done and any related workpapers: **"This record contains information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited "**.

Guidance/Criteria:

Record of Work Done:

# State of Washington

**This record may contain information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited.**

Redactions are highlighted in light orange.

## **STEP 3: Understand General IT Controls**

On April 15<sup>th</sup>, 2024, we met with the following people to discuss General IT Controls that provide assurance over the continued operation of the claim edit checks:

- Ed Hicks, IT System Administrator- Automated controls
- Angela Skinner, IT System Administrator- Configuration and Change Management
- Dineen Kilmer, IT Section Manager- SOC Audit review and vendor monitoring
- Heidi DeVries, IT Quality Assurance
- Samantha Zimmerman, Internal Controls Officer
- Kari Summerour, External Audit and Compliance Manager

Edits and rates must be programmed and updated correctly in order to rely on edits to consistently work as intended and providers to be paid the correct amount. Therefore, we determined program integrity and change management as the key control area for the automated controls identified at Key Controls #1 - 4 Edit Checks (Automated). Both the Acentra vendor and HCA are involved in the development and maintenance of edits as discussed below.

### **Vendor Controls:**

The ProviderOne system was created by Acentra (CNSI merged with Kepro and are now Acentra Health) who specializes in health information technology enterprise solutions. While HCA controls much of the day-to-day operation of the system, Acentra hosts the application and performs change management over the core P1 system. Therefore, processing integrity and change controls at Acentra are key general controls over the automated controls. HCA confirms that general controls are in place at Acentra by requiring in the contract with Acentra that a biennial Service Organization Controls (SOC) 2 Type 2 audit is conducted. In a SOC 2 Type 2 Audit, vendor controls are reviewed for security, availability, processing integrity, confidentiality, and privacy. These categories cover processing integrity and change management; therefore, the SOC audit addresses the IT general control areas applicable to our audit of automated controls.

**The ProviderOne vendor's SOC 2 Type 2 audit did not cover the entire fiscal year 2024. The audit did not include the first six months of the fiscal year, July 1, 2023 - December 31, 2023. (Weakness #1)** See V: HCA Confidential IT Controls SOC Audit (Part of ML). The previous SOC audit for P1 had an audit period of January 1 - June 30, 2022. The results of our FY22 review of the 6-month SOC report did not identify any issues. The following was taken from the S1Washington-FS22 TeamMate project: *The review covered a **six month period**, January 1, 2022 through June 30, 2022 and included expected review areas such as policies, procedures, system monitoring, access controls, network security, data center security, disaster recovery, among others. There were no exceptions noted. One area noted there had been no testing performed over the back up and recovery testing as it had not occurred within the audit time frame, and there was no mention of*

## State of Washington

*when the last testing had occurred. It was the opinion of the auditors that controls at CNSI related to the ProviderOne system operated effectively throughout the six month audit period. TA*

Dineen Kilmer, P1 Section Manager, receives and reviews the report to determine whether there are exceptions that require corrective action. Dineen explained that she reviews for findings and exceptions and will follow up with Acentra regarding a corrective action plan. Dineen further explained that Acentra submits an annual plan each year that includes items such as: user access, firewall (up-to-date), software upgrades, network upgrades, server upgrades, process improvements, and quality measures - keeping rework rates of UAT below 3%. This includes the submission of a monthly report where corrective action plans are tracked. Per Dineen, the vendor and HCA work together to determine the amount of time the corrective action will take. If Acentra did not correct deficiencies, there are consequences that could be enforced within the contract. Dineen stated that if this ever happened, she would work closely with HCA lawyers, but they have never needed to do so. Dineen provided us with a copy of the annual plan titled "Annual Plan for State of Washington ProviderOne System" dated 7/12/2023 which was during FY2024. *Note: Per the plan, this is not a contract requirement, rather an agreement between HCA and Acentra that this is a beneficial document for both parties.* We observed that the plan included the following areas:

- Major Activities Planned
- ProviderOne Software Releases
- System Maintenance and Infrastructure Activities
- Business and System Improvement Objectives
- Customer Service Performance
- Corrective Action

These areas align with the areas described by Dineen.

Dineen also provided us with the a montly progress report during the FY2024 audit period (November 2023). We observed that the monthly plan contains the same sections at the annual plan. As it relates to our automated controls, we noted the following from the document:

- 3.1.2 Other Contract Activities: Disaster Recovery Testing was performed on 9/14/2023. This was unknown based on our review of the SOC report.
- 4 Releases and release schedules
- 5.1 Change Requests

Based on our observations, an annual plan and monthly progress reports are submitted to HCA that communicate changes and corrective action plans.

Per Dineen, there are no formal procedures for receiving and reviewing the SOC audit report to ensure review occurs and is performed consistently. **The P1 Section Manager, receives and reviews the Acentra Health ProviderOne SOC 2 Type 2 audit report to determine whether there are exceptions that require corrective action. However, there are no documented procedures for**

# State of Washington

**receiving and reviewing the report. (Weakness #1)** See V: HCA Confidential IT Controls SOC Audit (Part of ML)

**Key General IT Control #1- The ProviderOne IT Section Manager, reviews the SOC Audit Report to determine if there are any findings that require corrective action to be taken. If corrective action is required, the ProviderOne IT Section Manager will monitor the corrective actions taken by reviewing the submission of the vendor's monthly report to HCA.**

## **HCA Controls:**

In addition to vendor controls, user entities (HCA) must also have controls over processing integrity and change management. We identified the following general controls that provide assurance over the complete and accurate operation of the claim edit checks:

- User Access
  - Access to turn the "force edit" function on/off (in other words, override the edit)
- Change Management
  - SOC Audit report review and vendor monitoring- Acentra
  - Configuration Management
    - Edit Configuration and Changes
    - Simple Rate Changes (Valuation) Note: We selected simple rate changes because they apply to Key Control #3: *ProviderOne only pays up to the maximum claim procedure amount. If the claim's requested amount is less than the maximum amount, the requested amount is paid.* (Valuation).
    - General Charge Modes
- Daily Monitoring Reports
- Program Integrity

## **User Access**

Each edit has a field named 'forcible' with a selection of 'yes' or 'no' which can be viewed on the P1 edit profile screen. If a claim edit forcible function is set to 'yes', this means that the claims processing team can force the claim through the edit. Based on our automated control testing population, there are currently 1,866 total edits. There are currently 1,645 edits that are forcible by claims processing. Each of these forcible edits has an exception path to follow. Every error code that could be forced by claims processing has a unique text file attached that gives instructions on how to force the specific edit. Additional information related to forcing edits is located on page 3: Error Code Maintenance\_client\_confidential.

If an edit's forcible function is set to 'no' then the claims processing team (adjudicators) can not force the claim. Currently, there are 221 edits that cannot be forced through the regular adjudication process. Because of their level of expertise related to edits and associated exception paths, only designated HCA Enterprise Technology (ETS) staff can switch the forcible field to 'yes', thereby overriding the edit. **Access to change an edit to be forcible (Override) is restricted to only those individuals who need access to perform their job duties. (Key**

## State of Washington

**General IT Control #2)** Occasionally, there is a request from the Clinical Policy group to override an edit due to a specific business need. Clinical Policy group is a group of clinicians, nurses, and doctors that are hired to perform review of claims submitted. Once the edit is made forcible and the claim is forced through by the ETS group, the edit's forcible field will then immediately be changed back to 'no' to prevent claim processing adjudicators from erroneously forcing other claims through the edit. The claim history and the edit history both record any edits that were changed or forced through.

### **Manual overriding edits - Significance**

There is a report (10377) that details forced claims, however, this report includes the edits that are determined to be set to forcible (not an override); therefore, this report would include all edits that were forced through the regular adjudication process. We are unable to use this report to determine materiality because it does not identify which edits were overridden and then forced. Ed requested the vendor produce a report listing all the edits that had been overridden by Ed's SIOU group. Ed provided us with the report of claims that were manually overridden. There were two claims on the report, one for \$89.00 and the other for \$943.56. Ed provided an explanation for each claim that was overridden. The number of claims and amount of the claims overridden is insignificant to the ACFR. See [Manual override of edits\\_client](#)

HCA has not configured a usable query/report that details overridden claims nor do they monitor for unauthorized overrides. **HCA did not have a monitoring process in place to ensure that all claims that were forced through the override process were authorized. (Weakness #2)** E: HCA ProviderOne Override IT Controls Confidential

### **Change Management**

There are three change management areas that relate to our automated key controls: Edit configuration and change controls, Simple Rate changes, and General Charge Modes. Configurations all follow a process that is enforced by system user profiles. Only specific users have the various role/profile to approve specific configuration changes in the Production environment.

#### 1. Edit configuration and change controls

Kari Summerour, HCA Audit Liaison, provided the following written procedures related to Error Code Maintenance; [Error Code Maintenance\\_client\\_confidential](#) that covers "adding a new error code" on page 8, the KT life cycle; [KT Lifecycle\\_client\\_confidential](#) that covers the System Development Life cycle on page 1, and KT Testing Process [KT Testing Process\\_client\\_confidential](#) that covers the User Acceptance testing on page 1. **Key General IT Control #3: New rule engine configurations go through a KT (change) process that includes user acceptance testing to ensure changes are authorized, tested, and function as intended.** Configurations requests come from the Policy group at HCA. The rate change process begins with the System Operations and Implementation Unit (SOIU) receiving a rate update request via a ticket through a shared inbox and are triaged for assignment to Information Technology Specialist (ITS) staff within SOIU. Each ticket has a number that is used to track the progress of these requests. ITS staff first review the information provided to ensure it is complete. The Policy group or Finance will submit a KT request form and Jira ticket including their proposed change to the IT Systems team for review. The Jira ticketing system is used by both HCA and Acentra to communicate.

## State of Washington

Angela performs the initial review of the request for new configuration and identifies how the edit will be configured and adds it to an edit change release log. Angela is the only staff that creates logic. The logic will be created and added to the rules engine (RULEIT) during a KT meeting. All changes are made during a KT meeting which includes the ProviderOne users and a Quality Assurance person attending this meeting. Once the logic is added to the development area of the rules engine, the new edit logic is ready for the vendor to perform testing. Acentra, the vendor does system integrity testing and regression testing to check the overall health in the system.

Once Acentra performs testing, Acentra will load edits into an HCA testing environment and the HCA end user who requested the change will conduct user acceptance testing (UAT) by creating and processing new claims with scenarios to trigger the new rule. UAT, where corrections are communicated to the vendor, if necessary, typically lasts four weeks. Once all test cases have passed, Angela will inform the vendor.

After UAT, a regression testing deck is run to determine if there were any adverse effects of the change. Once regression testing is complete, the new edit is loaded into the live environment by Acentra. Only Acentra has access to the live environment. Angela stated that staff at HCA staff do not have access to upload changes to the rule engine into the live environment. Once the change is uploaded by Acentra, a live test is also conducted by HCA.

There are instances where after an edit is uploaded into the live environment, an increased number of claims are denied. In this event, staff will investigate to see what is wrong with the newly configured edit. We were informed that because edits are tested by HCA and the vendor it isn't often an edit makes into the live environment configured incorrectly.

Changes made to the rule engine are manually logged in the history of the rule that was changed. When a staff member checks out the rule for an update, the system requires a note before the change can be checked back in. The note can be any description that HCA inputs. *Note: HCA does not have access to the live environment to the rule engine, any changes made would be routed through the change control process described above.*

Most edit changes require the change to be made in the rule engine, however there are some that do not. For example, limit edits, conflicts, duplicates are configurable directly in ProviderOne. The edits that do not require the rule engine follow the same process as simple rate changes detailed below. Similar to simple rate changes detailed below, edits that are created within ProviderOne are created by the System Admin team, primarily Angela Skinner and reviewed by Quality Assurance, primarily Heidi Devries.

### 2. Simple Rate changes (Valuation)

Fee-for-service and managed care premium payment rate factors are uploaded into ProviderOne. Ed Hicks, IT System Admin team is responsible for the fee-for-service rate uploads and Sam Trimble, IT Business Analyst (BA) area operates the managed care capitation rate factors. We inquired with and were informed by Ed and Sam that there are no written procedures for rate changes. **There were no documented procedures for performing rate changes in ProviderOne. (Weakness #3)** See E: HCA\_Non-Confidential Provider One IT Controls

## State of Washington

For managed care, HCA pays a monthly premium rate to manage care organizations (MCOs) based on a rate per member per month (PMPM). There are about ten different rate templates for various medical and behavioral contracts as well as three rate templates for different foundational community support (FCS) contracts. There are five factors used to calculate the rates: base rate factor (BRF), age group factor (AGF), geographic region factor (GRF), risk adjust factor (ADF), and qualitative adjust factor (ADF). Depending on the managed care program they may use all or some of the rate factors. Ideally, HCA would like two months from the time a rate change is requested before it is uploaded and executed in ProviderOne. This time is required to adequately review changes, test for errors, receive proper approvals, and update ProviderOne. For fee-for-service, HCA directly pays providers for services rendered on qualified Medicaid members. The number of items to review is not as complicated as managed care so rate turnaround time is usually about 48 hours.

Files with new or redefined code sets (CMS HIPAA codes, American Medical Association Current Procedural Terminology (CPT) codes, and American Dental Association CPT codes) are sent to HCA from CMS quarterly via email. These are provided about two months prior to the new quarter starting. Within the file, there may be new services/codes, updated services/codes, or service/codes that are ending. The services and codes within the file are provided by Heidi to Clinical Policy to review and determine applicability and coverage and if they are within the State Plan Amendment. Once applicability and coverage are determined, Clinical Policy will request the rates to be configured by the P1 System Operations and Implementation Unit (SOIU) staff who will request the rates be loaded by the vendor Acentra. Acentra will load the rates into a testing environment for Quality Assurance review and approval. Rates are loaded into ProviderOne with effective dates for claims processing. Heidi verifies that the codes are input into ProviderOne accurately and also runs test claims to determine if the system is correctly referencing the codes.

Existing rate change process begins with the System Operations and Implementation Unit (SOIU) receiving a rate update request ticket through a shared inbox. The requests are triaged for assignment to Information Technology Specialist (ITS) staff within SOIU. Each ticket has a number that is used to track the progress of these requests. ITS staff first review the information provided to ensure it is complete. The review is only limited to data validation such as number formats and date ranges, etc. The ITS staff member requests Acentra upload the provided file into the ProviderOne User Acceptance Testing (UAT) environment. This allows them to verify that the file uploads appropriately before attempting to upload the file into production. ProviderOne has processing controls to help ensure the rate data uploaded is complete and valid. Updates that do not meet programmed edits will suspend to an error file that is reviewed by the ITS. If errors are identified, ITS staff notify the business area to make corrections and submit a new file attachment to the ticket. Prior to uploading, Sam (BA) will also provide the business unit with a computed Rate Report for review. Once correct and successfully uploaded, ITS reviews the data and additionally compares the number of records in the source data to the number of records uploaded to ProviderOne. If everything processes appropriately, ITS then uploads the file into the production environment and the data goes through the same processing controls as in the UAT. When successfully uploaded, all rate updates will have an "In Review" status listed. ITS then updates and sends the ticket to Heidi DeVries, IT Specialist, who acts as an internal quality assurance for ProviderOne Operations. She reviews the rate data for accuracy and to ensure the requested changes conforms to medical related coding information which was provided to HCA from the Centers for Medicare and Medicaid Services (CMS). Once Heidi determines rates are accurate and conforms, she approves the rates. The status of the rate updates change to "Approved" and are active in Production. Heidi then updates the ticket and sends it back to the ITS for closure, or closes the ticket herself. Vicki Sutton, IT Quality Assurance, is Heidi's backup and is authorized

## State of Washington

to approve rate changes and other QA related duties. **Key General IT Control #4: All simple rate changes are reviewed and approved by Quality Assurance prior to being implemented in production to ensure simple rate changes function as intended.**

### 3. General Charge Modes

General Charge Modes are rates that are configured behind the scenes of ProviderOne by the vendor in a back-end area that HCA does not have access to. General charge modes are developed and tested by Acentra (CNSI) and HCA prior to upload into production. General Charge modes are specific to how different types of claims can process. As an example, General Charge Mode 252 is used exclusively on Hospice pricing when the client lives in a county that HCA does not load the rates for that county. Ed was unaware why the system was set up to have the vendor load the General Charge Modes. He stated that this was the way the system was configured originally. Ed further stated that General Charge Modes are not changed as often as other rates. For example, HCA changed one earlier this year for hospice that hadn't been changed since 2006. Most General Charge Modes are changed every couple years.

To determine whether charge mode rate changes were significant for the FY2024 ACFR audit, we requested a list of all changes made during FY2024. Ed provided us with a list of all the charge mode rate changes along with the SQL logic for pulling the data at FY2024 Charge Mode Rate Changes Client. (P/C: To determine significance of the general charge modes rate changes) There were 49 total. There were 60,365 simple rate changes (see testing of Key Control #4 below for identification of population). Charge mode rate changes account for .08% of rates changes. Therefore, for the FY2024 ACFR audit, we determined that we will not test charge mode rate changes. We will test simple rate changes as they are the majority of rate changes that occurred during the year.

### **Summary of Key General IT controls**

Key General IT Control #1- The ProviderOne IT Section Manager, reviews the SOC Audit Report to determine if there are any findings that require corrective action to be taken. If corrective action is required, the ProviderOne IT Section Manager will monitor the corrective actions taken by reviewing the submission of the vendors monthly report to HCA.

Key General IT Control #2- Access to change an edit to be forcible (Override) is restricted to only those individuals who need access to perform their job duties.

Key General IT Control #3: New rule engine configurations go through a KT (change) process that includes user acceptance testing to ensure changes are authorized, tested, and function as intended.

Key General IT Control #4: All simple rate changes are reviewed and approved by Quality Assurance prior to being implemented in production to ensure simple rate changes function as intended.

### **STEP 4: Confirm Key General IT Controls**

See screen prints at Gen IT KC confirmation system documentation\_client\_confidential for confirmation work below.

**Key General IT Control #1- The ProviderOne Section Manager, reviews the SOC audit report to determine if there are any findings that require corrective action to be taken. If corrective action is required, the ProviderOne Section Manager will monitor**

## State of Washington

### **the corrective actions taken by reviewing the submission of the vendors monthly report to HCA.**

Because there were no corrective actions from the 2022 SOC audit that were still being monitored during SFY2024, and the 2024 SOC audit will not be received until August 2024, there is no activity during the audit period to walk through. Therefore, we will not confirm this key general IT control but rather it will be tested under Step 5 below.

### **Key General IT Control #2- Access to change an edit to be forcible (Override) is restricted to only those individuals who need access to perform their job duties.**

To confirm that only system administrators have access to override a claim, on May 7, 2024, we met with Ed Hicks, IT System Admin and Kari Summerour, External Audit Liaison to perform a walk through. Ed first logged in to the test environment as a claims processor [12] that had error code 02190 posted on it. As Ed was logged in as a claims processor, he then tried to resolve error code 02190 by forcing it. The system denied the user from forcing the claim through the edit, see screen prints #1 and #2. We noted there was a claim supervisor role and requested that Ed also log in as a claims supervisor (Role: OCP MAS 4 MAS 5) and attempt to force the claim through the edit. The system denied the claims supervisor from forcing the edit. After we observed the claims processor, and supervisor roles not allowing the user to force the claim, Ed logged in as a System Administrator [12]. Using this role, Ed changed 02190 to be forcible and demonstrated that he could resolve the edit posting and force the claim through the edit, see screen prints #3, #4, and #5. Screen print #3 shows that the edit was changed to be forcible. Screen print #4 shows that during the 4th cycle run of the claim, prior to the edit being changed to forcible, edit 02190 was denied. Screen print #5 shows that after the edit was changed to be forcible, error code 02190 no longer populated on the list of error codes. [12]

: HCA ProviderOne Override IT Controls Confidential [12]

### **Key General IT Control #3: Rule engine configurations go through a KT (change) process that includes user acceptance testing to ensure changes are authorized, tested, and function as intended.**

On June 4th, 2024, we met with Ed Hicks, IT System Administrator, Angela Skinner, IT System Administrator, and William Sogge, External Audit Liaison to walk through a recent new edit configuration and confirm change management controls are in place. Angela presented her screen and walked us through ticket# P10036010 that requested three new encounter- pay and report edits to be configured, see Screen print #12. These edits were identified as error code #s 05050, 05051, 05052. This request was submitted by Kasandra Wilson, Coordination of Benefits and Claims Processing Section Manager on August 17th, 2023. Pay and report edits are soft edits that report information from paid claims for tracking purposes. Pay and report edits do not suspend or deny claims from payment when triggered. Because we were using a historical configuration request, we requested that Angela share with us the system enforced process flow that was linked to the ticket. Angela shared the system enforced process flow, see Screen print #11. After we reviewed the ticket and system enforced process flow, we requested that Angela show us

## State of Washington

the plain talk logic that was requested from Kasandra that was attached to the ticket. Angela walked us through the logic for each edit, see Screen print #13. Angela then showed us that these change requests along with many other change requests were rolled up into one large change request 'KT for R1 2024'. Angela showed us in the ticketing system that KT for R1 2024 was developed and tested by Acentra and then moved back to HCA for User Acceptance testing, see Screen print #14. Angela then logged into the POTS User Acceptance Testing system and showed us that KT for R1 2024 including tests for new edits 05050, 05051, 05052 was tested by Heidi Devries, Quality Assurance, see Screen print #15. Angela then showed us in the ticket history that after Heidi completed UAT in POTS, Angela then went back into the ticket in ProviderOne and approved UAT, see Screen print #14. Acentra then resolved the ticket and Angela closed the ticket, see Screen print #14.

### **Key General IT Control #4: All simple rate changes are reviewed and approved by Quality Assurance prior to being implemented in production to ensure simple rate changes function as intended.**

On June 3, 2024, we met with Ed Hicks, IT System Administrator, Lorena Delgado, IT System Administrator, Angela Skinner, IT System Administrator, Heidi DeVries, IT Quality Assurance, and Kari Summerour, External Audit and Compliance Manager to walk through and confirm Key General IT Control #4.

Lorena shared her screen and began walking us through a recent rate change request (Ticket #P10062208) that was requested on May 29, 2024 by the Rate group (Kathryn Mesaros, Social Service Billing and Training Program Manager). This rate change request was to Update the rate for SA298 and edit logic for logic 30149. Because tickets sometime come with multiple requests within, this ticket also had an edit configuration update. Here, we will only focus on the rate change for SA298 which is a Procedure Rate. This specific procedure rate was being updated from \$0.01 to \$4,000 to \$0.01 to \$10,000 effective May 1, 2024.

Lorena reviewed the Excel file submitted with the ticket by the Rates group see Screen print #6 and the attached excel file containing the rate update at Screen print #7. All elements on the rate change request were accurate. Lorena then logged into ProviderOne and uploaded the rate sheet into UAT and ran ProviderOne's processing verification on the rate sheet. ProviderOne returned no errors. Lorena then logged in as an approver and approved testing. *Note: The rate does not go live until after the QA Review in the Production environment.* Once testing was complete and approved, Lorena logged in as a tester in the production environment and conducted the same process and uploaded the rate sheet into ProviderOne's processing verification, see Screen print #8. Lorena again ran the Processing verification on the rate sheet in production and when ProviderOne returned no errors, see Screen print #9, Lorena then approved the rate sheet testing in Production. Batch instance number 500105893 is for file review tracking purposes. Lorena showed us that she did not have the profile (Operations and Support System Approver) to approve rates in production. Once Lorena approved the rate sheet's testing in Production, she took a copy of the rate sheet loaded into production and uploaded it into the help desk and assigned the ticket to Heidi Devries, IT Quality Assurance. Heidi shared her screen and logged in with the profile Operations and Support System Approver and walked us through her review and approval. Heidi verifies that original ticket matches the approved ticket in Production and that no changes were made. Heidi also expanded the rate past two decimals and verified that the rate ends in all zeros. Heidi did not identify any necessary revisions and so she approved the rate and it was then active in ProviderOne including a definite start date of May 1, 2024 and a indefinite end date, see Screen print #10.

# State of Washington

## **STEP 5: Test Key General IT Controls**

Because the SOC audit only covers half of the audit period and only 6 out of 24 months in a biennium, in order to support a LOW control risk assessment, we need to determine if we could rely on other compensating General IT controls (Key General IT Controls #1, #2 #3, and #4), therefore, we tested General IT controls as detailed below.

**Key General IT Control #1 - The ProviderOne Section Manager, reviews the System and Organization Controls (SOC) report to determine if there are any findings that require corrective action to be taken. If corrective action is required, the ProviderOne Section Manager will monitor the corrective actions taken by reviewing the submission of the vendors monthly report to HCA.**

We received the Acentra SOC 2, Type 2 audit report from Kari Summerour, External Audit Liaison/Internal Auditor. A SOC 2, Type 2 audit reports on the controls at a service organization relevant to security, availability, and processing integrity, providing us assurance over IT general controls (including network security, user access controls, and physical security) of the ProviderOne system at Acentra Health (previously known as CNSI). Per Dineen Kilmer, ProviderOne Operations Manager, she reviewed the report to determine whether the report meets HCA's needs and whether controls are in place including if any exceptions were noted. Dineen stated she does not have any documentation to support her review of the SOC report covering our audit period. **The Authority performs a review of the System and Organization Controls audit report for the ProviderOne system at Acentra Health. However, there is no documentation retained to support the review occurred and what was included in the review. (Weakness #1)** V: HCA Confidential IT Controls SOC Audit (Part of ML)

Through observation of the report, we determined the audit was completed by UHY LLP, a licensed independent CPA firm that provides services nationally. The review covered a **six month period**, January 1, 2024 through June 30, 2024 and included expected review areas such as policies, procedures, system monitoring, access controls, network security, data center security, disaster recovery, among others. We reviewed the test results for the three applicable trust services (Category: Security, Availability, and Processing Integrity). There were no exceptions noted. The audit report stated that testing of the Business Continuity and Disaster Recovery (BCDR) plan could not be tested, because there was no BCDR testing during the audit period. There was no mention in the report of when the last BCDR testing had occurred. There also was no testing of incident response as there were no incidents that required remediation during the audit period. It was the opinion of the auditors that controls at Acentra Health related to the ProviderOne system operated effectively throughout the six month audit period.

Based upon our review of the completed audit report, we have assurance Acentra had appropriate general controls in place during the six month period included in the review. However, since the report only covers half of fiscal year 2024, we do not have assurance covering a majority of our audit period and we are unable to rely on the controls tested above for the entire period. Due to this, we cannot consider the prior year audit exception completely resolved.

**Key Control #2 - Access to change an edit to be forcible (Override) is restricted to only those individuals who need access to perform their job duties.**

## State of Washington

**Scenario:** Determine whether access to change an edit to be forcible is limited to only those individuals who need access to perform their job duties.

**Selection:**

Population: All users who have the ability to force claims through edits.

We met on May 15, 2024 with Lisa Hadley, Senior P1 Business Analyst, Ed Hicks, IT System Administrator- Manager, and Kari Summerour, External Audit and Compliance Manager to determine what roles and profiles allowed access to the edit forcibility function, and the users who were assigned those roles/profiles. Access to functionality is controlled by the ProviderOne page that the particular function is on. For example, the function to force edits is on page ID 'pgErrorCodeDetail(Claims)'. Each page (identified by page ID) is associated to various roles. Those roles are associated to profiles. The profiles are associated to users. It is the role/profile combination that allows access to the functions within each page.

There are two roles that combined with their respective four profiles provide access to force edits:

[12]

[REDACTED]

[12]

[REDACTED]

[12]

[REDACTED]

There were a total of 31 users with one of the combination of role/profile listed above. Some users were listed in two profiles and appear on the list twice.

**Testing:** To conduct testing, we met on May 30, 2024 with Lisa Hadley, Senior P1 Business Analyst, Ed Hicks, IT System Administrator- Manager, Kari Summerour, External Audit and Compliance Manager, and Jennifer Robinson, Application Development Manager. We observed security screens from P1 and recorded all users within each profile. For each user listed within the profiles identified, we inquired with ProviderOne leadership (Ed and Jennifer) if the user was an active HCA employee, and whether the user needed such access to conduct their daily job duties. We also compared the users listed to the Enterprise Technology Services (ETS)- ProviderOne Operations organization chart: [HCA ETS.org](https://www.hca.wa.gov/ets)

# State of Washington

[chart\\_client](#). Testing can be seen here: [User Access Testing\\_confidential](#) .

**Results:** Based on inquiry with ProviderOne leadership, we did not identify any user with access that should not have access. All users were current employees who still work on the ProviderOne system and either configure or test edits, are a leadership member, or acting as a backup. We identified one backup user, Dineen Kilmer who is the Section Manager for the System Operations and Implementation Unit who was identified as a back up only. Because there are many others who could act as a backup, we inquired if there were more reasons Dineen required such access or if it could be removed. We were informed that Dineen needs to retain access for 3 reasons: analyzing claims issues, as a backup when assistance is needed, and to have the ability to view the whole breadth of an issue to determine a solution. Dineen is also trusted as the person to investigate any internal or external frauds within the system. **No Exception.**

**Key General IT Control #3: New rule engine configurations go through a Knowledge Transfer (KT) change process that includes user acceptance testing to ensure changes are authorized, tested, and function as intended.**

**Population/selection:** We logged into ProviderOne via its web interface, clicked on the Claims subsystem tab, clicked the Administration link, and clicked the Error Codes. We then saved the list of error codes by selecting the 'save to XLS' function. There were 2,253 edits in total. We then filtered to edits that had 'Effective Date' within State Fiscal Year 2024. There were 82 new edits with an effective date starting during SFY2024. Using the sampling spreadsheet for small populations, we determined our sample size is 14. We then used the random number generator to select our sample.

## Testing:

We uploaded our sample into HCA MFT and requested that HCA submit screen prints of the change request ticket and the POTS User Acceptance System. For each selected error code we reviewed the ticket and POTS documentation to determine whether changes included user acceptance testing. When providing the documentation, Ed explained that *"Simple configuration changes are rarely tested as we have done them for over a decade now and we know how this works. If we have to move to the next level of system change that requires KT these are tested because this is new functionality that we haven't done before or is different than what we have done in the past. Sometimes simple configuration will be tested if it is very extensive, and we want to make sure we did everything correctly."* Ed also stated that text only changes are not tested. Based on Ed's response, we do not expect text only changes or simple configuration changes to be tested.

Out of the 14 edit changes we selected for testing, Ed provided the following additional information:

- Six were simple configuration changes and no KT user acceptance testing was determined necessary.
- Four were text file changes, there was no configuration change to test.
- Four changes were determined necessary to have testing through the KT process.

See testing matrix at [Edit configuration and rate change testing\\_confidential](#)

## State of Washington

### Summary of testing:

- *Six simple configuration changes where no KT user acceptance testing was determined necessary.* We reviewed the requests and observed there was communication between the requestor and the person who made the change to provide assurance simple configuration changes were made as requested. No further testing necessary.
- *Four text file changes, there was no change to test:* For each of these text change requests we verified through observation of the ticket that the request was only for changes to the text. The person assigned to the ticket communicated with the requestor regarding the text change and when it was complete. We confirmed through inquiry of Heidi that text only changes are not tested. No further testing necessary.
- *Four changes were determined necessary to have testing through the KT process.*  
For the four changes that were at a complexity level needing testing, we observed screen prints from POTS and verified that testing was documented for all four changes. No exceptions.

From our sample of 14 edit changes, only four were considered new or complex enough to be "new configurations" that go through the KT change process. We determined all four were tested. We did not pull more changes for testing as all four passed the control testing and we are not planning on relying on the automated control for substantive testing (Control Risk at Max) at Substantive Test. **No Exception.**

**Key General IT Control #4: All simple rate changes are reviewed and approved by Quality Assurance prior to being loaded into production to ensure simple rate changes function as intended.**

**(Note: This testing also used for manual KC#5 for Team FA at Key Control #5 (Manual))**

**Population:** We generated populations of rate upload files for both fee-for-service and managed care within ProviderOne by pulling the following exports:

#### **Fee For Service:**

Rate Settings -> Rate Group drop down:

- Provider Rates- 9,102 rate changes
- Program Rates- No rate changes
- Group Rates- 1 rate change
- Proc/Svc/Revenue Rates- 36,841 rate changes
- Client Rates- 12,326 rate changes
- Taxonomy Rates- 2,080 rate changes
- DRG Value Rates- No rate changes

Filter By: Upload Date **07/01/2023 to 06/30/2024** And: File Name **%** And Status: **Approved.**

# State of Washington

## Managed Care:

Managed Care -> PMPM Rate Configuration and Select View Summary Rate Report. Then use the Filter by drop down and select Generate Date and input **07/01/2023 to 06/30/2024**. There were 480 rate changes

The process of rate change review, approval, and upload are similar between the MC and FFS rates, but the requests originate from different teams. We combined all FFS and MC rate change files into a single population to draw our sample. There were 60,365 total rate changes. Because multiple rate changes are included in a ticket, we summarized our population by File Name, and Upload date. This results in 687 file names or tickets.

**Sample Selection:** There were 687 tickets for rate changes in total during state fiscal year 2024. Based upon the sample criteria (population quantity/amount, expected misstatement, tolerable misstatement, and level assurance) we determined a sample size of 59 for each testing population. We will be using the same testing criteria for the FY24 Medicaid, therefore we will be using a 0% expected misstatement, 5% tolerable misstatement and a high level of assurance.

Using the sampling spreadsheet for large populations, we determined our sample size is 56. We then used the random number generator to select our sample. We uploaded our sample into HCA MFT and requested that HCA submit screen prints of the change request ticket. Ed compiled our request. Our testing is documented below.

## Testing:

For each selected rate change, we reviewed change request ticket to determine whether HCA Quality Assurance staff reviewed and approved the rate changes before released to production. See Edit configuration and rate change testing\_confidential Tab 'Rate Change Testing ' Large Pop'. All tickets were reviewed and approved by either Heidi Devries, IT Quality Assurance, or her backup Vicki Sutton, IT Quality Assurance. Notification to the requestor that changes were uploaded occurred after QA approval in all instances. **No exception.**

## Conclusion:

Based on our understanding, related general IT controls were in place and adequately designed to ensure that the control operated consistently during six months of the audit period. We identified the following control deficiencies:

**We identified the following weaknesses related to the Acentra Health, LLC Provider One System and Organization Controls (SOC) 2 Type 2 audit:**

- The ProviderOne vendor's SOC 2 Type 2 audit did not cover the entire fiscal year 2024. The audit did not include the first six months of the fiscal year, July 1, 2023 - December 31, 2023.
- The Authority receives and reviews the Acentra Health ProviderOne SOC 2 Type 2 audit report to determine whether there are exceptions that require corrective action. However, there are no documented procedures for receiving and reviewing the report to ensure the review is adequately and consistently performed.
- The Authority did not maintain documentation to support there was a review of the SOC 2 Type 2 audit report.

# State of Washington

**Weakness #1** V: HCA Confidential IT Controls SOC Audit (Part of ML)

We identified the following weaknesses related to the process of forcing edits through the override process:

- [REDACTED] [12]
- The Authority did not have a monitoring process in place to ensure that all claims that were forced through the override process were authorized. (Weakness #2) E: HCA ProviderOne Override IT Controls Confidential
- There were no documented procedures for performing rate changes in ProviderOne. (Weakness #3) E: HCA Non-Confidential Provider One IT Controls

Control deficiencies will be documented at LOR Summary, where the level of reporting will be determined.

Our understanding and control risk assessment, which incorporates these conclusions, is documented at Risk Assessment.

## D.4.PRg - Human Services

*Procedure Step:* Key Control #5 (Manual)  
*Prepared By:* AMG, 10/28/2024  
*Reviewed By:* RKM, 10/29/2024

Purpose/Conclusion:

### **Purpose:**

To confirm and test the review and approval of the rates changes in ProviderOne (key control #5 for ProviderOne) in order to assess control risk.

### **Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess**

## State of Washington

**control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency.*

***All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be***

## State of Washington

*reported as findings.*

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

# State of Washington

## SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk

Record of Work Done:

### **Human Services - Valuation**

**Key Control #5:** Health Care Authority reviews and approves the input of fee schedules into ProviderOne prior to being available for payment in processing in the system.

The understanding for this system is documented above in the "Controls - ProviderOne" step.

Additionally, after gaining an understanding of this key control, IT Audit identified the same general key control, documented - [IT General Controls](#)

IT identified the following control:

**Key General IT Control #4: All simple rate changes are reviewed and approved by Quality Assurance prior to being loaded into production to ensure simple rate changes function as intended.**

Therefore we will be utilizing the control confirmation preformed by Team IT Audit.

### **1. Confirmation of Key Manual Control:**

**This works was documented, reviewed and approved by Team IT Audit, see [\[IT General Controls\]](#)**

On June 3, 2024, we met with Ed Hicks, IT System Administrator, Lorena Delgado, IT System Administrator, Angela Skinner, IT System Administrator, Heidi DeVries, IT Quality Assurance, and Kari Summerour, External Audit and Compliance Manager to walkthrough and confirm Key General IT Control #4 [\[Gen IT KC confirmation system documentation client confidential\]](#).

Lorena shared her screen and began walking us through a recent rate change request (Ticket #P10062208) that was requested on May 29, 2024 by the Rate group (Kathryn Mesaros, Social Service Billing and Training Program Manager). This rate change request was to Update the rate for SA298 and edit logic for logic 30149. Because tickets sometime come with multiple requests within, this ticket also had an edit configuration update. Here, we will only focus on the rate change for SA298 which is a Procedure Rate. This specific procedure rate was being updated from \$0.01 to \$4,000 to \$0.01 to \$10,000 effective May 1, 2024.

Lorena reviewed the Excel file submitted with the ticket by the Rates group see Screen print #6 and the attached excel file containing the rate

## State of Washington

update at Screen print #7. All elements on the rate change request were accurate. Lorena then logged into ProviderOne and uploaded the rate sheet into UAT and ran ProviderOne's processing verification on the rate sheet. ProviderOne returned no errors. Lorena then logged in as an approver and approved testing. *Note: The rate does not go live until after the QA Review in the Production environment.* Once testing was complete and approved, Lorena logged in as a tester in the production environment and conducted the same process and uploaded the rate sheet into ProviderOne's processing verification, see Screen print #8. Lorena again ran the Processing verification on the rate sheet in production and when ProviderOne returned no errors, see Screen print #9, Lorena then approved the rate sheet testing in Production. Batch instance number 500105893 is for file review tracking purposes. Lorena showed us that she did not have the profile (Operations and Support System Approver) to approve rates in production. Once Lorena approved the rate sheet's testing in Production, she took a copy of the rate sheet loaded into production and uploaded it into the helpdesk and assigned the ticket to Heidi Devries, IT Quality Assurance. Heidi shared her screen and logged in with the profile Operations and Support System Approver and walked us through her review and approval. Heidi verifies that original ticket matches the approved ticket in Production and that no changes were made. Heidi also expanded the rate past two decimals and verified that the rate ends in all zeros. Heidi did not identify any necessary revisions and so she approved the rate and it was then active in ProviderOne including a definite start date of May 1, 2024 and a indefinite end date, see Screen print #10.

### Noted Weaknesses are as follows:

- We did not identify any weaknesses in the design or operation of controls.

### **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **3. Control Risk at LOW - Test of Key Manual Control:**

Not applicable - we are not planning to rely on controls and therefore do not need to test controls; control risk will be assessed at maximum.

### **D.4.PRG - Human Services**

*Procedure Step:* Key Control #6 (Manual)  
*Prepared By:* AMG, 6/17/2024  
*Reviewed By:* BM2, 11/20/2024

## State of Washington

Purpose/Conclusion:

**Purpose:**

To confirm and test batch reconciliations between ProviderOne and AFRS (key control #6 for ProviderOne) in order to assess control risk.

**Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. *If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all*

# State of Washington

*control testing.*

*D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

## **Human Services - Completeness**

**Key Control #6** - Fiscal analysts at both HCA and DSHS perform a daily reconciliation of amounts for batch interface uploads between the ProviderOne system and AFRS for AH (Payments and adjustments) and AI (Warrant cancelations or reissuances) batches.

The understanding for this system is documented above in the "Controls - ProviderOne" step.

### **1. Confirmation of Key Manual Control:**

To confirm whether daily reconciliations between ProviderOne to AFRS are performed (which would ensure complete roll-up of expenditures from the source system to AFRS), we performed the following procedures:

On May 8, 2024 we met with the following individuals from the Health Care Authority:

- Will Sogge, External Audit Liaison
- Tanya Daymon, Fiscal Analyst 3
- Cheri Gullekson, Medicaid Accounting Manager

Tanya shared her screen and walked us through the process of reconciling the P1 data to AFRS. Tanya will take a screen shot of the ProviderOne batch reconciliation report and paste it into the Excel workbook with a new worksheet for each day of the month. She will then access the AFRS - Batch Interface (BI) system and runs an AFRS batch interface report. The AFRS batch report also specifies agency, batch type, batch number,

## State of Washington

batch count, and batch amount. She will take a screen shot of this AFRS report and paste it to the same worksheet as the ProviderOne batch reconciliation report. The Fiscal Analyst verifies on the AFRS batch report that the batch date, batch number, batch count, and batch amount shown in the AFRS report matches to the ProviderOne batch report. If the batch item on both reports match, she will electronically sign the top of the worksheet where it says "Reviewer" for this batch date.

On June 11, 2024 we met with the following people from the Department of Social and Health Services:

- Rick Meyer, External Audit and Compliance Manager
- Laura Benson, Fiscal Analyst 5, Cash Unit Supervisor
- Christina Choate, Program Services Manager
- Christie Johnson, Administrative Services Manager
- Ashleigh Thompson, Fiscal Analyst 3

Laura shared her screen and walked us through the process of reconciling the P1 data to AFRS. She stated normally Jesrie Beane, Fiscal Analyst, would reconcile the workbooks and if she is not available, Ashleigh Thompson would reconcile the data if Jesrie is gone for more than a day. Laura explained that Jesrie will take a screen shot of the ProviderOne batch reconciliation report and paste it into the Excel workbook with a new worksheet for each day of the month. She will then access the AFRS - Batch Interface (BI) system and run an AFRS batch interface report. The AFRS batch report also specifies agency, batch type, batch number, batch count, and batch amount. She will take a screen shot of this AFRS report and paste it to the same worksheet as the ProviderOne batch reconciliation report. The Fiscal Analyst verifies on the AFRS batch report that the batch date, batch number, batch count, and batch amount shown in the AFRS report matches to the ProviderOne batch report. If the batch item on both reports match, she will electronically sign the top of the worksheet where it says "Reviewer" for this batch date.

### **Noted Weaknesses are as follows:**

None

### **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **3. Control Risk at LOW - Test of Key Manual Control:**

Not applicable - we are not planning to rely on controls and therefore do not need to test controls; control risk will be assessed at maximum.

### **D.4.PRG - Human Services**

# State of Washington

*Procedure Step:* Risk Assessment

*Prepared By:* AMG, 11/6/2024

*Reviewed By:* RKM, 12/2/2024

Purpose/Conclusion:

**Purpose / Conclusion:**

To assess inherent risk, control risk, and the risk of material misstatement in order to design an initial testing strategy for each assertion.

Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

1. Assess inherent risk for each relevant assertion. This assessment is based on understanding of the entity and the nature of the account balance or class of transactions.

*Inherent risk is the susceptibility of an assertion to a material misstatement, assuming that there are no related controls. Inherent risk can be thought of as the "threat" of misstatement. Inherent risk exists independently of control risk (the level of threat exists independent of the level of vulnerability to threats). Consider the following factors as your basis for this assessment:*

- *General Considerations*
  - *Does the balance include transactions that are difficult to audit or involve complex accounting issues?*
  - *Were there significant misstatements identified in previous audits or prior-period adjustments in the account balance or transaction class? If so, analyzing the cause of prior period misstatements will help in analyzing inherent risk.*
  - *Are there any inherent risk factors at the entity or industry level, such as changes in regulation or accounting rules, unique transactions or accounting practices, use of information technology, etc that affect the balance?*
- *Inherent Risk due to Error*
  - *How large are the transactions making up the balance? If the balance has only a few large transactions, even a single error may mean a significant misstatement.*
  - *Have there been changes in the transactions making up the balance that may increase risk? For example, significantly different composition, nature or volume of transactions may inherently disrupt established controls.*
  - *Are financial events originated or identified by accounting personnel or non-accounting personnel? This consideration is mainly for the completeness assertion.*

## State of Washington

- *Does the process to account for transactions involve judgment or estimation, complex calculations, numerous steps or significant manual steps?*
- *Do transactions have widely varying attributes that need to be manually identified? For example, grant loans that are accounted for in one of several ways depending on the terms of the agreement.*
- *Inherent Risk due to Fraudulent Reporting (intentional misstatements)*
  - *Are there substantial pressures or motivations to misstate the balance?*
- *Inherent Risk due to Misappropriation*
  - *Is the account balance or transaction class susceptible to sizable misappropriation?*
- *Inherent Risk due to Non-Compliance*
  - *Are there any laws, contracts or grant agreements affecting the balance? If so, would non-compliance lead to sizable misstatements?*
  - *Are compliance requirements complex, hard to understand, subject to judgment or otherwise difficult to comply with?*
  - *Are there any motivations or pressures to not comply?*

2. Assess control risk by system and assertion. This assessment should be based on the results of the control understanding, confirmation, and testing (if applicable). If applicable, auditors will evaluate any control deficiencies and determine whether those deficiencies, individually or in combination, are significant deficiencies or material weaknesses.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. Control risk could be thought of as the "vulnerability" of an entity to misstatements. Control risk exists independently of the inherent risk (the level of vulnerability exists independent of the level of threat).*

*In order to set control risk to LOW, general controls would also need to be tested to provide evidence of the consistent operation of automated controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*

*A material weakness exists when the design or operation of controls results in a reasonable possibility a material misstatement will not be prevented or detected and corrected in a timely manner. A significant deficiency is less severe than a material weakness, yet important enough to merit the attention of the governing body.*

***All potential material weaknesses and significant deficiencies should be discussed with the AIC, since they must be reported as findings.***

## State of Washington

- 3. Assess the risk of material misstatement for each relevant assertion for each material line item. The risk of material misstatement is a combination of the auditor's separate assessment of inherent and control risk.

*The Risk of Material Misstatement is a combined assessment of inherent and control risk based on auditor's judgment. If inherent and control risk are assessed differently, it is a matter of professional judgment as to whether the combined assessment is moderate or if one factor outweighs the other.*

4. Design a substantive testing strategy that addresses the relevant assertion in all significant transaction streams included within the material line item.

*In addition to identifying what to audit (material balances) and what to audit for (relevant assertions), planning has also identified how much to audit (risk of material misstatement). The quantity and quality of evidence obtained by substantive tests needs to match the level of risk. The higher the risk of material misstatement, the greater evidence needed. "Greater evidence" could either be greater quantity of evidence, greater quality of evidence, or some combination of greater quality and quantity.*

Guidance/Criteria.:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6210](#) – Planning Financial Statement Audits**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits](#) Planning Guide**

Record of Work Done.:

### **(1) Inherent Risk (IR):**

Based on our understanding of the line item, we assessed inherent risk as follows for each relevant assertion and significant class of transactions:

- Rights and Obligations - High
- Valuation - High
- Completeness - High

### **(2) Control Risk (CR):**

We assessed control risk as follows for each system and relevant assertion:

## State of Washington

- ProviderOne

**Rights and Obligations/Valuation/Completeness - MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level

**MAX** - While we have performed tests for the assertions above, general internal controls for the ProviderOne system can partially be relied due to the ISOC 2, Type II report for the fiscal year. As such, we identified the following weaknesses regarding the general controls during the fiscal year for the SOC report:

- The ProviderOne vendor's SOC 2 Type 2 audit did not cover the entire fiscal year 2024. The audit did not include the first six months of the fiscal year, July 1, 2023 - December 31, 2023.
- The Authority receives and reviews the Acentra Health ProviderOne SOC 2 Type 2 audit report to determine whether there are exceptions that require corrective action. However, there are no documented procedures for receiving and reviewing the report to ensure the review is adequately and consistently performed.
- The Authority did not maintain documentation to support there was a review of the SOC 2 Type 2 audit report.

Due to the identified weaknesses, we will be issuing a recommendation, see V: HCA Confidential IT Controls SOC Audit (Part of ML) See, IT General Controls for full analysis of gernal IT Controls.

### **(3) Risk of Material Misstatement (RMM):**

We considered both inherent and control risk and assessed the risk of material misstatement as follows for each relevant assertion and significant class of transactions:

- Rights and Obligations - High
- Valuation - High
- Completeness - High

### **(4) Testing Strategy:**

We designed our substantive testing strategy based on our assessment of the risk of material misstatement.

#### **A. Substantive test to meet the Rights and Obligations and Valuation assertions:**

Select a random sample of ProviderOne transactions and perform the following tests:

- Test 1: Determine whether the recipients are eligible (Rights & Obligations) at the time of service based upon their insurance group
- Test 2: Determine whether the providers are eligible to provide services and bill Medicaid at the time of service (Rights & Obligations)
- Test 3: Determine whether the services are allowable per State Plan (Rights & Obligations)

## State of Washington

- Test 4: Determine whether the paid amounts are correctly determined or calculated based on authorized rate or fee schedule (Valuation)

Additionally, we will select a sample of P1 IT helpdesk tickets and review the process of the rate change review, approval, and upload to the system and perform testing to determine if the Authority followed their procedures to ensure rates were being reviewed and applied correctly.

### **B. Substantive test to meet the Completeness assertion:**

Select a random sample of P1 and AFRS batch reconciliation reports (daily reconciliation reports) and performed testing on the sample reports to determine whether total amounts in the ProviderOne batch report tie to AFRS Batch Interface Report.

### **C. Completed in-house CAATs (computer assisted audit techniques) work**

This allowed us to look at the actual payments made during the audit period, and determined that ProviderOne processed payments as based on our understanding of automated controls in ProviderOne system. This was a re-performance of the controls on a large scale, which provided us with much more assurance if the controls were working as described. Additionally, since we reviewed actual payments, we also considered this as dual purpose testing because it provided us with a great deal of substantive evidence as well.

We anticipate that these tests will provide sufficient appropriate audit evidence to address the assessed risk of material misstatement for relevant assertions in significant classes of transactions.

### **D.4.PRG - Human Services**

*Procedure Step:* Substantive Test  
*Prepared By:* AMG, 11/15/2024  
*Reviewed By:* BM2, 11/20/2024

Purpose/Conclusion:
---------------------

#### **Purpose:**

To determine whether all expenses/expenditures incurred during the period were reported. (Completeness)

To determine whether the agency would have legal authority to make reported expenses/expenditures. (Rights & Obligations)

To determine whether expenses/expenditures were reported at properly valued or calculated amounts. (Valuation)

# State of Washington

## **Sources:**

DSHS documentation provided by Rick Meyer, External Audit Compliance Manager

HCA documentation provided by Willl Sogge, External Audit Liaison

ProviderOne - HCA System that store Medicaid Information and Documentation

## **Conclusion:**

- **Test 1:** Claims processed within ProviderOne were made to eligible clients (based upon their insurance group, recipient aid category, and enrolled managed care program, as applicable) on the date of service.
  - No exceptions noted.
- **Test 2:** Claims processed within ProviderOne were made by eligible providers (based upon their status and taxonomy group) on the date of service.
  - No exceptions noted.
- **Test 3:** Claims processed within ProviderOne were allowable per the State Medicaid Plan.
  - No exceptions noted.
- **Test 4:** Claims were paid at the correct amounts are correctly determined and calculated based on authorized rate or fee schedule.
  - No exceptions noted.

Testing Strategy:

## **Completeness**

The following is a list of **considerations** for testing the completeness assertion for expenses/expenditures. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

### **Detail Roll-Up**

- Compare totals from general ledger to accounts payable, payroll or other subsidiary software modules.
- Review the government's reconciliation of general ledger to subsidiary systems.

### **Cut off / Improper Expense Recognition**

- Scan expenditures recorded 1-3 months before and/or after fiscal year end (expenditures not charged to the current period). Based on the scan, test selected or sampled expenditures to determine if the expense should have been reported in the current period.
- Inquire with AP clerks regarding invoices held, but not entered as of year-end (ie: due to pending litigation or disputes).

### **Unrecorded Expenses**

- If the entity reconciles recorded revenues and expenses to bank activity, then reviewing monthly reconciliations and evaluating or testing reconciling items.

### **Accounts Payable**

## State of Washington

- If entity uses a warrant clearing account for vendor payments, review the entity's year-end reconciliation of recorded vendor payments with disbursements from the clearing account.
- Review edit check reports from the AP system that might indicate missing payments.

### **Payroll**

- If entity uses a payroll clearing account, review the entity's year-end reconciliation of recorded payroll with disbursements from the payroll clearing account.
- Perform an expected payroll test by taking the prior audited payroll amount and adjusting it for expected changes.

*The analysis should consider changes in employees, COLA increases, salary scale increases if automatic, changes wages or benefits due to changes in policy or union negotiations changes, etc. Sources for these expectations should be obtained apart from the payroll records that are being tested. Since the auditor would not expect to be able to precisely predict payroll, the auditor should document a reasonable range within which actual payroll is expected to vary from the auditor's prediction.*

- If the board directly approves salaries for a significant amount of employees, verify whether the actual salaries for these employees is within an expected reasonable range of the approved salary.
- For small entities, compare payroll by employee to known employees per observation, organization charts or a phone list.
- Review edit check reports from the payroll system that might indicate missing payments.

### **Unrecorded Liabilities**

- Evaluate liabilities directly related to expenses for completeness. See the completeness steps for current and non-current liabilities for testing considerations.

*For example, if the entity reports a self-insurance liability, the auditor might evaluate whether the change in the liability (and related expense) was determined and recorded. If no liability was reported, then the auditor might determine whether such a liability (and associated expense) should have been reported.*

**OPEB** - auditors should use the OPEB Testing Strategy workpaper available in the Store for auditing OPEB expenses.

**Pollution Remediation** - auditors should use the Pollution Liability Testing Strategy workpaper available in the Store for auditing pollution remediation expenses.

### **Removing Expenses from Accounting Records**

- Search for manual journal entries that credit (decrease) expenditures. Consider testing selected transactions.

## State of Washington

- Identify transactions that void, cancel, or manually adjust transactions in subsidiary AP or payroll systems. Auditors may conclude that the total amount of such transactions are trivial or otherwise reasonably small. Or auditors may sample or select transactions for testing.

*Also see considerations under the "Not recording expenses" section.*

### **Interfund Expenses**

For internal service fund charges, see testing strategies for internal service funds in the Accountability folder. For other types of internal charges, see testing strategies for Internal Activities.

### **Rights and Obligations**

The following is a list of **considerations** for testing the rights and obligations assertion for expenses/expenditures. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

- Review selected expenses/expenditures to determine whether the entity had legal authority to make the payments or incur the liability.
- If disbursements for different entities are made out of the same bank account, review the entity's reconciliation of accounting records to disbursements to verify that only expenditures of the entity were reported by that entity.
- Compare vouchers audited and certified by the auditing officer to the warrant register or review documentation for selected or sampled vouchers to determine whether expenses/expenditures were audited and certified in accordance with RCW 42.24.080.
- Compare board-approved vouchers to the warrant register or review documentation for selected or sampled vouchers to determine whether expenses/expenditures were properly approved by the governing body.
- Test selected or sampled transactions for compliance (allowability, eligibility, etc) with applicable restrictions or requirements.

*NOTE: this test may be combined with expenditure tests for other attributes. For example, expenditure testing for accountability or single audit purposes would normally also be considered testing for the rights & obligations assertion.*

### **Expenditures related to Joint Ventures or Other Arrangements**

- Review forming documents and agreements to verify expenditures for obligations of the venture.

**OPEB** - Auditors should use the OPEB Testing Strategy workpaper available in the Store for auditing OPEB expenses.

**Pollution Remediation** - Auditors should use the Pollution Liability Testing Strategy workpaper available in the Store for auditing pollution remediation expenses.

## State of Washington

### **Valuation**

The following is a list of **considerations** for testing the valuation assertion for expenses/expenditures. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests:

- Verify that payroll calculations are correct.
- If not already covered as part of control testing, verify that payroll software used correct rates.
- If not already covered as part of control testing, verify that accounts payable software used correct rates for calculating sales tax.
- Review calculation of any estimated expenses.
- Review related-party transactions to determine whether expense/expenditure transactions were correctly calculated.

### **Landfill Closure & Post-Closure Expenses**

*See the valuation testing strategy for non-current liabilities..*

**OPEB** - Auditors should use the OPEB Testing Strategy workpaper available in the Store for auditing OPEB expenses.

**Pollution Remediation** - Auditors should use the Pollution Liability Testing Strategy workpaper available in the Store for auditing pollution remediation expenses.

Guidance/Criteria.*
---------------------

### **Medicaid Specific:**

**Medicaid State Plan:** <https://www.hca.wa.gov/about-hca/programs-and-initiatives/apple-health-medicare/medicaid-title-xix-state-plan>

**Provider billing guides and fee schedules:** <https://www.hca.wa.gov/billers-providers-partners/prior-authorization-claims-and-billing/provider-billing-guides-and-fee-schedules>

**DSHS Rates (DDA/HCS/Nursing):** <https://www.dshs.wa.gov/altsa/management-services-division/office-rates-management>

### **Completeness**

#### **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

**BARS [3.6.13](#) Utility Tax (*applies only to cities*)** - should be accounted for as a revenue in the general fund (3164000) and expenditure in the utility fund (53P0040), if the utility passes the tax on to its customers then the additional charges should be recognized as revenue (343P000) directly in the utility fund not in the general fund

**BARS [3.8.6](#) Use of Payroll and Claims Funds**

# State of Washington

## **Rights and Obligations**

### **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

**BARS [3.8.5](#) Voucher Certification and Approval** - prescribes the form and manner of the audit and certification

**BARS [3.8.6](#) Use of Payroll and Claims Funds**

**RCW [42.24.080](#)** - describes statutory audit, certification and approval requirements

**RCW [42.24.180](#)** - gives the only exception to payment of claims prior to approval by the legislative body. In absence of meeting these requirements, no expenditure can be made without prior approval of the legislative body

## **Valuation**

### **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

**BARS [3.8.6](#) Use of Payroll and Claims Funds**

Record of Work Done:

### **Substantive tests performed to meet the Valuation Assertion:**

To test whether HCA adequately reviews and approves the input of fee schedules and changes into ProviderOne prior to them being available for payment processing in the system.

**Population:** We generated populations of rate upload files for both fee-for-service and managed care within ProviderOne by pulling the following exports:

#### **Fee For Service:**

Rate Settings -> Rate Group drop down:

- Provider Rates- 9,102 rate changes
- Program Rates- No rate changes

# State of Washington

- Group Rates- 1 rate change
- Proc/Svc/Revenue Rates- 36,841 rate changes
- Client Rates- 12,326 rate changes
- Taxonomy Rates- 2,080 rate changes
- DRG Value Rates- No rate changes

Filter By: Upload Date **07/01/2023 to 06/30/2024** And: File Name % And Status: **Approved**.

## **Managed Care:**

Managed Care -> PMPM Rate Configuration and Select View Summary Rate Report. Then use the Filter by drop down and select Generate Date and input **07/01/2023 to 06/30/2024**. There were 480 rate changes

The process of rate change review, approval, and upload are similar between the MC and FFS rates, but the requests originate from different teams. We combined all FFS and MC rate change files into a single population to draw our sample. There were 60,365 total rate changes. Because multiple rate changes are included in a ticket, we summarized our population by File Name, and Upload date. This results in 686 file names or tickets.

**Sample Selection:** There were 686 tickets for rate changes in total during state fiscal year 2024. Based upon the sample criteria (population quantity/amount, expected misstatement, tolerable misstatement, and level assurance) we determined a sample size of 56 for each testing population. We will be using the same testing criteria for the FY24 Medicaid, therefore we will be using a 0% expected misstatement, 5% tolerable misstatement and a high level of assurance.

Using the sampling spreadsheet for large populations, we determined our sample size is 56. We then used the random number generator to select our sample. We uploaded our sample into HCA MFT and requested that HCA submit screen prints of the change request ticket. Ed compiled our request. Our testing is documented here, see [Edit configuration and rate change testing\\_confidential](#).

## **Testing Results:**

For each selected rate change, we reviewed change request ticket to determine whether HCA Quality Assurance staff reviewed and approved the rate changes before released to production. See Tab 'Rate Change Testing ' Large Pop'. All tickets were reviewed and approved by either Heidi Devries, IT Quality Assurance, or her backup Vicki Sutton, IT Quality Assurance. Notification to the requestor that changes were uploaded occurred after QA approval in all instances. **No exception noted.**

## **Substantive tests performed to meet the Completeness Assertion:**

We selected a random sample of P1 and AFRS batch reconciliation reports (daily reconciliation reports) and performed testing on the sample reports to determine whether total amounts in the ProviderOne batch report tie to AFRS Batch Interface Report, see [FY24 Human Services FS](#)

# State of Washington

## Sampling Spreadsheet

For the randomly selected days we obtained ProviderOne batch reconciliation reports (report 1280) and AFRS Batch Interface Reports (screen C105P070) and confirmed that the quantity of records and total batch amounts in the ProviderOne batch report tied to the AFRS Batch Interface report, ensuring the completeness of interfacing for the claim payments.

To test whether daily reconciliations between ProviderOne to AFRS are performed (which would ensure complete roll-up of expenditures from the source system to AFRS), we performed the following procedures:

### ***Population***

As the reconciliations are performed daily, we identified workdays (non-weekends and non-holidays) between 7/1/2023 and 6/30/2024, resulting in a total of 249 workdays, see FY24 Human Services FS Sampling Spreadsheet. We consider our testing to be sufficient as the process is the same for the entire year and our population is sufficiently large to opine on.

### ***Selection***

As the reconciliations are the same between the two agencies, we determined each agency will be tested separately in order to determine if they each perform the daily reconciliations during the year. Based upon the small sampling spreadsheet with tolerable misstatement of 5% and 0% expected failure rate, the stated sample size is 24; this is the same sample size as the Control Statistical Sample with the same parameters. We randomly selected 24 reconciliation workdays for both DSHS and HCA.

### Testing Results:

- The agencies performed a reconciliation of the prior day between ProviderOne report 1280, for batch types AH/AI - **Both agencies performed reconciliations between AFRS and ProviderOne within the ProviderOne settlement date, no issues noted.**
- The ProviderOne report 1280 amounts reconciled to the AFRS Batch Interface Logs - We reconciled the AFRS batch interface amounts to the ProviderOne 1280 reports each day with **with no differences between the batched amounts noted.**

ProviderOne transactions batched completely to AFRS based upon amounts and quantities reported on the P1 report 1280 and AFRS Batch Interface Reports (screen C105P070) for batch types AH/AI (warrant related). **No issues noted.**

### **Random Sample Selection Procedures for Claims/Premiums for Valuation and Rights & Obligations:**

#### ***Populations***

HCA provided ProviderOne claim data covering the 7/1/2023 through 6/30/2024 time period. The claim data information, including total quantity of transactions and paid amounts, is summarized at [FY24 Human Services Stratification]. To address the risk of material misstatement (MAX for Rights/Obligations and MAX for Valuation), we set the assurance needed to **high** and set a **0% expected misstatement rate**. Because this test is also used for the Statewide Single Audit, the **tolerable misstatement was set for 5%**. This resulted in 59 sample items for testing.

# State of Washington

Due to the nature of claim transactions, we determined testing required sub-sampling for various populations. For the agencies, we noted the following populations of claims:

- ProviderOne Claims - DSHS - Social Services
- ProviderOne Claims - DSHS - Medical Service Claims (Fee for Service)
- ProviderOne Claims - HCA - Medical Service Claims (Fee for Service)
- ProviderOne Claims - DSHS - Managed Care Claims
- Provider One Claims - HCA - Managed Care Claims

We determined that the claims for DSHS Managed Care (0.49%) were insignificant to the balance of the ProviderOne claims and excluded this subset from testing. We additionally excluded negative values to \$1 claims from the sample frames and claims under \$10 (DSHS Fee for Service sample frame) due to their insignificance. For each sampling frame, we stratified the transactions into quartiles (to a reasonable degree) and/or along the natural histogram of the populations and allocated the 59 transactions pro-rata based upon each stratum's total amount to the overall sampling frame.

Samples were pulled by IT Audit using a stratified sampling method documented in:

**Fee for Service:** [Sampling for ProviderOne Claims](#)

**Managed Care:** [Sampling for ProviderOne Managed Care](#)

**Testing** (Sample results are summarized below; detailed testing notes and procedures are on subsequent tabs that are referenced)

**DSHS Social Services:** [CONFIDENTIAL FY24 Human Services Detailed Testing](#)

**DSHS Fee for Service:** [CONFIDENTIAL FY24 Human Services Detailed Testing](#)

**HCA Fee for Service:** [CONFIDENTIAL FY24 Human Services Detailed Testing](#)

**HCA Managed Care:** [CONFIDENTIAL FY24 Human Services Detailed Testing](#)

## **Substantive tests performed to meet the Rights & Obligations assertion:**

### *ProviderOne Claim Testing Procedures*

- **Test 1:** Determine whether the recipients are eligible at the time of service based upon their insurance group (client eligibility)
  - Medicaid Eligibility: ProviderOne client information to ensure that service beneficiaries were enrolled as an eligible Medicaid recipient (Insurance Type = MC: Medicaid) on the date(s) of service.
  - Recipient Aid Category Eligibility: We accessed ProviderOne client information to ensure that service beneficiaries were enrolled within the corresponding RAC on the date(s) of service for which the service was coded.
  - Managed Care (in addition to above for Medicaid for HCA - Managed Care sample): We accessed ProviderOne client information to ensure that service beneficiaries were enrolled in one of the Washington Managed Care organizations (Insurance Type = HM: Health Maintenance Organization) on the date of service/premium payment.

## State of Washington

- **Test 2:** Determine whether the providers are eligible to provide services and bill Medicaid at the time of service (provider eligibility)
  - Eligible Provider: We accessed ProviderOne provider information to ensure that providers (overall organization) were enrolled as an active (eligible) provider on the date of service.
  - Taxonomy (N/A for Managed Care): We accessed ProviderOne provider information for the claim provider to ensure that the provider was approved for the provider-type and speciality (taxonomy code) on the date of service.
  - Service Eligibility (N/A for Managed Care): We reviewed the claimed proc/svc code history and modification codes to ensure that the proc/svc was approved as part of the listed taxonomy on the date of service.
- **Test 3:** Determine whether the services are allowable per State Plan (service eligibility)
  - We reviewed the descriptions of services for the transactions using various attributes such as procedure code and reviewed the Washington State Medical State Plan, Attachment 3 and State Billing guides to determine whether the services were under a covered service category, e.g. Inpatient hospital, dental services, etc.
  - For HCA - Managed Care, the majority of samples were premium payments which are for a method of Medicaid administration. This includes the premium withholding release payments for prior premiums when the MCO met the requirements of the Value Based Purchasing targets.

*IT Dual Purpose Testing* [Key Controls #1 - 4 Edit Checks (Automated) - FY24 Dual Purpose Procedure Code Testing - Edit population, selection and testing client confidential]

- **IT Test 1:** Was the recipient eligible to receive the medical assistance services on the specific service dates?
  - CAATS/IT Procedures: IT audit performed editing testing and checks for a selection of error codes related to the validity of a claim's client.
- **IT Test 2:** Was the provider enrolled as an active (eligible) provider on the specific service dates?
- CAATS/IT Procedures: IT audit performed edit testing and checks for a selection of error codes related to the validity of a claim's provider.
- **IT Test 4:** Was the assistance service listed as an allowable service in the Medicaid State Plan?
  - CAATS/IT Procedures: IT audit performed edit testing and checks for a selection of error codes related to the validity of a claim's procedure code.

### **Substantive tests performed to meet the Valuation assertion:**

*ProviderOne Claim Testing Procedures*

- **Test 4:** Determine whether the paid amounts are correctly determined or calculated based on authorized rate or fee schedule (service paid rate)
  - HCA Fee-for-service - We reviewed billing guides and fee schedules, point of sale support, and rates within ProviderOne to recalculate the fees. Generally:

## State of Washington

- Pharmacy claims: We reviewed point-of-sale support to ensure that the POS system and ProviderOne paid the lesser of drug costs based upon various reference tables for the amount paid.
- Medicare Crossover claims: We ensured that ProviderOne elected the lesser of the allowable Medicaid (as computed) and Medicare amounts and deducted Medicare payments for the amount paid.
- Inpatient/Outpatient claims: We reviewed billing and fee schedules to ensure that ProviderOne used the correct factors (NPI conversion factors, EAPG weights, DRG weights, etc.) based upon claim information and recalculated the paid amount.
- Other Claims: We reviewed specific billing guides and fee schedules to ensure that ProviderOne used the correct rates and calculations for the amount paid.
- DSHS Fee-for-service and Social Services - We reviewed billing guides and fee schedules, Provider rates and authorized rates (from prior authorizations) within ProviderOne and recalculated the paid amount.
- HCA Managed Care -
  - Service Based Enhancement Claims - We ensured that the Provider's rate for the applicable charge mode was used for the payment amount and recalculated the paid amount.
  - Premiums - We reviewed client cohort information to ensure that the appropriate rates/factors were used and recalculated the client's monthly premium. This included withhold release TCNs (void old monthly premium TCN with amount withheld and processing a related TCN for a percentage release of the withhold amount).

### *IT Dual Purpose Testing* [Key Controls #1 - 4 Edit Checks (Automated) - FY24 Dual Purpose Procedure Code Testing]

- **IT Test 3:** Determine whether the paid amounts are correctly determined or calculated based on authorized rate or fee schedule (Valuation)
  - CAATS/IT Procedures: IT audit performed edit testing and checks for a selection of error codes related to the valuation of a claim.

### Testing Results:

#### *ProviderOne Claim Testing Results*

- **Test 1:** Claims processed within ProviderOne were made to eligible clients (based upon their insurance group, recipient aid category, and enrolled managed care program, as applicable) on the date of service.
  - No exceptions noted.
- **Test 2:** Claims processed within ProviderOne were made by eligible providers (based upon their status and taxonomy group) on the date of service.
  - No exceptions noted.
- **Test 3:** Claims processed within ProviderOne were allowable per the State Medicaid Plan.
  - No exceptions noted.
- **Test 4:** Claims were paid at the correct amounts are correctly determined and calculated based on authorized rate or fee schedule.

## State of Washington

- No exceptions noted.

### D.4.PRG - Human Services

*Procedure Step:* Sampling for ProviderOne Claims

*Prepared By:* JMT, 9/18/2024

*Reviewed By:* SHW, 11/5/2024

Purpose/Conclusion.:

**Purpose:**

To document sample design and methodology.

**Source:**

ProviderOne Claims data

**Conclusion:**

We have documented the sample design and methodology.

Testing Strategy.:

Guidance/Criteria.:

Record of Work Done.:

**AUDIT OBJECTIVE**

The audit objective was to determine if Claims payments processed through ProviderOne are legitimate.

**SAMPLE DESIGN AND METHODOLOGY**

The samples of ProviderOne Claims transactions were produced by the IT Audit Data Analysis team using data provided by the Health Care

# State of Washington

Authority (HCA).

HCA provided the full year (7/1/2023 - 6/30/2024) claims data on July 10, 2024 (social service claims) and August 16, 2024 (medical claims).

A document summarizing the total dollars and records received for FY24 was created and can be seen at [[FY24\\_ACFR\\_StratifiedSummaries](#)] (see tabs "DSHS SS Claims Summary" for the social service claims summary; "DSHS Med Claims Summary" and "HCA Med Claims Summary" for the medical claims summaries). Team Financial Audit (FA) Human Service line item auditors determined the amounts in these spreadsheets were reasonable based upon their general expectations of Medicaid expenditures during a fiscal year.

Team IT Audit also performs data reliability steps on all ProviderOne data received from HCA. Since the ProviderOne data mainly supports the Statewide Single Audit for the Medicaid program, all of the data reliability work is documented in that project (S1Medicaid-SA24 in V.4). In general, the following items are considered when determining the reliability of data:

- Record count of the dataset agrees to the record count provided by HCA.
- Fields requested are included in the dataset.
- Dataset covers the expected timeframe.
- Field values agree with data dictionary.
- The frequency count of values in a field are in a reasonable range.
- The minimum and maximum values of fields are in a reasonable range.
- Blank (or NULL) values do not appear in fields that should not contain missing information.
- Dataset does not contain duplication.
- Comparison of records in the dataset to the source ProviderOne system.

Based upon the various data reliability steps performed, it was determined the data used for testing was complete and accurate.

## **CHARACTERISTICS TO BE MEASURED**

We based our determination as to:

- Whether the recipients are eligible.
- Whether the providers are eligible to provide services.
- Whether the services are allowable per State Plan.
- Whether the paid amounts are correctly determined or calculated based on authorized rate or fee schedule in ProviderOne.

## **IT Audit Deliverables:**

## State of Washington

The first item provided to Team FA includes stratified summary tables for the claims and Managed Care premium payments split out by agency (DSHS and HCA). From these summaries, Team FA determines the final stratifications and sample sizes. Based on this information, IT Audit then pulls samples from the data populations and provides those to Team FA. For FY24, all samples will be pulled from the full year data and the social service and medical claims populations will be sampled from separately.

### Full Year Social Service Summary

IT Audit created summary tables by agency for the social service claims population between July 1, 2023 and June 30, 2024 [see [FY24 ACFR StratifiedSummaries](#)]. (see tab "DSHS SS Claims Summary").

The queries written to create the summary tables can be seen at [\[SS Claims Summary Queries\]](#).

### Full Year Medical Summary

IT Audit created summary tables by agency for the medical claims population between July 1, 2023 and June 30, 2024 [see [FY24 ACFR StratifiedSummaries](#)]. (see tabs "DSHS Med Claims Summary" and "HCA Med Claims Summary").

The queries written to create the summary tables can be seen at [\[Med Claims Summary Queries\]](#).

### Full Year Social Service Sample

Sample selections were made based upon the stratification and sample sizes provided by Team FA [see [FY24 Human Services Stratification](#)]. The population included all social service claims paid by Medicaid during FY24 (minimum \$1). The selected records were provided to Team FA via the internal network in a spreadsheet titled "!2024\_ACFR\_Samples\_SS\_Claims" due to the inclusion of confidential information. The queries written to select the samples can be seen at [\[SS Claims Sample Selection Queries\]](#).

### Full Year Medical Sample

Sample selections were made based upon the stratification and sample sizes provided by Team FA [see [FY24 Human Services Stratification](#)]. The population included all medical claims paid by Medicaid during FY24 (minimum \$1). The selected records were provided to Team FA via the internal network in a spreadsheet titled "!2024\_ACFR\_Samples\_Med\_Claims" due to the inclusion of confidential information. The queries written to select the samples can be seen at [\[Med Claims Sample Selection Queries\]](#).

## D.4.PRG - Human Services

*Procedure Step:* Sampling for ProviderOne Managed Care

*Prepared By:* JMT, 9/18/2024

*Reviewed By:* SHW, 11/5/2024

# State of Washington

Purpose/Conclusion.:

**Purpose:**

To document sample design and methodology.

**Source:**

ProviderOne Managed Care data

**Conclusion:**

We have documented the sample design and methodology.

Testing Strategy.:

Guidance/Criteria.:

Record of Work Done.:

**AUDIT OBJECTIVE**

The audit objective was to determine if Managed Care payments processed through ProviderOne are legitimate.

**SAMPLE DESIGN AND METHODOLOGY**

The samples of ProviderOne managed care transactions were produced by Team IT Audit using data provided by the Health Care Authority (HCA).

HCA's vendor, CNSI, provided the full year (7/1/2023 - 6/30/2024) managed care data on August 16, 2024.

A document summarizing the total dollars and records received for FY24 was created and can be seen at [FY24 ACFR StratifiedSummaries] (see tabs "DSHS MC Summary" and "HCA MC Summary" for the managed care summaries). Team FA Human Service line item auditors determined the amounts in these spreadsheets were reasonable based upon their general expectations of Medicaid expenditures during a fiscal year.

Team IT Audit also performs data reliability steps on all ProviderOne data received from HCA. Since the ProviderOne data mainly supports the Statewide Single Audit for the Medicaid program, all of the data reliability work is documented in that project (S1Medicaid-SA23 in V.4). In

# State of Washington

general, the following items are considered when determining the reliability of data:

- Record count of the dataset agrees to the record count provided by HCA.
- Fields requested are included in the dataset.
- Dataset covers the expected timeframe.
- Field values agree with data dictionary.
- The frequency count of values in a field are in a reasonable range.
- The minimum and maximum values of fields are in a reasonable range.
- Blank (or NULL) values do not appear in fields that should not contain missing information.
- Dataset does not contain duplication.
- Comparison of records in the dataset to the source ProviderOne system.

Based upon the various data reliability steps performed, it was determined the data used for testing was complete and accurate.

We will rely on the totals from the first six months for determining sample size as we expect the amounts to stay consistent throughout the fiscal year.

## **CHARACTERISTICS TO BE MEASURED**

We based our determination as to:

- Whether the recipients are eligible.
- Whether the providers are eligible to provide services.
- Whether the services are allowable per State Plan.
- Whether the paid amounts are correctly determined or calculated based on authorized rate or fee schedule in ProviderOne.

## **IT Audit Deliverables:**

The first item provided to Team FA includes stratified summary tables for the claims and Managed Care premium payments split out by agency (DSHS and HCA). From these summaries, Team FA determines the final stratifications and sample sizes. Based on this information, IT Audit then pulls samples from the data populations and provides those to Team FA. For FY24, all samples will be pulled from the full year data.

### Full Year Summary

IT Audit created summary tables by agency for the managed care population between July 1, 2023 and June 30, 2024 [see FY24\_ACFR\_StratifiedSummaries]. (see tabs "DSHS MC Summary" and "HCA MC Summary" for the managed care summaries). The queries written to create the summary tables can be seen at [MC Claims Summary Queries].

# State of Washington

## Full Year Sample

Sample selections were made based upon the stratification and sample sizes provided by Team Financial Audit [see [FY24 Human Services Stratification](#)]. The population included all Managed Care premium Medicaid transactions during FY24 (minimum \$1). We did not include any transactions that net to zero, nor did we include any transactions identified as a replaced transaction. The selected records were provided to the Team via the internal network in a spreadsheet titled "!2024\_ACFR\_Samples\_MC" due to the inclusion of confidential information. The queries written to select the samples can be seen at [\[MC Claims Sample Selection Queries\]](#).

## D.5.PRG - Federal Grants in Aid

*Procedure Step:* Summary & Conclusion

*Prepared By:* SRC, 10/22/2024

*Reviewed By:* RKM, 11/21/2024

Purpose/Conclusion:

### **Purpose:**

To evaluate risk assessments and the sufficiency and appropriateness of evidence obtained based on results of substantive work.

### **Conclusion:**

We determined that **no** modifications were necessary to inherent risk, control risk, or the risk of material misstatement as assessed in planning.

We also determined that evidence obtained was sufficient and appropriate in response to the risk of material misstatement.

Testing Strategy:

Auditors are **required** to evaluate conclusions for substantive testing as follows:

*Auditors may wish to use the optional Lead Sheet available in the Store to summarize testing related to each balance and assertion.*

**1.** Determine whether the results of substantive testing indicate a need to modify the inherent risk assessment (IR), control risk assessment (CR), risk of material misstatement (RMM) or other aspects of planning (such as material balances or assertions). If so, document changes and consider the need for additional testing.

## State of Washington

*If the results of substantive testing indicate a need to change control risk, auditors should also update the [Permanent File](#) by either correcting the documentation or by adding an update section describing changes to the top of the record of work done. For all changes to IR, CR, or RMM the [Material Balances](#) spreadsheet should be updated.*

*More significant changes to other aspects of planning (such as material balances or assertions) should be referenced in this step and documented in detail in the [Changes to FS Audit Plan](#) step.*

2. Evaluate whether the quality and quantity of evidence obtained is sufficient and appropriate in response to the risk of material misstatement. In making this determination, auditors should evaluate:

### Information to be used as audit evidence:

- Does evidence relate to the population, period of time and risk (assertion and “what could go wrong” from the Material Balance Spreadsheet)? If there are any gaps or uncertainties in the logical connection between the evidence and conclusions, is there a documented consideration and explanation?
- Are the sources of information sufficiently reliable and appropriate for the risk (whether internal to the government, external, or auditor developed)? If key information is not from a sufficiently reliable source (for example, inquiry), then is it corroborated by information that is?
- Are there any concerns about accuracy, completeness, authenticity, or bias in information? If so, did the auditor perform sufficient procedures to confirm reliability of that information?
- Is information precise enough to catch if misstatements exceeded the tolerable level?
- Is information detailed enough to conclude on whether or not there were misstatements?
- Was there any information that appeared contradictory or inconsistent? If so, was there a documented response to the inconsistencies or doubts about the reliability of evidence?

### Results:

- How much misstatement was identified by testing, and the likelihood and magnitude of further potential misstatement?
- How did misstatements occur and how often might they occur again in the population?
- Were misstatements caused by control deficiencies or circumvention of controls?
  - If control deficiencies, is there a need to re-evaluate our understanding of controls in the [Permanent File](#) folder or assessment of control risk?
  - If circumvention, the [Management Override of Controls](#) step should address or reference this area. Auditors should also consider whether a fraud risk has been identified.
  - Did tests identify a different level or type of risk than the planned audit response was designed to address?
  - If likely misstatements are identified, are further procedures necessary to improve the precision of our estimate?

## State of Washington

*To support the overall evaluation of audit risk and provide a basis for concluding on the overall sufficiency and appropriateness of evidence in the **FS Summary & Report** step, auditors should conclude in each area whether the auditor continues to believe that the tests performed and quality and quantity of evidence obtained are commensurate with RMM for all relevant risks (the "what could go wrong", in the **Material Balances** spreadsheet).*

If the auditor determines that evidence is not sufficient or appropriate, additional substantive testing should be done. If sufficient, appropriate evidence is not available for audit, the AIC should discuss the effect on our audit report with the AAM and AM.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6310](#) – Determining the Nature, Timing and Extent of Substantive Testing**

**SAO Audit Policy [3210](#) – Audit Evidence**

Record of Work Done:

Based on test results, we re-evaluated risk assessments, procedures, evidence obtained and conclusions as follows:

### **(1) Do the results of substantive tests indicate a need to modify our risk assessment (IR, CR and RMM)?**

The results of substantive tests do not indicate a need to modify our risk assessment.

### **(2) Was the quality and quantity of evidence obtained sufficient and appropriate?**

The quality and quantity of evidence obtained was sufficient and appropriate.

### **D.5.PRG - Federal Grants in Aid**

*Procedure Step:* Understanding of Line Item

*Prepared By:* SRC, 8/16/2024

*Reviewed By:* RKM, 8/22/2024

# State of Washington

Purpose/Conclusion:

**Purpose / Conclusion:**

To gain an understanding of the line item and confirm the scope of testing as documented in the Significant Account Matrix.

Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

**STEP 1: Prior Audit Exceptions**

Document any exceptions noted during the prior audit. Follow-up to determine how the agency has responded to or corrected the issue, unless this work is anticipated as part of the testing strategy.

**STEP 2: Analyze Composition and Changes of Line Item**

- Include link to the line item leadsheet. This will be completed at the end of the audit. Leadsheet analysis should be documented in this spreadsheet.
- Inquire with agency staff about the activities and transactions that make up the balance and any changes to those activities or transactions in relation to the prior year.
- Determine relevant classes of transactions or account balances within the line item to analyze (such as agencies, funds, programs, departments, accounts, and/or objects), and use AFRS to create trends of those elements. This step should not include any specific dollar amounts associated with the line item.
- Evaluate trends to identify:

(1) What classes of transactions or account balances are primary to the identified risk. Auditors should specifically consider what elements are primary to the line item (comprising a large percentage of the line item), and which elements the identified risk would apply to, and which elements might be most susceptible to the identified risk (having a high risk of non-trivial misstatement for a relevant assertion, considering likelihood and impact of potential for misstatement).

(2) What changes are primary to the identified risk, if applicable. Auditors should specifically consider whether the overall change to the line item from the prior year was significant, what elements were the primary drivers of overall change, whether any elements changed significantly from the prior year, and which changes (if any) might relate to the identified risk.

(3) Any unusual or unexpected elements, amounts, or changes that may indicate a risk, whether the one identified in planning or a new

## State of Washington

one that may need to be considered for a change to the plan.

**Consider** other procedures to gain an understanding of the line item, such as review of key policy documents, review of program information or reports, inquiry of staff, budget information, or other analytical procedures.

### STEP 3: Update Significant Account Matrix

Based on your understanding of the line item, update the Significant Account Matrix with final conclusions on the agencies covered, account description, significant accounting systems, and risk (what could go wrong and relevant assertions). The account description should reflect the significant transaction streams or account balances relevant to the risk.

*The description of agencies, significant accounting systems, and what could go wrong in the Significant Account Matrix constitute the overall scope of substantive testing.*

*A transaction stream is significant based on the potential for misstatement. This is often due in part to its size (ie: comprising a large percentage of the total line item), but is ultimately a judgment about the susceptibility to the identified risk (for example, when the risk is understatement a small or omitted account may hold the most potential for the largest misstatement).*

*Significant accounting system(s) are those that contain key controls over significant classes of transactions included in the line item. Control systems identified in this step must match the Significant Account Matrix and have a separate control understanding documented.*

*Talk with the AIC if you identify any changes to the Significant Account Matrix.*

Guidance/Criteria.:

Record of Work Done.:

#### **(1) Prior Audit Exceptions:**

There were no prior audit exceptions for the Federal Grants-in-Aid line item in the prior ACFR.

#### **(2) Composition & Change Analysis:**

Line Item Leadsheet: [\[Line Item Lead Sheet\]](#).

**Note:** We rely on work performed at the fund level to substantiate at the government-wide level.

#### **Significant Changes**

We inquired with:

- **HCA:** Laura Roberts, Federal Claims Supervisor and Jill Arlow, Deputy Section Manager (Federal Financial Reporting Section). Both confirmed that the process for the federal draw-downs and recording of the revenues have not changed.
- **DSHS:** Christina Choate, Program Services Manager, and Christie Johnson, Administrative Services Manager. Both confirmed that the process for the federal draw-downs and recording of the revenues have not changed.

# State of Washington

Federal cash revenues are recorded when agencies draw down federal cash (cash receipts) based upon the cash payments of federal program expenditures:

## *Cash Revenues - GL3210*

- **Cash Draw Downs (Cash Receipts)** - Agencies receive reimbursement funds from federal grants equal to cash expenditures less any prior year liquidations. Liquidations occur when revenues accrued in a prior year are paid out in the current year. The liquidation does not impact current year expenditure and revenue account balances as it is a cash payout for the accrual. The liquidation decreases the total cash draw balance and the revenue receivable balance.
- **Federal Cash Revenue:** Federal grantors pay out reimbursements owed to agencies once the agencies have paid for the expenditures. Cash received is based upon both cash expenditures and liquidations. Federal cash revenue, thus, equals the total of federal cash receipts less any cash received for liquidations of prior accrued expenditures.

## *Accrued Revenues - GL3205*

- Agencies accrue federal revenue up to the total allowed federal expenditure amounts as the federal grantors will reimburse agencies for those allowed expenditures that they have paid. Federal accrual revenues are recorded monthly. Accruals for June are handled separately due to the fiscal year end process.
- Monthly accruals are recorded as XX batches which are automatically reversed in the subsequent month with XY batches.
- June accruals are initially processed at the end of the fiscal year, but periodically updated with JV runs up until phase II close to calculate the most current and accurate accrual to record, using up-to-date enterprise reporting reports.

## Composition Analysis

We reviewed FY23 reports from the ACFR database for federal revenue (Roll up fund FAA, Major Source 03, GL Account 32%) as of 8/12/24 and noted that the following agencies composed 75.8% of the FGIA revenues (\$17,382,071,367):

- HCA: \$9,586,337,953, 41.8%
- DSHS: \$7,795,733,413, 34%

Amounts recorded in the Federal Grants in Aid line item are primarily the combined revenue of the Department of Social and Health Services (DSHS) and Health Care Authority (HCA), received for federal program expenditure reimbursements administered by both agencies. The total federal revenue balance contains cash revenues (GL3210), accrued revenues (GL3205) and revenue adjustments (GL3225).

We further analyzed the sources (federal administration) of above agencies' revenues and grouped the revenues by subsourse.

## **HCA**

HCA's revenue is primarily from Medicaid revenue subsources (D\*, N\*, Q\*, T\*, U\*), totaling approximately \$9.403 billion (63.7%) and Insurance

# State of Washington

Premiums, totaling \$4.843 billion (32.8%) for FY23.

## **DSHS**

DSHS's revenue is primarily from:

- Department of Agriculture - These are revenues associated with SNAP administration, totaling approximately \$131.3 million (2.8%). DSHS records the reimbursement draws to GL3225 for SNAP.
- Department of Health and Human Services - The primary revenues from DHHS are for the Medicaid program (see subsources above), totaling approximately \$4.276 billion (92.7%).

These percentage compositions are expected as DSHS is the administrator of the SNAP program and has Medicaid services within DDA and ALTSA administrations.

## **(3) Updates to Significant Account Matrix:**

No updates to the Significant Account Matrix are necessary. Revenues for the line items are in expected agencies and programs.

## **D.5.PRG - Federal Grants in Aid**

*Procedure Step:* Controls - HCA  
*Prepared By:* SRC, 8/20/2024  
*Reviewed By:* RKM, 9/27/2024

Purpose/Conclusion:

### **Purpose:**

To gain an understanding of internal controls.

### **Conclusion:**

We gained an understanding of internal controls as documented in the record of work done.

Testing Strategy:

**The following procedures are required for all material systems:**

## State of Washington

1. List the financial statement balance(s) and relevant assertion(s) addressed by the understanding.
2. Gain an understanding of the internal control process, identify how transactions are recorded in AFRS, identify key controls over relevant assertion(s), and note any control weaknesses.
  - In gaining an understanding of controls, consider the overall understanding of State-Level control elements as documented in the "State-Level Controls" step as they relate to this particular system.
  - Identify controls systems covering all relevant assertions for all significant classes of transactions.
  - Standards require the auditor to gain an understanding of the significant accounting system(s) that contain key controls over significant classes of transactions included in the line item.
  - Control systems identified in this step must match the Material Account Matrix and have a separate control understanding documented.
  - Talk with the ACFR Specialist or AIC if you identify different systems than the ones anticipated in the Material Account Matrix.

For each material system, auditors must document:

- A brief outline of the transaction flow from beginning to end.
- An expanded description of key controls.
- Business processes relevant to financial reporting of the relevant assertion for the material balance. Processes should encompass automated and manual procedures by which transactions or events are identified or initiated, authorized as needed, recorded, processed and corrected as needed.
- Original accounting records and how records are rolled-up to intermediary ledgers and transferred to the general ledger (AFRS) or financial statements.
- Detailed descriptions of key controls. Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

The following is information to **consider** when identifying key controls and transaction flow.

"Key controls" refer to the few controls that together provide reasonable assurance that material misstatements will be prevented or detected and corrected. This is contrasted with ancillary or supporting controls, which – although helpful and recommended – would provide less than reasonable assurance by themselves.

The focus of the write-up is on the key controls. Key controls should be specifically identified (as "key controls") in the write-up. This can be done in whatever way the auditor prefers, so long as it is obvious. Details that the auditor should document regarding key controls may include:

## State of Washington

- Who or what initiates the control
- When (or how often) is the control applied
- Who performs the control
- As needed, the experience, knowledge and attitude of the person applying the control
- Detailed description of the control process or activity. For example, if the control is a review: what exactly is reviewed, what is the reviewer looking at or for and what are the reviewer's criteria?
- How the key control is documented or evidenced
- If not obvious from the description, how the control prevents or timely detects and corrects misstatements
- Any exceptions or alternative processing to the normal process
- What happens when misstatements or issues are identified by the control

The "transaction flow" refers to the process by which transactions are initiated, authorized, recorded, processed and reported (as applicable). Outlining the transaction flow gives context to key controls, especially how transactions become subject to controls in the first place. If a control inherently ensures that all applicable transactions are included (ex: bank reconciliation where the assertion is existence), the auditor may decide to just start the write-up with the initiation of the control procedure and go from there.

Elements of the transaction flow are defined informally as follows:

- *Initiation:* How are transactions initiated?
- *Authorization:* How are transactions and accounting record maintenance authorized?
- *Recording:* How are transactions or balances identified and recorded in financial accounting systems?
- *Processing:* How are the transactions or balances processed after they are recorded (if at all)? Processing may be manual or automated and may occur at a subsidiary system level or at the general ledger level.
- *Reporting:* How are records translated into the financial statements? This part of the transaction flow extends the understanding to the actual financial statements that the audit is opining on. Since we already document an understanding of the financial reporting process in general, it is usually enough to simply reference this overall understanding. However, if there are important steps unique to the covered balances, it may be more appropriate to mention them here.

Although transaction flow is a good way to think about understanding and documenting a control system, auditors should not worry too much about documenting "each element, in order" because often elements may be combined, not noticeable, not applicable or occur in a different order.

Guidance/Criteria:
--------------------

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

# State of Washington

## SAO Audit Policy [2310](#) - Reporting Identified Audit Issues

## SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk

## [Financial Statement Audits](#) Planning Guide

Record of Work Done:

Internal controls for the Federal drawn down (HCA) process address the following balance(s):

- **General Fund - Federal Grants in Aid**
- **Governmental Activities - Operating Grants and Contributions: Human Services**

Primarily reimbursement from the Federal government for Medicaid - Payments of medical treatment of eligible, low-income persons.

For the following assertions:

- **Rights and Obligations** - Federal draw-down requests may not be based on actual grant expenditures in accordance with federal cash management requirements.
- **Valuation** - Federal Grant draw-down requests may not be correctly calculated.

### **Gain an Understanding of Internal Controls**

We met with:

- Laura Roberts, Federal Claims Supervisor
- Jill Arlow, Deputy Section Manager (Federal Financial Reporting Section)
- William Sogge, External Audit Liaison

A high level summary of the draw process is as follows:

- **Federal Revenue Draws:** The cash draw amount determination is based on actual cash and liquidation expenditures as recorded in AFRS. AFRS account coding identifies amounts to calculate the federal and state share of each expenditure based on match rates (FMAP) received from the appropriate federal awarding agency.
- **Draw Frequency:** HCA requests cash draws in the period the expenditures were incurred to ensure timely and regular draws. Timing frequency for draws varies:
  - Weekly (Monday) for the Title XIX services.
  - Bi-weekly (Payday) for all other federal awards to coincide with state payroll; this will include the administrative reimbursement for the program.

## State of Washington

- Monthly (Premium) for ProviderOne Medicaid payments with cash requests of forty percent of expenditure amount for MCO premium payments.

### **Federal Draw Process**

#### *Draw Preparation*

There are four Fiscal Analyst 5's (FA5) within the Federal Financial Reporting section (Federal Claims unit, FFRU) who ensure HCA's draw amount is correctly calculated and based upon actual expenditures by reconciling expenditure and revenue reports from Enterprise Reporting for relevant cost objectives and revenue subsources for a given program.

For **weekly and bi-weekly** draws, the FA will run enterprise reporting year-to-date reports for the cost objectives (expenditures) and subsources (revenue) of a program/grant. The draw-down calculation is:

**Total Expenditures less Total Revenues.** This is performed for every cost objective/subsource for the specific grant. E.g. for Title XIX services, services for clients are coded with T3\*, D3\*, N3\*, and Q3\* cost objectives and subsources. Both enterprise reporting reports are saved into FFRU's shared drive for records.

For **premium** draws, the process is the same except for ProviderOne will send an email indicating how much the payment going out will be. The FA5 calculates 40% for the draw request so they have enough funds to cover the expenditure.

The FA5 will then login to the Grants Management System (GMS) and select the requesting grant. The FA5 uploads the ER reports and calculates the current and liquidation portions of the expenditures and revenue and difference to calculate the draw amount. These figures are entered into a summary tracking workbook for each grant located on the FFRU's shared drive for each draw. The FA5 will submit the draw request in GMS and sends screenshots of the draw preparation screens, e-mails from the other agencies for their draw portion, and draw calculation reports to Laura Roberts (primary approver) and Jill Arlow (backup approver) for approval of the draw calculation.

Laura/Jill will manually review the reports (assessment of the criteria used for the reports), current draw information, and backup history of the draws to ensure that the current draw was correctly calculated and based upon actual and liquidated expenditures and revenues to date.

### **Key Control #1 - Draw calculation and approval**

#### *Draw Process*

After approval, the FA5 will complete the draw process portion within GMS for the current draw. The FA5 will select the approved draw prep to include in the draw process and selects the correct agency, grant, and enters the appropriate draw amount per agency.

The FA5 will then log into the Federal Payment Management System (PMS), enter the Payee Account Number (C7133P1 for HCA; subaccount XIX-MAP3 is for tracking Title XIX assistance), select the correct subaccount, and enter the requested draw amount (all three requesting agencies). There is a screenshot of the draw confirmation included in the AFRS batch draw workbook.

## State of Washington

The FA5 will obtain a TM\$ draw workbook and prepare the draw information for a cash receipts journal, with the total draw amount split among the agencies, document number being used to process the revenues, and effective date of the deposit (next business day) and send it to HCA's Cash Management group to process an A-8 with the Treasury (created by a separate group/individual). Once this is processed, the Cash Management group will provide the FRRU a screenshot of the processed A-8 within TM\$ (included in the revenue recording workbook).

### **How Transactions are Recorded in AFRS:**

After the draw amount is approved and the actual draw is performed, a separate FA5 will prepare an AFRS batch to record the revenue via a AFRS toolbox upload. The FA will log into GMS and select the current draw and review the number of transactions, hash total, and JV total. GMS will generate the JV's toolbox upload sheet with the correct transaction codes, variable GLs, funds, revenue groups, and subrevenue codes for the current document number. The FA5 will review the transaction codings (001/003 for currents, 835/835R for liquidations), ensuring the correct amounts are present in total for each grouping. The FA will then upload the financial toolbox file and submit it to AFRS, comparing the hash and transaction number amounts to ensure the transactions uploaded correctly.

When the uploaded batch is cleared of errors, the overall draw/revenue workbook is loaded into GMS and the overall draw is saved. The FA will then send the draw workbook along with request for review and approval of the AFRS batch to Laura and Jill. Laura/Jill will review the transactions for accuracy by doing a side-by-side comparison in the workbook (amount, transaction codes, subsources) for final approval of the batch into AFRS and completion of the draw process within GMS (**Key Control #2 - AFRS batch approvals**).

### **Key Controls are as Follows:**

- **Key Control 1 (Rights & Obligations/Valuation)** - Fiscal analysts run expenditure and revenue reports and perform a reconciliation to calculate the correct request amount for Federal draw downs. This is submitted to the Federal Claim Supervisor for review of the calculations and reports prior to the actual draw.
- **Key Control 2 (Rights & Obligations/Valuation)** - After approval and submission of the draw, the FA5 will prepare the AFRS batch to record the revenue. This includes reviewing the sub-resource codes for the revenues, amounts to be recorded, and appropriate transaction codes (which will determine whether the transaction line will impact the GL1351 (for liquidations) or GL3210 (for current period amounts). The Federal Claims Supervisor will then review the draw workbook for accuracy and approve and release the batch into AFRS.

### **Noted Weaknesses are as Follows:**

None

### **D.5.PRG - Federal Grants in Aid**

# State of Washington

**Procedure Step:** Key Control #1 (Manual) - Draw Calculations and Approval

**Prepared By:** SRC, 8/13/2024

**Reviewed By:** RKM, 8/20/2024

## Purpose/Conclusion.

### **Purpose:**

To confirm the reconciliation of expenditures and revenues for the draw calculation (key control #1 for federal revenue draw downs) in order to assess control risk.

### **Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

## Testing Strategy.

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude*

## State of Washington

*and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency.*

***All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.***

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements.*

## State of Washington

*In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

**Key Control #1:** Draw Calculations and Approval

#### **Assertions:**

Rights and Obligations

Valuation

**Key Control #1** - Fiscal analysts run expenditure and revenue reports and perform a reconciliation to calculate the correct request amount for Federal draw downs. This is submitted to the Federal Claim Supervisor for review of the calculations and reports prior to the actual draw.

The understanding for this system is documented above in the "Controls - HCA" step.

### **1. Confirmation of Key Manual Control:**

## State of Washington

We reviewed current document FA0073 for the T19 Assistance 2024 weekly draw down revenue recording for the week of 2/05/24. The draw reconciliation was performed by Rossner Gideon, FA5. Included in the workbook were the two enterprise reporting reports used to calculate the draw amount. Relevant report criteria included:

- Expenditure report
  - Begin fiscal month - 01-Jul FY1
  - End fiscal month: Nov FY1
  - Cost objective: T4\*,D4\*,N4\*,Q4\*, [T44C\*,D44C\*,N44C\*,Q44C\*]
  - Cost allocation type: F
  - Expenditure content: Cash
  - Expenditure liquidation Content: All liquidations
- Revenue report
  - Begin fiscal month - 01-Jul FY1
  - End fiscal month: Nov FY1
  - Major source: 03
  - Source: 03/93
  - Subsource: 03/93/D4\*,03/93/T4\*,03/93/N4\*,03/93/Q4\*, [03/93/D44C\*,03/93/T44C\*,03/93/N44C\*,03/93/Q44C\*]
  - Revenue content: Cash
  - Revenue liquidation content: Yes

Cost objectives (Expenditures), as summarized:

- T\*\*\*:
  - Disbursements: 1,860,174,892.94
  - Liquidations: (136,817,662.55)
- D\*\*\*:
  - Disbursements: 907,638,005.39
  - Liquidations: (45,562,574.13)
- N\*\*\*: No activity
- Q\*\*\*: No activity

Revenue sub-sources (Revenues), as summarized:

- T\*\*\*:
  - Cash Receipts: 1,712,858,629.38
  - Liquidations: (137,626,213.55)
- D\*\*\*:
  - Cash Receipts: 907,851,661.12

## State of Washington

- Liquidations: (45,006,818.63)
- N\*\*\*: No activity
- Q\*\*\*: No activity

### Totals:

Expenditures to date: 2,585,432,661.65  
Revenues to date: 2,438,077,258.32  
Draw amount: 147,355,403.33

This total draw of **147,355,403.33** appeared as the HCA portion of the total draw (draws include amounts from DSHS and DCYF as the Medicaid grant is administered through HCA) for PMS Subaccount XIX-MAP24. The reports were submitted by Rossner Gideon, FA5, to Laura Roberts, Federal Claims Supervisor, for review on 2/05/24, at 9:00 am, and the draw was approved by Laura Roberts at 9:15 on the same day. The draw was then submitted by Chau Duong, FA5, at 10:15 am, and a Cash A8 Reciept was created by Diana Dunn, FA3, at 10:31 am. The total draw amount within the Federal Payment Management System totaled **207,010,820.61** (HCA's \$147M was part of the total draw, including DSHS and DCYF) was completed on 2/05/24 with a payment due date of 2/06/24 for Account Number C7133P1, subaccount XIX-MAP24. **No issues noted**

### Noted Weaknesses are as follows:

None

### **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

### **D.5.PRG - Federal Grants in Aid**

*Procedure Step:* Key Control #2 (Manual) - AFRS revenue recording and release

*Prepared By:* SRC, 8/19/2024

*Reviewed By:* RKM, 8/20/2024

## State of Washington

Purpose/Conclusion:

**Purpose:**

To confirm the review and approval of the AFRS batching for revenues (key control #2 for federal draw downs) in order to assess control risk.

**Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

Record of Work Done:

**Key Control #2** : AFRS Revenue Recording and Release

#### **Assertions:**

Rights and Obligations

Valuation

**Key Control #2** - After approval and submission of the draw, the FA will prepare the AFRS batch to record the revenue. This includes reviewing the sub-resource codes for the revenues, amounts to be recorded, and appropriate transaction codes (which will determine whether the transaction line will impact the GL1351 (for liquidations) or GL3210 (for current period amounts). The Federal Claims Supervisor will then review the draw workbook for accuracy and approve and release the batch into AFRS.

The understanding for this system is documented above in the "Controls - HCA" step.

#### **1. Confirmation of Key Manual Control:**

We reviewed current document FA0073 for the T19 Assistance 2024 weekly draw down revenue recording for the week of 2/05/24. The draw reconciliation was performed by Rossner Gideon, FA5.

To summarize the draw calculation:

Expenditures to date: \$2,585,432,661

Revenues to date: \$2,438,077,258

# State of Washington

Draw amount: \$147,355,403

The AFRS revenue batch included the A8 Form (AFRS Cash Receipts) which included portions for HCA, DSHS, DCYF.

The line calculations of the draw workbook for current year were recorded using TCs 001 and 003 as determined by either a debit or credit amount, totaling \$147,102,607

The line calculations of the draw workbook for liquidations were recorded using TC835 to adjust the receivable amount from the prior period, totaling \$252,796

For a total receipt amount of \$147,355,403.

The revenue recording workbook was prepared by Chau Duong, FA5, and approved by Laura Roberts, Federal Claims Supervisor, for batch HB 086.

## **Noted Weaknesses are as follows:**

- None

## **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

## **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

*Reviewed By:* RKM, 8/22/2024

# State of Washington

Purpose/Conclusion:

**Purpose:**

To gain an understanding of internal controls.

**Conclusion:**

We gained an understanding of internal controls as documented in the record of work done.

Testing Strategy:

**The following procedures are required for all material systems:**

1. List the financial statement balance(s) and relevant assertion(s) addressed by the understanding.
2. Gain an understanding of the internal control process, identify how transactions are recorded in AFRS, identify key controls over relevant assertion(s), and note any control weaknesses.
  - In gaining an understanding of controls, consider the overall understanding of State-Level control elements as documented in the "State-Level Controls" step as they relate to this particular system.
  - Identify controls systems covering all relevant assertions for all significant classes of transactions.
  - Standards require the auditor to gain an understanding of the significant accounting system(s) that contain key controls over significant classes of transactions included in the line item.
  - Control systems identified in this step must match the Material Account Matrix and have a separate control understanding documented.
  - Talk with the ACFR Specialist or AIC if you identify different systems than the ones anticipated in the Material Account Matrix.

For each material system, auditors must document:

- A brief outline of the transaction flow from beginning to end.
- An expanded description of key controls.
- Business processes relevant to financial reporting of the relevant assertion for the material balance. Processes should encompass automated and manual procedures by which transactions or events are identified or initiated, authorized as needed, recorded, processed and corrected as needed.
- Original accounting records and how records are rolled-up to intermediary ledgers and transferred to the general ledger (AFRS) or financial statements.
- Detailed descriptions of key controls. Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

# State of Washington

The following is information to **consider** when identifying key controls and transaction flow.

“Key controls” refer to the few controls that together provide reasonable assurance that material misstatements will be prevented or detected and corrected. This is contrasted with ancillary or supporting controls, which – although helpful and recommended – would provide less than reasonable assurance by themselves.

The focus of the write-up is on the key controls. Key controls should be specifically identified (as “key controls”) in the write-up. This can be done in whatever way the auditor prefers, so long as it is obvious. Details that the auditor should document regarding key controls may include:

- Who or what initiates the control
- When (or how often) is the control applied
- Who performs the control
- As needed, the experience, knowledge and attitude of the person applying the control
- Detailed description of the control process or activity. For example, if the control is a review: what exactly is reviewed, what is the reviewer looking at or for and what are the reviewer’s criteria?
- How the key control is documented or evidenced
- If not obvious from the description, how the control prevents or timely detects and corrects misstatements
- Any exceptions or alternative processing to the normal process
- What happens when misstatements or issues are identified by the control

The “transaction flow” refers to the process by which transactions are initiated, authorized, recorded, processed and reported (as applicable). Outlining the transaction flow gives context to key controls, especially how transactions become subject to controls in the first place. If a control inherently ensures that all applicable transactions are included (ex: bank reconciliation where the assertion is existence), the auditor may decide to just start the write-up with the initiation of the control procedure and go from there.

Elements of the transaction flow are defined informally as follows:

- *Initiation:* How are transactions initiated?
- *Authorization:* How are transactions and accounting record maintenance authorized?
- *Recording:* How are transactions or balances identified and recorded in financial accounting systems?
- *Processing:* How are the transactions or balances processed after they are recorded (if at all)? Processing may be manual or automated and may occur at a subsidiary system level or at the general ledger level.
- *Reporting:* How are records translated into the financial statements? This part of the transaction flow extends the understanding to the actual financial statements that the audit is opining on. Since we already document an understanding of the financial reporting process in

# State of Washington

general, it is usually enough to simply reference this overall understanding. However, if there are important steps unique to the covered balances, it may be more appropriate to mention them here.

Although transaction flow is a good way to think about understanding and documenting a control system, auditors should not worry too much about documenting “each element, in order” because often elements may be combined, not noticeable, not applicable or occur in a different order.

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits](#) Planning Guide**

Record of Work Done:

Internal controls for the Federal drawn down (DSHS) process address the following balance(s):

- **General Fund - Federal Grants in Aid**
- **Governmental Activities - Operating Grants and Contributions: Human Services**

Primarily Revenue Sources:

- Department of Agriculture (SNAP)
- Human Health Services (HHS) Medicaid

For the following assertions:

- **Rights and Obligations** - Federal draw-down requests may not be based on actual grant expenditures in accordance with federal cash management requirements.
- **Valuation** - Federal Grant draw-down requests may not be correctly calculated

## **Gain an Understanding of Internal Controls**

On July 23, 2024, we met with:

- Christine Johnson, Administrative Services Manager

## State of Washington

- Christina Choate, Program Services Manager (took over for Gwendolyn Dain in May 2024)
- Debra Trickler, Accounting and Internal Control Administrator (ESA)
- Julia Mosier, Office Chief (ALTSA/DDA)
- Rick Meyer, External Audit Compliance Manager
- Raiatea Arcuri, Senior Financial Coordinator
- Temeke Maxwell, Federal Accounting and Reporting Manager (ESA)
- Summer Garcia, Staff Services and Operations Consultant
- Rebecca Doane, Office Chief (OAS)

A high level summary of the draw process is as follows:

- DSHS Technology Services Division loads a report into the Grants Management System (GMS) with data from AFRS for the relevant Medicaid cost objectives and subsources for revenue, expenditures, and liquidations processed through the prior day. AFRS data is loaded into GMS to assist with calculating the draw amount using the following calculation: Total Revenue – Total Expenditures – Liquidations = draw or return amount showing in GMS.
- The Senior Financial Coordinator reviews the Title XIX Medicaid Assistance draws weekly on the first business day of the week and Administrative draws during 'payday draws,' the day before payday; if any special draws are necessary, they are created as needed.
- The Senior Financial Coordinator reviews the draw amount in GMS, the Administrative Services Manager or Program Services Manager approves the draw amount in GMS, and the Grant Specialist (a Fiscal Analyst) draws the funds within GMS, as well as processes the batch to record the revenue for the draw through AFRS. Within GMS each position verifies the data and checks a box in GMS to ensure accurate calculations, review and approvals are processed prior to finalizing each draw request.

### **Draw Frequency:**

Title XIX - Weekly, Monday by 9am

Payday - Bi-Weekly

### **Federal Draw Process**

#### *Pre-Draw*

**Nightly**, an AFRS report with the day's transactions (through the cost allocation system) is generated and sent to WaTech. WaTech sends the report to the DSHS IT department who review for federal caps and revenue related to cost objectives and revenue sources then, upload the relevant data into GMS where updated revenues and expenditures can both be accessed in the morning.

**The day before a draw**, the Senior Financial Coordinator (SFC) initiates a review through email to program staff in the field. The staff then performs a review in GMS and sends confirmation of the review to back to OAS (by clicking a button). The SFC will also check for funds that are expired or fully spent and communicate notes or any other issues in the GMA notes feature. On the ESA side, staff will run a LOC credit balance report and send it to the grant managers who will review the numbers and change or deny the draw as necessary.

# State of Washington

## *Creating the Draw Request*

The Senior Financial Coordinator initiates the draw requests by comparing the reported amounts within GMS to an AFRS report for revenue, expenditure, and liquidation data for the relevant subsources (revenue) and cost objectives (expenditures). The Senior Financial Coordinator reconciles the report calculation to the pending draw screen amounts in GMS to ensure that the draw amount is correctly calculated. When the draw amount is correct, the Senior Financial Coordinator signs off on the draw amount and sends the Administrative Services Manager and Program Services Manager an e-mail summarizing the total draw amount, with an attached report for HCA. The Administrative Services Manager/Program Services Manager will review the related AFRS reports and the amounts within GMS to ensure that the total revenues, expenditures, and liquidations were captured for the draw process. After approval, the draw is sent to Fiscal Analyst (FA) staff to process the draw, bring in the funds from PMS, and process the Journal Vouchers (JVs) **(Key Control #1 - Draw Calculation and Approval - Rights & Obligations/Valuation)**.

## *HCA Draw Process and Recording*

HCA is the administering agency for Medicaid; as such, HCA is issued the grant and LOC (Letter of Credit) authorization amount for Medicaid. HCA processes draw requests from DSHS and DCYF during the weekly, semi-monthly, and ad-hoc draw requests within the Federal Payment Management Services (PMS) system.

After receiving approval from the Administrative Services Manager/Program Services Manager for the draw amount, the Senior Financial Coordinator will send HCA an e-mail with the AFRS report used in the draw calculation, alongside the agency's approval. During this time, HCA will work with DSHS if there are any discrepancies or if the draw amount needs to be adjusted for any reason (e.g. HCA requests that DSHS only draws up to a certain amount because of LOC authorization). HCA staff will create the draw within PMS and begin their process of creating the cash receipt A8/TM\$ journal, as they receipt the actual grant reimbursements (in total) as well. The A-8 entry by HCA is split among the requesting agencies (DSHS, DCFY, OFM as applicable) and is sent by the HCA creator to the DSHS FSA/OAS GMS share box.

## **How Transactions are Recorded in AFRS:**

A Fiscal Analyst records payment transactions to AFRS using a journal voucher template. For each draw, the Fiscal Analyst will move the current document number generated by GMS to the reference document field and uses HCA's current document number to ensure that the reimbursement and JV match HCA's. GMS will generate the JV's toolbox upload sheet with the correct transaction codes, variable GLs, funds, revenue groups, and subrevenue codes for the current document number. The FA will review the transaction codings (001/003 for currents, 835/835R for liquidations), ensuring the correct amounts are present in total for each grouping. The FA will then upload the financial toolbox file and submit it to AFRS, comparing the hash and transaction number amounts to ensure the transactions uploaded correctly.

The Program Services Manager/Administrative Services Manager, will review the batch to ensure the correct accounting coding is present and all relevant backup information is present within the draw/revenue recording workbook for final approval of the batch into AFRS **(Key Control #2 - AFRS Batch Approvals - Valuation)**.

# State of Washington

## **Supporting documentation within the draw workbooks include:**

From HCA:

- Embedded e-mail from HCA detailing the draw amount
- Screenshot from PMS for the draw
- A-8/TM\$ screenshot of the A-8 entry and breakdown of agency

From DSHS:

- Screenshots within GMS showing the approved pending draw and draw preparer's information
- Screenshots of the toolbox upload
- FPS Data Entry Report (shows summary information of the LOC subaccount and amount)
- Grant Financial Status Report (shows the LOC, total grant award, and summary draw calculation information)
- Approval e-mails by the Program Services Manager/Administrative Services Manager
- AFRS report that the draw calculations were based upon
- Back-up screenshots for each federal agency

## **Key controls are as follows:**

- **Key Control #1 (Rights & Obligations/Valuation)** - The Senior Financial Coordinator initiates the draw requests by comparing a report from GMS to a WEBI report of AFRS data based on AFRS revenue, expenditures, and liquidations. The Senior Financial Coordinator reconciles both reports to the pending draw screen amounts in GMS to ensure the draw amount is accurate. The Administrative Services Manager or Program Services Manager completes a secondary review of draw requests in GMS to ensure AFRS reports detailing total revenues, expenditures, and liquidations captured match the draw request with an accurate calculation before approving the draw calculation.
- **Key Control #2- (Rights & Obligations/Valuation)** - After HCA provides the A-8/TM\$ information for the actual federal reimbursement through PMS, a Fiscal Analyst will prepare the AFRS batch JV with transaction information from the GMS upload sheet, which includes the transaction codes, revenue subsources, fund, and variable GL codes. The Fiscal Analyst will review the report to ensure the transaction detail is accurate and matches the A-8/TM\$ from HCA. The Fiscal Analyst will submit the batch into AFRS and the Program Services Manager/Administrative Services Manager will perform a secondary review for correct account coding and amount and that all required reports/screenshots are within the JV workbook before approving and releasing into AFRS.

## **Noted Weaknesses are as follows:**

None

## **D.5.PRGR - Federal Grants in Aid**

# State of Washington

**Procedure Step:** Key Control #1 (Manual) - Draw Calculations and Approval  
**Prepared By:** SRC, 8/20/2024  
**Reviewed By:** RKM, 8/22/2024

## Purpose/Conclusion:

### **Purpose:**

To confirm the reconciliation of revenues and expenditures for the federal draw calculations (key control #1 for Federal draw downs) in order to assess control risk.

### **Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

## Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

## State of Washington

*When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency.*

***All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.***

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it*

## State of Washington

*would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

**Key Control #1:** Draw Calculations and Approval

#### **Assertions:**

Rights and Obligations

Valuation

**Key Control #1** - The Senior Financial Coordinator initiates the draw requests by comparing a report from GMS to a WEBI report of AFRS data based on AFRS revenue, expenditures, and liquidations. The Senior Financial Coordinator reconciles both reports to the pending draw screen amounts in GMS to ensure the draw amount is accurate. The Administrative Services Manager or Program Services Manager completes a secondary review of draw requests in GMS to ensure AFRS reports detailing total revenues, expenditures, and liquidations captured match the draw request with an accurate calculation before approving the draw calculation.

# State of Washington

The understanding for this system is documented above in the "Controls - DSHS" step.

## **1. Confirmation of Key Manual Control:**

We reviewed current document FA0047 (batch KX 139) for the T19 Assisst weekly draw down revenue recording for the week of 11/20/2023. Included in the draw workbook was the draw report, prepared by Beverley Muncaster, Senior Financial Coordinator, sent to HCA for DSHS's portion of the weekly draw which contained (in summary, based upon draw calculations (Current) Expenditures - (Current) Revenues - Net Liquidations) for AFRS transaction dates 11/06/23 - 11/13/23:

D4\*

Net current = \$76,298,676.82  
Net liquidations = \$(1,582,080.32)  
Net draw = \$74,716,596.50

T4\*

Net current = \$3,437,130.21  
Net liquidations = \$(188,629.81)  
Net draw = \$3,248,500.40

N4\*

Net current = \$0  
Net liquidations = \$(1,724.50)  
Net draw = \$(1,724.50)

**GMS Information for agency 3000:** Title XIX ASSIST - HCA to date (federal grant number 5-2405WA5MAP, LOC C7133P1)

Cash Disbursement to date: \$494,559,678.54  
Revenue Drawn to date: \$416,596,306.14  
Draw Amount: \$77,963,372.40

Total Actual draw = \$77,963,372.40

The subsorce amounts and total draw amount of \$77,963,372.40 was submitted for approval via e-mail by Beverley Muncaster to Gwendolyn Dain, Program Services Administrator, on 11/20/2023, alongside the Webi query and draw amount to submit to HCA. Gwendolyn reviewed the reports and approved the draw amount. This amount was present with the same information within GMS in the Approved Pending Draws tab after

# State of Washington

approval by Gwendolyn as "approved." **No issues noted**

## **Noted Weaknesses are as follows:**

None

## **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

## **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

## **D.5.PRG - Federal Grants in Aid**

*Procedure Step:* Key Control #2 (Manual) - AFRS Revenue Recording and Release

*Prepared By:* SRC, 8/20/2024

*Reviewed By:* RKM, 8/22/2024

Purpose/Conclusion:

### **Purpose:**

To confirm the review and approval for federal revenue AFRS batching (key control #2 for Federal draw downs) in order to assess control risk.

### **Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

## State of Washington

For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

# State of Washington

Record of Work Done:

**Key Control #2:** AFRS Revenue Recording and Release

**Assertion:**

Valuation

Rights and Obligations

**Key Control #2 - (Rights & Obligations/Valuation)** - After HCA provides the A-8/TM\$ information for the actual federal reimbursement through PMS, a Fiscal Analyst will prepare the AFRS batch JV with transaction information from the GMS upload sheet, which includes the transaction codes, revenue subsources, fund, and variable GL codes. The Fiscal Analyst will review the report to ensure the transaction detail is accurate and matches the A-8/TM\$ from HCA. The Fiscal Analyst will submit the batch into AFRS and the Program Services Manager/Administrative Services Manager will perform a secondary review for correct account coding and amount and that all required reports/screenshots are within the JV workbook before approving and releasing into AFRS.

The understanding for this system is documented above in the "Controls - DSHS" step.

**1. Confirmation of Key Manual Control:**

We reviewed current document FA0047 (batch HB 055) for the T19 Assist weekly draw down revenue recording for the week of 11/20/2023.

The draw amount calculated by Beverley Muncaster, Senior Financial Coordinator, was \$77,963,372.40. After approval of the draw calculation by DSHS (Gwendolyn Dain, Program Services Manager), Beverley sent the draw information (grant information including: LOC (C7133P1), total grant award and authorization, disbursements to date and revenue to date, the Webi report used to calculate the draw amount, and the e-mail chain for approvals for the draw calculation as noted above) to HCA and DSHS staff.

HCA employee Rossner Gideon, FA5, submitted the request for payment totaling \$109,232,118.98 (HCA: \$30,667,044.42 and DSHS: \$77,963,372.40, and DCYF:601,702.16) for the weekly draw. The generated A8 by Diana Dunn, Medical Assistance Specialist 3 (HCA), included the total \$77,963,372.40 for agency 3000 (HCA).

The draw workbook (KX 139) recording the revenues was prepared by Summaiya Khan, FA4; included in the workbook were approvals by Gwendolyn Dain for the draw calculations, summary screenshot of approved pending draws from GMS for the relevant LOC, screenshot within the Federal Grant Management System and HCA's A-8/TM\$ information all showing the total draw amount for DSHS of \$77,963,372.40.

Another tab was "Original Data" which is the system interface between GMS/PMS and creates a report by LOC, transaction code, fund, program

## State of Washington

index, revenue sources, and subrevenue sources, with the referenced GMS doc number. This amount matches the draw calculations per revenue source within the draw calculation section within GMS/PMS. This report drives the AFRS transaction records for the toolbox upload within the "KX 139" tab.

The line calculations of the draw workbook for current year were recorded using TCs 001 and 003 as determined by either a debit or credit amount, totaling \$75,941,264.94

The line calculations of the draw workbook for liquidations were recording using TC835 to adjust the receivable amount from the prior period, totaling \$2,022,107.46.

The workbook was prepared/submitted by Summaiya Khan and approved by Gwendolyn Dain.

### **Noted Weaknesses are as follows:**

None

### **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

### **D.5.PRG - Federal Grants in Aid**

*Procedure Step:* Risk Assessment

*Prepared By:* SRC, 8/16/2024

*Reviewed By:* RKM, 10/29/2024

Purpose/Conclusion:
---------------------

### **Purpose / Conclusion:**

To assess inherent risk, control risk, and the risk of material misstatement in order to design an initial testing strategy for each assertion.

# State of Washington

## Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

### **STEP 1: Inherent Risk (IR)**

Assess inherent risk for each relevant assertion. This assessment is based on understanding of the entity and the nature of the account balance or class of transactions.

*Inherent risk is the susceptibility of an assertion to material misstatement. It is our assessment of "total threat", which includes both "natural risk" and identified risk indicators, without any regard to any potential control activities. As inherent risk is fully independent of control risk, any understanding of controls cannot be used to increase/decrease the assessment of inherent risk. Consider the following factors as your basis for this assessment:*

- *General Considerations*
  - *Does the balance include transactions that are difficult to audit or involve complex accounting issues?*
  - *Were there significant misstatements identified in previous audits or prior-period adjustments in the account balance or transaction class? If so, analyzing the cause of prior period misstatements will help in analyzing inherent risk.*
  - *Are there any inherent risk factors at the entity or industry level, such as changes in regulation or accounting rules, unique transactions or accounting practices, use of information technology, etc that affect the balance?*
- *Inherent Risk due to Error*
  - *How large are the transactions making up the balance? If the balance has only a few large transactions, even a single error may mean a significant misstatement.*
  - *Have there been changes in the transactions making up the balance that may increase risk? For example, significantly different composition, nature or volume of transactions may inherently disrupt established controls.*
  - *Are financial events originated or identified by accounting personnel or non-accounting personnel? This consideration is mainly for the completeness assertion.*
  - *Does the process to account for transactions involve judgment or estimation, complex calculations, numerous steps or significant manual steps?*
  - *Do transactions have widely varying attributes that need to be manually identified? For example, grant loans that are accounted for in one of several ways depending on the terms of the agreement.*
- *Inherent Risk due to Fraudulent Reporting (intentional misstatements)*
  - *Are there substantial pressures or motivations to misstate the balance?*
- *Inherent Risk due to Misappropriation*
  - *Is the account balance or transaction class susceptible to sizable misappropriation?*
- *Inherent Risk due to Non-Compliance*

## State of Washington

- *Are there any laws, contracts or grant agreements affecting the balance? If so, would non-compliance lead to sizable misstatements?*
- *Are compliance requirements complex, hard to understand, subject to judgment or otherwise difficult to comply with?*
- *Are there any motivations or pressures to not comply?*

### **STEP 2: Control Risk (CR)**

Assess control risk by system and assertion. This assessment should be based on the results of the control understanding, confirmation, and (if setting control risk to LOW) testing. If applicable, auditors will evaluate any control deficiencies and determine whether those deficiencies, individually or in combination, are significant deficiencies or material weaknesses.

*Control risk is the risk that material misstatements would not be prevented or detected timely by the system of internal control. Control risk could be thought of as the "vulnerability" of an entity to misstatements. Control risk exists independently of the inherent risk (the level of vulnerability exists independent of the level of threat).*

*Control risk is MAX in both of the following situations: (1) controls aren't tested or (2) controls are problematic and cannot be relied upon. In order to set control risk to LOW, the auditor must test that controls operated effectively throughout the period.*

*A material weakness exists when the design or operation of controls results in a reasonable possibility a material misstatement will not be prevented or detected and corrected in a timely manner. A significant deficiency is less severe than a material weakness, yet important enough to merit the attention of the governing body. **All potential material weaknesses and significant deficiencies should be discussed with the AIC, since they must be reported as findings.***

### **STEP 3: Risk of Material Misstatement (RMM)**

Assess the risk of material misstatement for each relevant assertion for each significant line item. The risk of material misstatement (RMM) is a combination of the auditor's separate assessment of inherent and control risk.

*In practice, the RMM is the amount of substantive evidence that's needed, and the only way to reduce the amount of needed substantive evidence (equal to the inherent risk) is to test controls. As such, when control risk is MAX, the RMM must always equal the inherent risk (IR).*

*When controls are tested & can be relied upon (are determined to be effective) it is a matter of professional judgment how much the RMM should be set lower than inherent risk (1 or 2 steps).*

*Auditors should assess RMM by assertion, if different. For example, if RMM is assessed at MOD for the existence assertion, but LOW for the rights & obligations assertion, then document "MOD – existence and LOW – rights & obligations".*

# State of Washington

## **STEP 4: Design Substantive Testing**

Design a substantive testing strategy that addresses the relevant assertion (identified risk) in the portion of the line item that relates to that risk.

*Planning identifies where to audit (significant balances, classes of transactions & disclosures) what to audit for (relevant assertions), and how much to audit (RMM). The quantity and quality of evidence obtained by substantive tests needs to match the level of risk. The higher the risk of material misstatement, the greater evidence needed. "Greater evidence" could either be greater quantity of evidence, greater quality of evidence, or some combination of greater quality and quantity.*

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6210](#) – Planning Financial Statement Audits**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits Planning Guide](#)**

Record of Work Done:

## **(1) Inherent Risk (IR):**

Based on our understanding of the line item, we assessed inherent risk as follows for each relevant assertion and significant class of transactions:

- Rights and Obligations – LOW
- Valuation – LOW

## **(2) Control Risk (CR):**

We assessed control risk as follows for each system and relevant assertion:

- **Federal Draw Downs** – Rights and Obligations and Valuation

**MAX** – We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

## **(3) Risk of Material Misstatement (RMM):**

## State of Washington

We considered both inherent and control risk and assessed the risk of material misstatement as follows for each relevant assertion and significant class of transactions:

- Valuation – **LOW**
- Rights and Obligations – **LOW**

### **(4) Testing Strategy:**

We designed our substantive testing strategy based on our assessment of the risk of material misstatement.

- We will review a sample of drawdown revenue recordings and their related expenditure and revenue reports to ensure that the draw amount was correctly calculated and recorded.
- We will review a sample of drawdowns and their related expenditure and revenue reports to ensure that the draw amounts were based upon actual program expenditures.

We anticipate that these tests will provide sufficient appropriate audit evidence to address the assessed risk of material misstatement for relevant assertions in significant classes of transactions.

### **D.5.PRG - Federal Grants in Aid**

*Procedure Step:* Substantive Test  
*Prepared By:* SRC, 10/22/2024  
*Reviewed By:* RKM, 10/29/2024

Purpose/Conclusion.\*

#### **Purpose:**

To determine whether the entity has legal authority to collect or the legal right to reported revenues.  
To determine whether revenues were reported at properly valued or calculated amounts.

#### **Conclusion:**

The entities had a legal authority to collect/the legal right to reported revenues based upon expenditures data. **No issues noted.**  
The revenues were reported at properly valued and calculated amounts. **No issues noted.**

# State of Washington

## Testing Strategy:

The following is a list of **considerations** for testing the rights and obligations assertion for revenues. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

- Evaluate activities and approved rate or fee schedules (especially new activities or changed schedules) to verify that the entity has the legal right to collect or impose the revenue.
- Review support for selected revenues or revenue streams to verify that the entity has the legal right to the reported revenue.
- Determine whether revenues are properly recorded for amounts collected by another entity and that there is an appropriate receivable to them.
- Determine whether amounts collected by the entity for other governments are properly segregated and accounted for and that there is an appropriate payable to them.

### Revenues related to Joint Ventures or Other Arrangements

- Review forming documents and agreements to verify rights to any revenues generated by the venture.

### Property Taxes - see separate step

\*\*\*\*\*

The following is a list of **considerations** for testing the valuation assertion for revenues. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

### Calculation

- Recalculate billed revenues on a check (one of each variation), CAATS or sample basis.
- For large populations of standard billings, perform CAATS tests to identify unexpected or outlier transactions for further review.
- Review related-party transactions to determine whether revenue transactions were correctly calculated.

### Realizable Value

- Re-calculate a sample or selection of billings. If billings are calculated by software, the auditor could test and substantiate the automated control and also consider any risks associated with manual inputs used by software.
- Evaluate the entity's calculation of the allowance amount for reasonableness. This evaluation should include comparing the entity's estimate to the entity's actual historical experience of collecting or writing-off receivables.

## State of Washington

- Trace the amount of bad debt approved by the governing body (per minutes) to reductions of receivables and bad debt expense to verify it was properly accounted for. *Note: approvals may be slightly more, as customers may pay after the bad debt has been approved but before it is written off.*

### Estimation / Recognition

- Review calculation and support for assumptions of any estimated revenues.
- Accounting research to verify that revenues were reported in conformity with revenue recognition policies reported in the financial statement notes.

### Property Tax Revenues - see separate step

Guidance/Criteria:

**Add the Guidance/Criteria for each relevant assertion from the TeamStore. You may also include other resources that you used for testing.**

Record of Work Done:

### Population Sourcing and Reconciliation

**HCA:** [Population Reconciliation] tab "107\_CG"

**DSHS:** [Population Reconciliation] tab "300\_CG"

We ran queries from the ACFR database for significant balances (Rollup fund FAA and IS Sort Code CG) for DSHS and HCA. We ran queries in Enterprise Reporting Web Intelligence which were filtered to match the results of the ACFR database to obtain transaction level detail for sampling. We reconciled the amounts by source and GL to the ACFR query with **no variances noted**. As the total population of the Webi queries' FGIA revenues reconciled to the ACFR database, we consider the transaction data to be complete.

### Sample Frames

**HCA:** [Population Reconciliation] tab "107\_Sample Frame"

**DSHS:** [Population Reconciliation] tab "300\_Sample Frame"

Based upon overall analysis of the revenue sources (SAO source within ACFR database queries) and subsources (within Webi queries), we determined that we obtained sufficient coverage limiting testing to Title XIX Medicaid subsources: D\*, N\*, T\* and U\*

We filtered the Webi transaction data for Medicaid sub-sources\* (D\*, N\*, T\* and U\*) and summarized the transactions by document number (representing revenue draws) for sample frames:

**HCA:** 87 current doc numbers, totaling \$8,886,311,074.

**DSHS:** 78 current doc numbers, totaling \$4,098,997,806.

# State of Washington

## **Sample Number and Selection**

Based upon the substantive testing FA small population tables, we randomly selected and identified:

**HCA:** 7 transactions, no individually significant items

**DSHS:** 6 transactions, no individually significant items

## **Substantive tests performed to meet the Valuation assertion:**

**HCA:** [\[HCA - FS Sampling\]](#)

**DSHS:** [\[DSHS - FS Sampling\]](#)

### Testing Procedures:

*Weekly and Payday (semi-monthly draws)*

For the selected draws, we reviewed biennium-to-date expenditure Enterprise Reporting reports and Liquidation WEBI report for the relevant cost objectives/subsources and re-calculated the draw amount (current expenditures less liquidations) to ensure that the draws and amounts recorded to GL3210 were correctly calculated.

*Premium Draws (HCA Only)*

Premium draws are based upon a calculation of 40% times the ProviderOne expenditures for the weekly payment cycle. These are made as-needed, but are typically drawn near the end of a month to cover managed care premium payments. We verified the ProviderOne expenditures via reports provided by CNSI agents (ProviderOne vendor) to HCA and confirmed they matched the draw amounts for the timeframe.

### Testing Results:

Revenue draws (GL3210) were correctly calculated based upon expenditures and revenues for their given cost objectives/subsources. **No issues noted.**

## **Substantive tests performed to meet the Rights & Obligations assertion:**

**HCA:** [\[HCA - FS Sampling\]](#)

**DSHS:** [\[DSHS - FS Sampling\]](#)

### Testing Procedures:

*Weekly and Payday (semi-monthly draws)*

For the selected draws, we reviewed biennium-to-date expenditure and revenue Enterprise Reporting reports related to Cost Objectives D4\*, T4\*, U4\*, and N4\*, as well as, WEBI reports provided by the client in the Draw Workbooks for each sample. We calculated the difference between the Expenditures and Revenues related to the Cost Objectives for each sample to ensure it matched the draw amount.

*Premium draws (HCA only):*

# State of Washington

For the selected draws, we used the ProviderOne Expenditure Draw Report to confirm that the funds drawn matched the reported expenditures.

## Testing Results:

Revenue draw amounts (GL3210) are correctly based upon actual cash expenditures (GL6510) for their respective subsources and cost objectives.

## D.6.PRG - Education

*Procedure Step:* Summary & Conclusion

*Prepared By:* NJH, 9/11/2024

*Reviewed By:* CJG, 11/18/2024

Purpose/Conclusion:

### **Purpose:**

To evaluate risk assessments and the sufficiency and appropriateness of evidence obtained based on results of substantive work.

### **Conclusion:**

We determined that **no** modifications were necessary to inherent risk, control risk, or the risk of material misstatement as assessed in planning.

We also determined that evidence obtained was sufficient and appropriate in response to the risk of material misstatement.

Testing Strategy:

Auditors are **required** to evaluate conclusions for substantive testing as follows:

*Auditors may wish to use the optional Lead Sheet available in the Store to summarize testing related to each balance and assertion.*

**1.** Determine whether the results of substantive testing indicate a need to modify the inherent risk assessment (IR), control risk assessment (CR), risk of material misstatement (RMM) or other aspects of planning (such as material balances or assertions). If so, document changes and consider the need for additional testing.

*If the results of substantive testing indicate a need to change control risk, auditors should also update the **Permanent File** by either correcting*

## State of Washington

*the documentation or by adding an update section describing changes to the top of the record of work done. For all changes to IR, CR, or RMM the [Material Balances](#) spreadsheet should be updated.*

*More significant changes to other aspects of planning (such as material balances or assertions) should be referenced in this step and documented in detail in the [Changes to FS Audit Plan](#) step.*

2. Evaluate whether the quality and quantity of evidence obtained is sufficient and appropriate in response to the risk of material misstatement. In making this determination, auditors should evaluate:

### Information to be used as audit evidence:

- Does evidence relate to the population, period of time and risk (assertion and “what could go wrong” from the Material Balance Spreadsheet)? If there are any gaps or uncertainties in the logical connection between the evidence and conclusions, is there a documented consideration and explanation?
- Are the sources of information sufficiently reliable and appropriate for the risk (whether internal to the government, external, or auditor developed)? If key information is not from a sufficiently reliable source (for example, inquiry), then is it corroborated by information that is?
- Are there any concerns about accuracy, completeness, authenticity, or bias in information? If so, did the auditor perform sufficient procedures to confirm reliability of that information?
- Is information precise enough to catch if misstatements exceeded the tolerable level?
- Is information detailed enough to conclude on whether or not there were misstatements?
- Was there any information that appeared contradictory or inconsistent? If so, was there a documented response to the inconsistencies or doubts about the reliability of evidence?

### Results:

- How much misstatement was identified by testing, and the likelihood and magnitude of further potential misstatement?
- How did misstatements occur and how often might they occur again in the population?
- Were misstatements caused by control deficiencies or circumvention of controls?
  - If control deficiencies, is there a need to re-evaluate our understanding of controls in the [Permanent File](#) folder or assessment of control risk?
  - If circumvention, the [Management Override of Controls](#) step should address or reference this area. Auditors should also consider whether a fraud risk has been identified.
  - Did tests identify a different level or type of risk than the planned audit response was designed to address?
  - If likely misstatements are identified, are further procedures necessary to improve the precision of our estimate?

*To support the overall evaluation of audit risk and provide a basis for concluding on the overall sufficiency and appropriateness of evidence in*

## State of Washington

*the **FS Summary & Report** step, auditors should conclude in each area whether the auditor continues to believe that the tests performed and quality and quantity of evidence obtained are commensurate with RMM for all relevant risks (the "what could go wrong", in the **Material Balances** spreadsheet).*

If the auditor determines that evidence is not sufficient or appropriate, additional substantive testing should be done. If sufficient, appropriate evidence is not available for audit, the AIC should discuss the effect on our audit report with the AAM and AM.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6310](#) – Determining the Nature, Timing and Extent of Substantive Testing**

**SAO Audit Policy [3210](#) – Audit Evidence**

Record of Work Done:

Based on test results, we re-evaluated risk assessments, procedures, evidence obtained and conclusions as follows:

#### **(1) Do the results of substantive tests indicate a need to modify our risk assessment (IR, CR and RMM)?**

We determined that **no** modifications were necessary to inherent risk, control risk, or the risk of material misstatement as assessed in planning.

#### **(2) Was the quality and quantity of evidence obtained sufficient and appropriate?**

We also determined that evidence obtained was sufficient and appropriate in response to the risk of material misstatement.

### **D.6.PRG - Education**

*Procedure Step:* Understanding of Line Item

*Prepared By:* NJH, 6/10/2024

*Reviewed By:* RKM, 7/5/2024

# State of Washington

Purpose/Conclusion:

**Purpose / Conclusion:**

To gain an understanding of the line item and confirm the scope of testing as documented in the Significant Account Matrix.

Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

**STEP 1: Prior Audit Exceptions**

Document any exceptions noted during the prior audit. Follow-up to determine how the agency has responded to or corrected the issue, unless this work is anticipated as part of the testing strategy.

**STEP 2: Analyze Composition and Changes of Line Item**

- Include link to the line item leadsheet. This will be completed at the end of the audit. Leadsheet analysis should be documented in this spreadsheet.
- Inquire with agency staff about the activities and transactions that make up the balance and any changes to those activities or transactions in relation to the prior year.
- Determine relevant classes of transactions or account balances within the line item to analyze (such as agencies, funds, programs, departments, accounts, and/or objects), and use AFRS to create trends of those elements. This step should not include any specific dollar amounts associate with the line item.
- Evaluate trends to identify:

(1) What classes of transactions or account balances are primary to the identified risk. Auditors should specifically consider what elements are primary to the line item (comprising a large percentage of the line item), and which elements the identified risk would apply to, and which elements might be most susceptible to the identified risk (having a high risk of non-trivial misstatement for a relevant assertion, considering likelihood and impact of potential for misstatement).

(2) What changes are primary to the identified risk, if applicable. Auditors should specifically consider whether the overall change to the line item from the prior year was significant, what elements were the primary drivers of overall change, whether any elements changed significantly from the prior year, and which changes (if any) might relate to the identified risk.

(3) Any unusual or unexpected elements, amounts, or changes that may indicate a risk, whether the one identified in planning or a new one that may need to be considered for a change to the plan.

**Consider** other procedures to gain an understanding of the line item, such as review of key policy documents, review of program information or

## State of Washington

reports, inquiry of staff, budget information, or other analytical procedures.

### **STEP 3: Update Significant Account Matrix**

Based on your understanding of the line item, update the Significant Account Matrix with final conclusions on the agencies covered, account description, significant accounting systems, and risk (what could go wrong and relevant assertions). The account description should reflect the significant transaction streams or account balances relevant to the risk.

*The description of agencies, significant accounting systems, and what could go wrong in the Significant Account Matrix constitute the overall scope of substantive testing.*

*A transaction stream is significant based on the potential for misstatement. This is often due in part to its size (ie: comprising a large percentage of the total line item), but is ultimately a judgment about the susceptibility to the identified risk (for example, when the risk is understatement a small or omitted account may hold the most potential for the largest misstatement).*

*Significant accounting system(s) are those that contain key controls over significant classes of transactions included in the line item. Control systems identified in this step must match the Significant Account Matrix and have a separate control understanding documented.*

*Talk with the AIC if you identify any changes to the Significant Account Matrix.*

Guidance/Criteria.:

Record of Work Done.:

### **(1) Prior Audit Exceptions:**

We reviewed the prior audit and did not note any exceptions relevant to these line items.

### **(2) Composition & Change Analysis:**

Line Item Leadsheet: [[Line Item Lead Sheet](#)].

- General Fund - Education

We met with Amy Harris, Director of Federal Fiscal Policy and Grants Management, Amy Kollar, Director of Agency Financial Services, and Rachel Patrick, Account General Manager, on 6/10/24 from OSPI to gain an understanding of the line item as well as ask about internal controls. They noted that there were no changes from the PY other than a minor staff change.

We gained an understanding of the composition of this ACFR line item through inquiry with OSPI staff and review of the PY AFRS database reports (ER) for FY23. Objects beginning with "N" comprised a majority of the education expenditures. These represent apportionment payments made to all of the schools in Washington State, labeled as "Other Grants & Benefits" which makes up roughly 96% of the entire line item balance. The OSPI Apportionment System is used for all apportionment expenditures. After reviewing the AFRS database reports (ER),

## State of Washington

budget documents, and the agency website, we did not identify any significant events or changes from last year that affect the line item or risks of misstatement.

Per PY, our approach for the reconciliations of governmental fund statements to the government wide statements is to rely on our substantiation of the governmental fund statements and governmental activities column and then to agree the reconciliation to these other substantiated statements.

### **(3) Updates to Significant Account Matrix:**

We identified no changes that need to be made to the Significant Account Matrix.

### **D.6.PRG - Education**

*Procedure Step:* Controls - Apportionment

*Prepared By:* NJH, 6/12/2024

*Reviewed By:* RKM, 8/6/2024

Purpose/Conclusion.:

#### **Purpose:**

To gain an understanding of internal controls.

#### **Conclusion:**

We gained an understanding of internal controls as documented in the record of work done.

Testing Strategy.:

**The following procedures are required for all material systems:**

1. List the financial statement balance(s) and relevant assertion(s) addressed by the understanding.

## State of Washington

2. Gain an understanding of the internal control process, identify how transactions are recorded in AFRS, identify key controls over relevant assertion(s), and note any control weaknesses.

- In gaining an understanding of controls, consider the overall understanding of State-Level control elements as documented in the "State-Level Controls" step as they relate to this particular system.
- Identify controls systems covering all relevant assertions for all significant classes of transactions.
- Standards require the auditor to gain an understanding of the significant accounting system(s) that contain key controls over significant classes of transactions included in the line item.
- Control systems identified in this step must match the Material Account Matrix and have a separate control understanding documented.
- Talk with the ACFR Specialist or AIC if you identify different systems than the ones anticipated in the Material Account Matrix.

For each material system, auditors must document:

- A brief outline of the transaction flow from beginning to end.
- An expanded description of key controls.
- Business processes relevant to financial reporting of the relevant assertion for the material balance. Processes should encompass automated and manual procedures by which transactions or events are identified or initiated, authorized as needed, recorded, processed and corrected as needed.
- Original accounting records and how records are rolled-up to intermediary ledgers and transferred to the general ledger (AFRS) or financial statements.
- Detailed descriptions of key controls. Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

The following is information to **consider** when identifying key controls and transaction flow.

"Key controls" refer to the few controls that together provide reasonable assurance that material misstatements will be prevented or detected and corrected. This is contrasted with ancillary or supporting controls, which – although helpful and recommended – would provide less than reasonable assurance by themselves.

The focus of the write-up is on the key controls. Key controls should be specifically identified (as "key controls") in the write-up. This can be done in whatever way the auditor prefers, so long as it is obvious. Details that the auditor should document regarding key controls may include:

- Who or what initiates the control
- When (or how often) is the control applied
- Who performs the control

## State of Washington

- As needed, the experience, knowledge and attitude of the person applying the control
- Detailed description of the control process or activity. For example, if the control is a review: what exactly is reviewed, what is the reviewer looking at or for and what are the reviewer's criteria?
- How the key control is documented or evidenced
- If not obvious from the description, how the control prevents or timely detects and corrects misstatements
- Any exceptions or alternative processing to the normal process
- What happens when misstatements or issues are identified by the control

The "transaction flow" refers to the process by which transactions are initiated, authorized, recorded, processed and reported (as applicable). Outlining the transaction flow gives context to key controls, especially how transactions become subject to controls in the first place. If a control inherently ensures that all applicable transactions are included (ex: bank reconciliation where the assertion is existence), the auditor may decide to just start the write-up with the initiation of the control procedure and go from there.

Elements of the transaction flow are defined informally as follows:

- *Initiation:* How are transactions initiated?
- *Authorization:* How are transactions and accounting record maintenance authorized?
- *Recording:* How are transactions or balances identified and recorded in financial accounting systems?
- *Processing:* How are the transactions or balances processed after they are recorded (if at all)? Processing may be manual or automated and may occur at a subsidiary system level or at the general ledger level.
- *Reporting:* How are records translated into the financial statements? This part of the transaction flow extends the understanding to the actual financial statements that the audit is opining on. Since we already document an understanding of the financial reporting process in general, it is usually enough to simply reference this overall understanding. However, if there are important steps unique to the covered balances, it may be more appropriate to mention them here.

Although transaction flow is a good way to think about understanding and documenting a control system, auditors should not worry too much about documenting "each element, in order" because often elements may be combined, not noticeable, not applicable or occur in a different order.

Guidance/Criteria:
--------------------

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

# State of Washington

## Financial Statement Audits Planning Guide

Record of Work Done:

Internal controls in the Apportionment System address the following balance(s):

- Governmental Fund - Education

For the following assertions:

- Completeness: There is a risk that apportionment distributions omit or are less than source records. There is a risk of improper expense recognition resulting in understatement of apportionment distributions.

### **Gain an Understanding of Internal Controls**

We met with Amy Harris, Director of Federal Fiscal Policy and Grants Management, Amy Kollar, Director of Agency Financial Services, and Rachel Patrick, Accounting General Manager, on 6/10/24 from OSPI to gain an understanding of the line item as well as ask about internal controls. They noted that there were no changes from the PY other than a staff change. The staff change occurred 10 days prior to the meeting date. Jeannie Walker, the former Accounts Payable Supervisor, retired and Dereka Pedersen took over her duties with her title of Assistant General Accounting Manager.

Using the Senate Budgets and the Supplemental budgets, Washington State sets and updates the state appropriation for each fiscal year. The most recent budget, [2024 Supplemental Operating Budget](#), was passed March 7th, 2024. OSPI uses a portion of the appropriation to provide funding ("apportionment") to the schools in Washington State. This is noted in Part V Sec. 504 (pg. 683 of 896) of the passed budget showing the approved state appropriation for FY24 "General Apportionment" was \$9,784,078,000. Note here that this is only for "general apportionment" and does not include other state budgeted amounts granted to OSPI.

We met internally with Lauren Mason, IT Auditor (SAO), and Travis Jones, IT Auditor (SAO), on 6/12/24 to gain an understanding of how apportionments are calculated and paid for FY24 and to confirm that there were no changes from the prior year. We can rely on their understanding of apportionment as they are conducting a performance audit of OSPI in conjunction with our audit for FY24 and were in the process of confirming systems related to apportionment and have already met with OSPI staff recently. They confirmed that the following procedures are still in place related to how apportionment is calculated and paid:

### **How Apportionment is Calculated:**

# State of Washington

Apportionment amounts are determined by student enrollment and transportation. That enrollment data is submitted to OSPI from each school district with approval from their Educational Service District through the P223 system. Local education agencies (LEAs) complete forms P-223, P-223H, P-223S, or P-240 which includes data about their student enrollment. The enrollment data is then sent to Melissa Jarmon, Apportionment Payment Supervisor, to upload into the apportionment system. The apportionment system is a Education Data System (EDS) that compiles all of the data from the P-223, P-223H, P-223S, and P-240 forms. Transportation data is calculated through the Student Transportation Allocation Reporting System (STARS) with information provided from school districts.

The school year runs from September to August. From September to December, schools submit their estimated enrollment data to OSPI through form F-203 with approval from their Educational Service District. This data helps determine how much funding each school needs. Transportation funding will use last school year values until February when new data from STARS is available for the new school year. A true-up adjustment is made in January to reflect actual enrollment data. From January to the end of each school year, actual enrollment data is used to determine funding to the schools. Melissa enters the data from the district into the apportionment system.

## How Apportionment is Paid:

Payments are made through the following methods:

- **Office of the State Treasurer (OST):** Payments made through OST are determined by subtracting the amount of the warrant payments from the total amount of apportionment for the month. Fiscal Office at OSPI notifies OST using a Disbursements Request memo how much apportionment is to be distributed for the month to various Country Treasurers and Colleges. Once OST disburses the funds on the last working day of the month, the agency will send OSPI the report, "DetailReport 721," to confirm the disbursement.
- **Warrants:** Payments made through warrants normally comprise less than 1% of the apportionment to be paid for Month 1. On the Form 1198, they are highlighted in yellow and include: DSHS, the tribal agencies, charter schools, School for the Blind, Suquamish Tribal Education Department, WA State Center for Childhood Deafness and Hearing Loss, and the Washington Military Department.

The following controls are provided in the Apportionment Internal Control document [] received by OSPI staff. Note that we met with OSPI staff on 7/10/24 and were informed that their internal control document is outdated and lacks detailed processes that are in place. Rachel Patrick, Account General Manager, noted that she will be updating it this year. Therefore, the following controls are a combination of our understanding gained from discussion and walkthrough with OSPI staff as well as information in the original internal controls document.

## How Transactions are Recorded in AFRS:

The Fiscal Analyst records the payments in AFRS using the Financial Toolbox to prepare two separate batch's: one for OST payments and one for warrants. A batch is prepared for the Accounts Payable Supervisor's review, which includes:

- Upload report from the Financial Toolbox - Confirms that the data was uploaded to AFRS
- Distribution of Funds by Source memo
- Form 1198

## State of Washington

- Disbursements Request memo
- DetailReport 721

Before the batches are released in AFRS, the Accounts Payable Supervisor reviews the batches to ensure that the journal voucher is supported by the documentation noted above. At the beginning of the month, Dereka Pedersen, the Assistant General Accounting Manager, performs a monthly reconciliation using the Reconcile Apportionment Spreadsheet. She reviews the Distribution of Funds by Source memo against the actual AFRS distribution data (pulled from an AFRS query) to ensure that amounts are recognized in the proper period. **(Key Control #1 - Manual, Completeness)**. She also reviews the DetailReport 721 from the Office of State treasurer to AFRS distribution data for the month to ensure that the amount in AFRS represent all expenditures for the month.

### Monthly Monitoring of Appropriation vs. Expenditures

To verify that expenditures do not exceed appropriations each month, Amy Kollar, the Director of Agency Financial Services, reviews the EOY Apportionment Projections Summary Spreadsheet for any variances and discrepancies between the budgeted appropriations, the actual amount distributed for each month, and the remaining balance left for the year. **(Key Control #2 - Manual, Completeness)**. Every May, she will also use a spreadsheet to estimate June expenditures and total expenditures for the year to identify programs that have excess appropriation or are in shortfall to help plan for the upcoming year.

### Key Controls are as Follows:

- **Key Control #1** - At the beginning of the month, Dereka Pedersen, Assistant General Accounting Manager, performs a monthly reconciliation using the Reconcile Apportionment Spreadsheet. She reviews the Distribution of Funds by Source memo against the actual AFRS distribution data (pulled from an AFRS query) to ensure that amounts are recognized in the proper period **(Manual - Completeness)**.
- **Key Control #2** - Each month, Amy Kollar, Director of Agency Financial Services, reviews the EOY Apportionment Projections Summary Spreadsheet for any variances and discrepancies between the budgeted appropriations, the actual amount distributed for each month, and the remaining balance left for the year **(Manual - Completeness)**.

### Noted Weaknesses are as Follows:

- None

### D.6.PRG - Education

*Procedure Step:*      Key Control #1 (Manual)

# State of Washington

*Prepared By:* NJH, 7/12/2024

*Reviewed By:* RKM, 8/6/2024

Purpose/Conclusion:

**Purpose:**

To confirm at the beginning of the month, Dereka Pedersen, Assistant General Accounting Manager, performs a monthly reconciliation using the Reconcile Apportionment Spreadsheet. She reviews the Distribution of Funds by Source memo against the actual AFRS distribution data (pulled from an AFRS query) to ensure that amounts are recognized in the proper period (***Key Control #1 - Manual, Completeness***) in order to assess control risk

**Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

## State of Washington

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency.*

***All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.***

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:*

## State of Washington

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

**Key Control #1 (Completeness):** At the beginning of the month, Dereka Pedersen, Assistant General Accounting Manager, performs a monthly reconciliation using the Reconcile Apportionment Spreadsheet. She reviews the Distribution of Funds by Source memo against the actual AFRS distribution data (pulled from an AFRS query) to ensure that amounts are recognized in the proper period.

The understanding for this system is documented above in the [[Controls - Apportionment](#)] step.

### **1. Confirmation of Key Manual Control:**

To confirm this key control we met with Dereka Pedersen, Assistant General Accounting Manager, on 7/8/24 to have her perform a walkthrough of the Reconcile Apportionment Spreadsheet for the month of April 2024. Additionally, we received a copy of this spreadsheet from Dereka on 7/9/24 and inspected the contents she reviewed with us during our meeting. For April, Dereka stated that after an apportionment batch is released in AFRS by the fiscal analyst team, at the start of the month of May she will open up the Reconcile Apportionment Spreadsheet and in the tab titled "Apr 2024 AFRS" will pull in AFRS data from GL 6505 - Accrued Expenditures/Expenses & GL 6510 - Cash Expenditures/Expenses for

## State of Washington

the month of April. On a separate tab titled "Apr 2024" she will pull in the details from the "Distribution of Funds by Source Memo" acquired from the Apportionment team after they confirm apportionments for that month to be released and sent over to OST. At the bottom of this tab she will reconcile the amounts from the memo and the AFRS data to look for any variances. For April she showed us that there was one variance for April for \$188,652.81 that was noted in her document as "Charter School Commission - not included in JV". ***No issues noted.***

There are two additional tabs in her document that Dereka mentioned in our walkthrough that we were able to confirm by inspecting the spreadsheet. One of these tabs is titled "Comparison to App" which shows all accounts in the general fund for each fiscal month. There is a running FYTD total that she will check against what is in AFRS at the time of this reconciliation. The total FYTD activity was \$13,304,546,289.54 and the amount in AFRS showed \$13,305,296,924.62 with a variance of \$143,590.01. Dereka did not explicitly address this variance in our walkthrough but through our inspection we were able to identify that this is coming from a timing issue of an amount corrected in May as well as a "suspense" payment yet to be disbursed. The other tab in this spreadsheet is titled "251 Rec Summary" which shows all of the months throughout FY24. Dereka added arrows and references for us to better understand where certain amounts are coming from throughout the spreadsheet. We were able to understand that the purpose of this tab is to show the activity for April (in this case) and the amount in recorded in AFRS as well as the total YTD total in AFRS for apportionment. There appeared to be no differences or variances noted here on this tab. ***No issues noted.***

### **Noted Weaknesses are as follows:**

- **None**

### **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

### **D.6.PRG - Education**

*Procedure Step:* Key Control #2 (Manual)

*Prepared By:* NJH, 7/12/2024

*Reviewed By:* RKM, 8/6/2024

# State of Washington

Purpose/Conclusion:

**Purpose:**

To confirm each month, Amy Kollar, Director of Agency Financial Services, reviews the EOY Apportionment Projections Summary Spreadsheet for any variances and discrepancies between the budgeted appropriations, the actual amount distributed for each month, and the remaining balance left for the year (**Key Control #2 - Manual, Completeness**) in order to assess control risk.

**Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

See the Guidance/Criteria tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency.*

***All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.***

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider

## State of Washington

*whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*

*B. Controls are not related to a "significant risk" identified in the audit plan.*

*C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*

*D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

**Key Control #2 (Completeness):** Each month, Amy Kollar, Director of Agency Financial Services, reviews the EOY Apportionment Projections Summary Spreadsheet for any variances and discrepancies between the budgeted appropriations, the actual amount distributed for each month, and the remaining balance left for the year.

The understanding for this system is documented above in the [\[Controls - Apportionment\]](#) step.

### **1. Confirmation of Key Manual Control:**

To confirm this key control we met with Amy Kollar, Director of Agency Financial Services, on 7/8/24 to have her perform a walkthrough of the *EOY Apportionment Projections Summary Spreadsheet* for the month of April 2024. Additionally, we received a copy of this spreadsheet from Amy on 7/10/24 and inspected the contents she reviewed with us during our meeting. For April, Amy stated that this process will usually take place after the apportionment batch is released in AFRS by the fiscal analyst team, and after Dereka Pedersen, Assistant General Accounting Manager, has performed her reconciliation and variance check as identified at [\[Key Control #1 \(Manual\)\]](#). Amy noted that this spreadsheet consists of AFRS data for the particular month she is reviewing (in this case it was April 2024) compared to the total OSPI appropriation budgeted amount. Through Amy's walkthrough and inspection of the spreadsheet we were able to confirm this control as described in the following paragraph. **No**

# State of Washington

## *issues noted.*

The data is represented by legislative "sections" (i.e. 506 School Employee Compensation, 508 Transportation, etc.) as listed in the actual WA annual budget and is compared (in order from left to right) as Appropriations, the current month ending balance Amy is reviewing from AFRS, the remaining yearly balance, the projected budget left after the current month's apportionments, and the "final balance" to show any variances. For the fiscal year there was a budgeted appropriation of \$9,071,125,000 for section 504 (which included General Apportionment). At the end of April, AFRS showed an ending balance of \$8,892,279,301. Note here that we compared this ending balance amount with the amount on Dereka's *Reconcile Apportionment Spreadsheet* and found a slight variance of \$1,567 which we were able to identify as April substitute reimbursements from Amy's spreadsheet. ***No issues noted.***

## **Noted Weaknesses are as follows:**

- **None**

## **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

## **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

## **D.6.PRG - Education**

*Procedure Step:* Risk Assessment

*Prepared By:* NJH, 10/7/2024

*Reviewed By:* RKM, 10/14/2024

Purpose/Conclusion.\*

## **Purpose / Conclusion:**

To assess inherent risk, control risk, and the risk of material misstatement in order to design an initial testing strategy for each assertion.

# State of Washington

## Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

### **STEP 1: Inherent Risk (IR)**

Assess inherent risk for each relevant assertion. This assessment is based on understanding of the entity and the nature of the account balance or class of transactions.

*Inherent risk is the susceptibility of an assertion to material misstatement. It is our assessment of "total threat", which includes both "natural risk" and identified risk indicators, without any regard to any potential control activities. As inherent risk is fully independent of control risk, any understanding of controls cannot be used to increase/decrease the assessment of inherent risk. Consider the following factors as your basis for this assessment:*

- *General Considerations*
  - *Does the balance include transactions that are difficult to audit or involve complex accounting issues?*
  - *Were there significant misstatements identified in previous audits or prior-period adjustments in the account balance or transaction class? If so, analyzing the cause of prior period misstatements will help in analyzing inherent risk.*
  - *Are there any inherent risk factors at the entity or industry level, such as changes in regulation or accounting rules, unique transactions or accounting practices, use of information technology, etc that affect the balance?*
- *Inherent Risk due to Error*
  - *How large are the transactions making up the balance? If the balance has only a few large transactions, even a single error may mean a significant misstatement.*
  - *Have there been changes in the transactions making up the balance that may increase risk? For example, significantly different composition, nature or volume of transactions may inherently disrupt established controls.*
  - *Are financial events originated or identified by accounting personnel or non-accounting personnel? This consideration is mainly for the completeness assertion.*
  - *Does the process to account for transactions involve judgment or estimation, complex calculations, numerous steps or significant manual steps?*
  - *Do transactions have widely varying attributes that need to be manually identified? For example, grant loans that are accounted for in one of several ways depending on the terms of the agreement.*
- *Inherent Risk due to Fraudulent Reporting (intentional misstatements)*
  - *Are there substantial pressures or motivations to misstate the balance?*
- *Inherent Risk due to Misappropriation*
  - *Is the account balance or transaction class susceptible to sizable misappropriation?*
- *Inherent Risk due to Non-Compliance*

## State of Washington

- *Are there any laws, contracts or grant agreements affecting the balance? If so, would non-compliance lead to sizable misstatements?*
- *Are compliance requirements complex, hard to understand, subject to judgment or otherwise difficult to comply with?*
- *Are there any motivations or pressures to not comply?*

### **STEP 2: Control Risk (CR)**

Assess control risk by system and assertion. This assessment should be based on the results of the control understanding, confirmation, and (if setting control risk to LOW) testing. If applicable, auditors will evaluate any control deficiencies and determine whether those deficiencies, individually or in combination, are significant deficiencies or material weaknesses.

*Control risk is the risk that material misstatements would not be prevented or detected timely by the system of internal control. Control risk could be thought of as the "vulnerability" of an entity to misstatements. Control risk exists independently of the inherent risk (the level of vulnerability exists independent of the level of threat).*

*Control risk is MAX in both of the following situations: (1) controls aren't tested or (2) controls are problematic and cannot be relied upon. In order to set control risk to LOW, the auditor must test that controls operated effectively throughout the period.*

*A material weakness exists when the design or operation of controls results in a reasonable possibility a material misstatement will not be prevented or detected and corrected in a timely manner. A significant deficiency is less severe than a material weakness, yet important enough to merit the attention of the governing body. **All potential material weaknesses and significant deficiencies should be discussed with the AIC, since they must be reported as findings.***

### **STEP 3: Risk of Material Misstatement (RMM)**

Assess the risk of material misstatement for each relevant assertion for each significant line item. The risk of material misstatement (RMM) is a combination of the auditor's separate assessment of inherent and control risk.

*In practice, the RMM is the amount of substantive evidence that's needed, and the only way to reduce the amount of needed substantive evidence (equal to the inherent risk) is to test controls. As such, when control risk is MAX, the RMM must always equal the inherent risk (IR).*

*When controls are tested & can be relied upon (are determined to be effective) it is a matter of professional judgment how much the RMM should be set lower than inherent risk (1 or 2 steps).*

*Auditors should assess RMM by assertion, if different. For example, if RMM is assessed at MOD for the existence assertion, but LOW for the rights & obligations assertion, then document "MOD – existence and LOW – rights & obligations".*

# State of Washington

## **STEP 4: Design Substantive Testing**

Design a substantive testing strategy that addresses the relevant assertion (identified risk) in the portion of the line item that relates to that risk.

*Planning identifies where to audit (significant balances, classes of transactions & disclosures) what to audit for (relevant assertions), and how much to audit (RMM). The quantity and quality of evidence obtained by substantive tests needs to match the level of risk. The higher the risk of material misstatement, the greater evidence needed. "Greater evidence" could either be greater quantity of evidence, greater quality of evidence, or some combination of greater quality and quantity.*

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6210](#) – Planning Financial Statement Audits**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits Planning Guide](#)**

Record of Work Done:

### **(1) Inherent Risk (IR):**

Based on our understanding of the line item, we assessed inherent risk as follows for each relevant assertion and significant class of transactions:

- Completeness - **Low**

### **(2) Control Risk (CR):**

We assessed control risk as follows for each system and relevant assertion:

- **Apportionment** – Completeness

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **(3) Risk of Material Misstatement (RMM):**

We considered both inherent and control risk and assessed the risk of material misstatement as follows for each relevant assertion and significant

## State of Washington

class of transactions:

- Completeness - **Low**

### **(4) Testing Strategy:**

We designed our substantive testing strategy based on our assessment of the risk of material misstatement. We plan to perform the following tests:

- For **Completeness**: We will review the monthly reconciliations between OST's FY24 distributed amounts to the amount reported in AFRS to determine whether all expenditures incurred during the period were reported. Additionally, we will determine if expenditures exceeded allocations at fiscal year end. We will verify that the amounts paid out to each school district through the Office of the State Treasurer (OST) represent all obligations incurred during the period and were supported by documentation, including form Report 1198 and a letter to OST. We will reconcile the "Grand Total" from the OST Distribution Detail 721 Report to the "Statewide Total" on the OSPI reports (Form 1198, apportionment memo and letter to OST) and review the apportionment memo, reconciliation worksheet, and other documentation to determine the amount of apportionment expenditures that occurred in FY24.

We anticipate that these tests will provide sufficient appropriate audit evidence to address the assessed risk of material misstatement for relevant assertions in significant classes of transactions.

### **D.6.PRG - Education**

*Procedure Step:* Substantive Test  
*Prepared By:* NJH, 10/7/2024  
*Reviewed By:* RKM, 10/14/2024

Purpose/Conclusion.
---------------------

#### **Purpose:**

To determine whether all expenses/expenditures incurred during the period were reported.

#### **Conclusion:**

We determined that all expenses/expenditures incurred during the period were reported. *No issues noted.*

# State of Washington

## Testing Strategy:

### **Completeness:**

The following is a list of **considerations** for testing the completeness assertion for expenses/expenditures. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

### **Detail Roll-Up**

- Compare totals from general ledger to accounts payable, payroll or other subsidiary software modules.
- Review the government's reconciliation of general ledger to subsidiary systems.

*Detail roll-up testing is not sufficient audit evidence by itself since it only entails comparing different sets of the entity's own accounting records. However, it may be combined with other substantive tests to address identified risks. For example, if substantive testing is performed at the subledger level, it may be combined with a test that the subledger detail accurately rolls up to the general ledger or financial statements.*

### **Cut off / Improper Expense Recognition**

- Scan expenditures recorded 1-3 months before and/or after fiscal year end (expenditures not charged to the current period). Based on the scan, test selected or sampled expenditures to determine if the expense should have been reported in the current period.
- Inquire with AP clerks regarding invoices held, but not entered as of year-end (ie: due to pending litigation or disputes).

### **Unrecorded Expenses**

- If the entity reconciles recorded revenues and expenses to bank activity, then reviewing monthly reconciliations and evaluating or testing reconciling items.

### **Accounts Payable**

- If entity uses a warrant clearing account for vendor payments, review the entity's year-end reconciliation of recorded vendor payments with disbursements from the clearing account.
- Review edit check reports from the AP system that might indicate missing payments.

### **Payroll**

- If entity uses a payroll clearing account, review the entity's year-end reconciliation of recorded payroll with disbursements from the payroll clearing account.
- Perform an expected payroll test by taking the prior audited payroll amount and adjusting it for expected changes.

*The analysis should consider changes in employees, COLA increases, salary scale increases if automatic, changes wages or benefits due to changes in policy or union negotiations changes, etc. Sources for these expectations should be obtained apart from the payroll records*

## State of Washington

*that are being tested. Since the auditor would not expect to be able to precisely predict payroll, the auditor should document a reasonable range within which actual payroll is expected to vary from the auditor's prediction.*

- If the board directly approves salaries for a significant amount of employees, verify whether the actual salaries for these employees is within an expected reasonable range of the approved salary.
- For small entities, compare payroll by employee to known employees per observation, organization charts or a phone list.
- Review edit check reports from the payroll system that might indicate missing payments.

### **Unrecorded Liabilities**

- Evaluate liabilities directly related to expenses for completeness. See the completeness steps for current and non-current liabilities for testing considerations.

*For example, if the entity reports a self-insurance liability, the auditor might evaluate whether the change in the liability (and related expense) was determined and recorded. If no liability was reported, then the auditor might determine whether such a liability (and associated expense) should have been reported.*

**OPEB** - auditors should use the OPEB Testing Strategy workpaper available in the Store for auditing OPEB expenses.

**Pollution Remediation** - auditors should use the Pollution Liability Testing Strategy workpaper available in the Store for auditing pollution remediation expenses.

### **Removing Expenses from Accounting Records**

- Search for manual journal entries that credit (decrease) expenditures. Consider testing selected transactions.
- Identify transactions that void, cancel, or manually adjust transactions in subsidiary AP or payroll systems. Auditors may conclude that the total amount of such transactions are trivial or otherwise reasonably small. Or auditors may sample or select transactions for testing.

*Also see considerations under the "Not recording expenses" section.*

### **Interfund Expenses**

For internal service fund charges, see testing strategies for internal service funds in the Accountability folder. For other types of internal charges, see testing strategies for Internal Activities.

Guidance/Criteria:

### **AUDIT CRITERIA - Occurrence**

## State of Washington

Key criteria that auditors will likely use when testing this area.

### **BARS [3.8.6](#) Use of Payroll and Claims Funds**

#### **AUDIT CRITERIA - Completeness**

Key criteria that auditors will likely use when testing this area.

**BARS [3.6.13](#) Utility Tax (*applies only to cities*)** - should be accounted for as a revenue in the general fund (3164000) and expenditure in the utility fund (53P0040), if the utility passes the tax on to its customers then the additional charges should be recognized as revenue (343P000) directly in the utility fund not in the general fund

### **BARS [3.8.6](#) Use of Payroll and Claims Funds**

Record of Work Done.

#### **Substantive tests performed to meet the Completeness assertion:**

See testing performed at [\[OSPI Testing\]](#).

We performed substantive testing to meet the completeness assertion by the following two testing methodologies described:

- OSPI provided us with various treasury reports and letters that include details about the net amount of apportionment to be paid out for each fiscal month throughout the FY24 year. We first analyzed and compared the apportionment amount shown on the letter sent to OST for funds disbursement with the amount shown on the "DistDetail721" report. We noted no variances between these reports. Additionally, we compared the internal OSPI apportionment "Report 1198" showing the distribution of state funds, the Type 9 payments, and amounts to state agencies & charters with the amounts reported to the state treasury. We noted no variances between the OSPI reports and the OST letters. We included July 2024 (FY 25) in the scope of our testing due to the frequency by which remaining PY funds are oftentimes paid out during the first few months of the next fiscal year. We noted variances for either the OST reports or the OSPI apportionment reports for July of FY25.

We determined that reported expenditures were complete for all periods evaluated. *No issues noted.*

- Additionally, we obtained the "June Items" excel workbook from Dereka Pedersen, Assistant General Accounting Manager, on 8/14/24 containing the total FY 24 OSPI reports, OST reports, AFRS JV log, and the reconciling apportionment spreadsheet, all in one workbook. We ran an Enterprise Reporting (ER) report for "GL Activity Flexible", for Fund 001, Object N, and GL account 6510 to obtain all of the grant/apportionment payments made throughout the year. We then sorted this report by fiscal month to determine the total

## State of Washington

apportionment paid out in AFRS. We compared these figures with the "AFRS Dist. JV & Detail Tranx Log" spreadsheet (included in the *June Items* workbook) which showed the total amount to be reported to OST and any necessary JV's needed for AFRS. We made two comparisons with these amounts: the first was comparing the AFRS Dist. Detail to our *Existence* testing OSPI Report 1198, where we noted no variances. We then compared the AFRS Dist Detail to the amounts reported on the ER Report, where we noted 4 months with variances. We inquired about these variances and determined that they are PY apportionments paid out during the current FY. As noted similarly above, we included July 2024 (FY 25) in the scope of our testing due to the frequency by which remaining PY funds are oftentimes paid out during the first few months of the next fiscal year. We expected to see a variance for July FY25 to include some FY24 apportionment amounts and we were able to confirm this by noting 12 transactions that had PY task codes for FY24 during July. From FY24 months, there were 18 total transactions that had PY task codes, resulting in 30 total PY transactions identified during our testing. To ensure all transactions were accounted for, we compared the total monthly AFRS Dist Detail with the total ER subtotal for all 13 months (including July of FY25), as well as the apportionments made in PY's, and confirmed that they tied to the ER Report subtotal of \$18,352,573,363.

We determined that all expenditures incurred during the period were reported. *No issues noted.*

### D.7.PRG - Due From Other Governments

*Procedure Step:* Summary & Conclusion  
*Prepared By:* EZM, 11/21/2024  
*Reviewed By:* RKM, 11/21/2024

Purpose/Conclusion.:

#### **Purpose:**

To evaluate risk assessments and the sufficiency and appropriateness of evidence obtained based on results of substantive work.

#### **Conclusion:**

We determined that **no** modifications were necessary to inherent risk, control risk, or the risk of material misstatement as assessed in planning.

Testing Strategy.:

Auditors are **required** to evaluate conclusions for substantive testing as follows:

# State of Washington

*Auditors may wish to use the optional Lead Sheet available in the Store to summarize testing related to each balance and assertion.*

**1.** Determine whether the results of substantive testing indicate a need to modify the inherent risk assessment (IR), control risk assessment (CR), risk of material misstatement (RMM) or other aspects of planning (such as material balances or assertions). If so, document changes and consider the need for additional testing.

*If the results of substantive testing indicate a need to change control risk, auditors should also update the **Permanent File** by either correcting the documentation or by adding an update section describing changes to the top of the record of work done. For all changes to IR, CR, or RMM the **Material Balances** spreadsheet should be updated.*

*More significant changes to other aspects of planning (such as material balances or assertions) should be referenced in this step and documented in detail in the **Changes to FS Audit Plan** step.*

**2.** Evaluate whether the quality and quantity of evidence obtained is sufficient and appropriate in response to the risk of material misstatement. In making this determination, auditors should evaluate:

Information to be used as audit evidence:

- Does evidence relate to the population, period of time and risk (assertion and “what could go wrong” from the Material Balance Spreadsheet)? If there are any gaps or uncertainties in the logical connection between the evidence and conclusions, is there a documented consideration and explanation?
- Are the sources of information sufficiently reliable and appropriate for the risk (whether internal to the government, external, or auditor developed)? If key information is not from a sufficiently reliable source (for example, inquiry), then is it corroborated by information that is?
- Are there any concerns about accuracy, completeness, authenticity, or bias in information? If so, did the auditor perform sufficient procedures to confirm reliability of that information?
- Is information precise enough to catch if misstatements exceeded the tolerable level?
- Is information detailed enough to conclude on whether or not there were misstatements?
- Was there any information that appeared contradictory or inconsistent? If so, was there a documented response to the inconsistencies or doubts about the reliability of evidence?

Results:

- How much misstatement was identified by testing, and the likelihood and magnitude of further potential misstatement?
- How did misstatements occur and how often might they occur again in the population?
- Were misstatements caused by control deficiencies or circumvention of controls?

## State of Washington

- If control deficiencies, is there a need to re-evaluate our understanding of controls in the [Permanent File](#) folder or assessment of control risk?
- If circumvention, the [Management Override of Controls](#) step should address or reference this area. Auditors should also consider whether a fraud risk has been identified.
- Did tests identify a different level or type of risk than the planned audit response was designed to address?
- If likely misstatements are identified, are further procedures necessary to improve the precision of our estimate?

*To support the overall evaluation of audit risk and provide a basis for concluding on the overall sufficiency and appropriateness of evidence in the [FS Summary & Report](#) step, auditors should conclude in each area whether the auditor continues to believe that the tests performed and quality and quantity of evidence obtained are commensurate with RMM for all relevant risks (the "what could go wrong", in the [Material Balances](#) spreadsheet).*

If the auditor determines that evidence is not sufficient or appropriate, additional substantive testing should be done. If sufficient, appropriate evidence is not available for audit, the AIC should discuss the effect on our audit report with the AAM and AM.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

### **SAO Audit Policy [6310](#) – Determining the Nature, Timing and Extent of Substantive Testing**

### **SAO Audit Policy [3210](#) – Audit Evidence**

Record of Work Done:

Based on test results, we re-evaluated risk assessments, procedures, evidence obtained and conclusions as follows:

#### **(1) Do the results of substantive tests indicate a need to modify our risk assessment (IR, CR and RMM)?**

We determined that **no** modifications were necessary to inherent risk, control risk, or the risk of material misstatement as assessed in planning.

#### **(2) Was the quality and quantity of evidence obtained sufficient and appropriate?**

We also determined that evidence obtained was sufficient and appropriate in response to the risk of material misstatement.

## State of Washington

### Issues

ISS.1 - E: HCA_Receivables Lack of Complete Reconciliation Pay1 to AFRS		
<i>Prepared By:</i>	MRF, 10/17/2024	<i>Issue</i>  The Health Care Authority did not fully reconcile the fiscal year 2024 Due From Other Governments balance for PEBB and SEBB from PAY1 to AFRS. AFRS reported \$9,382,356 less than amounts included in PAY1 receivable reports.  We recommend the Health Care Authority improve resources (PAY1 reports, databases, etc.) to facilitate the tracking of invoices, payments, any related adjustments, and batched revenue transactions between PAY1 and AFRS.

### NOTES

**Communication of the Audit Issue with the Client:**

We verbally communicated the issue to Kari Summerour, External Audit Liaison, Dineen Kilmer, ProviderOne Section Manager, Ed Hicks, IT System Admin, and Angie Skinner IT System Admin, in a Teams meeting on 10/11/2024.

### ISS.4 - V: HCA\_Confidential IT Controls\_SOC Audit (Part of ML)

*Prepared By:* DLE, 10/17/2024  
*Reviewed By:* SHW, 12/9/2024  
*Type:* Verbal Recommendation  
*Category:* IT Controls - Confidential  
*Reporting Level(s):*

*Impact**Cost Savings:**Questioned Costs:* \$0.00*Issue*

We identified the following weaknesses related to the Acentra Health, LLC Provider One SOC 2 Type 2 audit:

The ProviderOne vendor's SOC 2 Type 2 audit did not cover the entire fiscal year 2024. The audit did not include the first six months of the fiscal year, July 1, 2023 - December 31, 2023.

The Authority receives and reviews the Acentra Health ProviderOne SOC 2 Type 2 audit report to determine whether there are exceptions that require corrective action. However, there are no documented procedures for receiving and reviewing the report to ensure the review is adequately and consistently performed.

The Authority did not maintain documentation to support there was a review of the SOC 2 Type 2 audit report.

We recommend the Authority:

Continue to work with its vendor to obtain an annual SOC 2 Type 2 report that covers the entire fiscal year.

Implement formal procedures for receiving and reviewing the report to include maintaining documentation evidencing the review occurred and the results.

### NOTES

**Level of Reporting Summary:** [LOR Summary].

**INCLUDED IN ML at Iss.40**

## State of Washington

### Communication of the Audit Issue with the Client:

We verbally communicated the issue to Kari Summerour, External Audit Liaison, Dineen Kilmer, ProviderOne Section Manager, Ed Hicks, IT System Admin, and Angie Skinner IT System Admin, in a Teams meeting on 10/11/2024.

### Rational for Level of Reporting:

We issued a Management Letter in FY20 as HCA did not obtain a SOC report that covered any part of the fiscal year. In prior audits we issued Management Letters when HCA obtained SOC reports that covered only six months of the fiscal year. Although we did not identify material errors, from a qualitative standpoint there is a possibility of additional undetected misstatements. To date HCA has been unable to obtain funding from the Legislature to pay for annual service organization reports.

### Issue history:

FY23 Finding (No report)  
FY22 Management Letter (Report covered 6 months)  
FY21 Finding (No report)  
FY20 Management Letter (Report covered 6 months)  
FY19 Finding (No report)  
FY18 Management Letter (Report covered 6 months)  
FY17 Finding (No report)  
FY16 Management Letter (Report covered 6 months)  
FY15 Finding (No report)  
FY14 Management Letter (Report covered 3 months)  
FY13 Finding (No report)

### ISS.6 - E: WSDOT\_Depreciable Assets Manual Input Error

<i>Prepared By:</i>	NJH, 7/11/2024	<i>Issue</i>
<i>Reviewed By:</i>	RKM, 12/17/2024	The Department of Transportation did not ensure the monthly depreciation amount and the total accumulated depreciation were correct for a selected asset in the Computer Aided Facilities Management (CAFM) system. There were approximately five months of missing depreciation, which was due to manual input error of the placed-in-service date.
<i>Type:</i>	Financial Statements	
<i>Category:</i>	Accounting/Financial Reporting	
		We recommend the Department of Transportation have the Capital Facilities

## State of Washington

<p><i>Reporting Level(s):</i> Exit Item</p> <p><i>Impact</i></p> <p><i>Cost Savings:</i></p> <p><i>Questioned Costs:</i> \$0.00</p>	<p>Financial Manager frequently (once a month or other periodic interval) review the manual inputs of required CAFM fields such as the "Date Acquired" and the "Date Placed in Service" to ensure they are appropriate as they relate to the original work order or the completed work timeline.</p>
<b>NOTES</b>	
<p><b>See Level of Reporting Summary at: <a href="#">[LOR Summary]</a>.</b></p> <p><b>Communication of the Audit Issue with the Client:</b></p> <p>We verbally addressed this issue during a meeting with Elena Fehr, Facilities Inventory Specialist, and Krystle Mize, DOT Budget &amp; Financial Manager, on 6/27/24 and sent over a copy of our recalculation that led us to discover the error. Elena Fehr confirmed through screenshots &amp; email that she had forgotten to update the system with the correct date acquired, which was causing the CAFM system to calculate straight-line depreciation incorrectly. She successfully updated the CAFM system with the corrected "date acquired" field and depreciation amounts. We were able to verify this correction on our end.</p>	
<b>ISS.8 - E: ESD_PFML Control Weaknesses</b>

We notified Heidi Algieri and Devon Phelps about the issue on 10/16/24

### ISS.11 - E: HCA\_Misstatement of Due From Other Governments Receivables

<i>Prepared By:</i> MRF, 10/22/2024 <i>Reviewed By:</i> RKM, 11/8/2024 <i>Type:</i> Financial Statements <i>Category:</i> Accounting/Financial Reporting <i>Reporting Level(s):</i> Exit Item  <i>Impact</i> <i>Cost Savings:</i> <i>Questioned Costs:</i> \$0.00	<p><i>Issue</i></p> <p>The Health Care Authority incorrectly excludes payments for the current month if the payments are received after billing is generated for the next month in the Pay1 system. The system did not include some payments in the calculation of the Due From Other Government's receivable balance as of June 30th, 2024. The omissions overstated the balance by the \$15,456,165 payment amounts and also overstated premium and assessment revenue by the same amount as of June 30th.</p> <p>We recommend the Health Care Authority update the Pay1 system so that it records payments in the month received.</p>
---	--

### NOTES

## State of Washington

We communicated the known issue over Teams with Rita Homan on 09/18/2024, and communicated the projected misstatement via email same day, and included William Sogge and Kari Summerour (HCA's external audit liaisons). Rita Homan provided additional documentation to show the true misstatement of the line item, which we reviewed and agreed with. We communicated our acceptance of the known misstatement of 15.5M on 10/16/2024 via email. See LOR here [[LOR Summary](#)] and AOM here [[Aggregation of Misstatements \(GAAP\)](#)].

### ISS.12 - V: ECY\_Application of Loan Payments

<i>Prepared By:</i> EJB, 10/22/2024 <i>Reviewed By:</i> CJG, 11/6/2024 <i>Type:</i> Verbal Recommendation <i>Category:</i> Accounting/Financial Reporting <i>Reporting Level(s):</i>  <i>Impact</i> <i>Cost Savings:</i> <i>Questioned Costs:</i> \$0.00	<i>Issue</i> The Department of Ecology did not ensure Clean Water State Revolving Fund loan payments were applied correctly. The payments in November on three loans were incorrectly applied to only one loan. The selected loan was understated by \$59,250. However, this error does not effect the overall amount reported as due from other governments.  We recommend the Department of Ecology review their reconciliation process of eHub receivables on a loan by loan basis before entry into AFRS.
--	--

### NOTES

**See Level of Reporting Summary at:** [[LOR Summary](#)].

#### **Communication of the Audit Issue with the Client:**

We emailed Beth Swanson, Senior Financial Advisor, on 10/22/2024 informing her that "We have finished the testing for the loans receivable line item on the ACFR. When we take into consideration the one issue I ran into that I had emailed you about earlier this week, this misstatement was \$59,250 for the one loan. However, in the aggregate, there is minimal affect. We recommend that ECY does a loan by loan reconciliation before making an entry into AFRS."

We note that as of 10/4/2024, it would be too late to make a correcting entry into AFRS. Therefore, this misstatement will remain uncorrected.

## State of Washington

### ISS.13 - V: CCS\_Lack of Documented Review and Approval of Investment Reconciliations

<i>Prepared By:</i> JAG, 10/14/2024 <i>Reviewed By:</i> RKM, 11/8/2024 <i>Type:</i> Verbal Recommendation <i>Category:</i> Accounting/Financial Reporting <i>Reporting Level(s):</i>     <i>Impact</i> <i>Cost Savings:</i> <i>Questioned Costs:</i> \$0.00	<i>Issue</i> The Community Colleges of Spokane did not evidence review and approval of their June 2024 bank reconciliations for investments. <i>Prepared By:</i> DRR, 11/19/2024 <i>Reviewed By:</i> RKM, 12/17/2024 <i>Type:</i> Financial Statements <i>Category:</i> Accounting/Financial Reporting <i>Reporting Level(s):</i> Exit Item  <i>Impact</i> <i>Cost Savings:</i> <i>Questioned Costs:</i>	<i>Issue</i> The state produces a series of year-end exception reports designed to identify potential errors in financial reporting. Based on our review of these reports, we found a number of likely errors that should have been investigated and corrected. The State Board for Community & Technical Colleges (SBCTC) did not actively work, investigate, and adjust a number of the high-risk balances noted in these reports including:  <u>Assets with credit balance</u> Fund 450 GL 1110 Cash in Bank (\$4,954,750). Fund 790 GL 1318 Unbilled Receivables (\$1,641,146). Fund 859 GL 1110 Cash in Bank (\$2,148,656).  <u>Liabilities with debit balance</u> Fund 145 GL 5181 Employee Insurance Deductions Payable \$1,922,085. Fund 846 GL 5190 Unearned Revenues \$1,596,204.  These potential errors were not corrected in the financial statements.  We recommend SBCTC actively investigate and adjust balances when appropriate.

ISS.40 - ML: OFM_Financial Statement Preparation	
<p><i>Prepared By:</i> RKM, 12/9/2024</p> <p><i>Reviewed By:</i> CJG, 12/9/2024</p> <p><i>Type:</i> Financial Statements</p> <p><i>Category:</i> Accounting/Financial Reporting</p> <p><i>Reporting Level(s):</i> Management Letter</p> <p><i>Impact</i></p> <p><i>Cost Savings:</i></p> <p><i>Questioned Costs:</i></p>	<p><i>Issue</i></p> <p><u>Management Letter</u> Office of Financial Management July 1, 2023 through June 30, 2024</p> <p><b>Financial Statement Preparation</b> The Office of Financial Management (OFM) is responsible for preparing the state's financial statements in accordance with generally accepted accounting principles (GAAP). These statements provide a thorough and detailed presentation of the state's overall financial condition. OFM is responsible for obtaining state agencies' financial data that is required to prepare these statements. At year-end, OFM is also responsible for ensuring the accuracy of the financial information presented in the statements.</p> <p>During the audit, we found instances in which the financial information presented in the financial statements were not accurate or was misclassified.</p> <p><i>Allocation of Other Postemployment Benefits (OPEB)</i></p> <p>OFM allocated OPEB balances across opinion units based on incorrectly calculated allocation percentages. As a result, the following balances were misstated:</p> <p>Statement of Net Position (Government Wide) - Business-Type Activities:</p> <p>Long-Term Liabilities Due in More Than One Year (OPEB) was overstated by \$7.1 million</p> <p>Deferred Inflows of Resources (OPEB) was understated by \$8.6 million</p> <p>Statement of Net Position (Proprietary Funds) - Health Insurance:</p> <p>Other Long-Term Liabilities - Noncurrent (OPEB) was overstated by \$155,000</p> <p>Statement of Net Position (Proprietary Funds) - Higher Education Student Services:</p> <p>Other Long-Term Liabilities - Noncurrent (OPEB) was overstated by \$8.8 million</p>

## State of Washington

	<p>Deferred Outflows of Resources (OPEB) was overstated by \$946,000 Deferred Inflows of Resources (OPEB) was understated by \$7 million</p> <p><i>Washington State University's Federal Assistance Reconciliation to AFRS Revenue</i> Washington State University reported receipts of Federal Direct Student Loans as federal revenue rather than a reduction in expenditures. This resulted in a \$145.1 million overstatement of Federal Grants in Aid revenue and a corresponding expenditures overstatement within the Higher Education Special Revenue Funds.</p> <p><i>Budgetary Comparison Schedule - Budget to GAAP Reconciliation</i> OFM incorrectly reported the entire Budgetary Comparison Schedule - Budget to GAAP Reconciliation for the Wildlife and Natural Resources Special Revenue Fund due to a formula error. The errors ranged from \$25.2 million to \$7.7 billion. This schedule is part of the Required Supplementary Information and the errors did not affect the reporting of the basic financial statements.</p> <p><i>GASB 100 Implementation</i> OFM incorrectly classified accounting changes and error corrections on the Governmental Funds Statement of Revenues, Expenditures, and Changes in Fund Balances and Nonmajor Special Revenue Funds Combining Statement of Revenues, Expenditures, and Changes in Fund Balances by \$3.1 billion. OFM should have presented the changes and corrections as a single line on the statements or individually. Also, OFM did not properly disclose two error corrections in the notes to the financial statements as required by GASB 100.</p> <p><i>Reporting Entity and Related Party Transactions</i> OFM defines the state of Washington for reporting purposes and determining which organizations are financially accountable to the state and which other organizations, that do not meet the financial accountability criteria, should be included in the reporting entity. OFM makes this determination by assessing if the nature and significance of the organization's relationship with the state are such that exclusion would cause the state's financial statements to be misleading. OFM incorrectly reported the following: Two related organizations were excluded in the reporting entity note disclosure</p>
--	---

## State of Washington

	<p>One entity was included as part of the primary government that should have been disclosed as a joint venture with equity interest</p> <p>Six entities were excluded from being discretely presented component units</p> <p>One blended component unit was excluded in the reporting entity note disclosure</p> <p>All commodity commissions were excluded from being reported as part of the primary government.</p> <p>Also, OFM did not have a process to identify or track related party transactions that would require disclosure. These reporting errors are not significant to the state's financial statements.</p> <p><i>Use of Exception Reports</i></p> <p>OFM runs a series of year-end exception reports designed to identify potential errors in financial reporting. We found OFM did not actively work and investigate several high-risk balances noted in these reports. Based on our review of the reports, we found several likely errors that should have been investigated and corrected, including:</p> <ul style="list-style-type: none"><li>Due from other governments (\$60.8 million) should have been written off</li><li>Claims and judgements payable (\$19.5 million) should have been liquidated</li><li>Claims and judgements payable (\$8.2 million) required further investigation</li><li>Assets (\$57.2 million) that likely needed adjustment</li></ul> <p><i>Investments Misclassification</i></p> <p>OFM is responsible for preparing a Statement of Net Position – Component Units based on the various component unit financial statements it obtains. OFM understated current investments for the Fred Hutchinson Cancer Center by \$646.2 million and overstated noncurrent investments by \$646.2 million.</p> <p>We recommend OFM:</p> <ul style="list-style-type: none"><li>Perform a thorough review of underlying calculations related to OPEB balances to ensure they are accurately allocated across opinion units</li><li>Assist Washington State University in its reconciliation of Direct Federal Assistance to ensure the proper accounting and recording of federal revenues</li></ul>
--	---

## State of Washington

	<p>Perform a thorough review of reconciliations and schedules to ensure they are accurately reported</p> <p>Thoroughly review the reporting entity note disclosure to ensure all information is accurate and develop a process to identify or track related party transactions</p> <p>Correctly report entities that are part of the state in accordance with GASB Statements 14 and 80</p> <p>Report and disclose all accounting change and error corrections in accordance with GASB 100.</p> <p>Actively work and investigate high-risk balances identified in its year-end exception reports</p> <p>Conduct a sufficient review to ensure financial statement balances are accurately reported</p> <p><u>Management Letter</u> Health Care Authority July 1, 2023 through June 30, 2024</p> <p><b><u>ProviderOne System</u></b> The Health Care Authority (HCA) contracts with a vendor for its Medicaid payment system, ProviderOne. During the fiscal year that ended June 30, 2024, ProviderOne processed about 141 million Medicaid transactions totaling \$18 billion. In the prior 11 audits, we recommended HCA obtain a Service Organization Control (SOC 2) report that covers an entire fiscal year.</p> <p>Although HCA's controls have improved, we found its SOC 2 report covered only six months of the fiscal year. This report is essential because it determines whether controls are properly designed and operating as intended in the processing and recording of Medicaid payments.</p> <p>Without a complete annual SOC 2 report, HCA risks inaccurate financial reporting in the state's general fund. HCA also risks having ineffective internal controls, which could lead to misuse, loss or misappropriation, inaccurate payments, and unauthorized software changes to the ProviderOne system.</p>
--	--

## State of Washington

	<p>Also, HCA receives and reviews the SOC 2 report to determine whether there are exceptions that require corrective action. However, HCA did not maintain documentation to support there was a SOC 2 report review. HCA has no documented procedures for receiving and reviewing the SOC 2 report to ensure it adequately and consistently performs the review.</p> <p>We recommend HCA continue to work with its vendor to obtain an annual SOC 2 report that covers the entire fiscal year. We also recommend HCA implement formal procedures for receiving and reviewing the report to include maintaining documentation evidencing the review occurred and the results.</p> <p><u>Management Letter</u> Washington State University July 1, 2023 through June 30, 2024</p> <p><b>Cash and Accrued Liabilities</b> Management is responsible for ensuring adjusting entries are input in the Agency Financial Reporting System (AFRS). Washington State University (WSU) did not include an adjusting entry in AFRS. This was due to there being a translation error between the University's chart of accounts and the AFRS chart of accounts. This caused the amount of cash and cash equivalents to be overstated and accrued liabilities to be overstated by \$267.8 million. This error was corrected in the state's financial statements.</p> <p>We recommend WSU perform a thorough review to ensure all entries are recorded in the state's accounting system.</p>
<b>NOTES</b>

ISS.43 - F: Discretely Presented Component Units	
<i>Prepared By:</i> SHW, 12/6/2024 <i>Reviewed By:</i> CJG, 1/8/2025 <i>Type:</i> Financial Statements <i>Category:</i> Accounting/Financial Reporting <i>Reporting Level(s):</i> Finding  <i>Impact</i> <i>Cost Savings:</i> <i>Questioned Costs:</i>	<i>Issue</i> <b>2024-002 The State lacked adequate internal controls over financial reporting to ensure it reported all discretely presented component unit financial activity in its financial statements.</b>  <b><i>Background</i></b>  State management is responsible for designing, implementing and maintaining internal controls that provide reasonable assurance financial statements are fairly presented and financial reporting is reliable. We identified deficiencies in internal controls that could adversely affect the State's ability to prevent, or quickly detect and correct, misstatements in the financial statements.  Washington state universities and colleges obtain support from nonprofit foundations. These foundations generally

## State of Washington

	<p>raise, administer and invest funds and make expenditures to or for the benefit of the university or college. Although the foundations are separate legal entities, accounting standards require the State to report their financial activity as discretely presented component units in the state's financial statements.</p> <p>The Washington State Housing Finance Commission (WSHFC) is a component unit of the state of Washington. It is a self-sustaining public agency committed to increasing housing access and affordability for Washington residents.</p> <p><i>Government Auditing Standards</i>, prescribed by the Comptroller General of the United States, requires the auditor to communicate material weaknesses in internal controls, as defined below in the Applicable Laws and Regulations section, as a finding.</p> <p><b><i>Description of Condition</i></b></p> <p>The Office of Financial Management (OFM) did not report the financial activity of the state university and college foundations as a component unit in the state's financial statements. Additionally, OFM did not report complete financial activity of the WSHFC in the state's financial statements.</p> <p>We consider this internal control deficiency to be a material weakness.</p> <p><b><i>Cause of Condition</i></b></p> <p>OFM deemed the financial activity of the foundations as</p>
--	--

## State of Washington

insignificant to the state's financial statements and elected not to report them. OFM staff also believed reporting complete financial information of the WSHFC was not appropriate as the state was not obligated for the entity's special assessment debt.

### ***Effect of Condition***

By not reporting university and college foundation financial activity and complete activity of the WSHFC, the state's component unit statement of net position and statement of revenues, expenses and changes in net position were materially misstated.

Although university and college foundation financial data for the fiscal year ending June 30, 2024, was not available at the time of our report, we estimated the following understatements based on prior years activity:

Assets/Deferred Outflows - \$1.5 billion

Liabilities/Deferred Inflows - \$65 million

Revenues - \$460 million

Expenses - \$379 million

OFM's omissions of certain WSHFC activity resulted in the following misstatements:

Assets and deferred outflows were understated by \$1.1 billion

Liabilities and deferred inflows were understated by \$998 million

## State of Washington

	<p>Net investment in capital assets were overstated by \$763,000</p> <p>Restricted for other purposes were understated by \$112.3 million</p> <p>Unrestricted net position were understated by \$763,000</p> <p>Expenses were understated by \$38.7 million</p> <p>Revenues were understated by \$46.6 million</p> <p>OFM did not correct these errors in the financial statements.</p> <p><b><i>Recommendation</i></b></p> <p>We recommend OFM establish a process to obtain timely financial information from university and college foundations to include in the state's financial statements. We further recommend OFM report complete financial information of the WSHFC as presented in its audited financial statements.</p> <p><b><i>Agency's Response</i></b></p> <p><b><i>Auditor's Remarks</i></b></p> <p><b><i>Applicable Laws and Regulations</i></b></p> <p><i>Government Auditing Standards, July 2018 Revision,</i></p>

<b>NOTES</b>	
See LOR at: <a href="#">[LOR Summary]</a> .  We communicated this issue to Anna Quichocho, Financial Reporting Manager, and Angie Dobbins, Executive Director/Controller, on November 27, 2024. <b>INCLUDED IN ML at ISS. 40</b>	

### D.7.PRG - Due From Other Governments

*Procedure Step:* Controls - Year-end Accrual and Liquidations (HCA)  
*Prepared By:* EZM, 10/23/2024  
*Reviewed By:* SHW, 10/28/2024

Purpose/Conclusion.\*

**Purpose:**

To gain an understanding of internal controls.

**Conclusion:**

We gained an understanding of internal controls as documented in the record of work done.

# State of Washington

Testing Strategy:

**The following procedures are required for all significant systems:**

1. List the financial statement balance(s) and relevant assertion(s) addressed by the understanding.
2. Gain an understanding of the internal control process, identify how transactions are recorded in AFRS, identify key controls over relevant assertion(s), and note any control weaknesses.
  - In gaining an understanding of controls, consider the overall understanding of State-Level control elements as documented in the "State-Level Controls" step as they relate to this particular system.
  - Identify controls systems covering all relevant assertions for all significant classes of transactions.
  - Standards require the auditor to gain an understanding of the significant accounting system(s) that contain key controls over significant classes of transactions included in the line item.
  - Control systems identified in this step must match the Material Account Matrix and have a separate control understanding documented.
  - Talk with the ACFR Specialist or AIC if you identify different systems than the ones anticipated in the Material Account Matrix.

For each material system, auditors must document:

- A brief outline of the transaction flow from beginning to end.
- An expanded description of key controls.
- Business processes relevant to financial reporting of the relevant assertion for the material balance. Processes should encompass automated and manual procedures by which transactions or events are identified or initiated, authorized as needed, recorded, processed and corrected as needed.
- Original accounting records and how records are rolled-up to intermediary ledgers and transferred to the general ledger (AFRS) or financial statements.
- Detailed descriptions of key controls. Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

The following is information to **consider** when identifying key controls and transaction flow.

"Key controls" refer to the few controls that together provide reasonable assurance that material misstatements will be prevented or detected and corrected. This is contrasted with ancillary or supporting controls, which – although helpful and recommended – would provide less than reasonable assurance by themselves.

## State of Washington

The focus of the write-up is on the key controls. Key controls should be specifically identified (as “key controls”) in the write-up. This can be done in whatever way the auditor prefers, so long as it is obvious. Details that the auditor should document regarding key controls may include:

- Who or what initiates the control
- When (or how often) is the control applied
- Who performs the control
- As needed, the experience, knowledge and attitude of the person applying the control
- Detailed description of the control process or activity. For example, if the control is a review: what exactly is reviewed, what is the reviewer looking at or for and what are the reviewer’s criteria?
- How the key control is documented or evidenced
- If not obvious from the description, how the control prevents or timely detects and corrects misstatements
- Any exceptions or alternative processing to the normal process
- What happens when misstatements or issues are identified by the control

The “transaction flow” refers to the process by which transactions are initiated, authorized, recorded, processed and reported (as applicable). Outlining the transaction flow gives context to key controls, especially how transactions become subject to controls in the first place. If a control inherently ensures that all applicable transactions are included (ex: bank reconciliation where the assertion is existence), the auditor may decide to just start the write-up with the initiation of the control procedure and go from there.

Elements of the transaction flow are defined informally as follows:

- *Initiation:* How are transactions initiated?
- *Authorization:* How are transactions and accounting record maintenance authorized?
- *Recording:* How are transactions or balances identified and recorded in financial accounting systems?
- *Processing:* How are the transactions or balances processed after they are recorded (if at all)? Processing may be manual or automated and may occur at a subsidiary system level or at the general ledger level.
- *Reporting:* How are records translated into the financial statements? This part of the transaction flow extends the understanding to the actual financial statements that the audit is opining on. Since we already document an understanding of the financial reporting process in general, it is usually enough to simply reference this overall understanding. However, if there are important steps unique to the covered balances, it may be more appropriate to mention them here.

Although transaction flow is a good way to think about understanding and documenting a control system, auditors should not worry too much about documenting “each element, in order” because often elements may be combined, not noticeable, not applicable or occur in a different order.

# State of Washington

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits](#) Planning Guide**

Record of Work Done:

## **Significant Balance(s) and Assertions**

Internal controls in the Receivable Accrual and Subsequent Liquidations address the following balance(s):

- **Due from Other Governments** - Amounts due from the Federal Government to reimburse program expenditures made by the state.

For the following assertions:

- **Existence** - Amounts due from the Federal Government to reimburse program expenditures are supported by amounts actually paid during the period and the underlying program expenditures.
- **Valuation** - Amounts due from the Federal Government to reimburse program expenditures have been calculated correctly.

## **Gain an Understanding of Internal Controls**

On October 21, 2024, we inquired with Kari Summerour, External Audit and Compliance Manager, regarding the internal controls for HCA's portion of the Due from Other Governments balance. She confirmed the understanding with the following individuals to ensure it was accurate for fiscal year 2024:

- Cheri Wright, Medicaid Accounting Manager
- Victoria Xu, Fiscal Analyst 4
- Laura Roberts, Federal Claims Supervisor
- Jill Arlow, Deputy Section Manager, Federal Financial Reporting

## *General Information*

All federal expenditures are recorded to cost objectives specific to the federal funding source. When a federal cost objective is established in AFRS, a corresponding federal revenue source is established and associated with the cost objective. Enterprise Reporting uses this structure to

## State of Washington

produce a report specifically developed to compare the level of federal expenditures for a period to the federal revenue source associated with those expenditures, and calculates the amount to be accrued. This process ensures federal expenditures for the period match the level of federal revenue posted for the same period. The variance column represents total expenditures less total revenues and would be the amount of additional accrued revenue that would be required to be posted to adjust GL1351. An analysis is then performed by the Fiscal Analyst to ensure that the revenue accrual is accurately calculated and based on final expenditures that are recorded and submitted for reimbursement.

### **Monthly Accruals**

The accrual process is performed monthly through a series of JVs that are processed for the regularly scheduled draws. The monthly revenue accruals are booked with XX batches. The process for calculating the monthly receivable begins by running a "Revenue Accrual Calculation" report by Program/Fund/MajorSource/SubSource. The program query criteria will depend on the program for which the accrual is being done, e.g. program 200 would be Medicaid, and the remaining criteria would include General Fund 001, and Major Group 03 (federal revenue). The report details federal disbursements, federal accruals, total expenditures, cash receipts, revenue accruals, total revenue and variance by major source (federal agency) and sub source (cost objective).

These JVs are MAJVs and are automatically reversed the next fiscal month under XY batches and primarily serve for information and reporting purposes; since the the monthly accruals are automatically reversed, they do not impact the final line amount at the end of the year.

### **Year End (Hard Accrual)**

At year-end, the revenue is accrued using a regular JV batch. This establishes an actual accrual for the fiscal year close. This accrual will be liquidated in the following year as prior period revenue is received.

The first year-end JV is completed using a main JV number as a JV batch to differentiate from the other XH batches. All subsequent JV's will use the same main JV number with a suffix from the beginning of the alphabets to tie all the year-end JVs together. The JV process is the same as for all subsequent accruals in which a template is set up and the final expenditure and revenue reports are run to determine the final accrual to be posted (**Key Control #1 - Existence/Valuation - Year-end accrual amount is based upon final expenditure and revenue reports**). This accrual process occurs repeatedly during FMs 12-99 and 24-25 in order to obtain the most accurate and current expenditure/revenue amounts for the accrual calculation. A fiscal analyst analyzes the final year-end expenditures, revenue, and revenue draws to calculate the final revenue accrual to record the Due from Federal Governments amount.

### **How Transactions are Recorded in AFRS (YE Accrual):**

Transactions are recorded in AFRS using the JV process that is performed by the Fiscal Analyst during the calculation of the revenue accrual noted above. The workbook will provide the coding details for the transaction that will be needed to record the transaction in AFRS. The Fiscal Analyst will log into AFRS and check the JV batch for errors. If there are no errors, the batch is then released in AFRS and a screen print of the AFRS release screen is saved to the "Upload and Release" tab of the JV workbook. If there are errors, the Fiscal Analyst will then research the JV to identify the error before making a correction and resubmitting it to the Assistant Accounting Manager for re-approval; this process occurs for

## State of Washington

every accrual run during the close (**Key Control #2 - Year-end accrual reviews and approvals**)

### **Adjustments to the GL1351 Amount (prior periods)**

The "hard coded" revenue accruals from the prior period are adjusted as the expenditures and revenues are liquidated throughout the subsequent fiscal year; these expenditure/revenue liquidations are identified through MOS and Fiscal Year fields in the determination of current vs prior period transactions. This occurs during standard federal draw downs and the recording process as summarized in the Federal Grants in Aid understanding [Controls - HCA]. The revenue adjustment associated with liquidations are recorded with TC 835 to adjust the GL1351 recorded amount (**Key Control #3 - Valuation - Adjustments to prior period year-end accruals are based upon expenditure and revenue liquidations in the current period**).

### Key Controls:

- **Key Control #1 - Valuation/Existence - The year-end hard revenue accrual/receivable recording is prepared and calculated using year-end expenditure and revenue amounts for programs.**
- **Key Control #2 - Valuation/Existence - The year-end revenue accrual/receivable recording is reviewed at each subsequent rerun by the Accounting Manager to ensure the correct amounts are posted and for the correct revenue subsources.**
- **Key Control #3 - Valuation - During the Federal Grants in Aid draw down process, adjustments to the prior period's revenue accrual are based upon expenditure and revenue liquidations.**

### **Noted Weaknesses are as follows:**

- None.

### **D.7.PRG - Due From Other Governments**

*Procedure Step:* Key Control #1 and 2 (Manual) - Calculation and Review of YE Accrual

*Prepared By:* EZM, 10/28/2024

*Reviewed By:* SHW, 10/28/2024

Purpose/Conclusion:
---------------------

### **Purpose:**

To confirm the calculation, recording, and review of the year-end federal revenues accrual (key control #1 and #2 for the Year-End Accrual) in

## State of Washington

order to assess control risk.

### **Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision,*

## State of Washington

*the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency.*

***All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.***

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially*

## State of Washington

*be relied upon for both the periods ending 2023 and 2024.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

### **Due From Other Governments - Valuation and Existence**

**Key Control #1** - The year-end hard revenue accrual/receivable recording is prepared and calculated using year-end expenditure and revenue amounts for programs.

**Key Control #2** - The year-end revenue accrual/receivable recording is reviewed at each subsequent rerun by the Assistant Accounting Manager to ensure the correct amounts are posted and for the correct revenue subsources.

The understanding for this system is documented above in the "Controls - Year-End Accrual and Liquidations (HCA)" step.

### **STEP 1: Confirm Key Controls**

We reviewed the series of year-end JVs for the federal revenue accrual process to determine whether the federal revenue accruals (receivable side):

- Existed at year end, i.e. were based upon actual program receipts and liquidations of expenditures and revenues, and
- were reported at correct values, i.e. correctly calculated based upon the program expenditures and revenues. The details of testing is documented at [\[Substantive Test\]](#).

We reviewed [\[HCA YE Accrual\]](#) the following JV documents:

- MAJV8189, 7/17/24
- MAJV8189-AA, 7/30/24
- MAJV8189-BB, 8/15/24
- MAJV8189-CC, 8/28/24
- MAJV8189-DD, 8/29/24
- MAJV8189-EE, 9/4/24

## State of Washington

and their supporting documentation, including Enterprise Reporting revenue/expenditures reports (**KC1**) and additional correspondence related to the JVs and recalculated the revenue accruals and compared them to recorded accruals (and corresponding receivable) with **no issues noted**. The criteria for each run of the ER reports were adequate to capture all federal revenues and expenditures for the agency and time frames. **No issues noted**.

We documented the preparer/submitter (Victoria Xu, FA4) and approver/releaser (Cheri Gullekson, Medicaid Accounting Manager) of the JVs and noted that there was evidence of review of the revenue subsources and calculations based upon the JV tabs. The preparer/submitter and approver/releasers were separate individuals (**KC2**). **No issues noted**.

### **STEP 2: Preliminary Control Risk Assessment**

**MAX** - We noted **no matters** involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **STEP 3: Control Risk at LOW - Test Key Controls**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

### **D.7.PRG - Due From Other Governments**

*Procedure Step:* Key Control #3 (Manual) - Accrual/Receivable Liquidations

*Prepared By:* EZM, 10/23/2024

*Reviewed By:* SHW, 10/28/2024

Purpose/Conclusion.*
----------------------

#### **Purpose:**

To confirm the calculation and recordings of receivable liquidations (key control #3 for Year-End Accrual and Liquidations) in order to assess control risk.

#### **Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

# State of Washington

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

Guidance/Criteria.7

### **ADDITIONAL BACKGROUND**

# State of Washington

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:
----------------------

**Key Control #3 (Valuation): During the Federal Grants in Aid draw down process, adjustments to the prior period's revenue accrual are based upon expenditure and revenue liquidations.**

The understanding for this system is documented above in the "Controls - Year-End Accrual and Liquidations (HCA)" step.

## **STEP 1: Confirm Key Controls**

We reviewed current document FA0073 for the T19 Assistance 2024 weekly draw down revenue recording for the week of 2/05/24. The draw reconciliation was performed by Rossner Gideon, FA5. Included in the workbook were the two enterprise reporting reports used to calculate the draw amount. Relevant report criteria included:

- Expenditure report
  - Begin fiscal month - 01-Jul FY1
  - End fiscal month: Nov FY1
  - Cost objective: T4\*,D4\*,N4\*,Q4\*, [T44C\*,D44C\*,N44C\*,Q44C\*]
  - Cost allocation type: F
  - Expenditure content: Cash
  - Expenditure liquidation Content: All liquidations
- Revenue report
  - Begin fiscal month - 01-Jul FY1
  - End fiscal month: Nov FY1
  - Major source: 03
  - Source: 03/93
  - Subsource: 03/93/D4\*,03/93/T4\*,03/93/N4\*,03/93/Q4\*, [03/93/D44C\*,03/93/T44C\*,03/93/N44C\*,03/93/Q44C\*]
  - Revenue content: Cash
  - Revenue liquidation content: Yes

Cost objectives (Expenditures), as summarized:

- T\*\*\*:

## State of Washington

- Disbursements: 1,860,174,892.94
  - Liquidations: (136,817,662.55)
- D\*\*\*:
  - Disbursements: 907,638,005.39
  - Liquidations: (45,562,574.13)
- N\*\*\*: No activity
- Q\*\*\*: No activity

Revenue sub-sources (Revenues), as summarized:

- T\*\*\*:
  - Cash Receipts: 1,712,858,629.38
  - Liquidations: (137,626,213.55)
- D\*\*\*:
  - Cash Receipts: 907,851,661.12
  - Liquidations: (45,006,818.63)
- N\*\*\*: No activity
- Q\*\*\*: No activity

Totals:

Current Disbursements: 2,767,812,898.33

Current Receipts: 2,620,710,290.50

**Liquidations (Net):** 252,795.50

Draw Amount: 147,355,403.33

This total draw of \$147,355,403.33 appeared as the HCA portion of the total draw (draws include amounts from DSHS and DCYF as the Medicaid grant is administered through HCA) for PMS Subaccount XIX-MAP24. The reports were submitted by Rossner Gideon, FA5, to Laura Roberts, Federal Claims Supervisor, for review on 2/05/24, at 9:00 am, and the draw was approved by Laura Roberts at 9:15 on the same day.

As the liquidations were related to the prior period, the revenue recording workbook used TC835 for the net expenditure and revenue liquidations for the relevant subsource to adjust the accrual in GL1351. This was verified in the A8-A report with the:

- D\* transactions totaling \$(769,411.23) (as calculated by the revenue/expenditure report)
- T\* transactions totaling \$148,124,814.56 (as calculated by the revenue/expenditure report).

Total liquidation of the receivable: \$147,355,403.33

**No issues noted.**

# State of Washington

## **STEP 2: Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

## **STEP 3: Control Risk at LOW - Test Key Controls**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

### **D.7.PR.G - Due From Other Governments**

*Procedure Step:* Controls - Year-end Accrual and Liquidations (DSHS)

*Prepared By:* EZM, 11/7/2024

*Reviewed By:* RKM, 11/8/2024

Purpose/Conclusion:

#### **Purpose:**

To gain an understanding of internal controls.

#### **Conclusion:**

We gained an understanding of internal controls as documented in the record of work done.

Testing Strategy:

#### **The following procedures are required for all significant systems:**

1. List the financial statement balance(s) and relevant assertion(s) addressed by the understanding.
2. Gain an understanding of the internal control process, identify how transactions are recorded in AFRS, identify key controls over relevant assertion(s), and note any control weaknesses.
  - In gaining an understanding of controls, consider the overall understanding of State-Level control elements as documented in the "State-Level Controls" step as they relate to this particular system.
  - Identify controls systems covering all relevant assertions for all significant classes of transactions.

## State of Washington

- Standards require the auditor to gain an understanding of the significant accounting system(s) that contain key controls over significant classes of transactions included in the line item.
- Control systems identified in this step must match the Material Account Matrix and have a separate control understanding documented.
- Talk with the ACFR Specialist or AIC if you identify different systems than the ones anticipated in the Material Account Matrix.

For each material system, auditors must document:

- A brief outline of the transaction flow from beginning to end.
- An expanded description of key controls.
- Business processes relevant to financial reporting of the relevant assertion for the material balance. Processes should encompass automated and manual procedures by which transactions or events are identified or initiated, authorized as needed, recorded, processed and corrected as needed.
- Original accounting records and how records are rolled-up to intermediary ledgers and transferred to the general ledger (AFRS) or financial statements.
- Detailed descriptions of key controls. Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

The following is information to **consider** when identifying key controls and transaction flow.

“Key controls” refer to the few controls that together provide reasonable assurance that material misstatements will be prevented or detected and corrected. This is contrasted with ancillary or supporting controls, which – although helpful and recommended – would provide less than reasonable assurance by themselves.

The focus of the write-up is on the key controls. Key controls should be specifically identified (as “key controls”) in the write-up. This can be done in whatever way the auditor prefers, so long as it is obvious. Details that the auditor should document regarding key controls may include:

- Who or what initiates the control
- When (or how often) is the control applied
- Who performs the control
- As needed, the experience, knowledge and attitude of the person applying the control
- Detailed description of the control process or activity. For example, if the control is a review: what exactly is reviewed, what is the reviewer looking at or for and what are the reviewer’s criteria?
- How the key control is documented or evidenced
- If not obvious from the description, how the control prevents or timely detects and corrects misstatements

## State of Washington

- Any exceptions or alternative processing to the normal process
- What happens when misstatements or issues are identified by the control

The “transaction flow” refers to the process by which transactions are initiated, authorized, recorded, processed and reported (as applicable). Outlining the transaction flow gives context to key controls, especially how transactions become subject to controls in the first place. If a control inherently ensures that all applicable transactions are included (ex: bank reconciliation where the assertion is existence), the auditor may decide to just start the write-up with the initiation of the control procedure and go from there.

Elements of the transaction flow are defined informally as follows:

- *Initiation:* How are transactions initiated?
- *Authorization:* How are transactions and accounting record maintenance authorized?
- *Recording:* How are transactions or balances identified and recorded in financial accounting systems?
- *Processing:* How are the transactions or balances processed after they are recorded (if at all)? Processing may be manual or automated and may occur at a subsidiary system level or at the general ledger level.
- *Reporting:* How are records translated into the financial statements? This part of the transaction flow extends the understanding to the actual financial statements that the audit is opining on. Since we already document an understanding of the financial reporting process in general, it is usually enough to simply reference this overall understanding. However, if there are important steps unique to the covered balances, it may be more appropriate to mention them here.

Although transaction flow is a good way to think about understanding and documenting a control system, auditors should not worry too much about documenting “each element, in order” because often elements may be combined, not noticeable, not applicable or occur in a different order.

Guidance/Criteria:
--------------------

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits](#) Planning Guide**

# State of Washington

Record of Work Done:

## **Significant Balance(s) and Assertions**

Internal controls in the Receivable Accrual and Subsequent Liquidations address the following balance(s):

- **Due from Other Governments** - Amounts due from the Federal Government to reimburse program expenditures made by the state.

For the following assertions:

- **Existence** - Amounts due from the Federal Government to reimburse program expenditures are supported by amounts actually paid during the period and the underlying program expenditures.
- **Valuation** - Amounts due from the Federal Government to reimburse program expenditures have been calculated correctly.

## **Gain an Understanding of Internal Controls**

We inquired with Rick Meyer, External Audit Compliance Manager, on October 30, 2024 regarding the controls for DSHS's portion of the Due from Other Governments balance. He confirmed the prior year understanding with the following individuals to ensure it was accurate for fiscal year 2024:

- Christine Johnson, Administrative Services Manager
- Christina Choate, Program Services Manager
- Debra Trickler, ESA
- Julia Mosier, Office Chief (DDA/AL TSA)
- Rick Meyer, External Audit Liaison

The Office of Accounting Services (OAS) prepares revenue accruals monthly and at fiscal year-end. For both instances, the formula for determining the revenue accrual is:

Cash expenditures + Accrued Expenditures - Cash Revenue - Existing Accrued Revenue = Revenue to be accrued.

## **Monthly Revenue Accrual**

At fiscal month close, the Fiscal Analyst preparing the monthly accrual will run an Enterprise Reporting report "Revenue Accrual Calculation by Program/Account/Major Source/Source/Subsource". Relevant criteria includes:

- Agency: 300
- Fiscal Month: 1-11 or 13-23
- Account: 001
- Program: [080,850]
- Major Source: 03
- Source: 03/\*
- Subsource: [03/16/523\*\*,03/93/T19TR0,03/93/596\*\*\*,03/21/019V\*\*,03/93/498\*\*,03/99/APPTRN, 03/55/CMPRE0]

## State of Washington

The above subsources are excluded for varying reasons including: own funding, expenditures not tied to specific grant, etc.

This reports captures year-to-date expenditures, revenues, and liquidations for the relevant grant programs for the agency and is the basis for the monthly accrual calculations.

OAS has a monthly accrual JV log for preparers to fill information such as the JV number, date, and prepared by. The monthly accruals are prepared using XS batches, which automatically reverse using an XY batch upon subsequent monthly accruals, i.e. the monthly accruals do not impact the final Due from Other Governments line item.

The Fiscal Analyst will load the Enterprise Reporting report into the accrual workbook with minor formatting to create the toolbox for AFRS upload; the transactions use TC 051 (dr 1351, cr 3205) by subsource code for the accrual. The log is then updated with the JV hash amounts and submitted, the Program/Administrative Manager will review the batch for accuracy/calculations and approve it for release.

### **Year-End Accrual**

The year-end hard accrual is prepared in a similar manner as the monthly accruals in that the calculation is still the same:  
 $\text{Cash expenditures} + \text{Accrued Expenditures} - \text{Cash Revenue} - \text{Existing Accrued Revenue} = \text{Revenue to be accrued.}$

The year-end accrual is processed for fiscal months 12-99 and 24-25 and uses KH Batch types for recording. The procedures are performed at the below intervals:

- FM12 & FM24 - On the last working day of fiscal month
- FM99 & FM25 - On the last working day of Phase 1 for fiscal month
- FM99 & FM25 - Weekly; each Friday between Phase 1 (P1) close and Phase 1B (P1B) cutoff
- FM99 & FM25 – Daily; between Phase 1B (P1B) through Phase 2 (P2) close

The fiscal analyst will run the following report:

- Agency: 300
- Fiscal Month: 12 (or 12A, 24, 24A)
- Account: 001
- Program: [080,850]
- Major Source: 03
- Source: 03/\*
- Subsource: [03/16/523\*\*,03/93/T19TR0,03/93/596\*\*\*,03/21/019V\*\*,03/93/498\*\*,03/99/APPTRN, 03/55/CMPRE0]

The above subsources are excluded for varying reasons including: own funding, expenditures not tied to specific grant, etc.

## State of Washington

This reports captures year-to-date expenditures, revenues, and liquidations for the relevant grant programs for the agency and is the basis for the accrual calculation. **(Key Control #1 - Year-end accrual calculations - Valuation/Existence)**

Each subsequent run of the year-end accrual JV calculation to adjust (FM99/25) the original FM12/24 accrual will append a batch suffix AA, BB, CC, and so on to the JV.

The Fiscal Analyst will load the Enterprise Reporting report into the accrual workbook with minor formatting to create the toolbox for AFRS upload; the transactions (TC051) are by subsource code for each program, and the year-end log is then updated with the JV hash amounts and submitted. The Program/Administrative Manager will review the each of the accrual batches for verification of revenue subsources and calculation amounts and approve it for release.

### **How Transactions are Recorded in AFRS (YE Accrual):**

Transactions are recorded in AFRS using the JV process that is performed by the Fiscal Analyst during the calculation of the revenue accrual note above. The workbook will provide the coding details for the transaction that will be needed to record the transaction in AFRS. The Fiscal Analyst will log into AFRS and check the batch for errors. If there are no errors, the batch is then released in AFRS and a screen print of the AFRS release screen is saved to the "Upload and Release" tab of the JV workbook. If there are errors, the Fiscal Analyst will then research the JV to identify the error before making a correction and resubmitting it to the Program/Administrative Manager for re-approval. **(Key Control #2 - Year-end accrual review and approval - Valuation/Existence)**

### **Adjustments to the GL1351 Amount (prior periods)**

The "hard coded" revenue accruals from the prior period are adjusted as the expenditures and revenues are liquidated throughout the subsequent fiscal year; these expenditure/revenue liquidations are identified through MOS and Fiscal Year fields in the determination of current vs prior period transactions. This occurs during standard federal draw downs and their recording process as summarized in the Federal Grants in Aid understanding [[Controls - DSHS](#)]. The revenue adjustment associated with liquidations are recorded with TC835 or TC835(R) to adjust the GL1351 recorded amount. **(Key Control #3 - Prior period year-end accrual adjustments - Valuation)**

### **Key Controls are as Follows:**

- **Key Control #1 - Valuation/Existence - The year-end hard revenue accrual/receivable recording is prepared and calculated using year-end expenditure and revenue amounts for programs.**
- **Key Control #2 - Valuation/Existence - The year-end revenue accrual/receivable recording is reviewed at each subsequent rerun by the Administrative/Program Manager to ensure the correct amounts are posted and for the correct revenue subsources.**
- **Key Control #3 - Valuation - During the Federal Grants in Aid draw down process, adjustments to the prior period's revenue accrual are based upon expenditure and revenue liquidations.**

# State of Washington

## Noted Weaknesses are as Follows:

None

### D.7.PRG - Due From Other Governments

*Procedure Step:* Key Control #1 and 2 (Manual) - Calculation and Review of YE Accrual

*Prepared By:* EZM, 11/13/2024

*Reviewed By:* SHW, 11/14/2024

Purpose/Conclusion:

#### **Purpose:**

To confirm the calculation, recording, and review of the year-end federal revenues accrual (key control #1 and #2 for the Year-End Accrual) in order to assess control risk.

#### **Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation.*

## State of Washington

*Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency.*

***All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.***

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

## State of Washington

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

### **Due From Other Governments - Valuation and Existence**

**Key Control #1** - The year-end hard revenue accrual/receivable recording is prepared and calculated using year-end expenditure and revenue amounts for programs.

**Key Control #2** - The year-end revenue accrual/receivable recording is reviewed at each subsequent rerun by the Administrative/Program Manager to ensure the correct amounts are posted and for the correct revenue subsources.

The understanding for this system is documented above in the "Controls - Year-End Accrual and Liquidations (DSHS)" step.

# State of Washington

## **1. Confirmation of Key Manual Control:**

We reviewed the series of year-end JVs for the federal revenue accrual process to determine whether the federal revenue accruals (receivable side):

- Existed at year end, i.e. were based upon actual program receipts and liquidations of expenditures and revenues, and
- were reported at correct values, i.e. correctly calculated based upon the program expenditures and revenues. The details of testing is documented at [Substantive Test].

DSHS processed a total of 14 year-end JVs (JVKH0015, base through suffix MM) from 7/15/2024 through 8/23/2024 to post their year-end receivable. We reviewed each run of the year-end accrual [DSHS YE Accrual] and their supporting documentation include Enterprise Reporting revenue/expenditure reports **(KC1)** and additional correspondence and recalculated the revenue accruals and compared them to recorded accruals with no issues noted. The criteria for the ER reports were adequate to capture all federal revenues and expenditures for the agency and time frames. **No issues noted.**

We documented the preparer/submitter/releaser (Sumanpreet Kaur, FA3 and Eddie Yang, FA4) and approver (Raiatea Arcuri, Senior Financial Coordinator, and Christina Choate, Program Services Manager) of the JVs and noted that there was evidence of review of the revenue subsources and calculations based upon the JV tabs. The preparer/submitter/releaser and approver were separate individuals **(KC2)**. **No issues noted.**

## **Noted Weaknesses are as follows:**

None

## **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

## **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

## **D.7.PRG - Due From Other Governments**

*Procedure Step:* Key Control #3 (Manual) - Accrual/Receivable Liquidations

*Prepared By:* EZM, 11/7/2024

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

### **Due From Other Governments - Valuation and Existence**

**Key Control #3 - Valuation - During the Federal Grants in Aid draw down process, adjustments to the prior period's revenue accrual are based upon expenditure and revenue liquidations.**

The understanding for this system is documented above in the "Controls - Year-End Accrual and Liquidations (DSHS)" step.

### **1. Confirmation of Key Manual Control:**

We reviewed current document FA0047 (batch KX 139) for the T19 Assist weekly draw down revenue recording for the week of November 20, 2023. Included in the draw workbook was the draw report, prepared by Beverley Muncaster, Senior Financial Coordinator, sent to HCA for DSHS's portion of the weekly draw which contained (in summary, based upon draw calculations (Current) Expenditures - (Current) Revenues - Net Liquidations) for AFRS transaction dates 11/06/23 - 11/13/23:

D4\*

Net current = \$76,298,676.82

**Net liquidations = \$(1,582,080.32)**

Net draw = \$74,716,596.50

## State of Washington

T4\*

Net current = \$3,437,130.21

**Net liquidations = \$(188,629.81)**

Net draw = \$3,248,500.40

N4\*

Net current = \$0

**Net liquidations = \$(1,724.50)**

Net draw = \$(1,724.50)

As the liquidations were related to the prior period, the revenue recording workbook (Batch KX 443) used TC835 for the net expenditure and revenue liquidations for the relevant subresource to adjust the accrual in GL1351. The total amount for TC835 matched the draw calculations for the relevant cost objectives/subsource. This was verified in the "KX443" tab (AFRS upload transactions) with following as calculated by the revenue/expenditure reports and the GMS draw calculations:

D4\* transactions totaling **\$(1,582,080.32)**

T4\* transactions totaling **\$(188,629.81)**

N4\* transactions totaling **\$(1,724.50)**

The revenue recording workbook was prepared/submitted by Summaiya Khan, Fiscal Analyst 4, and approved by Gwendolyn Dain, Program Services Manager.

**No issues noted.**

### **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

### **D.7.PRG - Due From Other Governments**

*Procedure Step:* Risk Assessment

# State of Washington

*Prepared By:* EZM, 11/7/2024

*Reviewed By:* RKM, 11/8/2024

Purpose/Conclusion:

**Purpose / Conclusion:**

To assess inherent risk, control risk, and the risk of material misstatement in order to design an initial testing strategy for each assertion.

Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

**STEP 1: Inherent Risk (IR)**

Assess inherent risk for each relevant assertion. This assessment is based on understanding of the entity and the nature of the account balance or class of transactions.

*Inherent risk is the susceptibility of an assertion to material misstatement. It is our assessment of "total threat", which includes both "natural risk" and identified risk indicators, without any regard to any potential control activities. As inherent risk is fully independent of control risk, any understanding of controls cannot be used to increase/decrease the assessment of inherent risk. Consider the following factors as your basis for this assessment:*

- *General Considerations*
  - *Does the balance include transactions that are difficult to audit or involve complex accounting issues?*
  - *Were there significant misstatements identified in previous audits or prior-period adjustments in the account balance or transaction class? If so, analyzing the cause of prior period misstatements will help in analyzing inherent risk.*
  - *Are there any inherent risk factors at the entity or industry level, such as changes in regulation or accounting rules, unique transactions or accounting practices, use of information technology, etc that affect the balance?*
- *Inherent Risk due to Error*
  - *How large are the transactions making up the balance? If the balance has only a few large transactions, even a single error may mean a significant misstatement.*
  - *Have there been changes in the transactions making up the balance that may increase risk? For example, significantly different composition, nature or volume of transactions may inherently disrupt established controls.*
  - *Are financial events originated or identified by accounting personnel or non-accounting personnel? This consideration is mainly for the completeness assertion.*

## State of Washington

- Does the process to account for transactions involve judgment or estimation, complex calculations, numerous steps or significant manual steps?
- Do transactions have widely varying attributes that need to be manually identified? For example, grant loans that are accounted for in one of several ways depending on the terms of the agreement.
- **Inherent Risk due to Fraudulent Reporting (intentional misstatements)**
  - Are there substantial pressures or motivations to misstate the balance?
- **Inherent Risk due to Misappropriation**
  - Is the account balance or transaction class susceptible to sizable misappropriation?
- **Inherent Risk due to Non-Compliance**
  - Are there any laws, contracts or grant agreements affecting the balance? If so, would non-compliance lead to sizable misstatements?
  - Are compliance requirements complex, hard to understand, subject to judgment or otherwise difficult to comply with?
  - Are there any motivations or pressures to not comply?

### **STEP 2: Control Risk (CR)**

Assess control risk by system and assertion. This assessment should be based on the results of the control understanding, confirmation, and (if setting control risk to LOW) testing. If applicable, auditors will evaluate any control deficiencies and determine whether those deficiencies, individually or in combination, are significant deficiencies or material weaknesses.

*Control risk is the risk that material misstatements would not be prevented or detected timely by the system of internal control. Control risk could be thought of as the "vulnerability" of an entity to misstatements. Control risk exists independently of the inherent risk (the level of vulnerability exists independent of the level of threat).*

*Control risk is MAX in both of the following situations: (1) controls aren't tested or (2) controls are problematic and cannot be relied upon. In order to set control risk to LOW, the auditor must test that controls operated effectively throughout the period.*

*A material weakness exists when the design or operation of controls results in a reasonable possibility a material misstatement will not be prevented or detected and corrected in a timely manner. A significant deficiency is less severe than a material weakness, yet important enough to merit the attention of the governing body. **All potential material weaknesses and significant deficiencies should be discussed with the AIC, since they must be reported as findings.***

### **STEP 3: Risk of Material Misstatement (RMM)**

Assess the risk of material misstatement for each relevant assertion for each significant line item. The risk of material misstatement (RMM) is a combination of the auditor's separate assessment of inherent and control risk.

## State of Washington

*In practice, the RMM is the amount of substantive evidence that's needed, and the only way to reduce the amount of needed substantive evidence (equal to the inherent risk) is to test controls. As such, when control risk is MAX, the RMM must always equal the inherent risk (IR).*

*When controls are tested & can be relied upon (are determined to be effective) it is a matter of professional judgment how much the RMM should be set lower than inherent risk (1 or 2 steps).*

*Auditors should assess RMM by assertion, if different. For example, if RMM is assessed at MOD for the existence assertion, but LOW for the rights & obligations assertion, then document "MOD – existence and LOW – rights & obligations".*

### **STEP 4: Design Substantive Testing**

Design a substantive testing strategy that addresses the relevant assertion (identified risk) in the portion of the line item that relates to that risk.

*Planning identifies where to audit (significant balances, classes of transactions & disclosures) what to audit for (relevant assertions), and how much to audit (RMM). The quantity and quality of evidence obtained by substantive tests needs to match the level of risk. The higher the risk of material misstatement, the greater evidence needed. "Greater evidence" could either be greater quantity of evidence, greater quality of evidence, or some combination of greater quality and quantity.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6210](#) – Planning Financial Statement Audits**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits](#) Planning Guide**

Record of Work Done:

### **(1) Inherent Risk (IR):**

Based on our understanding of the line item, we assessed inherent risk as follows for each relevant assertion and significant class of transactions:

- Year-End Accruals – Existence and Valuation: **MODERATE**
- Accrual/Receivable Liquidations - Valuation: **MODERATE**

# State of Washington

## **(2) Control Risk (CR):**

We assessed control risk as follows for each system and relevant assertion:

- **Year-End Accruals** – Existence and Valuation
- **Accrual/Receivable Liquidations** - Valuation

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

## **(3) Risk of Material Misstatement (RMM):**

We considered both inherent and control risk and assessed the risk of material misstatement as follows for each relevant assertion and significant class of transactions:

- Year-End Accruals – Existence and Valuation: **MODERATE**
- Accrual/Receivable Liquidations - Valuation: **MODERATE**

## **(4) Testing Strategy:**

We designed our substantive testing strategy based on our assessment of the risk of material misstatement. We plan to perform the following tests:

- Adjustments to Receivable balances - We plan to sample draw-down workbooks from HCA and DSHS, and review backup documentation including enterprise reporting reports to determine whether the adjustments to the receivable amounts were properly valued based upon actual revenues and expenditures **(Valuation)**.
- Year-end accrual - We plan to review all related year-end accrual JVs and their backup documentation for HCA and DSHS, including enterprise reporting reports, to determine whether the final accrual is properly valued based upon actual revenues and expenditures **(Existence and Valuation)**.

We anticipate that these tests will provide sufficient appropriate audit evidence to address the assessed risk of material misstatement for relevant assertions in significant classes of transactions.

## **D.7.PR.G - Due From Other Governments**

*Procedure Step:* Substantive Test

*Prepared By:* EZM, 11/15/2024

# State of Washington

*Reviewed By:* RKM, 11/21/2024

## Purpose/Conclusion.

### Purpose:

To determine reported receivables represent amounts uncollected as of the end of the period  
To determine whether other assets were reported at properly valued or calculated amounts.

### Conclusion:

Reported receivable amounts represent amounts uncollected as of the end of the period. **No issues noted.**  
Receivable amounts were reported at properly valued and calculated amounts. **No issues noted.**

## Testing Strategy.

We designed our substantive testing strategy based on our assessment of the risk of material misstatement.

- Adjustments to Receivable balances - We plan to sample draw-down workbooks from HCA and review backup documentation including enterprise reporting reports to determine whether the adjustments to the receivable amounts were properly valued based upon actual revenues and expenditures (**Valuation**).
- Year-end accrual - We plan to review all related year-end accrual JVs and their backup documentation including enterprise reporting reports to determine whether the final accrual is properly valued based upon actual revenues and expenditures (**Existence and Valuation**).

## Guidance/Criteria.

## Record of Work Done.

### **Population Reconciliation Procedures for the Due from Other Governments Line Item** [JV Population Reconciliation]

We ran queries from the ACFR database for the significant balances (Rollup fund FAA and GL Sort Code CD) for HCA and DSHS.

We ran queries in Enterprise Reporting Web Intelligence which were filtered to match the results of the ACFR database to obtain transaction level detail for sampling. We reconciled the amounts by GL to the ACFR query with **no variances noted**. As the total population of the Webi queries' Due from Receivables reconciled to the ACFR database, we consider the transaction data to be complete.

# State of Washington

## **Sample Frame**

For both agencies, GL1351 (Due from Federal Government) composed the significant percentage of receivable amounts in the line item at year-end (95% for HCA and 87% for DSHS). Based upon this information, we elected to test only from this GL account. This is in line with our assumptions as these agencies participate in federal reimbursable programs (Medicaid primarily).

Per our understandings and testing strategy, we split the transactions into:

1. Adjustments to the GL1351 balance during FY24, and
2. The year-end accruals, identified by:
  - a. FM99/Current Doc MAJV8189 for HCA
  - b. Batch type KH for DSHS (batches in FM12 and 99)

## **Substantive tests performed to meet the Existence assertion**

### Testing Procedures:

Review all related year-end accrual JVs and their backup documentation including enterprise reporting reports to determine whether the final accrual is properly valued based upon actual revenues and expenditures.

**HCA:** [HCA YE Accrual]

**DSHS:** [DSHS YE Accrual]

We reviewed the year-end accrual JVs and the backup documentation including Enterprise Reporting reports (Revenue Accrual Calculation by Program/Account/Major Source/Source/Subsource) and e-mail correspondence. For each run of the year-end accrual, we recalculated the revenue accrual based upon subsource and compared them to recorded amounts ensure that a year-end receivable actually existed (expenditures exceeded revenues).

### Testing Results:

Year-end accrued federal revenues and the federal receivable actually existed as of year-end as the expenditures exceeded revenues for relevant subsources. **No issues noted.**

**No issues noted.**

## **Substantive tests performed to meet the Valuation assertion:**

### *Year-End Accrual*

### Testing Procedures:

Review all related year-end accrual JVs and their backup documentation including enterprise reporting reports to determine whether the final accrual is properly valued based upon actual revenues and expenditures

**HCA:** [HCA YE Accrual]

# State of Washington

## **DSHS:** [DSHS YE Accrual]

We reviewed the year-end accrual JVs and the backup documentation including Enterprise Reporting reports (Revenue Accrual Calculation by Program/Account/Major Source/Source/Subsource) and e-mail correspondence. For each run of the year-end accrual, we recalculated the revenue accrual based upon subsource and compared them to recorded amounts to ensure that a year-end receivable was correctly valued.

### Testing Results:

Year-end accrued federal revenues and the federal receivable was correctly calculated based upon FY expenditures and revenues for relevant subsources. **No issues noted.**

### *Adjustments to Receivables*

#### Testing Procedures:

We plan to sample draw-down workbooks from HCA and DSHS and review backup documentation including enterprise reporting reports to determine whether the adjustments to the receivable amounts were properly valued based upon actual revenues and expenditures and correctly calculated (**Valuation**).

We ran a query in Enterprise Reporting WEBi for the following query filters for fiscal year 2024:

- GL Account = 0159 (liability liquidations)
- Cost Allocation Funding Type = "F"

We summarized the liquidations by Process Date and Cost Objective and compared the totals of each cost objective in the liquidations report to the recorded adjustments to GL1351 in the draw calculation workbooks\* processed during sample drawdowns. We additionally recalculated the adjustment amount through a review of the drawdown's total draw and current draw amounts (based upon the current expenditures/revenues).

\*Note: Draw calculation workbook amounts for subsources for transaction codes 835. These transaction codes are associated with the liquidations of GL1351 receivable amounts. Total draws factor in current expenditures and revenues (GLs 6510/3210)

### Testing Results:

#### **HCA:** [HCA Due From Adjustments Testing]

#### **DSHS:** [DSHS Due From Adjustments Testing]

Adjustments to the federal receivable during drawdowns were properly valued and based upon prior period expenditure liquidations (GL0159). **No issues noted.**

# State of Washington

## E.1.PRG - Cash & Cash Equivalents

*Procedure Step:* Summary & Conclusion

*Prepared By:* DRR, 10/23/2024

*Reviewed By:* RKM, 11/20/2024

Purpose/Conclusion:

**Purpose:**

To evaluate risk assessments and the sufficiency and appropriateness of evidence obtained based on results of substantive work.

**Conclusion:**

We determined that **no** modifications were necessary to inherent risk, control risk, or the risk of material misstatement as assessed in planning.

We also determined that evidence obtained was sufficient and appropriate in response to the risk of material misstatement.

Testing Strategy:

Auditors are **required** to evaluate conclusions for substantive testing as follows:

*Auditors may wish to use the optional Lead Sheet available in the Store to summarize testing related to each balance and assertion.*

**1.** Determine whether the results of substantive testing indicate a need to modify the inherent risk assessment (IR), control risk assessment (CR), risk of material misstatement (RMM) or other aspects of planning (such as material balances or assertions). If so, document changes and consider the need for additional testing.

*If the results of substantive testing indicate a need to change control risk, auditors should also update the **Permanent File** by either correcting the documentation or by adding an update section describing changes to the top of the record of work done. For all changes to IR, CR, or RMM the **Material Balances** spreadsheet should be updated.*

*More significant changes to other aspects of planning (such as material balances or assertions) should be referenced in this step and documented in detail in the **Changes to FS Audit Plan** step.*

**2.** Evaluate whether the quality and quantity of evidence obtained is sufficient and appropriate in response to the risk of material misstatement. In

# State of Washington

making this determination, auditors should evaluate:

## Information to be used as audit evidence:

- Does evidence relate to the population, period of time and risk (assertion and “what could go wrong” from the Material Balance Spreadsheet)? If there are any gaps or uncertainties in the logical connection between the evidence and conclusions, is there a documented consideration and explanation?
- Are the sources of information sufficiently reliable and appropriate for the risk (whether internal to the government, external, or auditor developed)? If key information is not from a sufficiently reliable source (for example, inquiry), then is it corroborated by information that is?
- Are there any concerns about accuracy, completeness, authenticity, or bias in information? If so, did the auditor perform sufficient procedures to confirm reliability of that information?
- Is information precise enough to catch if misstatements exceeded the tolerable level?
- Is information detailed enough to conclude on whether or not there were misstatements?
- Was there any information that appeared contradictory or inconsistent? If so, was there a documented response to the inconsistencies or doubts about the reliability of evidence?

## Results:

- How much misstatement was identified by testing, and the likelihood and magnitude of further potential misstatement?
- How did misstatements occur and how often might they occur again in the population?
- Were misstatements caused by control deficiencies or circumvention of controls?
  - If control deficiencies, is there a need to re-evaluate our understanding of controls in the **Permanent File** folder or assessment of control risk?
  - If circumvention, the **Management Override of Controls** step should address or reference this area. Auditors should also consider whether a fraud risk has been identified.
  - Did tests identify a different level or type of risk than the planned audit response was designed to address?
  - If likely misstatements are identified, are further procedures necessary to improve the precision of our estimate?

*To support the overall evaluation of audit risk and provide a basis for concluding on the overall sufficiency and appropriateness of evidence in the **FS Summary & Report** step, auditors should conclude in each area whether the auditor continues to believe that the tests performed and quality and quantity of evidence obtained are commensurate with RMM for all relevant risks (the “what could go wrong”, in the **Material Balances** spreadsheet).*

If the auditor determines that evidence is not sufficient or appropriate, additional substantive testing should be done. If sufficient, appropriate evidence is not available for audit, the AIC should discuss the effect on our audit report with the AAM and AM.

# State of Washington

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6310](#) – Determining the Nature, Timing and Extent of Substantive Testing**

**SAO Audit Policy [3210](#) – Audit Evidence**

Record of Work Done:

Based on test results, we re-evaluated risk assessments, procedures, evidence obtained and conclusions as follows:

### **(1) Do the results of substantive tests indicate a need to modify our risk assessment (IR, CR and RMM)?**

The results of substantive tests do not indicate a need to modify our risk assessment.

### **(2) Was the quality and quantity of evidence obtained sufficient and appropriate?**

The quality and quantity of evidence obtained is sufficient and appropriate.

## **E.1.PRG - Cash & Cash Equivalents**

*Procedure Step:* Understanding of Line Item

*Prepared By:* DRR, 5/20/2024

*Reviewed By:* RKM, 5/29/2024

Purpose/Conclusion:

### **Purpose / Conclusion:**

To gain an understanding of the line item and confirm the scope of testing as documented in the Significant Account Matrix.

# State of Washington

## Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

### **STEP 1: Prior Audit Exceptions**

Document any exceptions noted during the prior audit. Follow-up to determine how the agency has responded to or corrected the issue, unless this work is anticipated as part of the testing strategy.

### **STEP 2: Analyze Composition and Changes of Line Item**

- Include link to the line item leadsheet. This will be completed at the end of the audit. Leadsheet analysis should be documented in this spreadsheet.
- Inquire with agency staff about the activities and transactions that make up the balance and any changes to those activities or transactions in relation to the prior year.
- Determine relevant classes of transactions or account balances within the line item to analyze (such as agencies, funds, programs, departments, accounts, and/or objects), and use AFRS to create trends of those elements. This step should not include any specific dollar amounts associated with the line item.
- Evaluate trends to identify:

(1) What classes of transactions or account balances are primary to the identified risk. Auditors should specifically consider what elements are primary to the line item (comprising a large percentage of the line item), and which elements the identified risk would apply to, and which elements might be most susceptible to the identified risk (having a high risk of non-trivial misstatement for a relevant assertion, considering likelihood and impact of potential for misstatement).

(2) What changes are primary to the identified risk, if applicable. Auditors should specifically consider whether the overall change to the line item from the prior year was significant, what elements were the primary drivers of overall change, whether any elements changed significantly from the prior year, and which changes (if any) might relate to the identified risk.

(3) Any unusual or unexpected elements, amounts, or changes that may indicate a risk, whether the one identified in planning or a new one that may need to be considered for a change to the plan.

**Consider** other procedures to gain an understanding of the line item, such as review of key policy documents, review of program information or reports, inquiry of staff, budget information, or other analytical procedures.

### **STEP 3: Update Significant Account Matrix**

Based on your understanding of the line item, update the Significant Account Matrix with final conclusions on the agencies covered, account description, significant accounting systems, and risk (what could go wrong and relevant assertions). The account description should reflect the significant transaction streams or account balances relevant to the risk.

## State of Washington

*The description of agencies, significant accounting systems, and what could go wrong in the Significant Account Matrix constitute the overall scope of substantive testing.*

*A transaction stream is significant based on the potential for misstatement. This is often due in part to its size (ie: comprising a large percentage of the total line item), but is ultimately a judgment about the susceptibility to the identified risk (for example, when the risk is understatement a small or omitted account may hold the most potential for the largest misstatement).*

*Significant accounting system(s) are those that contain key controls over significant classes of transactions included in the line item. Control systems identified in this step must match the Significant Account Matrix and have a separate control understanding documented.*

*Talk with the AIC if you identify any changes to the Significant Account Matrix.*

Guidance/Criteria.:

Record of Work Done.:

### **(1) Prior Audit Exceptions:**

We noted one exit item related to this balance from the prior audit:

- The Employment Security Department (ESD) was unable to completely reconcile their bank accounts to the accounting records at fiscal year end June 30, 2023. Various reconciling items totaling \$(34,060,232) should not have been included in their respective reconciliations. We determined, after removing these reconciling errors from the reconciliations, that ESD understated Cash & Cash Equivalents by \$16,573,418.

As we will be reviewing the Departments bank reconciliations as part of our testing of this balance, we did not follow-up with Department staff regarding the Departments response or correction of this issue.

### **(2) Composition & Change Analysis:**

Line Item Leadsheet: [[Line Item Lead Sheet](#)].

We noted the balance included activity from the following funds:

- 620: Unemployment Compensation Account
- 622: Unemployment Compensation Federal Employees' Benefit Payment Account
- 22E: Family and Medical Leave Enforcement Account
- 22F: Family and Medical Leave Insurance Account
- 567: Long-Term Services & Supports Trust Account

We evaluated the funds and determined transactions from fund 620 make up most of the account balance. The Cash & Cash Equivalents line item

## State of Washington

is mainly composed of cash collected from employers, cash held for the minimum amount of operations (6-10 million), cash held in the trust fund, and cash ready to be expended for unemployment insurance benefits. The majority of the changes to this balance over the prior year were in fund 620 GL account 1150 "Cash with Fiscal Agents" and fund 620 GL account 1110 "Cash in Bank". This GL account 1150 increased \$676.5 million (25%) over the prior year and GL account 1110 decreased \$197 million (-62.5%). Overall this balance increased 15.6% from the prior year.

The Cash & Cash Equivalents line item is composed of three main cash accounts and two pandemic cash accounts that the ESD held during FY24. The Key Bank accounts discussed in the FY23 ACFR were closed in January 2024 and the funds in these accounts, if applicable, were rolled into their respective US Bank accounts. See below for ESD's current accounts:

- Main Accounts
  - US Bank Clearance Account (Employer Side)
  - US Treasury Trust Account
  - US Bank Benefit Account
- Pandemic Accounts
  - State Pandemic Relief Program (PRP) US Bank Account
  - Lost Wages Assistant (LWA) US Bank Account

### **(3) Updates to Significant Account Matrix:**

- None

### **E.1.PR.G - Cash & Cash Equivalents**

*Procedure Step:* Controls - Cash Reconciliations

*Prepared By:* DRR, 6/10/2024

*Reviewed By:* RKM, 6/11/2024

Purpose/Conclusion:
---------------------

#### **Purpose:**

To gain an understanding of internal controls.

#### **Conclusion:**

# State of Washington

We gained an understanding of internal controls as documented in the record of work done.

Testing Strategy:

**The following procedures are required for all material systems:**

1. List the financial statement balance(s) and relevant assertion(s) addressed by the understanding.
2. Gain an understanding of the internal control process, identify how transactions are recorded in AFRS, identify key controls over relevant assertion(s), and note any control weaknesses.
  - In gaining an understanding of controls, consider the overall understanding of State-Level control elements as documented in the "State-Level Controls" step as they relate to this particular system.
  - Identify controls systems covering all relevant assertions for all significant classes of transactions.
  - Standards require the auditor to gain an understanding of the significant accounting system(s) that contain key controls over significant classes of transactions included in the line item.
  - Control systems identified in this step must match the Material Account Matrix and have a separate control understanding documented.
  - Talk with the ACFR Specialist or AIC if you identify different systems than the ones anticipated in the Material Account Matrix.

For each material system, auditors must document:

- A brief outline of the transaction flow from beginning to end.
- An expanded description of key controls.
- Business processes relevant to financial reporting of the relevant assertion for the material balance. Processes should encompass automated and manual procedures by which transactions or events are identified or initiated, authorized as needed, recorded, processed and corrected as needed.
- Original accounting records and how records are rolled-up to intermediary ledgers and transferred to the general ledger (AFRS) or financial statements.
- Detailed descriptions of key controls. Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

The following is information to **consider** when identifying key controls and transaction flow.

"Key controls" refer to the few controls that together provide reasonable assurance that material misstatements will be prevented or detected and corrected. This is contrasted with ancillary or supporting controls, which – although helpful and recommended – would provide less than reasonable

## State of Washington

assurance by themselves.

The focus of the write-up is on the key controls. Key controls should be specifically identified (as “key controls”) in the write-up. This can be done in whatever way the auditor prefers, so long as it is obvious. Details that the auditor should document regarding key controls may include:

- Who or what initiates the control
- When (or how often) is the control applied
- Who performs the control
- As needed, the experience, knowledge and attitude of the person applying the control
- Detailed description of the control process or activity. For example, if the control is a review: what exactly is reviewed, what is the reviewer looking at or for and what are the reviewer’s criteria?
- How the key control is documented or evidenced
- If not obvious from the description, how the control prevents or timely detects and corrects misstatements
- Any exceptions or alternative processing to the normal process
- What happens when misstatements or issues are identified by the control

The “transaction flow” refers to the process by which transactions are initiated, authorized, recorded, processed and reported (as applicable). Outlining the transaction flow gives context to key controls, especially how transactions become subject to controls in the first place. If a control inherently ensures that all applicable transactions are included (ex: bank reconciliation where the assertion is existence), the auditor may decide to just start the write-up with the initiation of the control procedure and go from there.

Elements of the transaction flow are defined informally as follows:

- *Initiation:* How are transactions initiated?
- *Authorization:* How are transactions and accounting record maintenance authorized?
- *Recording:* How are transactions or balances identified and recorded in financial accounting systems?
- *Processing:* How are the transactions or balances processed after they are recorded (if at all)? Processing may be manual or automated and may occur at a subsidiary system level or at the general ledger level.
- *Reporting:* How are records translated into the financial statements? This part of the transaction flow extends the understanding to the actual financial statements that the audit is opining on. Since we already document an understanding of the financial reporting process in general, it is usually enough to simply reference this overall understanding. However, if there are important steps unique to the covered balances, it may be more appropriate to mention them here.

Although transaction flow is a good way to think about understanding and documenting a control system, auditors should not worry too much about documenting “each element, in order” because often elements may be combined, not noticeable, not applicable or occur in a different order.

# State of Washington

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits](#) Planning Guide**

Record of Work Done:

## **Significant Balance(s) and Assertions**

Internal controls in the Cash Reconciliation address the following balance(s):

- Statement of Net Position - Government Wide
  - Cash and Cash Equivalents
- Statement of Net Position - Proprietary Funds
  - Cash and Cash Equivalents (Local Portion)

For the following assertions:

- Existence
  - There is risk that reported cash and cash equivalents don't match reconciled bank accounts and records. In the prior audit we found an error in the cash reconciliation.

## **Gain an Understanding of Internal Controls**

We met with the following people on May 1, 2024 to update our understanding over cash and cash equivalents:

- Meghan Phelps, Treasury Manager
- Shelly Peterson, Assistant Treasury Manager
- Son Pham, Fiscal Analyst 4

Meghan Phelps, Treasury Manager, started her position in March 2024. Prior to March 2024, Aundrea Nunez, Controller, performed most reviews of the bank reconciliations while the Treasury Department transitioned between managers. The Employment Security Department (ESD) held three main cash accounts and two pandemic cash accounts during FY24. The Key Bank accounts previously used by ESD were closed on January

## State of Washington

19, 2024 and funds in these accounts were rolled into their new US Bank accounts. Cash accounts held with US Bank are managed under four master accounts. Sub-accounts are used to isolate transactions between receipts and payments. All sub-accounts are swept to the master account every night. Also, ESD held funds at the US Federal Treasury for the state and Federal Trust fund. Most cash is held with the Federal Treasury.

The general flow of funds consists of the following:

1. Cash is receipted in the clearance account. Payments are typically from employers for payment of their unemployment taxes. Funds in excess of operating needs are transferred into the Treasury Trust account.
2. Funds are held in the Treasury Trust account until needed.
3. Money is transferred out of the Treasury Trust and temporary accounts to the benefit account for payments to claimants for unemployment benefits.

State month end close occurs on the 10<sup>th</sup> business day of the following month. Reconciliations are performed shortly after (mid/end-month).

### US Bank Clearance Account (Employer Side)

The main purpose of the clearance account was to collect cash from employers, hold a minimum amount for operations, and remit all excess collected funds to the trust accounts held with the US Treasury in a daily transfer.

The clearance account consists of the following accounts:

1. Clearance Master
2. Clearance Disbursement
3. Clearance Deposit

Nightly, the clearance disbursement and clearance deposit accounts are swept into the clearance master account.

### Monthly Reconciliations for Clearance Accounts (Existence)

The banking desk prepares the clearance account reconciliation. My-Phuong Tran, Fiscal Analyst 3, prepares the reconciliation. She downloads the monthly statement from US Bank's online bank module. She downloads all three account statements and reconciles all three to ensure the existence of all cash transactions reported in the general ledger. Supporting documentation included "Monthly AFRS JV," GL balance from AFRS, and other reconciling items support as needed. My-Phuong signs the reconciliation and routes it to Meghan Phelps, Treasury Manager, or Shelly Peterson, Assistant Treasury Manager. Either Meghan or Shelly then electronically review the reconciliation and indicates reconciling items were accurate with tickmarks to ensure reported cash existed at year end (**Key Control 1 - Existence**). Meghan or Shelly then signs or initials the reconciliation to document the review.

### US Treasury Trust Account

ESD remits all excess cash to their US Treasury account. Excess limits are determined internally and based on cash needs. Based on minimum

## State of Washington

balances set in years prior, ESD determined \$6-10 million was the minimum balance needed to maintain operations. Minimums aren't expected to change.

The US Treasury account held the state and federal trust accounts. The US Treasury does not prepare traditional statements. In lieu of a monthly bank statement, Shelly Peterson, Assistant Treasury Manager, obtains three reports from TreasuryDirect.gov to verify the accuracy and existence of cash general ledger transactions. The three reports are:

1. Transaction Report: This report detailed all transactions by program.
2. Account Summary: This report detailed all transactions without classification of program.
3. Federal Report: The report detailed only federal program transactions.

Here is a link to the website that the ESD obtains the reports from: <https://www.treasurydirect.gov/govt/reports/tbp/account-statement/report.html>

Transactions (date, amount, classification) from the above reports are vouched to the Excel file "Monthly AFRS JV" workbook. Typically there are a few reconciling items (cash transfers between accounts that occurred before the bank's deadline). Shelly prepares the reconciliation from a template. Reconciliations are saved in Excel workbook "GL 1150 to Trust Fund". Reconciling items are typically for the last day of the trust fund draw and benefit returns for special programs like Federal Additional Compensation (FAC), Extended Benefit (EB), and Emergency Employment Compensation (EEC). Meghan Phelps, Treasury Manager, reviews the GL 1150 to Trust Fund reconciliation and supporting documentation, which includes Account Settlement Reports from ASAP.gov, reports from Treasury Direct, reports that show amounts sent to AFRS from their benefits payment system, and the Trust Fund Journal (**Key Control 1 - Existence**).

### US Bank Benefit Account

In general, the Benefit Account receives transfers from the US Treasury Trust Fund account. The Benefit account expends benefits to eligible participants. Trust Fund draws are based on UTAB report data of benefits paid to eligible participants for almost all benefit types. For more information on US Treasury Trust Fund draws, see our premiums and claims write up here [[Controls - UTAB](#)].

The master benefit account consists of the following accounts:

1. Benefit Master
2. Benefit Warrant Disbursement
3. Benefit ACH & Debit Card Disbursement
4. Benefit EFT
5. Benefit Deposit

### Monthly Reconciliations of Benefit Accounts (Existence)

Before state close and after UTAB sends the file (5<sup>th</sup> or 6<sup>th</sup> business day of the following month), Son Pham, Fiscal Analyst 4, pulls general ledger

## State of Washington

activity from AFRS (WEBI report) by fund (state benefits Fund 620 and federal benefits Fund 622). AFRS activity is entered into the "Monthly AFRS JV" Excel file. Activity from AFRS is reconciled to the "Monthly AFRS JV" Excel file. If any errors are found, JVs are used to correct the activity in the following month's activity. The accounting desk uses reports from UTAB and reconciles that to the AFRS JV spreadsheet monthly. After the monthly AFRS JV spreadsheet is reconciled then it gets reconciled to bank.

When the AFRS activity is reconciled to the "Monthly AFRS JV" Excel file, My-Phuong Tran, Fiscal Analyst 3, reconciles the five benefit account statements using a template. She also generates daily and monthly reports from UTAB (see list below) to aid in her reconciliation. Meghan Phelps, Treasury Manager, or Shelly Peterson, Assistant Treasury Manager, reviews the reconciliation and indicates reconciling items were accurate with tickmarks to ensure reported cash existed at year end (**Key Control 1 - Existence**). Meghan or Shelly then signs or initials the reconciliation to document the review.

Lastly, after state close (10<sup>th</sup> business day of the following month), Son pulls the same general ledger activity from AFRS by fund to ensure there were no changes.

Monthly UTAB Reports used in the Benefit Account Reconciliation:

1. Intercepted Money filtered for the month (benefits issued to claimant paid to another source for back taxes or child support)
2. UTAB Repayments (Details) filtered by source (US Bank Electronic Bill) and reason (returned payment)
3. UTAB Repayments (Details) filtered by source (lock box) and reason (returned payment)
4. General Ledger Posting filtered for cash draws related the end of the month and posted in the following month (dates depended on the month and business days)
5. General Ledger Posting filtered for book transfers related to the end of the month and posted in the following month (dates depended on the month and business days)

Daily UTAB Reports used in the Benefit Account Reconciliation:

6. Issued Funds (Benefit Payments & Refunds) filtered by payment channel (standard paper checks)
7. Issued Funds (Benefit Payments & Refunds) filtered by date (dates depended on the month and business days)

My-Phuong, Fiscal Analyst 3, uses a snippet of UTAB to support outstanding checks. The image is saved in the cash reconciliation workbook.

### Pandemic - US Bank Accounts

There are 2 pandemic US Bank accounts. Please see below:

- State Pandemic Relief Program (PRP) Account
  - This account was opened during December 2020 due to the extension of pandemic unemployment assistance (PUA) benefits not being signed in time by the federal legislation. Due to the extension not being signed, on December 27, 2020, Governor Jay Inslee authorized the use of federal CARES Act funds (approximately \$50 million) to help Washington claimants whose PUA

## State of Washington

benefits expired on December 26, 2020 and were waiting for federal legislation to extend those benefits. Federal legislation ended up getting signed into law on December 27, 2020, which extended, expanded, and changed the CARES Act provisions. Regardless, claimants eligible for the one-time PRP payment (\$550) still received it.

- Meghan stated that currently there a small amount left in this account.
- Monthly Reconciliation: This is similar to the reconciliation for the US Bank Benefit Account (see above), however there are no sub-accounts. Before state close and after UTAB sends the entry to AFRS (5<sup>th</sup> or 6<sup>th</sup> business day of the following month), My-Phuong Tran, Fiscal Analyst 3, prepares the bank to AFRS reconciliation, Meghan Phelps, Treasury Manager, or Shelly Peterson, Assistant Treasury Manager, reviews the reconciliation and indicates reconciling items were accurate with tickmarks to ensure reported cash existed at year end **(Key Control 1 - Existence)**. Meghan or Shelly then signs or initials the reconciliation to document the review.
- Lost Wages Assistance (LWA) Account
  - This account was opened by the ESD during August 2020 due to the ESD being approved for the LWA program through the Federal Emergency Management Agency (FEMA). LWA is a federal program that adds \$300 for each week the program remains federally funded. The ESD started processing LWA payments on September 21, 2020. Approved weeks for the program:
    - August 1 - 29, 2020
    - September 5, 2020
  - Department of Labor deposited the funds (approximately 708 million) from FEMA to their LWA account and the ESD was only able to draw down the funds based on what their actual draws were for the program.
  - They are currently receiving repayments in this account. This account has changed permanent account.
  - Monthly Reconciliation: This is similar to the reconciliation for the US Bank Benefit Account (see above), however there are no sub-accounts. Before state close and after UTAB sends the entry to AFRS (5<sup>th</sup> or 6<sup>th</sup> business day of the following month), My-Phuong Tran, Fiscal Analyst 3, prepares the bank to AFRS reconciliation, Meghan Phelps, Treasury Manager, or Shelly Peterson, Assistant Treasury Manager reviews the reconciliation and indicates reconciling items were accurate with tickmarks to ensure reported cash existed at year end **(Key Control 1 - Existence)**. Meghan or Shelly then signs or initials the reconciliation to document the review.

### How Transactions are Recorded in AFRS:

- Journal Entries: Journal entries were used to record cash received and transfers (i.e. from the Clearing Account to the US Treasury Trust Fund and from the US Treasury Trust Fund to the Benefit Account). Journal vouchers were also used to enter adjustments or corrections (Employer Side).
- System Interface: UTAB data posted to AFRS monthly in an automatic journal voucher.

### Key Controls are as Follows:

## State of Washington

- **Key Control 1:** The Treasury Manager or Assistant Treasury Manager review reconciliations and indicate reconciling items are accurate with tickmarks to ensure reported cash existed at period end **(Existence)**.

### Noted Weaknesses are as Follows:

- None

### E.1.PRG - Cash & Cash Equivalents

*Procedure Step:* Key Control 1 (Cash Reconciliations)

*Prepared By:* DRR, 6/5/2024

*Reviewed By:* RKM, 9/20/2024

Purpose/Conclusion:

#### **Purpose:**

To confirm cash reconciliations were reviewed by the Treasury Manager or Assistant Treasury Manager **(Key Control 1 - Cash Reconciliations)** in order to assess control risk.

#### **Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

## State of Washington

*A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency.*

***All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.***

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

## State of Washington

*If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

Guidance/Criteria.:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done.:

### **Cash and Cash Equivalents - Existence**

# State of Washington

**Key Control 1 (Existence - Manual):** The Treasury Manager or the Assistant Treasury Manager review reconciliations and indicate reconciling items are accurate with tickmarks to ensure reported cash existed at period end.

The understanding for this system is documented above in the "Controls - Cash Reconciliations" step.

## **1. Confirmation of Key Manual Control:**

### **January 2024 Reconciliations:**

1. Clearance Master Account (account number ending in 9589)

US Bank Balance: \$51,418,218.64

Adjusted GL Balance: \$51,418,218.65

Variance: \$0.01

Preparation: We noted My-Phuong Tran, Fiscal Analyst 3, prepared this reconciliation.

Review: We noted Aundrea Nunez, Controller, signed off on the reconciliation to document her review. Additionally, we were provided with the January 2024 KeyBank statement for account 1184, which had a balance of \$2,608.01 and was closed on January 19, 2024, and deposited in account 9589 on January 31, 2024. **No issues noted.**

2. Trust Fund Account

Trust Balance: \$3,452,897,229.07

Adjusted GL Balance: \$3,441,830,952.17 (reconciling item of \$11,066,276.90 due to Last Day State Draw)

Variance: \$0.00

Preparation: We noted Shelly Peterson, Assistant Treasury Manager, prepared the reconciliation.

Review: We noted Aundrea Nunez, Controller, made tickmarks and signed off on the reconciliation to document her review. **No issues noted.**

3. Benefit Master Account (account number ending 9530)

US Bank Balance: \$71,705,597.46

US Bank Adjusted GL Balance: \$71,705,597.46

Variance: \$0.00

Preparation: We noted My-Phuong Tran, Fiscal Analyst 3, prepared the reconciliation.

Review: We noted Aundrea Nunez, Controller signed off on the reconciliation to document her review. Additionally, we were provided with the January 2024 KeyBank statement for account 3855, which was closed on January 19, 2024, and deposited in account 9548 on January 26, 2024. **No issues noted.**

See UTAB reconciliation at: [Key Control 6 (Manual - UTAB to AFRS Reconciliation)].

## State of Washington

### 4. State Pandemic Relief Program (PRP) Account (account number ending 9639)

US Bank Balance: \$1,360.00

Adjusted GL Balance: \$1,360.00

Variance: \$0.00

Preparation: We noted My-Phuong Tran, Fiscal Analyst 3, prepared this reconciliation.

Review: We noted Aundrea Nunez, Controller signed off on the reconciliation to document her review. Additionally, we were provided with the January 2024 KeyBank statement for account 0229, which was closed on January 18, 2024 and had a \$0 balance prior to closure. ***No issues noted.***

### 5. Lost Wages Assistance (LWA) Account (account number ending 9621)

US Bank Balance: \$3,890,344.10

Adjusted GL Balance: \$3,649,421.22 (reconciling items of \$240,922.88 due to transfers from 9530)

Variance: \$0.00

Preparation: We noted My-Phuong Tran, Fiscal Analyst 3, prepared this reconciliation.

Review: We noted Aundrea Nunez, Controller signed off on the reconciliation to document her review. Additionally, we were provided with the January 2024 KeyBank statement for account 8181, which was closed on January 18, 2024 and had a \$0 balance prior to closure. ***No issues noted.***

***No issues noted.***

Note: Prior to March 2024, Aundrea Nunez, Controller, performed most reviews of the bank reconciliations while the Treasury Department transitioned between managers.

### **Noted Weaknesses are as follows:**

- None

### **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

### **E.1.PRG - Cash & Cash Equivalents**

# State of Washington

*Procedure Step:* Risk Assessment  
*Prepared By:* DRR, 6/18/2024  
*Reviewed By:* RKM, 9/30/2024

Purpose/Conclusion:

**Purpose / Conclusion:**

To assess inherent risk, control risk, and the risk of material misstatement in order to design an initial testing strategy for each assertion.

Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

**STEP 1: Inherent Risk (IR)**

Assess inherent risk for each relevant assertion. This assessment is based on understanding of the entity and the nature of the account balance or class of transactions.

*Inherent risk is the susceptibility of an assertion to material misstatement. It is our assessment of "total threat", which includes both "natural risk" and identified risk indicators, without any regard to any potential control activities. As inherent risk is fully independent of control risk, any understanding of controls cannot be used to increase/decrease the assessment of inherent risk. Consider the following factors as your basis for this assessment:*

- *General Considerations*
  - *Does the balance include transactions that are difficult to audit or involve complex accounting issues?*
  - *Were there significant misstatements identified in previous audits or prior-period adjustments in the account balance or transaction class? If so, analyzing the cause of prior period misstatements will help in analyzing inherent risk.*
  - *Are there any inherent risk factors at the entity or industry level, such as changes in regulation or accounting rules, unique transactions or accounting practices, use of information technology, etc that affect the balance?*
- *Inherent Risk due to Error*
  - *How large are the transactions making up the balance? If the balance has only a few large transactions, even a single error may mean a significant misstatement.*
  - *Have there been changes in the transactions making up the balance that may increase risk? For example, significantly different composition, nature or volume of transactions may inherently disrupt established controls.*

## State of Washington

- *Are financial events originated or identified by accounting personnel or non-accounting personnel? This consideration is mainly for the completeness assertion.*
- *Does the process to account for transactions involve judgment or estimation, complex calculations, numerous steps or significant manual steps?*
- *Do transactions have widely varying attributes that need to be manually identified? For example, grant loans that are accounted for in one of several ways depending on the terms of the agreement.*
- *Inherent Risk due to Fraudulent Reporting (intentional misstatements)*
  - *Are there substantial pressures or motivations to misstate the balance?*
- *Inherent Risk due to Misappropriation*
  - *Is the account balance or transaction class susceptible to sizable misappropriation?*
- *Inherent Risk due to Non-Compliance*
  - *Are there any laws, contracts or grant agreements affecting the balance? If so, would non-compliance lead to sizable misstatements?*
  - *Are compliance requirements complex, hard to understand, subject to judgment or otherwise difficult to comply with?*
  - *Are there any motivations or pressures to not comply?*

### **STEP 2: Control Risk (CR)**

Assess control risk by system and assertion. This assessment should be based on the results of the control understanding, confirmation, and (if setting control risk to LOW) testing. If applicable, auditors will evaluate any control deficiencies and determine whether those deficiencies, individually or in combination, are significant deficiencies or material weaknesses.

*Control risk is the risk that material misstatements would not be prevented or detected timely by the system of internal control. Control risk could be thought of as the "vulnerability" of an entity to misstatements. Control risk exists independently of the inherent risk (the level of vulnerability exists independent of the level of threat).*

*Control risk is MAX in both of the following situations: (1) controls aren't tested or (2) controls are problematic and cannot be relied upon. In order to set control risk to LOW, the auditor must test that controls operated effectively throughout the period.*

*A material weakness exists when the design or operation of controls results in a reasonable possibility a material misstatement will not be prevented or detected and corrected in a timely manner. A significant deficiency is less severe than a material weakness, yet important enough to merit the attention of the governing body. **All potential material weaknesses and significant deficiencies should be discussed with the AIC, since they must be reported as findings.***

### **STEP 3: Risk of Material Misstatement (RMM)**

Assess the risk of material misstatement for each relevant assertion for each significant line item. The risk of material misstatement (RMM) is a

## State of Washington

combination of the auditor's separate assessment of inherent and control risk.

*In practice, the RMM is the amount of substantive evidence that's needed, and the only way to reduce the amount of needed substantive evidence (equal to the inherent risk) is to test controls. As such, when control risk is MAX, the RMM must always equal the inherent risk (IR).*

*When controls are tested & can be relied upon (are determined to be effective) it is a matter of professional judgment how much the RMM should be set lower than inherent risk (1 or 2 steps).*

*Auditors should assess RMM by assertion, if different. For example, if RMM is assessed at MOD for the existence assertion, but LOW for the rights & obligations assertion, then document "MOD – existence and LOW – rights & obligations".*

### **STEP 4: Design Substantive Testing**

Design a substantive testing strategy that addresses the relevant assertion (identified risk) in the portion of the line item that relates to that risk.

*Planning identifies where to audit (significant balances, classes of transactions & disclosures) what to audit for (relevant assertions), and how much to audit (RMM). The quantity and quality of evidence obtained by substantive tests needs to match the level of risk. The higher the risk of material misstatement, the greater evidence needed. "Greater evidence" could either be greater quantity of evidence, greater quality of evidence, or some combination of greater quality and quantity.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6210](#) – Planning Financial Statement Audits**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits](#) Planning Guide**

Record of Work Done:

### **(1) Inherent Risk (IR):**

Based on our understanding of the line item, we assessed inherent risk as follows for each relevant assertion and significant class of transactions:

- **Existence – HIGH**

# State of Washington

## **(2) Control Risk (CR):**

We assessed control risk as follows for each system and relevant assertion:

- **Cash Reconciliations** – Existence

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

## **(3) Risk of Material Misstatement (RMM):**

We considered both inherent and control risk and assessed the risk of material misstatement as follows for each relevant assertion and significant class of transactions:

- Existence – HIGH

## **(4) Testing Strategy:**

We designed our substantive testing strategy based on our assessment of the risk of material misstatement. We plan to perform the following tests:

- We do not plan to send cash confirmations to third parties. As an alternative, we plan to obtain month-end reports from TreasuryDirect.gov for the trust account. We expect the trust account to hold the majority of the Department's cash.
- We also plan to test cash reconciliations for other bank accounts (i.e. clearance, trust benefit, PRP, and LWA). We will test all reconciling items above the floor.

We anticipate that these tests will provide sufficient appropriate audit evidence to address the assessed risk of material misstatement for relevant assertions in significant classes of transactions.

## **E.1.PRG - Cash & Cash Equivalents**

*Procedure Step:* Substantive Test  
*Prepared By:* DRR, 10/23/2024  
*Reviewed By:* RKM, 10/29/2024

# State of Washington

## Purpose/Conclusion:

### **Purpose:**

To determine whether reported cash and cash equivalents existed as of the end of the period **(Existence)**.

### **Conclusion:**

We determined cash and cash equivalents existed as of the end of the period, however, through testing we determined the following:

- We noted that there were several reconciling items in the benefit master account reconciliation that should not have been included. These reconciling items totaled \$(4,795,580) and resulted in an understatement of cash and cash equivalents by \$9,090,932. **See issue [E: ESD Cash Reconciliation Variances] and AOM [Aggregation of Misstatements (GAAP)].**

## Testing Strategy:

### **SAO Policy Requirement: Confirming or Verifying Cash & Investment Balances**

Confirmations can either be blind or a positive confirmation. In a blind confirmation (sweep), the auditor requests information on all accounts the bank holds for the entity (by entity name and/or EIN). In a positive confirmation, the auditor lists accounts (or accounts and balances) per the entity and asks the bank to confirm that the information is correct.

- Confirm cash and investment account balances with County Treasurer, bank and/or brokerage. Use the template confirmation form provided in the Store when needed.
  - Confirmations can be mailed to addresses listed on the Bank Confirmation Address List available on the Auditor Reference Guide. If the bank notifies you of a different address, please contact Team Audit Support to update the list.
  - Banks may confirm incorrect amounts either due to a simple mistake, use of a wrong confirmation date or incorrectly including or excluding accounts. The first step in resolving differences should be to check information against the entity's bank statements and then call the bank to specifically confirm any difference.
  - Confirming investments may involve physical inspection, confirmation with the issuer, confirmation with the custodian, confirmation of unsettled transactions with the broker/dealer, confirmation with the counterparty, and/or reading executed partnership or similar agreements. When confirming investments, ensure investments are held in the entity's name.
- *If confirmations are not used*, auditors must at minimum verify balances to the County Treasurer, bank and/or brokerage statements. If this is done, the auditor should consider the risk that the statements were altered and should examine papers for indications of alteration.

The following is a list of **additional considerations** for testing the existence assertion for cash and investments. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

# State of Washington

## Bank Reconciliations

If the auditor is comparing reconciled (confirmed) bank or county treasurer balances to the GL (rather than confirmed amounts within an expected variance due to reconciling items), the auditor should consider performing some or all of the following tests to verify the accuracy of the reconciliations. Note that testing the reconciliation will provide evidence of both the existence and completeness of cash and investment balances.

- Trace (or compare summed) bank balances per statements to reconciliations.
- Trace (or compare summed) book balances per reconciliations to the general ledger or financial statements.

*If a cash account is allocable to a particular fund, the balance in the general ledger should be recorded in the same fund.*

- Scan the reconciliation for reasonableness. Look for unusual, unexpected or vaguely described reconciling items, lack of support or detail, very large reconciling items, very old reconciling items, and missing or extra elements that would indicate that the reconciliation was being performed incorrectly.
- Foot the reconciliation for accuracy.
- Trace deposits in transit to the subsequent month's bank statement, considering reasonableness of the in-transit period.
- Trace outstanding checks to cash disbursement journal.
- Check that any other reconciling items are valid and have been properly accounted for (ex: large debit or credit memos).
- Check reconciliation against prior and/or subsequent reconciliations for reasonableness of amounts and items included and to trace reconciling items from the previous and/or subsequent period.

## Other Tests

- Inquire whether any checks or deposits were being held at year end for budget, cash flow or other purposes.
- Confirm investments purchased but not received as of year-end
- Confirm investments sold but still held as of year-end
- Confirm interest due or accrued but not yet received as of year-end
- Search for manual journal entries that debit (increase) cash. Consider testing if risk indicators are noted.
- Review reconciliations of clearing and transmittal accounts.
- See accountability steps for testing strategies related to petty cash and imprest funds, which are not expected to be material to the financial statements.

*Auditors may perform additional procedures to confirm information in the deposit and investment note disclosure in this step or in the Notes to the Financial Statements step. Auditors should contact the Investment Specialist if they note significant interest rate or other risks with the*

# State of Washington

*government's deposits or investments.*

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**Outstanding Checks and Deposits in Transit** – Per TIS section 1100.08 (AICPA Technical Questions and Answers), outstanding checks should be reported as a reduction of cash and the amount of deposits in transit should be reported as cash. A check is considered outstanding from the time that it is out of the payor's control – when mailed or delivered to the payee – until the time it clears the bank. Cash should represent amounts within the control of the reporting entity, that is, the amount of cash in banks plus cash and checks on hand and deposits in transit minus the amount of outstanding checks.

**SAO Audit Policy [6350](#) – External Confirmations**

**[Investments](#) Area Guide**

**[LGIP Fund Summary Reports](#)** - includes a list of local government accounts and balances in the Local Government Investment Pool

## **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

**BARS [3.8.6](#) Use of Payroll and Claims Funds**

Record of Work Done:

## **Substantive tests performed to meet the Existence assertion**

We obtained the year-end reconciliations for the following accounts:

1. Trust Account held with the US Department of Treasury
2. Benefit Master Account held at US Bank and Key Bank
3. Clearance Master Account held at US Bank and Key Bank
4. Pandemic Relief Account held at US Bank
5. Lost Wages Assistance Account held at US Bank

See testing: [[Cash & Cash Equivalents Testing](#)]. We performed the following required and additional procedures:

# State of Washington

## Required Procedure:

### **1. Confirm cash and investment account balances with bank and/or brokerage.**

- We did not perform formal cash confirmations. We performed additional procedures noted below. During those procedures, we reviewed documentation for alterations or modifications. We did not note any alterations or modifications to any documentation. In addition to the procedures performed below, we obtained the Employment Security Department's (ESD) June 30, 2024 trust fund account statement from the U.S. Treasury's website, [TreasuryDirect](#).

## Additional Procedures:

### **1. Trace (or compare summed) bank balances per statements to reconciliations.**

- We vouched bank balances presented on each reconciliation to the respective bank statement. *No issues noted.*

### **2. Trace (or compare summed) book balances per reconciliations to the general ledger or financial statements.**

- We compared the bank reconciliation balances to the general ledger balances as reported in the ACFR database. See: [\[Cash & Cash Equivalents Testing\]](#), tabs, "Existence" and "Testing", for tying the general ledger balances as reported in the ACFR database to the financial statements. Through testing we determined the following:
  - We noted that several reconciling items in the benefit master account totaling \$(4,795,580), should not have been included in their respective reconciliations.
  - We determined that the Cash & Cash Equivalents balance was understated by \$9,090,932. **See issue and AOM link in the conclusion.**

### **3. Scan the reconciliation for reasonableness. Look for unusual, unexpected or vaguely described reconciling items, lack of support or detail, very large reconciling items, very old reconciling items, and missing or extra elements that would indicate that the reconciliation was being performed incorrectly.**

- We re-performed the ESD's cash reconciliations. We reconciled bank balances to the general ledger. We listed all reconciling items and descriptions at: [\[Cash & Cash Equivalents Testing\]](#), see tab, "Existence". We vouched all items greater than the floor to the source documentation. See tab "Testing". Through testing we determined the following:
  - We noted that several reconciling items in the benefit master account totaling \$(4,795,580), should not have been included in their respective reconciliations.
- We determined that the Cash & Cash Equivalents balance was understated by \$9,090,932. **See issue and AOM link in the conclusion.**

### **4. Foot the reconciliation for accuracy.**

## State of Washington

- We footed the reconciliations. We noted ESD's reconciliations of the Trust Fund, Clearance Master, Lost Wages Assistance, and Pandemic Relief accounts footed without exception. See: Cash & Cash Equivalents Testing, tab "Existence". ***No issues noted.***

**5. Trace deposits in transit to the subsequent month's bank statements, considering reasonableness of the in-transit period.**

- See procedure 3 above.

**6. Check that any other reconciling items are valid and have been properly accounted for (ex: large debit or credit memos).**

- See procedure 3 above.

**7. Check reconciliation against prior and/or subsequent reconciliations for reasonableness of amounts and items included and to trace reconciling items from the previous and/or subsequent period.**

- We reviewed cash testing from the FY 2023 ACFR to determine reasonableness. We determined the reconciliation was reasonable compared to prior year and found similar issues in the CY reconciliations.

### E.2.PRG - Receivables (Net of Allowance)

*Procedure Step:* Summary & Conclusion

*Prepared By:* DRR, 10/15/2024

*Reviewed By:* CJG, 11/20/2024

Purpose/Conclusion.:

**Purpose:**

To evaluate risk assessments and the sufficiency and appropriateness of evidence obtained based on results of substantive work.

**Conclusion:**

We determined that **no** modifications were necessary to inherent risk, control risk, or the risk of material misstatement as assessed in planning.

We also determined that evidence obtained was sufficient and appropriate in response to the risk of material misstatement.

Testing Strategy.:

# State of Washington

Auditors are **required** to evaluate conclusions for substantive testing as follows:

*Auditors may wish to use the optional Lead Sheet available in the Store to summarize testing related to each balance and assertion.*

**1.** Determine whether the results of substantive testing indicate a need to modify the inherent risk assessment (IR), control risk assessment (CR), risk of material misstatement (RMM) or other aspects of planning (such as material balances or assertions). If so, document changes and consider the need for additional testing.

*If the results of substantive testing indicate a need to change control risk, auditors should also update the **Permanent File** by either correcting the documentation or by adding an update section describing changes to the top of the record of work done. For all changes to IR, CR, or RMM the **Material Balances** spreadsheet should be updated.*

*More significant changes to other aspects of planning (such as material balances or assertions) should be referenced in this step and documented in detail in the **Changes to FS Audit Plan** step.*

**2.** Evaluate whether the quality and quantity of evidence obtained is sufficient and appropriate in response to the risk of material misstatement. In making this determination, auditors should evaluate:

Information to be used as audit evidence:

- Does evidence relate to the population, period of time and risk (assertion and “what could go wrong” from the Material Balance Spreadsheet)? If there are any gaps or uncertainties in the logical connection between the evidence and conclusions, is there a documented consideration and explanation?
- Are the sources of information sufficiently reliable and appropriate for the risk (whether internal to the government, external, or auditor developed)? If key information is not from a sufficiently reliable source (for example, inquiry), then is it corroborated by information that is?
- Are there any concerns about accuracy, completeness, authenticity, or bias in information? If so, did the auditor perform sufficient procedures to confirm reliability of that information?
- Is information precise enough to catch if misstatements exceeded the tolerable level?
- Is information detailed enough to conclude on whether or not there were misstatements?
- Was there any information that appeared contradictory or inconsistent? If so, was there a documented response to the inconsistencies or doubts about the reliability of evidence?

Results:

- How much misstatement was identified by testing, and the likelihood and magnitude of further potential misstatement?
- How did misstatements occur and how often might they occur again in the population?

## State of Washington

- Were misstatements caused by control deficiencies or circumvention of controls?
  - If control deficiencies, is there a need to re-evaluate our understanding of controls in the [Permanent File](#) folder or assessment of control risk?
  - If circumvention, the [Management Override of Controls](#) step should address or reference this area. Auditors should also consider whether a fraud risk has been identified.
  - Did tests identify a different level or type of risk than the planned audit response was designed to address?
  - If likely misstatements are identified, are further procedures necessary to improve the precision of our estimate?

*To support the overall evaluation of audit risk and provide a basis for concluding on the overall sufficiency and appropriateness of evidence in the [FS Summary & Report](#) step, auditors should conclude in each area whether the auditor continues to believe that the tests performed and quality and quantity of evidence obtained are commensurate with RMM for all relevant risks (the "what could go wrong", in the [Material Balances](#) spreadsheet).*

If the auditor determines that evidence is not sufficient or appropriate, additional substantive testing should be done. If sufficient, appropriate evidence is not available for audit, the AIC should discuss the effect on our audit report with the AAM and AM.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6310](#) – Determining the Nature, Timing and Extent of Substantive Testing**

**SAO Audit Policy [3210](#) – Audit Evidence**

Record of Work Done:

Based on test results, we re-evaluated risk assessments, procedures, evidence obtained and conclusions as follows:

### **(1) Do the results of substantive tests indicate a need to modify our risk assessment (IR, CR and RMM)?**

Results of substantive tests do not indicate a need to modify our risk assessment.

### **(2) Was the quality and quantity of evidence obtained sufficient and appropriate?**

The quality and quantity of evidence obtained was sufficient and appropriate.

# State of Washington

## E.2.PRg - Receivables (Net of Allowance)

*Procedure Step:* Understanding of Line Item

*Prepared By:* DRR, 6/11/2024

*Reviewed By:* RKM, 12/7/2024

Purpose/Conclusion:

### **Purpose / Conclusion:**

To gain an understanding of the line item and confirm the scope of testing as documented in the Significant Account Matrix.

Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

### **STEP 1: Prior Audit Exceptions**

Document any exceptions noted during the prior audit. Follow-up to determine how the agency has responded to or corrected the issue, unless this work is anticipated as part of the testing strategy.

### **STEP 2: Analyze Composition and Changes of Line Item**

- Include link to the line item leadsheet. This will be completed at the end of the audit. Leadsheet analysis should be documented in this spreadsheet.
- Inquire with agency staff about the activities and transactions that make up the balance and any changes to those activities or transactions in relation to the prior year.
- Determine relevant classes of transactions or account balances within the line item to analyze (such as agencies, funds, programs, departments, accounts, and/or objects), and use AFRS to create trends of those elements. This step should not include any specific dollar amounts associated with the line item.
- Evaluate trends to identify:

(1) What classes of transactions or account balances are primary to the identified risk. Auditors should specifically consider what elements are primary to the line item (comprising a large percentage of the line item), and which elements the identified risk would apply to, and

## State of Washington

which elements might be most susceptible to the identified risk (having a high risk of non-trivial misstatement for a relevant assertion, considering likelihood and impact of potential for misstatement).

(2) What changes are primary to the identified risk, if applicable. Auditors should specifically consider whether the overall change to the line item from the prior year was significant, what elements were the primary drivers of overall change, whether any elements changed significantly from the prior year, and which changes (if any) might relate to the identified risk.

(3) Any unusual or unexpected elements, amounts, or changes that may indicate a risk, whether the one identified in planning or a new one that may need to be considered for a change to the plan.

**Consider** other procedures to gain an understanding of the line item, such as review of key policy documents, review of program information or reports, inquiry of staff, budget information, or other analytical procedures.

### STEP 3: Update Significant Account Matrix

Based on your understanding of the line item, update the Significant Account Matrix with final conclusions on the agencies covered, account description, significant accounting systems, and risk (what could go wrong and relevant assertions). The account description should reflect the significant transaction streams or account balances relevant to the risk.

*The description of agencies, significant accounting systems, and what could go wrong in the Significant Account Matrix constitute the overall scope of substantive testing.*

*A transaction stream is significant based on the potential for misstatement. This is often due in part to its size (ie: comprising a large percentage of the total line item), but is ultimately a judgment about the susceptibility to the identified risk (for example, when the risk is understatement a small or omitted account may hold the most potential for the largest misstatement).*

*Significant accounting system(s) are those that contain key controls over significant classes of transactions included in the line item. Control systems identified in this step must match the Significant Account Matrix and have a separate control understanding documented.*

*Talk with the AIC if you identify any changes to the Significant Account Matrix.*

Guidance/Criteria.:

Record of Work Done.:

#### **(1) Prior Audit Exceptions:**

We noted that the Employment Security Department (ESD) had the following three exceptions related to this balance in the fiscal year 2023 ACFR audit:

**(Finding)** ESD incorrectly calculated the allowance for doubtful receivables related to claimant overpayments. We found the allowance for uncollectible receivables related to claimant overpayments to be overstated and net receivables to be understated by \$330.5 million. This error was corrected in the financial statements.

# State of Washington

We recommend ESD perform a thorough review of the allowance for uncollectible receivables to ensure it is calculated correctly.

**(Verbal)** ESD is unable to fully reconcile receivables reported within UTAB to amounts reported within AFRS. The variance identified was \$548,531.

We recommend ESD to fully reconcile receivables reported within UTAB to AFRS.

**(Verbal)** The certified uncollectible amount (CUA) used to calculate the NGTS allowance was based on incomplete data. From 2018 to 2021 the CUA has been significantly higher. We were unable to quantify the understatement, however we don't expect this error to have a significant financial impact since the Department uses a five year average for their allowance estimate.

We recommend the Department to ensure complete date is used in their allowance methodology.

As we will be reviewing receivables and allowance for doubtful receivables during our testing, we did not inquire how the Department responded, or corrected the issue.

## **(2) Composition & Change Analysis:**

Line Item Leadsheet: [[Line Item Lead Sheet](#)].

We noted the balance included activity from the following funds:

- 620: Unemployment Compensation Account
  - OFM Account description: The first priority is to provide services to eligible participants within the state; second priority is to provide substitute services or program support; and last priority is the direct payment of funds to the federal government.
    - Authority: RCW [50.16.010](#)
- 622: Unemployment Compensation Federal Employees' Benefit Payment Account
  - OFM Account description: Local fund outside the state treasury used to account for funds received from the federal government to cover benefits paid by the state for eligible unemployed federal workers. Per the Federal Employment Security Act (Title V).
    - Authority: RCW [43.88.195](#)

We evaluated the funds and determined transactions from fund 620 and 622 make up 74% of the account balance. The Receivables (Net of Allowance) line item is mostly composed of the receivables from employers (NGTS - taxes) and claimants (UTAB - overpayments).

We also identified that many of the funds did see some significant changes year over year (FY2022 to FY2023):

## State of Washington

- 620: Unemployment Compensation Account:
  - GL1342 (Accounts receivable) decreased by 21% or \$1M.
  - GL1349 (Allowance for Uncollectible Other receivables) increased by 14% or \$30M.

Fund 622 - Unemployment Compensation Federal Employees' Benefit Payment Account did not see significant changes from the prior year.

We inquired with Meghan Phelps, Treasury Manager, on May 23, 2024 and she stated that there were no significant changes from FY23 to FY24 in regards to the receivables (net of allowance) line item processes or procedures in the Treasury department, however, she noted that the agency is still applying federal waivers to some assessed over payments that occurred during the pandemic between February 2, 2020 and September 4, 2021.

On November 27, 2024 we inquired with Meghan Phelps, Treasury Manager, and Corbin Foster, Enterprise Financial Recovery Manager, to determine why the receivables balance is so large now, compared to pre-pandemic. Per Meghan, the reason for the increase in the balance is due to outstanding fraud benefits that were paid out during 2020 and 2021. Meghan stated that ESD has collected approximately \$450 million of the \$640 million that was paid out and ESD is still actively working with financial institutions and law enforcement to collect as much of the outstanding balance as possible. Per Meghan, she expects a more significant drop in FY25 as the Department continues it's overpayment waiver project and she would expect the backlog of collections to catch up over the next few years.

Corbin mentioned that during 2020 and 2021 the agency saw a dramatic increase in the overall volume and dollar amount of benefits paid out. He mentioned that during an 18 month period, ESD paid out the same amount of benefits from the previous 18 years. Additionally, he stated that "In the early days of the pandemic, agency leadership at the time decided to pause active collections, meaning for example the filing of liens against individuals and employers, the garnishing of assets such as wages or bank accounts, and proactively contacting customers to request payment. Throughout these past several years, we have allowed and welcomed customers who contact us to voluntarily remit payment or enter into long-term payment plans, and we have also continued offsetting benefits against any overpayment balances. The collections pause was lifted for employers in December 2023, and we are in the early stages of doing the same for UI claimants with benefit overpayments."

In Unemployment Insurance Program Letter Number (UIPL) 20-21, Change 1, U.S. Department of Labor provided scenarios where certain CARES Act overpayments may be waived on a blanket basis. This allows states to process waivers for multiple overpayments simultaneously based on a single set of facts that satisfy the requirement that the individual be without fault in the creation of the overpayment and that recovery would be contrary to equity and good conscience. UTAB has been automated to identify and process blanket waivers in the limited scenarios described in the UI Policy Update from February 14, 2023 found here [[UI Policy Update \(Including Fed. Waivers\)](#)].

The first round of these waivers were applied at the end of March 2023, with automatic waivers and write-offs to specific types of overpayments. There is an overpayment waiver request form on the ESD website that can be submitted by those assessed with overpayment notices and these are being manually reviewed by ESD staff to determine if the claimant is eligible for the waiver.

# State of Washington

**Note:** Federal Waivers were selected for audit in the FY23 Accountability audit of ESD at **[S1EmploymentSecurity-AC23]**. This work provides a complete understanding of the federal waiver process and has determined that the Department's methodology for applying waivers is correct.

## **(3) Updates to Significant Account Matrix:**

- None

## **E.2.PRG - Receivables (Net of Allowance)**

*Procedure Step:* Controls - UTAB

*Prepared By:* DRR, 10/11/2024

*Reviewed By:* RKM, 11/20/2024

Purpose/Conclusion:

### **Purpose:**

To gain an understanding of internal controls.

### **Conclusion:**

We gained an understanding of internal controls as documented in the record of work done.

Testing Strategy:

### **The following procedures are required for all material systems:**

1. List the financial statement balance(s) and relevant assertion(s) addressed by the understanding.
2. Gain an understanding of the internal control process, identify how transactions are recorded in AFRS, identify key controls over relevant assertion(s), and note any control weaknesses.
  - In gaining an understanding of controls, consider the overall understanding of State-Level control elements as documented in the "State-Level Controls" step as they relate to this particular system.
  - Identify controls systems covering all relevant assertions for all significant classes of transactions.

## State of Washington

- Standards require the auditor to gain an understanding of the significant accounting system(s) that contain key controls over significant classes of transactions included in the line item.
- Control systems identified in this step must match the Material Account Matrix and have a separate control understanding documented.
- Talk with the ACFR Specialist or AIC if you identify different systems than the ones anticipated in the Material Account Matrix.

For each material system, auditors must document:

- A brief outline of the transaction flow from beginning to end.
- An expanded description of key controls.
- Business processes relevant to financial reporting of the relevant assertion for the material balance. Processes should encompass automated and manual procedures by which transactions or events are identified or initiated, authorized as needed, recorded, processed and corrected as needed.
- Original accounting records and how records are rolled-up to intermediary ledgers and transferred to the general ledger (AFRS) or financial statements.
- Detailed descriptions of key controls. Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

The following is information to **consider** when identifying key controls and transaction flow.

“Key controls” refer to the few controls that together provide reasonable assurance that material misstatements will be prevented or detected and corrected. This is contrasted with ancillary or supporting controls, which – although helpful and recommended – would provide less than reasonable assurance by themselves.

The focus of the write-up is on the key controls. Key controls should be specifically identified (as “key controls”) in the write-up. This can be done in whatever way the auditor prefers, so long as it is obvious. Details that the auditor should document regarding key controls may include:

- Who or what initiates the control
- When (or how often) is the control applied
- Who performs the control
- As needed, the experience, knowledge and attitude of the person applying the control
- Detailed description of the control process or activity. For example, if the control is a review: what exactly is reviewed, what is the reviewer looking at or for and what are the reviewer’s criteria?
- How the key control is documented or evidenced
- If not obvious from the description, how the control prevents or timely detects and corrects misstatements

## State of Washington

- Any exceptions or alternative processing to the normal process
- What happens when misstatements or issues are identified by the control

The “transaction flow” refers to the process by which transactions are initiated, authorized, recorded, processed and reported (as applicable). Outlining the transaction flow gives context to key controls, especially how transactions become subject to controls in the first place. If a control inherently ensures that all applicable transactions are included (ex: bank reconciliation where the assertion is existence), the auditor may decide to just start the write-up with the initiation of the control procedure and go from there.

Elements of the transaction flow are defined informally as follows:

- *Initiation:* How are transactions initiated?
- *Authorization:* How are transactions and accounting record maintenance authorized?
- *Recording:* How are transactions or balances identified and recorded in financial accounting systems?
- *Processing:* How are the transactions or balances processed after they are recorded (if at all)? Processing may be manual or automated and may occur at a subsidiary system level or at the general ledger level.
- *Reporting:* How are records translated into the financial statements? This part of the transaction flow extends the understanding to the actual financial statements that the audit is opining on. Since we already document an understanding of the financial reporting process in general, it is usually enough to simply reference this overall understanding. However, if there are important steps unique to the covered balances, it may be more appropriate to mention them here.

Although transaction flow is a good way to think about understanding and documenting a control system, auditors should not worry too much about documenting “each element, in order” because often elements may be combined, not noticeable, not applicable or occur in a different order.

Guidance/Criteria:
--------------------

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits](#) Planning Guide**

# State of Washington

## Record of Work Done:

Internal controls in UTAB address the following balances:

- Statement of Net Position - Proprietary Funds
  - Receivables (net of allowance)
- Statement of Net Position - Government Wide
  - Other Receivables (net of allowance for uncollectible)

For the following assertions:

- **Existence:** There is a risk that reported insurance premium receivables do not represent valid uncollected amounts due from employers and claimant overpayments and/or fraudulent payments at year end (Existence). There is as risk that federal waivers were included in the receivable balance (Existence - Significant Risk).
- **Valuation:** There a significant risk that a reasonable allowance for uncollectible accounts has not been established. There was an error (\$330.5M) in calculating the year-end adjustment for the UTAB allowance, which is an estimation performed at year-end (Valuation - Significant Risk).

### **Gain an Understanding of Internal Controls**

We met with the following people on May 23, 2024 to update our understanding over UTAB receivables:

- Meghan Phelps, Treasury Manager
- Shelley Peterson, Assistant Treasury Manager
- Son Pham, Fiscal Analyst

### **General Information:**

Claimant over-payments are tracked in GL 1319 and tracked by fund (620 – federal or 622 – state).

Over payments were governed by the following:

- RCW 50.20.190 - Recovery of benefit payments (<http://app.leg.wa.gov/rcw/default.aspx?cite=50.20.190>)
- WAC 192-220-045 - How is the fraud penalty calculated? (<http://apps.leg.wa.gov/wac/default.aspx?cite=192-220-045>)
- RCW 50.24.200 - Charge-off of uncollectible accounts (<https://app.leg.wa.gov/rcw/default.aspx?cite=50.24.200>)
- RCW 50.32.020 - Filing of benefit appeals (<https://app.leg.wa.gov/rcw/default.aspx?cite=50.32.020>)
- SAAM 85.54.55 – Receivables (<https://www.ofm.wa.gov/sites/default/files/public/legacy/policy/85.54.htm>)

### **Overpayment Penalties and Interest (UTAB Receivable)**

See understanding of UTAB benefits (Premiums & Claims) at: [[Premiums and Claims](#)]

## State of Washington

Over payments of unemployment benefits occur when someone received benefits that they are later found to have been ineligible to receive. This can happen if someone receives more benefits than they were entitled to. For example:

- A claimant was paid on a conditional basis while their case was under review and the review subsequently finds that they were not entitled to receive benefits.
- A claimant does not respond to requests for more information during a 10 day window. Benefits will stop and the amount already paid out will be due back to ESD.

Claimants are able to appeal and provide the requested information which, if approved, will negate the overpayment assessment letter.

When over payments are identified, the Department mails the claimant an overpayment assessment letter which details the amount of the overpayment and states that the claimant has 30 days to appeal the overpayment determination or provide additional information to the Department. Over payments were also classified as fraudulent and non-fraudulent.

### **Repayment of Over payments**

When over payments are identified, benefit recipients are not expected to repay the full amount due immediately. UTAB calculates the minimum monthly payment depending on the type of overpayment (fraud or non-fraud). The calculation is:

#### Fraud:

- The weekly benefit amount client was receiving at the time the overpayment occurred, or 3% of the overpayment balance, whichever is greater.
- Interest is assessed at 1% per month on the balance, the interest begins the day the overpayment is established.

#### Non-Fraud

- One third of the weekly benefit amount, 3% of the overpayment balance, or \$25.00, whichever is greater.
- Interest is assessed at 1% per month on the balance, on accounts at least a portion of two payments past due.

If the account is delinquent, UTAB calculates the minimum monthly payment by totaling the minimum monthly payment, accrued interest and past due amount.

When a client has an existing overpayment and begins claiming benefits, offsetting the principal balance will occur when:

1. The account is at least a portion of two payments past due; or
2. The overpayment is due to a UI Claim cancellation; or
3. The overpayment balance equals the New Balance Available (NBA) left on the UI Claim

Benefits will be offset at 50% of the weekly benefits payable for each week claimed for Non-Fraud over payments.

## State of Washington

Offsetting occurs at 100% of the weekly benefits payable for each week claimed for the following:

1. Fraud Over payments; or
2. The overpayment is due to a UI Claim cancellation; or
3. The overpayment balance equals the NBA left on the UI Claim

If the client sends in the full overdue amount, current monthly payment, and total interest owed to bring the account current, offsetting will stop as long as the client continues to keep the account current.

### **Monthly Review of UTAB Receivable Data (Existence/Valuation)**

UTAB automatically posts accounts receivable activity to AFRS monthly (6<sup>th</sup> business day after the end of the month). Activity is posted in summary. To review the automatic post, Son Pham, Fiscal Analyst 4, runs a general ledger query from the Web Intelligence (WEBI) system. The report is exported into an Excel workbook titled "New AFRS File," tab "Receivable Activity." Son takes a screen shot of the UTAB report titled "Aging Receivables", as of the last day of the month. She pastes the UTAB screen shot in the New AFRS File Excel workbook tab "Receivable Activity". Son ties totals from the UTAB aging report to the general ledger. If exceptions are noted, the Fiscal Analyst 4 prepares an adjusting journal voucher. When complete, Son notifies Shelly Peterson, Assistant Treasury Manager, and Meghan Phelps, Treasury Manager. Shelly or Meghan review the Excel workbook "New AFRS File" to ensure the receivables post from UTAB is accurately calculated, and receivables exist (**Key Control 1 – Manual - Existence/Valuation**).

The process described above is the same process for fraud receivables.

### **Calculation of Allowance for Doubtful Accounts (Valuation, Manual)**

The allowance for doubtful accounts estimate is prepared from historical receipt trends tracked in UTAB. Monthly, Meghan Phelps, Treasury Manager, reviews repayments by revenue source and aging. The UTAB report is called "Age of Account Payments," and documented in the Excel workbook "AgeOfAccountPayments\_YrEnd." The aging report is broken out by the following increments: 0-90 days, 91-180 days, 181-365 days, 366-730 days, 731-1,095 days, and 1,096 and more days. Collection percentages are calculated by dividing the total receipts for each aging bucket by the total receipts collected. Monthly percentages for each aging bucket are averaged to determine the collection percentages for the fiscal year. This is calculated on tabs "age of accounts (Fiscal Year)" and "Historical Percentage" in the AgeOfAccountPayments\_YrEnd workbook. The percent calculations are later used to estimate how much would be collected and how much would likely be written off.

Balances that were past due are tracked in the UTAB report "Uncollectible Balances." The Uncollectible Balances report tracks all repayment plans that are delinquent for 180 days or more. This report does not track the age of the initial repayment plan, but status of the repayment plan. Shelly Peterson, Assistant Treasury Manager, multiplies the total uncollectible balances by the annual average collection percentages for each respective aging bucket. This is calculated on tab "Quick Glance" in the AgeOfAccountPayments\_YrEnd workbook. The difference between the total uncollectible balances from the UTAB report and the expected repayment by aging category was the expected and likely write-off

## State of Washington

amount.

The uncollectible multiplying factor is determined by dividing the expected write off amount by total receivables (Age of Account Payments UTAB report). The multiplying factor is updated annually to reflect current collection practices and historical trends as calculated by the expected write-offs.

Shelly prepares a journal voucher based on the Excel workbook. Meghan Phelps, Treasury Manager, reviews and approves the journal voucher. She reviews the Excel formulas to ensure amounts were accurately calculated (**Key Control 2 – Valuation, Manual**). See below for GL coding (reversing JV):

- State (Fund 620) GL 1349/6505
- Federal (Fund 622) GL 1349/5151

Meghan also reviews the total allowance for doubtful accounts and the allowance as a percentage to total accounts receivable to determine consistency and reasonableness.

For fraud receivables they take the total UTAB receivables and determine what portion is related to fraud. They reduce the fraud receivable amount by any items still in process as of June 30, 2024. This amount is divided by the receivables amount to determine the percentage that will be determined uncollectible. The journal voucher preparation and review process is the same as described above.

We agree with ESD's methodology for determining allowance for doubtful accounts.

### Charge Off Criteria

UTAB automatically writes off balances (daily and yearly write-offs). Daily, UTAB reviews receivables and charged off balances that met the following criteria:

- Amounts less than \$25.00;
- No payment has been received within the past six months;
- The claimant did file or opened a claim within the last three months;
- If a lien was attached to the determination, the system automatically released the lien and sent notification to the county.

UTAB also reviews receivables annually and writes off balances that met the following criteria:

- Over payments were ten years or older or the overpayment was less than \$100 (total includes principal, penalty, interest, court cost, and surcharge);
- No repayments were made within the last 15 months;
- If a lien was attached to the determination, the system automatically released the lien and sent notification to the county.

## State of Washington

The annual review excludes over payments that were in suspense (by ESD, the business, stay of collection, prosecution, or request from the attorney general), out of state over payments, and balances greater than \$0 for current ESD employees.

### How transactions are recorded in AFRS:

- Accounts receivable data (monthly) is automatically posted to AFRS on the sixth business day after month-end.
- Year-end accounts receivable balances and related allowance for uncollectible accounts are posted to AFRS via journal voucher.

### Key Controls are as Follows:

- **Key Control 1 (Manual - Existence/Valuation):** Monthly, the Treasury Manager and Fiscal Analyst 4 review the Excel workbook "New AFRS File" (GL query run through WebI), tab "Aging Receivables" to ensure accounts receivable (including fraud) recorded in UTAB were accurately calculated, receivables existed and were correctly imported into AFRS from UTAB.
- **Key Control 2 (Manual - Valuation):** The Treasury Manager reviews and approves the JVs and related support to ensure the allowance for doubtful accounts (including fraud) was accurately calculated based on historical collection data and the correct percentage.

### Noted Weaknesses are as Follows:

- None

### E.2.PR.G - Receivables (Net of Allowance)

*Procedure Step:* Key Control #1 UTAB (Manual)

*Prepared By:* DRR, 6/25/2024

*Reviewed By:* BM2, 11/20/2024

Purpose/Conclusion:
---------------------

### **Purpose:**

To confirm the Treasury Manager reviews the "New AFRS File" to ensure accounts receivable (including fraud) are accurately calculated and imported into AFRS from UTAB (**Key Control #1 for UTAB**) in order to assess control risk.

# State of Washington

## **Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

## Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*

## State of Washington

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency.*

***All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.***

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

# State of Washington

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

## **Receivables (Net of Allowance) (Existence/Valuation)**

**Key Control 1 (Existence/Valuation - Manual):** Monthly, the Treasury Manager and Fiscal Analyst 4 review the Excel workbook "New AFRS File" (GL query run through WebI), tab "Aging Receivables" to ensure accounts receivable (including fraud) recorded in UTAB were accurately calculated, receivables existed and were correctly imported into AFRS from UTAB.

The understanding for this system is documented above in the "Controls - UTAB" step.

### **1. Confirmation of Key Manual Control:**

We obtained the "New AFRS File March 2024" excel spreadsheet from Meghan Phelps, Treasury Manager. There was a tab in the spreadsheet titled, "Receivable Activity". This tab included the March 2024 Webi "Agency Wide Management Report by Date" (process date 4/16/2024). On this report, GL 1319 "other receivables" totaled \$10,890,305.04 in funds 620 and 622. GL 1349 "Allowance for uncollectible other receivables" was \$10,178,894.29 for funds 620 and 622. There was detail below which indicated the GL1319 and 1349 February ending balances, and the March ending balance after the adjustments noted above from the WEBi report.

Below that, there was a reconciliation of these balances to the adjustments from the UTAB report. There was a variance of \$2,252,630.22 in GL 1319 and the variance in GL 1349 was zero.

	GL1319	GL1349
Feb. Ending Balance	1,542,438,180.32	(1,478,476,529.38)
March Adjustment	10,890,305.04	(10,178,894.29)
<b>Total:</b>	1,553,328,485.36	(1,488,655,423.67)
UTAB	(1,572,288,942.45)	1,488,655,423.67

## State of Washington

Excess Repayment	16,707,826.87	-
Variance	(2,252,630.22)	-

We inquired with Meghan Phelps, Treasury Manager of the receivables variance, and she informed us that the variance is attributed to timing differences. These variances are reviewed, but not adjusted monthly. The main adjustment process is done at year end to calculate the allowance adjustment, which will be reviewed and confirmed for key control 2.

Below that, there were screen shots of UTAB reports providing support for the amounts used to reconcile the WEBI report to UTAB.

- The screen shot of the UTAB "Aging Receivables-details" report ending 3/31/2023 totaled \$1,572,288,942.45. This was composed of 8 years of receivables beginning in 2017. The revenue types were broken out and listed as "Receivable Fraud Open Balance (Uncollectible debt)", Receivable Interest Open Balance, Receivable Interest Open Balance (Uncollectible Debt), Receivable Penalty Open balance, Receivable Penalty Open Balance (Uncollectible Debt) ,Receivable Principal Open Balance, and Receivable Principal Open Balance (Uncollectible debt).
- The screenshot of "Aging Receivables-details" report for the Revenue Type - Excess Repayment (Repayment Balance) was composed of 8 years of receivables beginning in 2017 and totaled \$16,707,826.87.
- Another screen shot was included that broke down the Uncollectible Balance of \$1,488,655,423.67 by activity and revenue type: Fraud, Interest, Penalty, or Principal.

### **Noted Weaknesses are as follows:**

- None

### **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

### **E.2.PR.G - Receivables (Net of Allowance)**

*Procedure Step:* Key Control #2 UTAB (Manual)

*Prepared By:* DRR, 10/16/2024

# State of Washington

Reviewed By: BM2, 11/20/2024

## Purpose/Conclusion.

### **Purpose:**

To confirm the Treasury Manager reviews and approves the JVs and related support to ensure the allowance for doubtful accounts (including fraud) was accurately calculated based on historical collection data and the correct percentage.

**(Key Control #2 for UTAB)** in order to assess control risk.

### **Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls, however, we did note the following:

- ESD's review of the UTAB allowance calculation was insufficient to ensure that the calculation was performed correctly. This resulted in an overstatement of GL1349 "Allowance for Uncollectible Other Receivables" for Funds 620 and 622 by \$5,455,650 and an equal understatement of GL1319 "Other Receivables" for Funds 620 and 622. **See issue:** [E: ESD UTAB Allowance Calculation Error]

## Testing Strategy.

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

## State of Washington

*When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency.*

***All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.***

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it*

## State of Washington

*would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

### **Receivables (Net of Allowance) (Valuation)**

**Key Control 2 (Valuation - Manual):** The Treasury Manager reviews and approves the JVs and related support to ensure the allowance for doubtful accounts (including fraud) was accurately calculated based on historical collection data and the correct percentage.

The understanding for this system is documented above in the "Controls - UTAB" step.

#### **1. Confirmation of Key Manual Control:**

We obtained journal vouchers and related support for the year end UTAB allowance for doubtful accounts adjustment. Meghan Phelps, Treasury Manager, prepared the JVs on 9/3/2024. Kim Green, Deputy CFO, reviewed and approved the JVs on 9/3/2024. The JVs were uploaded by Son Pham, Fiscal Analyst, on 9/3/2024 and released by Meghan Phelps on the same date.

## State of Washington

We received a spreadsheet titled "FY 2024 UTAB Allowance and Reversal" which included the journal entries, calculations performed and related support to book the allowance adjustment to GLs 1319 and 1349, which distinguished between fraud and non fraud receivables in funds 620 (state) and 622 (federal). There were numerous screen shots from the UTAB system of cube reports run on 8/13/2024 included as support for the numbers used in the calculation. Additionally, there were screen shots of ER General Ledger Trial Balance reports included as support for amounts used in the calculations.

Note: The percentage used to book the non-fraud allowance was identified as 32% (rounded) and the percentage used to book the fraud allowance was identified on the support as 97%.

- We were also provided with historical data from UTAB used to obtain the percentage used in the calculation, and we requested this information in excel to use for our testing.

We determined that the agency is using historical data and system reports to calculate the amounts for the journal entries to record allowance adjustments, and that these journal entries are reviewed and approved by ESD management prior to upload and release by ESD staff. However, we noted during our review and recalculation of the UTAB allowance [Allowance for Doubtful Accounts Testing - UTAB] that ESD referenced the FY23 multiplying factor, and not the FY24 multiplying factor when calculating their UTAB non-fraud allowance for doubtful accounts which resulted in an error of \$5,455,650. **See issue in conclusion above.**

### **Noted Weaknesses are as follows:**

- ESD's review of the UTAB allowance calculation was insufficient to ensure that the calculation was performed correctly. **See issue in conclusion above.**

### **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

### **E.2.PR.G - Receivables (Net of Allowance)**

*Procedure Step:* Controls - NGTS

# State of Washington

*Prepared By:* DRR, 7/24/2024

*Reviewed By:* BM2, 11/20/2024

Purpose/Conclusion:

**Purpose:**

To gain an understanding of internal controls.

**Conclusion:**

We gained an understanding of internal controls as documented in the record of work done.

Testing Strategy:

**The following procedures are required for all material systems:**

1. List the financial statement balance(s) and relevant assertion(s) addressed by the understanding.
2. Gain an understanding of the internal control process, identify how transactions are recorded in AFRS, identify key controls over relevant assertion(s), and note any control weaknesses.
  - In gaining an understanding of controls, consider the overall understanding of State-Level control elements as documented in the "State-Level Controls" step as they relate to this particular system.
  - Identify controls systems covering all relevant assertions for all significant classes of transactions.
  - Standards require the auditor to gain an understanding of the significant accounting system(s) that contain key controls over significant classes of transactions included in the line item.
  - Control systems identified in this step must match the Material Account Matrix and have a separate control understanding documented.
  - Talk with the ACFR Specialist or AIC if you identify different systems than the ones anticipated in the Material Account Matrix.

For each material system, auditors must document:

- A brief outline of the transaction flow from beginning to end.
- An expanded description of key controls.
- Business processes relevant to financial reporting of the relevant assertion for the material balance. Processes should encompass automated and manual procedures by which transactions or events are identified or initiated, authorized as needed, recorded, processed and corrected as needed.
- Original accounting records and how records are rolled-up to intermediary ledgers and transferred to the general ledger (AFRS) or financial statements.

## State of Washington

- Detailed descriptions of key controls. Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

The following is information to **consider** when identifying key controls and transaction flow.

“Key controls” refer to the few controls that together provide reasonable assurance that material misstatements will be prevented or detected and corrected. This is contrasted with ancillary or supporting controls, which – although helpful and recommended – would provide less than reasonable assurance by themselves.

The focus of the write-up is on the key controls. Key controls should be specifically identified (as “key controls”) in the write-up. This can be done in whatever way the auditor prefers, so long as it is obvious. Details that the auditor should document regarding key controls may include:

- Who or what initiates the control
- When (or how often) is the control applied
- Who performs the control
- As needed, the experience, knowledge and attitude of the person applying the control
- Detailed description of the control process or activity. For example, if the control is a review: what exactly is reviewed, what is the reviewer looking at or for and what are the reviewer’s criteria?
- How the key control is documented or evidenced
- If not obvious from the description, how the control prevents or timely detects and corrects misstatements
- Any exceptions or alternative processing to the normal process
- What happens when misstatements or issues are identified by the control

The “transaction flow” refers to the process by which transactions are initiated, authorized, recorded, processed and reported (as applicable). Outlining the transaction flow gives context to key controls, especially how transactions become subject to controls in the first place. If a control inherently ensures that all applicable transactions are included (ex: bank reconciliation where the assertion is existence), the auditor may decide to just start the write-up with the initiation of the control procedure and go from there.

Elements of the transaction flow are defined informally as follows:

- *Initiation:* How are transactions initiated?
- *Authorization:* How are transactions and accounting record maintenance authorized?
- *Recording:* How are transactions or balances identified and recorded in financial accounting systems?

## State of Washington

- *Processing:* How are the transactions or balances processed after they are recorded (if at all)? Processing may be manual or automated and may occur at a subsidiary system level or at the general ledger level.
- *Reporting:* How are records translated into the financial statements? This part of the transaction flow extends the understanding to the actual financial statements that the audit is opining on. Since we already document an understanding of the financial reporting process in general, it is usually enough to simply reference this overall understanding. However, if there are important steps unique to the covered balances, it may be more appropriate to mention them here.

Although transaction flow is a good way to think about understanding and documenting a control system, auditors should not worry too much about documenting “each element, in order” because often elements may be combined, not noticeable, not applicable or occur in a different order.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits](#) Planning Guide**

Record of Work Done:

Internal controls in NGTS address the following balances:

- Statement of Net Position - Proprietary Funds
  - Receivables (net of allowance)
- Statement of Net Position - Government Wide
  - Other Receivables (net of allowance for uncollectible)

For the following assertions:

- **Existence:** Reported insurance premium receivables do not represent valid uncollected amounts due from employers and claimant overpayments and/or fraudulent payments at year end.
- **Valuation:** There is a risk that a reasonable allowance for uncollectible accounts has not been established.

**Gain an Understanding of Internal Controls**

# State of Washington

We met with the following people on May 23, 2024 to update our understanding over NGTS receivables:

- Meghan Phelps, Treasury Manager
- Shelley Peterson, Assistant Treasury Manager
- Son Pham, Fiscal Analyst

## Source of Guidance

- Penalties for Late Reports and Contributions: [RCW 50.12.220](#)

## General Accounts Receivable Information - NGTS

Employers file quarterly hour and wage information for their respective employees. Reports are due one month after the end of the calendar quarter (i.e. April, July, October, and January). Accounts receivable statements are mailed monthly for balances greater than \$5.00.

## Basic Tax Calculation

Receivable balances are based on payroll data provided by employers and the employers respective unemployment tax rates as reported on quarterly tax reports. Reports are typically prepared online through the Next Generation Tax System (NGTS) and Employment Account Management Services (EAMS). The calculation is automatically calculated through the online reporting system. Tax rates are determined annually in the fall and notices are mailed to employers in December.

Rates are based on industry rates for new employers and historical information for established employers. Calculations for established employers comprised of the following:

- Unemployment Insurance Tax (Includes Social Cost)
- Employment Administrative Fund Tax

For a full understanding of premiums & assessments and related control confirmation see: [\[Premiums and Assessments\]](#).

## Accounts Receivable Monthly and Year-End JVs (Existence/Valuation, Manual)

Accounts receivable balances, employer account activity, and payments are managed in NGTS. NGTS receivable information is dynamic and does not produce historical information on reports. As such, the Treasury Department use and review a monthly SQL query to post and report accounts receivable. Query results are saved in an Excel workbook called, "Monthly NGTS Receivables". Query results are summarized by employer class in a pivot table. Query totals are reduced by amounts reported in future periods (all employer classes who reported amounts not due yet) and select employer class codes, such as, 154 - Federal Agencies and 155 - Military which is excluded because they are reimbursable employers, and ESD draws down funds through IB6 electronic billing process daily and payments do not get posted to NGTS. As ESD gets reimbursed daily for these employer class codes, there is no receivable related to them.

NGTS has an AR report that they compare to the SQL query. They do this monthly.

## State of Washington

Journal vouchers book the incremental change to the AFRS receivable balance. Adjustments are made to increase or decrease accounts receivable GL 1312 with an off-set to accrued revenue. The transaction code used to increase receivables and increase accrued revenue is 012 (GL 1312/3205). The transaction code used to decrease receivables and decrease accrued revenue is 020 (GL 3205/1312). The monthly journal vouchers are typically prepared by Son Pham, Fiscal Analyst 4, and reviewed by the Treasury Manager, or Assistant Treasury Manager to ensure receivables were calculated correctly and existed (**Key Control 1 - Manual - Existence/Valuation**).

The Employment Security Department (ESD) also uses additional queries to record period-end or year-end receivables. These receivables are for Q2 assessments (April - June) that are determined or estimated after June. See below for the queries used and a brief description:

1. Added: Second Quarter Assessments:

- This query is ran to capture assessments due for the second quarter (April-June) and due July 31st on the employer's quarterly report. This query is ran at the end of August (day before phase 2 close) to allow for as many employers as possible to complete their reporting and reduce ESD calculated assessments. This report is re-ran in late September or early October to ensure no significant changes of assessments as reported by employers reporting wages and hours.

2. Subtracted: Second Quarter Assessments Paid in June:

- This query lists all employers that filled and paid their second quarter assessments before fiscal year-end. Since payment is made prior to year end, ESD removed this from their receivable balance.

3. Added: Estimated Assessment for Second Quarter Based on First Quarter Return Data (wages and hours):

- This query is ran at the end of August (day before phase 2 close) to reduce the amount of estimated assessments. NGTS automatically calculates assessments for employers who reported wages in the first quarter of the year (January - March), but did not report wages for the second quarter (April - June).

4. Added: Estimated Assessments for Second Quarter not Previously Liabile:

- This query estimates the number of new employers who did not establish an employer account or file any quarterly returns. These estimates are based on the employer's industry average unemployment insurance tax. The number of estimated new employers is based on the previous year's actual new employers. Estimated new employers are charged the average filling amount. The average filling amount is determined by the Labor Market and Performance Analysis (LMPA) department.

Query results are summarized by employer class in a pivot table. Query totals are reduced by amounts reported in future periods (all employer classes who reported amounts not due yet) and select employer class codes, such as, 154 - Federal Agencies and 155 - Military which is excluded because they are reimbursable employers, and ESD draws down funds through IB6 electronic billing process daily and payments do not get posted to NGTS. As ESD gets reimbursed daily for these employer class codes, there is no receivable related to them.

## State of Washington

Adjustments are made to increase or decrease accounts receivable with an off-set to accrued revenue. The transaction code used to increase receivables and increase accrued revenue is 012 (GL 1312/3205). The transaction code used to decrease receivables and decrease accrued revenue is 020 (GL 3205/1312). Year-end journal vouchers are prepared by Shelly Peterson, Assistant Treasury Manager, and reviewed by Meghan Phelps, Treasury Manager to ensure receivables were calculated correctly and existed as of month and year-end (**Key Control 1 - Manual - Existence/Valuation**).

### Allowance for Doubtful Accounts Year-End Adjustments (Existence/Valuation, Manual)

The Department reviews allowance for doubtful accounts by reviewing revenues, collections, and write-offs. They expect the allowance for doubtful accounts to reflect the Department's actual write-offs. ESD calculates the allowance using the following queries:

- Query 1: Write-Offs Totals (CUA) – Annual with Average
  - The first query produces the amounts determined (certified) uncollectible by fiscal year. The report also aggregates annual uncollectible balances and produces the average yearly uncollectible amount. ESD uses a five year average. The five year average is considered as the basis for the allowance for doubtful accounts.
- Query 2: Detailed Write-Offs
  - The second query provides all the detailed write offs to ensure the accuracy of the annual query amounts. Amounts and assessment types are reviewed to ensure the average write-off amounts included NGTS related transactions. The query details the following information:
    - ESD Number
    - Legal Business Name
    - Transaction Date
    - Payment Method
    - Assessment Type
    - Write-Off Applied To (Account Where Write-Off Was Applied)
    - ASM Amount
    - CUA (Certified Uncollectible Amount)
    - Qtr/Year (When the Tax Assessment Was Earned)
    - Class (ESD Employer Class)
    - Ownership Structure
    - Transaction Type

If there is anything questionable in these queries Shelly or Meghan reach out to the NGTS team.

Son Pham, Fiscal Analyst 4, aggregates the results in an Excel workbook called "NGTS Allowance Calculation Template.xlsx". Adjustments are made to increase or decrease allowance for doubtful accounts with an off-set to accrued revenue. The transaction code used to increase the

## State of Washington

allowance for doubtful accounts and decrease accrued revenue is 122 (GL 3205/1342). The transaction code used to decrease allowance for doubtful accounts and increase accrued revenue is 122R (GL 1342/3205). The journal voucher is prepared by Son and reviewed by Shelly Peterson, Assistant Treasury Manager, or Meghan to ensure the estimate calculation reflected operations and historical trends (**Key Control 2 - Manual - Existence/Valuation**).

### How transactions are recorded in AFRS:

- Transactions are recorded in NGTS. NGTS data is queried and recorded in AFRS monthly and at year end by general journal vouchers prepared by Son Pham, Fiscal Analyst 4, and reviewed by Shelly Peterson, Assistant Treasury Manager.

### Key Controls are as Follows:

- **Key Control 1 (Manual):** Monthly, the Treasury Manager or Assistant Treasury Manager reviews journal vouchers to record the incremental change to the NGTS accounts receivable balance. The Assistant Treasury Manager reviews the monthly schedule of accounts receivable prepared by the Fiscal Analyst and supporting query results to ensure receivables were calculated correctly and existed (**Existence/Valuation**).
- **Key Control 2 (Manual):** The Treasury Manager or Assistant Treasury Manager reviews journal vouchers to record the incremental change to the allowance for doubtful accounts. The Treasury Manager reviews the quarterly Allowance for uncollectible accounts receivable schedule prepared by the Fiscal Analyst and the supporting query results to ensure the estimate calculation reflected operations and historical trends (**Existence/Valuation**).

### Noted Weaknesses are as Follows:

- None

### E.2.PRG - Receivables (Net of Allowance)

*be relied upon for both the periods ending 2023 and 2024.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

### **Receivables (Net of Allowance) (Existence/Valuation)**

**Key Control 1 (Existence/Valuation - Manual):** Monthly, the Treasury Manager or Assistant Treasury Manager reviews journal vouchers to record the incremental change to the NGTS accounts receivable balance. The Assistant Treasury Manager reviews the monthly schedule of accounts receivable prepared by the Fiscal Analyst and supporting query results to ensure receivables were calculated correctly and existed

The understanding for this system is documented above in the "Controls - NGTS" step.

#### **1. Confirmation of Key Manual Control:**

We requested and obtained the "FUND 620 AR JULY 2023-JUNE 2025" excel spreadsheet and the journal voucher to record the incremental change to the NGTS accounts receivable balance for March of 2024. We reviewed AFRS journal voucher 54009801, which was prepared and uploaded on April 3, 2024 by Son Pham, Fiscal Analyst and reviewed and released by Shelly Peterson, Assistant Treasury Manager on April 3, 2024.

The explanation of the journal entry was listed as "To record fund 620 financial transaction for the month of March 2023". The total for the JV was \$32,658,822.41 and contained various entries to GLs 1110, 3210, and receivables. All entries were in fund 620, revenue source 0471 (Unemployment Compensation Contributions). The amount booked to GL 3205/1312 accounts was a decrease in employer A/R in the amount of (\$1,608,339.41) using trans code 020.

We reviewed the spreadsheet and noted a schedule of Accounts Receivable for the month ending March 2024, which showed the change in A/R GL 1312 from the previous month. It contained screen shots of reports and pivot tables identifying the March 2024 ending receivable balance of \$96,578,519.28 and the March 2024 beginning receivable balance of \$98,186,858.69. The change in A/R for March was (\$1,608,339.41) which

## State of Washington

tied to the journal voucher.

**No issues noted.**

**Noted Weaknesses are as follows:**

- None

### **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

### **E.2.PRG - Receivables (Net of Allowance)**

*Procedure Step:* Key Control #2 NGTS (Manual)

*Prepared By:* DRR, 10/14/2024

*Reviewed By:* BM2, 11/20/2024

Purpose/Conclusion:

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

## State of Washington

*A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency.*

***All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.***

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood*

## State of Washington

*of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

Guidance/Criteria.:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done.:

## State of Washington

**Key Control 2 (Existence/Valuation - Manual):** The Treasury Manager or Assistant Treasury Manager reviews journal vouchers to record the incremental change to the allowance for doubtful accounts. The Treasury Manager reviews the quarterly Allowance for uncollectible accounts receivable schedule prepared by the Fiscal Analyst and the supporting query results to ensure the estimate reflected operations and historical trends.

The understanding for this system is documented above in the "Controls - NGTS" step.

### **1. Confirmation of Key Manual Control:**

We obtained journal vouchers 54099816 (to record NGTS Allowance as of 6/30/2024) and 54014807 which adjusted the NGTS allowance for doubtful accounts to calculated five-year average of uncollectible (written-off) receivables. We noted the journal vouchers were prepared by Son Pham, Fiscal Analyst, on 8/30/2024 and were approved by Meghan Phelps, Treasury Manager, on 8/30/2024.

We reviewed the journal voucher support and noted the Fiscal Analyst averaged write-offs or amounts certified as uncollectible from 2020 through 2024. The average as of 06/30/2024 was \$2,562,517.16. We also noted the workpapers, which included the 2024 NGTS Allowance Calculation spreadsheet with tabs that included both journal entries, the "option 2 write off average" tab, a detail write off report from 2020 through 2024 from NGTS, and a tab showing the effect of the Journal to AFRS on GL1342. This tab included the June 2024 beginning balance in GL1342, the amount recorded to increase the allowance for Uncollectible A/R, and the Allowance year end adjustment to bring the balance to the amount calculated on the "option 2 write off average" tab.

Additionally, we recalculated this amount without exception here [[Allowance for Doubtful Accounts Testing - NGTS](#)].

### **Noted Weaknesses are as follows:**

- The Employment Security Department used incomplete data as the basis for its certified uncollectible amount (CUA). The CUA is used to calculate the NGTS allowance. From 2018 to 2021, and in 2024 the CUA was significantly higher than in 2022 and 2023. **See issue in conclusion.**

### **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

### **E.2.PR.G - Receivables (Net of Allowance)**

# State of Washington

*Procedure Step:* Risk Assessment  
*Prepared By:* DRR, 7/17/2024  
*Reviewed By:* BM2, 11/20/2024

Purpose/Conclusion:

**Purpose / Conclusion:**

To assess inherent risk, control risk, and the risk of material misstatement in order to design an initial testing strategy for each assertion.

Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

**STEP 1: Inherent Risk (IR)**

Assess inherent risk for each relevant assertion. This assessment is based on understanding of the entity and the nature of the account balance or class of transactions.

*Inherent risk is the susceptibility of an assertion to material misstatement. It is our assessment of "total threat", which includes both "natural risk" and identified risk indicators, without any regard to any potential control activities. As inherent risk is fully independent of control risk, any understanding of controls cannot be used to increase/decrease the assessment of inherent risk. Consider the following factors as your basis for this assessment:*

- *General Considerations*
  - *Does the balance include transactions that are difficult to audit or involve complex accounting issues?*
  - *Were there significant misstatements identified in previous audits or prior-period adjustments in the account balance or transaction class? If so, analyzing the cause of prior period misstatements will help in analyzing inherent risk.*
  - *Are there any inherent risk factors at the entity or industry level, such as changes in regulation or accounting rules, unique transactions or accounting practices, use of information technology, etc that affect the balance?*
- *Inherent Risk due to Error*
  - *How large are the transactions making up the balance? If the balance has only a few large transactions, even a single error may mean a significant misstatement.*
  - *Have there been changes in the transactions making up the balance that may increase risk? For example, significantly different composition, nature or volume of transactions may inherently disrupt established controls.*

## State of Washington

- *Are financial events originated or identified by accounting personnel or non-accounting personnel? This consideration is mainly for the completeness assertion.*
- *Does the process to account for transactions involve judgment or estimation, complex calculations, numerous steps or significant manual steps?*
- *Do transactions have widely varying attributes that need to be manually identified? For example, grant loans that are accounted for in one of several ways depending on the terms of the agreement.*
- *Inherent Risk due to Fraudulent Reporting (intentional misstatements)*
  - *Are there substantial pressures or motivations to misstate the balance?*
- *Inherent Risk due to Misappropriation*
  - *Is the account balance or transaction class susceptible to sizable misappropriation?*
- *Inherent Risk due to Non-Compliance*
  - *Are there any laws, contracts or grant agreements affecting the balance? If so, would non-compliance lead to sizable misstatements?*
  - *Are compliance requirements complex, hard to understand, subject to judgment or otherwise difficult to comply with?*
  - *Are there any motivations or pressures to not comply?*

### **STEP 2: Control Risk (CR)**

Assess control risk by system and assertion. This assessment should be based on the results of the control understanding, confirmation, and (if setting control risk to LOW) testing. If applicable, auditors will evaluate any control deficiencies and determine whether those deficiencies, individually or in combination, are significant deficiencies or material weaknesses.

*Control risk is the risk that material misstatements would not be prevented or detected timely by the system of internal control. Control risk could be thought of as the "vulnerability" of an entity to misstatements. Control risk exists independently of the inherent risk (the level of vulnerability exists independent of the level of threat).*

*Control risk is MAX in both of the following situations: (1) controls aren't tested or (2) controls are problematic and cannot be relied upon. In order to set control risk to LOW, the auditor must test that controls operated effectively throughout the period.*

*A material weakness exists when the design or operation of controls results in a reasonable possibility a material misstatement will not be prevented or detected and corrected in a timely manner. A significant deficiency is less severe than a material weakness, yet important enough to merit the attention of the governing body. **All potential material weaknesses and significant deficiencies should be discussed with the AIC, since they must be reported as findings.***

### **STEP 3: Risk of Material Misstatement (RMM)**

Assess the risk of material misstatement for each relevant assertion for each significant line item. The risk of material misstatement (RMM) is a

## State of Washington

combination of the auditor's separate assessment of inherent and control risk.

*In practice, the RMM is the amount of substantive evidence that's needed, and the only way to reduce the amount of needed substantive evidence (equal to the inherent risk) is to test controls. As such, when control risk is MAX, the RMM must always equal the inherent risk (IR).*

*When controls are tested & can be relied upon (are determined to be effective) it is a matter of professional judgment how much the RMM should be set lower than inherent risk (1 or 2 steps).*

*Auditors should assess RMM by assertion, if different. For example, if RMM is assessed at MOD for the existence assertion, but LOW for the rights & obligations assertion, then document "MOD – existence and LOW – rights & obligations".*

### **STEP 4: Design Substantive Testing**

Design a substantive testing strategy that addresses the relevant assertion (identified risk) in the portion of the line item that relates to that risk.

*Planning identifies where to audit (significant balances, classes of transactions & disclosures) what to audit for (relevant assertions), and how much to audit (RMM). The quantity and quality of evidence obtained by substantive tests needs to match the level of risk. The higher the risk of material misstatement, the greater evidence needed. "Greater evidence" could either be greater quantity of evidence, greater quality of evidence, or some combination of greater quality and quantity.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6210](#) – Planning Financial Statement Audits**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits](#) Planning Guide**

Record of Work Done:

### **(1) Inherent Risk (IR):**

Based on our understanding of the line item, we assessed inherent risk as follows for each relevant assertion and significant class of transactions:

- **Existence – SIGNIFICANT RISK**

## State of Washington

- **Valuation - SIGNIFICANT RISK**

### **(2) Control Risk (CR):**

We assessed control risk as follows for each system and relevant assertion:

- **UTAB – Existence**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

- **UTAB – Valuation**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

- **NGTS – Existence**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

- **NGTS – Valuation**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **(3) Risk of Material Misstatement (RMM):**

We considered both inherent and control risk and assessed the risk of material misstatement as follows for each relevant assertion and significant class of transactions:

- **Existence – VERY HIGH**
- **Valuation – VERY HIGH**

### **(4) Testing Strategy:**

We designed our substantive testing strategy based on our assessment of the risk of material misstatement. We plan to perform the following

## State of Washington

tests:

- **UTAB** Accounts Receivable - Including Fraud
  - We will select a sample of accounts receivable reported as of 6/30/2024 and review existence through subsequent payments made on repayment plans or pursuit of legal action (liens, garnishments, etc.) **(Existence)**.
- **UTAB** Accounts Receivable - Waivers
  - We will select a sample of federal waivers that were applied during FY24 and determine if they were correctly excluded from accounts receivable **(Existence)**.
- **UTAB** Allowance for Doubtful Accounts - Including Fraud
  - We will recalculate the allowance for doubtful accounts to ensure the ESD followed the correct process and determine if we agree with the methodology **(Valuation)**.
- **NGTS** Accounts Receivables
  - We will select a sample of accounts receivable from one or more of the 6/30/2024 queries that make up the accounts receivable balance. We will review existence through subsequent payments **(Existence)**.
- **NGTS** Allowance for Doubtful Accounts
  - We will recalculate the allowance for doubtful accounts to ensure the ESD followed the correct process and determine if we agree with the methodology **(Valuation)**.

We anticipate that these tests will provide sufficient appropriate audit evidence to address the assessed risk of material misstatement for relevant assertions in significant classes of transactions.

### E.2.PRG - Receivables (Net of Allowance)

*Procedure Step:* Substantive Test  
*Prepared By:* DRR, 10/16/2024  
*Reviewed By:* RKM, 12/10/2024

Purpose/Conclusion.*
----------------------

# State of Washington

## **Purpose:**

To determine whether reported receivables represent amounts uncollected as of the end of the period **(Existence)**.

To determine whether receivables were reported at properly valued or calculated amounts **(Valuation)**.

## **Conclusion:**

We determined that reported receivables represent amounts uncollected as of the end of the period **(Existence)**.

We determined that receivables were reported at properly valued or calculated amounts **(Valuations)** with the following exceptions:

- (UTAB Allowance) ESD referenced the FY23 multiplying factor instead of the FY24 multiplying factor when calculating their UTAB Allowance for Doubtful Accounts and double counted the receivables related to federal waiver applications. **See issue here : [E: ESD UTAB Allowance Calculation Error]**
- (NGTS Allowance) ESD continues to use negative and low certified uncollectible amounts from prior periods when calculating their NGTS Allowance for Doubtful Accounts. **See issue here: [E: ESD Certified Uncollectible Amount].**

**See AOM here: [Aggregation of Misstatements (GAAP)].**

Testing Strategy:

The following is a list of **considerations** for testing the existence assertion for other assets. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

## **Receivables**

- Confirm receivables with the obligated party.
- Confirm intergovernmental receivables with the other agency.
- Confirm trade receivables using negative or positive confirmations to customers. *NOTE: if trade receivables were not confirmed, auditors should document the reasons for not following the audit requirement (see policy/criteria tab).*
- Verify receivables to source billing documents, reimbursement requests or other documentation.
- If receivables are sent to an external collection agency or trigger an action that affects the obligated party (ie: water shut-off) within a reasonably short time period, trace or reconcile from the A/R Aging report to the collection agency's report or evidence of a confirming action.
- Verify receivables through subsequent receipt of funds (remittance documentation should evidence the period to which it applies).
- For the period following balance sheet date, scan the accounts receivable general ledger control account for material charge-off and unusual transactions, and investigate.

Perform analytical procedures to determine the reasonableness of receivable balances and follow-up on any unexpected results. For example, trend analysis of aged A/R, trend of beginning balance, billings, adjustments, payments and ending balance, inventory/volume usage

## State of Washington

reconciliation, etc.

The following is a list of **considerations** for testing the valuation assertion for other assets. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

- Review the entity's calculation of the value of intangible assets.
- Review the entity's calculation of write-off of inventory or other assets due to obsolescence or damage.

### Calculation or Realizable Value of Receivables

- Re-calculate a sample or selection of billings. If billings are calculated by software, the auditor could test and substantiate the automated control and also consider any risks associated with manual inputs used by software.
- Evaluate the entity's calculation of the allowance amount for reasonableness. This evaluation should include comparing the entity's estimate to the entity's actual historical experience of collecting or writing-off receivables.

Trace the amount of bad debt approved by the governing body (per minutes) to reductions of receivables and bad debt expense to verify it was properly accounted for. *Note: approvals may be slightly more, as customers may pay after the bad debt has been approved but before it is written off.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

### **SAO Audit Policy [6350](#) – External Confirmations**

Record of Work Done:

### **Substantive tests performed to meet the Existence assertion:**

UTAB Accounts Receivable Testing: [[UTAB Receivables Testing](#)]

We tested the UTAB report "Aging Receivables - Detail" for completeness against the screen shot of the UTAB report "Aging Receivables - Detail" through 6/30/2024 ran on 7/1/2024 by ESD. To ensure we could rely on UTAB's accounts receivable aging report for sample testing, we compared the "Aging Receivables - Detail" (created on 7/1/2024) with AFRS GL balances 1319 Other Receivables for fund 620 and 622 through 6/30/2024 run from Enterprise reporting.

- We removed revenue types that included pending descriptions, and excluded fraud receivables in process. After this adjustments we noted the UTAB AR total was different than the GL total by \$34,063, which is below the floor.

## State of Washington

- **We determined we could rely on the UTAB report data for testing purposes.** See tab, "Completeness UTAB Data" at: [UTAB Receivables Testing]. *No issues noted.*

### **Regular Receivables:**

Our regular receivables population consisted of over payments (by claimant) and revenue source. Due to the size of the population and the high level of detail provided by UTAB, we determined random sampling would be the most effective and efficient test. We used the TeamStore sampling spreadsheet to determine our sample size. Our sample was based on an expected misstatement rate of 0%, a tolerable misstatement rate of 7.5% and a very high assurance level. Our planned sample included 60 items. We exported the UTAB report "Aging Receivables - Detail" through 6/30/2024 and noted that we were not able to export the full population due to the size limitation of the UTAB detail reports. We downloaded a report with the "maximum number of detailed rows that could be displayed" by the system and selected from the transactions contained in it. We determined that the following revenue types made up the majority of the balance:

- 17.92% Receivable Interest Open Balance (Uncollectible Debt)
- 64.45% Receivable Principal Open Balance (Uncollectible Debt)

Our random sample pulled both the Receivable Principal and Interest Open Balance (Uncollectible Debt) types of revenue transactions from the UTAB detail report.

We reviewed the following documentation in the UTAB system to determine existence of receivables as of 06/30/2024:

- Monthly Overpayment Letters/Determination Letters sent to claimants to record the receivable amount for the month of June or July 2024.
- Repayment plans created for the claimant
- Liens filed against the claimant
- Garnishments from claimant's bank or employer
- Repayments in subsequent periods

We determined that all 60 receivables existed based on documentation in the UTAB system. **See tab, "UTAB Receivable Testing Regular" at: [UTAB Receivables Testing]. *No issues noted.***

### **Fraud Receivables:**

To obtain our fraud receivables population, we used the cube version of the UTAB Aging Receivables report, dated 7/1/2024, to export a detail report of the fraud receivables at 6/30/2024. Due to the size of the population and the high level of detail provided by UTAB, we determined random sampling would be the most effective and efficient test. We used the TeamStore sampling spreadsheet to determine our sample size. Our sample was based on an expected misstatement rate of 0%, a tolerable misstatement rate of 7.5% and a high assurance level. We used a high assurance level on the fraud receivables balance as this balance is significantly smaller than the "regular receivables" balance which was set at very high assurance needed in testing. Our planned sample included 39 items. We exported the UTAB report "Aging Receivables - Detail" through

## State of Washington

6/30/2024 and noted that we were not able to export the full population due to the size limitation of the UTAB detail reports. We downloaded a report with the "maximum number of detailed rows that could be displayed" by the system and selected from the transactions contained in it. We determined that the following revenue types made up the majority of the balance:

- 11.78% Receivable Interest Open Balance (Uncollectible Debt)
- 72.38% Receivable Principal Open Balance (Uncollectible Debt)

Our random sample pulled only the Receivable Principal and Interest Open Balance (Uncollectible Debt) types of revenue transactions from the UTAB detail report.

We reviewed the accounts for the following documentation in the UTAB system to determine existence of reported receivables as of 06/30/2024:

- Monthly Overpayment Letters/Determination Letters sent to claimants to record the receivable amount
- Repayment plans created for the claimant
- Liens filed against the claimant
- Garnishments from claimant's bank or employer- N/A
- Repayments in subsequent periods/fraud recovery

We determined that all 39 fraud receivables existed based on documentation in the UTAB system. **See tab, "UTAB Receivable Testing Fraud" at: [\[UTAB Receivables Testing\]](#). *No issues noted.***

### **NGTS Accounts Receivable Testing**

We reviewed the composition of NGTS receivables in our reconciliation at: [\[NGTS Receivables Testing\]](#). Tab, "Completeness NGTS Recon". We noted SQL Query #1 - Liable Q2 Amounts Assessed for Q2 totaled approximately \$373.6M or about 77% of the total accounts receivable balance (fund 620 GL 1312). We obtained the SQL query results from Meghan Phelps, Treasury Manager, and tied the report total to our reconciliation. Amounts tied without exception.

We noted our population included 317,756 assessments or employer accounts. We determined random sampling would be the most effective and efficient test. We used the Financial Audit Substantive Sample testing spreadsheet to determine our population based on an expected misstatement rate of 0%, 7.5% tolerable misstatement rate, and a very high assurance level. Our sample population totaled 60 assessments or employer accounts. We randomly selected the 60 samples.

We reviewed Q2 assessments in NGTS and ensured the amount tied to the query results. We determined the existence of the receivable as of June 30, 2024 by tying the amount of the assessment to the subsequent payment, collections documentation, or application of credits on account. See testing at: [\[NGTS Receivables Testing\]](#). ***No issues noted.***

Waiver Testing:

## State of Washington

We requested a population of all federal waivers applied between July 1, 2023 and June 30, 2024, which was provided as "SQR 13135 SAO EGC Waivers.xlsx" by Stephanie Eskesen, Audit Liaison. Due to the size of the population, we determined random sampling would be the most effective and efficient test. We used the TeamStore sampling spreadsheet to determine our sample size. Our sample was based on an expected misstatement rate of 0%, a tolerable misstatement rate of 7.5% and a very high assurance level. Our planned sample included 60 items. We used the claim IDs provided in our sample to look up the waivers in UTAB to ensure the waiver was correctly excluded from accounts receivable with a credit to the claimants account. See testing at: [\[Federal Waiver Testing\]](#). **No issues noted.**

### **Substantive tests performed to meet the Valuation assertion:**

#### **UTAB Accounts Receivable Testing**

We recalculated payments in UTAB at: [\[Premiums and Claims\]](#). We determined this work was sufficient to ensure UTAB was calculating overpayments correctly.

#### **NGTS Accounts Receivable Testing**

We recalculated premiums in NGTS at: [\[Premiums and Assessments\]](#). We determined this work was sufficient to ensure NGTS was calculating premiums correctly.

#### **UTAB Allowance for Doubtful Accounts**

**See testing here:** [\[Allowance for Doubtful Accounts Testing - UTAB\]](#)

##### Non Fraud Allowance:

The UTAB non-fraud allowance for doubtful accounts is based on monthly collection data by aging category and the year-end amounts. We based our recalculation steps on the Department's desk manual. We performed the following steps:

1. Determine the annual average collection history by aging category.
  - First, we obtained the "Age of Account Payments" report from UTAB for each month in the fiscal year. This report totaled collections by revenue source and aging category of the repayment plan. We recorded the total amounts receipted for each aging category for every month of fiscal year ended June 2024. We averaged the totals and determined the average amount receipted as a percent for each aging category.
2. Determine how many past-due repayment plans will likely be collected.
  - UTAB also tracked repayment plans that were not being repaid (no payments for 180 days or more). This data was reported on UTAB report "Uncollectible Balances". We multiplied the total Uncollectible Balances (less any previous aging category balances) by the respective annual average aging category percent. This determined the amount expected to be eventually collected.
3. Determine the amount of repayment plans that are likely to be written off in a dollar value and percent
  - The amount expected to be collected less the total uncollectible balance was the amount expected to be written off. The amount expected to be written off was divided by the total uncollectible balances to determine the expected write-offs or multiplying factor (percent).
4. Multiply the amount expected to be written off by total regular accounts receivable (for each fund).

## State of Washington

- Last, we multiplied the regular accounts receivable balance by fund by the multiplying factor to determine the allowance for doubtful accounts for each fund. We calculated the same multiplying factor as the Department without exception, however, when calculating their UTAB Allowance, ESD referenced the FY23 multiplying factor and not the FY24 multiplying factor in their excel calculation document. This error and ESD including federal waivers in their calculation resulted in overstatement their GL1349 for fund 620 by \$3,096,136 and overstatement in GL1349 in fund 622 by \$14,010,152. For a total overstatement of \$17,106,288 in GL1349.

We determined the calculation methodology was appropriate and based on accurate collection information or bad debts (write-offs), as the UTAB system automatically writes off receivable accounts that have been inactive (no payments made) for 180 days.

**We determined ESD has taken corrective action regarding our finding from FY23. We verified that data used in the calculation of the allowance was accurate and agreed to accounting records, however, ESD referenced the incorrect cell in their allowance calculation and included additional steps to include federal waivers in their calculation which resulted in double counting the related receivable in their allowance calculation, and should have been caught during management review. See Issue and AOM link in the conclusion above.**

See tab, "Non-Fraud Allowance" at: [[Allowance for Doubtful Accounts Testing - UTAB](#)].

### Fraud Allowance:

During FY24 the ESD also calculated an expected fraud uncollectible estimate. This was due to the fraud that occurred during FY20 in regards to the unemployment benefits. ESD worked with OFM to determine the percentage that would be the allowance for fraud receivables. They took the total UTAB receivables and determined the portion related to fraud. Once they determined that they took the fraud receivables amount and reduced it by any items still in process as of June 30, 2024. Once they had this amount they divided it by the receivables amount to determine the percentage that was determined uncollectible. We calculated 97% to be the allowance for fraud. This tied to ESD's percentage without exception. We reviewed the UTAB allowance calculation document and supporting documentation provided by Meghan Phelps, Treasury Manager, to verify that the percentage seemed reasonable for the fraud allowance for doubtful accounts. We determined that 97% is a reasonable estimate.

See tab, "Fraud Allowance" at" [[Allowance for Doubtful Accounts Testing - UTAB](#)].

### Federal Waivers

The receivable balance in GL1319 includes the receivables related to federal waiver applications and are already captured in ESD's normal allowance for doubtful accounts calculation. ESD performed additional steps to include the receivables related to the waivers in their allowance calculation, which resulted in a double counting of these receivables. This resulted in a misstatement and is included in issue 16 along with the referencing of the incorrect cell in ESD's allowance calculation. **See issue and AOM link in the conclusion above.**

### **NGTS Allowance for Doubtful Accounts**

## State of Washington

Note: We reached out to Corbin Foster, Enterprise Financial Recover Manager (aka Collections Manager), on November 27, 2024 to inquire about the ESD Collections Team's progress in catching up on their collections work related to Certified Uncollectable Account (CUA). Corbin wanted to clarify our understanding of "Collections being placed on hold during the pandemic". He mentioned that in the early days of the pandemic, agency leadership decided to pause active collections, meaning for example the filing of liens against individuals and employers, the garnishing of assets such as wages or bank accounts, and proactively contacting customers to request payment. Throughout these past several years, ESD has allowed and welcomed customers who contacted them to voluntarily remit payment or enter into long-term payment plans, and ESD has also continued offsetting benefits against any overpayment balances. The collections pause was lifted for employers in December 2023 and ESD is in the early stages of lifting the collections pause for UI claimants with benefit overpayments.

Corbin informed us that employer collections are still a work in progress. As of March 2020, there were an estimated 4.5k employers who owed a collective estimated total of \$35 million in principle, penalties & interest. This amount has grown to approximately 15k employers owing approximately \$102 million in principle, penalties, and interest as of December 3, 2024, mostly due to the pandemic. Additionally, Corbin mentioned that he expects the majority of this \$102 million to be collectible, as only about 3.5k employers are inactive (closed their business), and the remaining business are actively conducting businesses, and are generating operating revenues, which can be used to satisfy their outstanding balance owed to ESD.

We used the above information to estimate the potential NGTS receivable allowance error. **See potential error here** [[Potential NGTS Allowance Error](#)]. We estimated that the CUA based on the above information should have been approximately \$23.8 million greater than was used in the Departments calculations which resulted in an understatement of the NGTS receivable allowance by approximately \$4.76 million. Additionally, the Department should have reduced their NGTS receivable balance by the \$23.8 million as they have been aware of this information throughout the fiscal year.

ESD's NGTS allowance for doubtful accounts method is based on bad debt write-offs or balances determined certified uncollectible amounts (CUA). ESD used a five year average (fiscal year end June 2020 through 2024) to determine what the allowance for doubtful accounts should be for fiscal year 2024. This method was consistent with the NGTS allowance calculation used in prior years.

We obtained the detailed (transaction level) CUA data for fiscal year 2024. See tab "Option 2-Write Off Details" in our testing at [[Allowance for Doubtful Accounts Testing - NGTS](#)]. We noted the data was isolated to NGTS revenue streams (i.e. assessment types). We used the data to create a pivot table that summarized the amounts determined certified uncollectible and the date when written off. After we manually added the correct fiscal year the Excel pivot table automatically summarized the dates by fiscal year.

See tab "SAO NGTS CUA Summary" in our testing at [[Allowance for Doubtful Accounts Testing - NGTS](#)]. We used the summary level data to recalculate the amount of CUA's for each fiscal years ended 2020 through 2024. See tab "NGTS Allowance Testing" in our testing at [[Allowance for Doubtful Accounts Testing - NGTS](#)]. We recalculated the average CUA for fiscal year ended 2024 and used a five year average. The average tied to GL 1342 without exception. However, ESD has received audit issues in the FY22 and FY23 audits due to using certified uncollectible amounts (CUA) in their NGTS allowance calculation that are not reasonable. In FY22 we determined the amount should not be negative, and the FY23

## State of Washington

amount was unreasonably low compared to their historical average. We identified that ESD used the same negative CUA amount from FY22 and the low CUA amount from FY23 in their calculation of the FY24 NGTS allowance for doubtful accounts. Using the information we obtained we calculated a potential error. **See issue and AOM links in the conclusion above.**

### E.3.PRG - Premiums and Assessments

*Procedure Step:* Summary & Conclusion

*Prepared By:* CJM, 11/15/2024

*Reviewed By:* RKM, 11/21/2024

Purpose/Conclusion:

**Purpose:**

To evaluate risk assessments and the sufficiency and appropriateness of evidence obtained based on results of substantive work.

**Conclusion:**

We determined that **no** modifications were necessary to inherent risk, control risk, or the risk of material misstatement as assessed in planning.

We also determined that evidence obtained was sufficient and appropriate in response to the risk of material misstatement.

Testing Strategy:

Auditors are **required** to evaluate conclusions for substantive testing as follows:

*Auditors may wish to use the optional Lead Sheet available in the Store to summarize testing related to each balance and assertion.*

**1.** Determine whether the results of substantive testing indicate a need to modify the inherent risk assessment (IR), control risk assessment (CR), risk of material misstatement (RMM) or other aspects of planning (such as material balances or assertions). If so, document changes and consider the need for additional testing.

*If the results of substantive testing indicate a need to change control risk, auditors should also update the **Permanent File** by either correcting the documentation or by adding an update section describing changes to the top of the record of work done. For all changes to IR, CR, or RMM the **Material Balances** spreadsheet should be updated.*

# State of Washington

*More significant changes to other aspects of planning (such as material balances or assertions) should be referenced in this step and documented in detail in the [Changes to FS Audit Plan](#) step.*

2. Evaluate whether the quality and quantity of evidence obtained is sufficient and appropriate in response to the risk of material misstatement. In making this determination, auditors should evaluate:

Information to be used as audit evidence:

- Does evidence relate to the population, period of time and risk (assertion and “what could go wrong” from the Material Balance Spreadsheet)? If there are any gaps or uncertainties in the logical connection between the evidence and conclusions, is there a documented consideration and explanation?
- Are the sources of information sufficiently reliable and appropriate for the risk (whether internal to the government, external, or auditor developed)? If key information is not from a sufficiently reliable source (for example, inquiry), then is it corroborated by information that is?
- Are there any concerns about accuracy, completeness, authenticity, or bias in information? If so, did the auditor perform sufficient procedures to confirm reliability of that information?
- Is information precise enough to catch if misstatements exceeded the tolerable level?
- Is information detailed enough to conclude on whether or not there were misstatements?
- Was there any information that appeared contradictory or inconsistent? If so, was there a documented response to the inconsistencies or doubts about the reliability of evidence?

Results:

- How much misstatement was identified by testing, and the likelihood and magnitude of further potential misstatement?
- How did misstatements occur and how often might they occur again in the population?
- Were misstatements caused by control deficiencies or circumvention of controls?
  - If control deficiencies, is there a need to re-evaluate our understanding of controls in the [Permanent File](#) folder or assessment of control risk?
  - If circumvention, the [Management Override of Controls](#) step should address or reference this area. Auditors should also consider whether a fraud risk has been identified.
  - Did tests identify a different level or type of risk than the planned audit response was designed to address?
  - If likely misstatements are identified, are further procedures necessary to improve the precision of our estimate?

*To support the overall evaluation of audit risk and provide a basis for concluding on the overall sufficiency and appropriateness of evidence in the [FS Summary & Report](#) step, auditors should conclude in each area whether the auditor continues to believe that the tests performed and quality and quantity of evidence obtained are commensurate with RMM for all relevant risks (the “what could go wrong”, in the [Material](#)*

# State of Washington

*Balances spreadsheet).*

If the auditor determines that evidence is not sufficient or appropriate, additional substantive testing should be done. If sufficient, appropriate evidence is not available for audit, the AIC should discuss the effect on our audit report with the AAM and AM.

Guidance/Criteria.:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6310](#) – Determining the Nature, Timing and Extent of Substantive Testing**

**SAO Audit Policy [3210](#) – Audit Evidence**

Record of Work Done.:

Based on test results, we re-evaluated risk assessments, procedures, evidence obtained and conclusions as follows:

### **(1) Do the results of substantive tests indicate a need to modify our risk assessment (IR, CR and RMM)?**

The results of substantive tests do not indicate a need to modify our risk assessment.

### **(2) Was the quality and quantity of evidence obtained sufficient and appropriate?**

The quality and quantity of evidence obtained was sufficient and appropriate.

## **E.3.PR.G - Premiums and Assessments**

*Procedure Step:* Understanding of Line Item

*Prepared By:* CJM, 6/4/2024

*Reviewed By:* SHW, 7/23/2024

Purpose/Conclusion.:

# State of Washington

## **Purpose / Conclusion:**

To gain an understanding of the line item and confirm the scope of testing as documented in the Significant Account Matrix.

## Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

### **STEP 1: Prior Audit Exceptions**

Document any exceptions noted during the prior audit. Follow-up to determine how the agency has responded to or corrected the issue, unless this work is anticipated as part of the testing strategy.

### **STEP 2: Analyze Composition and Changes of Line Item**

- Include link to the line item leadsheet. This will be completed at the end of the audit. Leadsheet analysis should be documented in this spreadsheet.
- Inquire with agency staff about the activities and transactions that make up the balance and any changes to those activities or transactions in relation to the prior year.
- Determine relevant classes of transactions or account balances within the line item to analyze (such as agencies, funds, programs, departments, accounts, and/or objects), and use AFRS to create trends of those elements. This step should not include any specific dollar amounts associate with the line item.
- Evaluate trends to identify:

(1) What classes of transactions or account balances are primary to the identified risk. Auditors should specifically consider what elements are primary to the line item (comprising a large percentage of the line item), and which elements the identified risk would apply to, and which elements might be most susceptible to the identified risk (having a high risk of non-trivial misstatement for a relevant assertion, considering likelihood and impact of potential for misstatement).

(2) What changes are primary to the identified risk, if applicable. Auditors should specifically consider whether the overall change to the line item from the prior year was significant, what elements were the primary drivers of overall change, whether any elements changed significantly from the prior year, and which changes (if any) might relate to the identified risk.

(3) Any unusual or unexpected elements, amounts, or changes that may indicate a risk, whether the one identified in planning or a new one that may need to be considered for a change to the plan.

**Consider** other procedures to gain an understanding of the line item, such as review of key policy documents, review of program information or reports, inquiry of staff, budget information, or other analytical procedures.

## State of Washington

### STEP 3: Update Significant Account Matrix

Based on your understanding of the line item, update the Significant Account Matrix with final conclusions on the agencies covered, account description, significant accounting systems, and risk (what could go wrong and relevant assertions). The account description should reflect the significant transaction streams or account balances relevant to the risk.

*The description of agencies, significant accounting systems, and what could go wrong in the Significant Account Matrix constitute the overall scope of substantive testing.*

*A transaction stream is significant based on the potential for misstatement. This is often due in part to its size (ie: comprising a large percentage of the total line item), but is ultimately a judgment about the susceptibility to the identified risk (for example, when the risk is understatement a small or omitted account may hold the most potential for the largest misstatement).*

*Significant accounting system(s) are those that contain key controls over significant classes of transactions included in the line item. Control systems identified in this step must match the Significant Account Matrix and have a separate control understanding documented.*

*Talk with the AIC if you identify any changes to the Significant Account Matrix.*

Guidance/Criteria:

Record of Work Done:

#### **(1) Prior Audit Exceptions:**

None

#### **(2) Composition & Change Analysis:**

Line Item Leadsheet: [\[Line Item Lead Sheet\]](#).

We noted the balance included activity from the following fund:

620: Unemployment Compensation Account

Fund 620 makes up the entire account balance. We do not expect to see any major changes to this line item. The transactions that are included in this line item are the premiums received from the employers. We will rely on work performed at the fund level to substantiate at the government-wide level.

Insurance Premiums at the Employment Security Department (ESD) are revenues from Unemployment Insurance (UI) taxes. Employers in the state of Washington pay for unemployment insurance through unemployment taxes; workers do not pay unemployment taxes. Unemployment tax rates are recalculated each year using a formula specified in [RCW 50.29.025](#). See permanent document at [\[FW ESD Contacts \(re SAO inquiry re RCW 50.29.025\)\]](#) for additional information related to [RCW 50.29.025](#) and the information provided by the Assistant Attorney General (AAG) over there being two RCWs within this section [(as amended by 2011 c 3) and (as amended by 2011 c 4)]. The tax rates are based on the employer

## State of Washington

payment and reporting data from the state's fiscal year even though the tax rates are in effect from January through December. The state unemployment insurance tax consists of two components, the experience-rated tax and the social-cost tax.

The employer's experience-rated tax is based on the amount of unemployment benefits paid to former employees over the past four years and the payroll size. It's determined by taking the benefit charges associated with the employer and dividing that by the total wages paid by the employer. Each employer is then assigned to one of 40 rate classes based on this number. They move up or down these classes based on their past experience.

The social-cost tax recovers costs from the previous year that can't be attributed to a specific employer. In prior years, ESD determined the flat social-cost tax by dividing the total social cost by the total taxable payroll. Based on the assigned rate class, the employer was assigned to one of twenty one social rate multipliers as specified in [RCW 50.29.025](#). However, during FY22 [Senate Bill 5873](#) made changes to the flat social tax rates assigned by [Senate Bill 5061](#) (during FY21). For rate year 2011 and thereafter, the calculation may not result in a flat social cost factor that is more than one and twenty-two one-hundredths percent except for:

- Rate year 2021 the calculation may not result in a flat social cost factor that is more than five-tenths percent (.5%)

- Rate year 2022 the calculation may not result in a flat social cost factor that is more than five-tenths percent (.5%)

- Rate year 2023 the calculation may not result in a flat social cost factor that is more than seven-tenths percent (.7%)

- Rate year 2024 the calculation may not result in a flat social cost factor that is more than eighty-five one-hundredths percent (.85%)

- Rate year 2025 the calculation may not result in a flat social cost factor that is more than nine-tenths percent (.9%)

The flat social cost is then multiplied by the assigned multiplier to determine the total social-cost tax for each employer. This social-cost tax is added to the experience-rate tax to determine the employer's total UI tax rate. There are also delinquent tax rates that are added on to the experience-rated tax and social-cost tax for employers who did not pay their total taxes the prior year.

According to ESD's Website - [Determining Your Tax Rates](#), the 2024 average total tax rate is 1.35%, a decrease from 1.43% in 2023. According to ESD's Website - [Taxable Wage Base](#), during FY24, employers will pay taxes on the first \$68,500 of each employee's wages. This increased from \$67,600 in 2023. On a quarterly basis, employers file and pay their UI taxes.

The transactions that are included in this line item are the premiums received from the employers. Insurance premiums are under fund 620 - Unemployment Compensation Account with Source 71 - Unemployment Compensation Contribution. ESD uses the Next Generation Tax System (NGTS) for calculating and collecting all premiums.

On 5/8/24, we inquired with Jeff Robinson, Labor Market Analysis/UI Research & Forecasting Manager, and Meredith Cole, Benefits Specialist 4, about significant changes. Jeff stated there have been no new changes to social-cost rate changing since FY22 due to [Senate Bill 5873](#). Jeff confirmed there were no new legislative changes that affected rates for FY24.

# State of Washington

## **(3) Updates to Significant Account Matrix:**

None

## **E.3.PR.G - Premiums and Assessments**

*Procedure Step:* Controls - NGTS

*Prepared By:* CJM, 6/28/2024

*Reviewed By:* RKM, 11/7/2024

Purpose/Conclusion:

### **Purpose:**

To gain an understanding of internal controls.

### **Conclusion:**

We gained an understanding of internal controls as documented in the record of work done.

Testing Strategy:

### **The following procedures are required for all material systems:**

1. List the financial statement balance(s) and relevant assertion(s) addressed by the understanding.
2. Gain an understanding of the internal control process, identify how transactions are recorded in AFRS, identify key controls over relevant assertion(s), and note any control weaknesses.
  - In gaining an understanding of controls, consider the overall understanding of State-Level control elements as documented in the "State-Level Controls" step as they relate to this particular system.
  - Identify controls systems covering all relevant assertions for all significant classes of transactions.
  - Standards require the auditor to gain an understanding of the significant accounting system(s) that contain key controls over significant classes of transactions included in the line item.
  - Control systems identified in this step must match the Material Account Matrix and have a separate control understanding documented.
  - Talk with the ACFR Specialist or AIC if you identify different systems than the ones anticipated in the Material Account Matrix.

## State of Washington

For each material system, auditors must document:

- A brief outline of the transaction flow from beginning to end.

- An expanded description of key controls.

- Business processes relevant to financial reporting of the relevant assertion for the material balance. Processes should encompass automated and manual procedures by which transactions or events are identified or initiated, authorized as needed, recorded, processed and corrected as needed.

- Original accounting records and how records are rolled-up to intermediary ledgers and transferred to the general ledger (AFRS) or financial statements.

- Detailed descriptions of key controls. Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

The following is information to **consider** when identifying key controls and transaction flow.

“Key controls” refer to the few controls that together provide reasonable assurance that material misstatements will be prevented or detected and corrected. This is contrasted with ancillary or supporting controls, which – although helpful and recommended – would provide less than reasonable assurance by themselves.

The focus of the write-up is on the key controls. Key controls should be specifically identified (as “key controls”) in the write-up. This can be done in whatever way the auditor prefers, so long as it is obvious. Details that the auditor should document regarding key controls may include:

- Who or what initiates the control

- When (or how often) is the control applied

- Who performs the control

- As needed, the experience, knowledge and attitude of the person applying the control

- Detailed description of the control process or activity. For example, if the control is a review: what exactly is reviewed, what is the reviewer looking at or for and what are the reviewer’s criteria?

- How the key control is documented or evidenced

- If not obvious from the description, how the control prevents or timely detects and corrects misstatements

- Any exceptions or alternative processing to the normal process

- What happens when misstatements or issues are identified by the control

The “transaction flow” refers to the process by which transactions are initiated, authorized, recorded, processed and reported (as applicable).

## State of Washington

Outlining the transaction flow gives context to key controls, especially how transactions become subject to controls in the first place. If a control inherently ensures that all applicable transactions are included (ex: bank reconciliation where the assertion is existence), the auditor may decide to just start the write-up with the initiation of the control procedure and go from there.

Elements of the transaction flow are defined informally as follows:

*Initiation:* How are transactions initiated?

*Authorization:* How are transactions and accounting record maintenance authorized?

*Recording:* How are transactions or balances identified and recorded in financial accounting systems?

*Processing:* How are the transactions or balances processed after they are recorded (if at all)? Processing may be manual or automated and may occur at a subsidiary system level or at the general ledger level.

*Reporting:* How are records translated into the financial statements? This part of the transaction flow extends the understanding to the actual financial statements that the audit is opining on. Since we already document an understanding of the financial reporting process in general, it is usually enough to simply reference this overall understanding. However, if there are important steps unique to the covered balances, it may be more appropriate to mention them here.

Although transaction flow is a good way to think about understanding and documenting a control system, auditors should not worry too much about documenting "each element, in order" because often elements may be combined, not noticeable, not applicable or occur in a different order.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits](#) Planning Guide**

Record of Work Done:

### **Material Balance(s) and Assertions**

Internal controls in the NGTS address the following balance(s):

Statement of Revenues, Expenses, and Changes in Net Position - Proprietary Funds

# State of Washington

Premiums and Assessments

Statement of Activities - Government Wide

Unemployment Compensation - Charges for Services

For the following assertions:

Completeness: There is a risk that all reported revenues occurring in the fiscal period were not reported.

Valuation: There is a risk premiums and assessments are incorrectly calculated.

## **Gain an Understanding of Internal Controls**

On 5/8/2024 we met with Meredith Cole, Benefit Specialist, and Jeff Robinson, Labor Market/UI Research & Forecasting Manager, to update our understanding over premiums and assessments (assigning tax rates).

Initially new employers are assigned a North American Industry Classification system (NAICS) rate by the Labor Market and Performance Analysis (LMPA) based on the industry average for the business activity of the applicant. After two years of providing timely wage reports and payments the employer will qualify for a lower experience rate. LMPA calculates the taxable wage base used by every employer and the social flat cost rate for the year applicable to each employer's tax rate based on state law within RCWs. During FY21 [Senate Bill 5061](#) assigned the flat social tax rate of .5%. During FY22 [Senate Bill 5873](#) made changes to the flat social tax rates assigned by Senate Bill 5061. For rate year 2011 and thereafter, the calculation may not result in a flat social cost factor that is more than one and twenty-two one-hundredths percent except for:

Rate year 2021 the calculation may not result in a flat social cost factor that is more than five-tenths percent (.5%)

Rate year 2022 the calculation may not result in a flat social cost factor that is more than five-tenths percent (.5%)

Rate year 2023 the calculation may not result in a flat social cost factor that is more than seven-tenths percent (.7%)

Rate year 2024 the calculation may not result in a flat social cost factor that is more than eighty-five one-hundredths percent (.85%)

Rate year 2025 the calculation may not result in a flat social cost factor that is more than nine-tenths percent (.9%)

[Senate Bill 5873](#) also gave many small employers with 10 or fewer employees in fourth quarter 2021 more relief on their social tax rate in 2023.

Employers in rate classes 8 to 40 will get the social tax rate for rate class 7.

Employers in rate classes 1 to 7 will stay at their social tax rate.

LMPA relies on a computer generated report (ESD Referred to this report as LMPA\_AAW) to completely and accurately identify financial activity pulled to calculate the Taxable Wage Base and Social Cost tax rate. The financial activity report used in calculating the rates is produced by the Quarterly Census of Employment and Wage (QCEW) unit of the Employment Security Department (ESD). The QCEW unit collects the quarterly Unemployment Insurance tax reports from employers and then processes/verifies and edits the wage and employment records. Wage and employment information is used as the basis for calculating the average annual wage and contribution amount. To ensure accurate insurance premium revenues, the taxable wage base and the Flat Social Cost factor for the year is determined using the computer generated financial activity report or calculated in accordance with RCWs (**Key Control 1 - Valuation**).

## State of Washington

Tax rates are calculated by NGTS as specified in [RCW 50.29.025](#). NGTS calculates the Employer's experience-rated tax (component of total employer tax rate) based on the amount of unemployment benefits paid to former employees over the past four years and the payroll size. It's determined by taking the benefit charges associated with the employer and dividing that by the total wages paid by the employer. Each employer is then assigned to one of 40 rate classes based on this number. Employers are notified of their UI tax rate in December of each year. The data used for calculating UI annual tax rates are based on employers' account information as of September 30th. The UI tax rate for an employer is dependent on several factors; the employer's benefit ratio, delinquent balance, social cost rate, legislative limit, and Employer Assistant Fund. Once the rate has been calculated, the system determines the amount which should have been billed (received in payment), as the employer would have calculated the taxes owed the same as the system. Tax rates are calculated by NGTS as specified in [RCW 50.29.025](#) (**Key Control 2 - Valuation**).

### Payments

After the employer is registered and has paid employees, the employer reports employee wages and hours to ESD electronically through Employer Account Management Services (EAMS). EAMS is a program that collects the wage data that is then uploaded into NGTS for payment (not considered significant accounting systems). Paper tax & wage reports are mailed to the ESD mail room or to the retail lock box. Payments for Insurance Premiums due are submitted through e-pay or mailed to the retail Lockbox or ESD mailroom. State agencies make up the rest of the collections.

Every quarter employees must file and pay their unemployment insurance taxes using one of the following methods.

- Original paper forms that are sent to a Retail Lockbox

- A special request must be made for these paper forms

- Electronic filing through the Employer Account Management Services (EAMS)

- ePay

- Automatic Clearing House (ACH) electronic payment

Tax Calendar			
Quarter One (Q1)	January Q4 taxes due 1/31	February	March Q1 ends 3/31
Quarter Two (Q2)	April Q1 taxes due 4/30	May	June Q2 end 6/30
Quarter Three (Q3)	July Q2 taxes due 7/31	August	September Q3 end 9/30
Quarter Four (Q4)	October Q3 taxes due 10/31	November	December Q4 end 12/31

## State of Washington

The transactions that are included in this line item are the premiums received from the employers. Insurance premiums are under fund 620 - Unemployment Compensation Account with Source 71 - Unemployment Compensation Contribution. ESD uses the Next Generation Tax System (NGTS) for calculating and collecting all premiums.

### **How Transactions are Recorded in AFRS:**

#### Treasury's Reconciliation

On 5/22/24, we met with the following people to update our understanding over premiums and assessments (treasury's reconciliation):

Meredith Cole, Tax Supervisor

Janel Lamm, Tax Specialist 4

Tina Drew, Tax Specialist 4

Meghan Phelps, UI Treasury Manager

ESD performs NGTS reconciliations daily except on Tuesday when no bank statement is available. The daily NGTS reconciliation is performed by Tina Drew, Tax Specialist 4. The reconciliation starts with the NGTS report, Daily Bank Deposit Worksheet. This report itemizes the different deposit sources, payments, the amount posted by the bank, and the receipts posted in NGTS. Tina reconciles the Daily Bank Deposit Worksheet to US Bank activity (BAI2 report) **(Key Control 3 - Completeness/Valuation)**. Differences between bank deposits and NGTS are calculated and shown in a column. These differences, are due to timing differences between the bank and NGTS (i.e. payment didn't post so they have to make an adjustment to a different day). To reconcile these differences the dates of the NGTS reports are revised to reflect the bank's deposits.

Son Pham, Fiscal Analyst 4, posts the NGTS activity (from the BAI2 report) in the "Monthly AFRS JV" spreadsheet to ensure US Bank, AFRS, and NGTS activity are accurate. A bank reconciliation is then performed by My-Phuong Tran, Fiscal Analyst 3, to ensure the deposits posted by the bank agrees to the NGTS receipts and all items expected are received by the ESD. A Fiscal Analyst will review the BAI2 report on a daily basis and post to the UC Clearance Journal. At the end of the month, the Treasury Department, then uploads the total in the JV to AFRS fund 620 using the AFRS toolbox. Monthly, Meghan Phelps, UI Treasury Manager, reviews the AFRS to bank reconciliation to ensure accuracy and completeness in AFRS. She does this by comparing the Monthly AFRS JV, UC Clearance Journal and daily deposits to the total recorded in AFRS **(Key Control 4 - Completeness/Valuation)**. The ESD determines the amount of accrued revenue to recognize during their accounts receivable process and books the entry to the AR and accrued revenue as part of the monthly journal voucher, based on a SQL run by Treasury. Meghan reviews this entry as well before it is entered into AFRS **(Key Control 5 - Completeness/Valuation)**.

In 2018/2019 ESD decided to not have an interface between NGTS and AFRS for receipts. UI Treasury developed a process prior to this decision to be able to reconcile NGTS to AFRS. They use a series of SQL queries, "Agency Receipt" reports, and "BAI2" Reports".

### **Key Controls are as Follows:**

## State of Washington

**Key Control 1 (Automated)** - The taxable wage base and the Flat Social Cost factor for the year is determined using the computer generated financial activity report or calculated in accordance with RCWs, to ensure that insurance premiums and assessments are calculated correctly using these factors **(Valuation)**.

**Key Control 2 (Automated)** - Tax rates are calculated by NGTS as specified in [RCW 50.29.025](#) **(Valuation)**.

**Key Control 3 (Manual)** - A daily reconciliation is performed by a Tax Specialist to ensure the deposits posted by the bank agrees to the NGTS receipts and all items expected are received by the ESD **(Completeness/Valuation)**.

**Key Control 4 (Manual)** - Monthly, the Treasury Manager reviews the AFRS to bank reconciliation to ensure accuracy and completeness in AFRS. The Manager does this by comparing the Monthly AFRS JV, UC Clearance Journal and daily deposits to the total recorded in AFRS **(Completeness/Valuation)**.

**Key Control 5 (Manual)** - The ESD determines the amount of accrued revenue to recognize during their accounts receivable process and books the entry to the AR and accrued revenue as part of the quarterly journal voucher **(Completeness/Valuation)**.

### Noted Weaknesses are as Follows:

None

### E.3.PRG - Premiums and Assessments

*Procedure Step:* Key Control 1 (Automated)

*Prepared By:* CJM, 7/11/2024

*Reviewed By:* RKM, 10/18/2024

Purpose/Conclusion:

#### **Purpose:**

To determine whether the taxable wage base and Flat Social Cost factor for the year is determined using the computer generate financial activity report or calculated in accordance with RCWs **(Key Control 1 for NGTS)** was in place in order to assess control risk.

#### **Conclusion:**

Based on our understanding and test results, we concluded that the automated control **was** in place and operating effectively.

Based on our understanding, related general IT controls **were** in place and adequately designed to ensure that the control operated consistently

## State of Washington

during the audit period. However, we did not test the operating effectiveness of general IT controls.

Our understanding and control risk assessment, which incorporates these conclusions, is documented at [Controls - NGTS].

Testing Strategy:

The following procedures are **required** for all automated key controls for financial and single audits:

### **STEP 1: Understand Automated Key Control**

Gain an understanding of the automated key control. The understanding can either be documented in the control system step or could be documented here in this step. Auditors should consider the following aspects of the automated control when gaining an understanding:

#### **Software Calculation:**

Is there written documentation of the calculation, and/or the source rates and factors used in the calculation?

*We would expect written documentation that defines the calculation and is an official, approved source for the formulas, rates and factors. This may be an approved policy or could be system documentation.*

What formulas are used to make the calculation?

What values or factors are used to make the calculation? For example:

- Rate tables used by the calculation
- Profile fields (i.e., applicable transaction types)
- Programmed/set formulas and/or values
- Constraints (i.e., effective date, minimums/maximums, etc.)

How is the calculation triggered or initiated?

How is the calculation recorded in the accounting system (or used in an end result)?

*g monitoring controls if personnel are responsible for both application settings and transaction processing controls.*

### **STEP 2: Confirm and Test Automated Key Control**

Confirm and test the automated control. To test the automated control, consider the following procedures:

#### **Software Calculation:**

Re-perform the calculation for selected transactions.

*Auditors would NOT normally use sampling for automated controls. Instead, auditors should judgmentally select one instance of each*

## State of Washington

*significant variation of the calculation. If the number of potential variations is large, auditors would judgmentally select based on risk factors (for example, the most common scenarios, or scenarios associated with identified risks, or scenarios that are not addressed by the entity's testing procedures).*

*In some cases, it may be possible for the auditor to reperform the calculation for the entire population.*

If any rate tables or values were updated during the period, view the current values (by observing the rate table or values in an admin menu or from a printed system report) and compare to approved sources.

*If no updates were made or there are only a few values, this risk could be addressed by re-performing the calculation. However, if source rate tables or values are large or complex, it may be more efficient to test these values directly than to recalculate a larger number of transactions.*

Consider the use of analytical procedures such as trends or descriptive statistics on the population (like average, minimum and maximum values, or a graph of values across the population) and follow up on any unexpected values or trends. *Analytical procedures would normally also count as a substantive test.*

### Software Calculation:

Inquire if the entity has experienced any errors or irregularities with the calculation. Also how often changes are made to the calculation, and how many changes (if any) were made during the year.

How can the software calculation (formulas, rates/values, settings/configurations) be changed or customized?

*Software calculations will usually have one or more administrative menus that allow the government to modify rate tables or other calculation values, or to configure the calculation or apply settings.*

*In other cases, software calculation formulas and/or values may be hard-coded into the system and require programmers to make the changes. If the government has access to source code, then it needs internal procedures for program changes. If the program is controlled by vendors, we would expect program change procedures and expectations to be included in the contract.*

What are the procedures to authorize and make program changes or configuration/setting changes to the software calculation?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

*If utilizing a test environment, there should be controls to ensure that the live environment is updated and is consistent with the live*

## State of Washington

*production environment. As management is responsible for the accuracy of their automated controls (i.e., in the live environment), we would expect there to be a procedure to confirm each key automated control once it is in the live environment. This could be manually re-performing the calculation, reviewing reports against known expectations, etc.*

How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change programming, but they may be responsible for patch management, master table data, and/or configurations.*

### **STEP 4: Confirm Key General IT Controls**

Confirm your understanding of key general IT controls to determine whether they have been placed in operation (*whether the entity has actually implemented key controls*).

### **STEP 5: Test Key General IT Controls**

Document whether general IT controls will be tested. Option 1 would result in control risk at MAX for the automated control. Either option 2 or 3 is necessary in order to set control risk at LOW. If general IT controls are tested, consider the following procedures:

#### **Software Calculation:**

If program changes or setting/configuration changes are logged, review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the calculation may also provide this evidence if the re-performance tests address all states of the calculation during the period.

If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.

# State of Washington

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

## **STEP 6: Final Control Risk**

Evaluate the results and document a final control risk assessment in the control system step. Consider whether any deficiencies identified with either the automated control or related general IT controls represent material weaknesses or significant deficiencies.

*Note: general IT control deficiencies do not necessarily mean the automated control is not properly functioning. General IT control deficiencies would normally be considered a significant deficiency or material weakness only if it caused an issue with the compliance requirement or assertion.*

## **Recommendation Review Requirement**

IT Security related information is considered category 3 data protected by Public Request Exemption RCW 42.56.420. Issues related to IT Security require the following special handling:

[Instructions](#) are located in Team IT Audit's System's Sharepoint page.

Details of IT Security related issues should NOT be included in any emails or helpdesks.

Exit, ML and Findings should be separately communicated in an IT Security Results Document.

Findings will be referenced, but not included in the audit report.

All IT security-related recommendations must be reviewed by [Team IT Audit](#).

Template language for common IT related recommendations can be found in [ARS Part 5 Chapter 8](#).

## **PUBLIC REQUEST EXEMPTION**

Some IT related information is protected by Public Request Exemption RCW 42.56.420 for cyber security purposes. The details documented in the record of work and support workpapers may qualify for this exemption. If so, auditors must include this statement in the record of work done and any related workpapers: **"This record contains information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited "**.

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Information Technology](#) Planning Guide**

## State of Washington

Auditors may contact [Team IT Audit](#) with any testing strategy or control assessment questions or to request assistance from an IT Specialist.

**Software Calculation:** A **software calculation control** exists when the value of a transaction is determined by a software application. This process can be a key control when the entity relies on the system to generate calculations correctly to determine the amount of transactions (i.e., summarizing/account code allocation to post to general ledger, calculate student, utility, other charges, etc.).

**Automated Interfaces:** An interface is a process that moves information from one computer application to another. The interface can occur internally between systems maintained by a single agency, or between systems maintained by different agencies or private companies. The interface can also occur between modules within the same computer application.

The data transferred might be a file consisting of one or more records processed at a later time (batch), or it can be a real-time update. Risk associated with interfaces increases as the number of transactions or the number of other services and systems supported by the interfaced data increases.

Poor design or inadequate oversight can affect the transfer of transaction data among the systems. Interface controls are automated and/or manual processes designed to ensure transmission and processing of information is complete and accurate.

### Manual vs. Automated Interfaces

A "manual interface" is the transfer of data from one system or module to another system or module, initiated and controlled by a user. An example of a manual interface is when customer accounts are downloaded from a utility billing system to be used to perform meter readings. When complete, the file with meter readings may be uploaded and posted to the customer accounts.

An "automated interface" is the transfer of data from one system or module to another system or module that happens automatically based on a schedule, or other predefined criteria. A common example of an automated interface is the payroll module of a system. Typically, a payroll batch is created in the payroll module. Once approved, the batch is automatically sent by the system to the general ledger or other applicable modules, such as accounts payable.

Entities should have reconciliation controls between their various applications regardless of the method used for interfacing.

*Auditors should have determined whether system interfaces are automated as part of the Key Software Applications workpaper. **If not**, ask the following question to determine whether the system interface is manual or automated.*

*Is the data transferred from one system/module to another system/module by a user using an uploading and posting technique? For example, data is pulled from one system into a text file or other format, that is then uploaded into a different system or module by posting or in an upload feature of the module. If the answer to this question is yes, the interface would be considered "manual" since it is*

## State of Washington

*initiated and controlled by manually rather than through an automated process.*

**Edit Checks:** An **edit check** is a programmed routine designed to check input data or processing results for accuracy, compliance, or reasonableness. Types of edit checks include:

Range Checks: ensure that numeric values fall within specified ranges, minimums and/or maximums. For example, ensuring that a capital asset can only be entered as a positive amount, or a purchase order can only be submitted without secondary approval for less than a certain threshold.

Consistency Checks: verify that related data fields are consistent with each other. For example, ensuring that a patient's age matches their date of birth.

Format Checks: validate data formats (for example, dates as MM/DD/YYYY or phone numbers as ###-###-####).

Logical Checks: assess logical relationships between data fields. For instance, verifying that total debits equals total credits in a journal entry.

Duplicate Checks: identify duplicate records or entries. For example, preventing the same invoice from being entered twice.

Cross-Field Checks: compare data across different fields. For instance, ensuring that the start date of a project is before the end date.

Required Field Checks: ensure that mandatory fields are filled out. For instance, making sure that a patient's name and date of birth are provided.

Referential Integrity Checks: validate relationships between data tables. For example, confirming that a vendor number exists in the vendor master file as an active entity.

Outlier Checks: detect extreme or unexpected values. For instance, flagging water meter reading values that are extreme outliers for the customer type or account history.

Pattern Checks: look for specific patterns in data. For example, verifying that email addresses follow a valid format.

Edit checks may result in automatic rejection of a transaction, inability to proceed with a transaction, trigger for additional processing or review, or may simply result in a warning message to the user.

Edit checks may be identified as a key control when they are sufficiently relevant (ie: addressing the risk), precise (ie: able to catch all errors, rather than just being only reasonableness or limit check), and sufficiently strong (ie: prevent invalid transactions, rather than just generating a warning messages). Auditors may identify an individual edit or a group of edit checks together as a key control.

**Computer Generated Reports:** A **computer-generated report** is a report that is created by a computer program. The computer program, also referred to as a report generator or tool, takes data from a data source, such as a database, and displays it in a specified format. The process to generate a report often includes performing calculations on the data, such as summarizing, classifying, etc., before displaying, or can display the calculations on the report.

There are two types of computer-generated reports, pre-programmed and ad-hoc or customized reports.

## State of Washington

Pre-programmed or canned reports are pre-defined reports where criteria and specifications are hard coded in the system. A canned report may allow limited parameters, (month/year, for example), but in general the information that will be displayed is pre-determined. Ad-hoc or customized reports allow the user to drill down and customize what information is displayed on the report based on some allowed criteria, such as account codes, dollar amounts minimum, etc).

In contrast, a **manual report** is one that is created outside the system using data exports or is created ad hoc by a user. An example of a manual report is one that is created by copying data from a data source and pasting the data in an Excel spreadsheet or Word document or Powerpoint presentation where it is then processed further. With manual reports, each time a report is created, the data could be incorrect due to user error, such as not copying all relevant data, or processing errors. Therefore, these types of reports should be understood and tested similar to manual controls.

**Electronic Approvals:** Electronic approvals, electronic signatures and digital signatures are technically different, although often these terms are used interchangeably by entities.

Auditors should have determined whether the electronic approval is an automated control as part of the overall understanding of controls. For automated control purposes, an electronic approval is a software system functionality that:

- Permits a user to approve transaction(s) within the software system

- The system automatically documents, or logs, the data approved by the user and any subsequent manipulation

- The acceptance or rejection of the transaction by the approver will trigger an additional software system process, such as posting of a transaction.

E-mail, scanned-in pictures of signatures, or font-changed signatures, etc. may be part of a control activity but are generally not considered an automated control and are not covered by this testing strategy.

### Electronic Signature vs Digital Signature

An “**electronic signature**” can look like a handwritten signature that has been scanned and then pasted into an electronic document. The reliability of this type of approval is variable. Recommend gaining an understanding of the process used to store and affix the signature to the document and then discuss the process with Team IT Audit before placing reliance on this control.

A “**digital signature**” is a legal signature with a formal certification process that documents who approved the document and ensures the document is not modified after certification. Reliability of this process is very high but has significant technical features. Recommend brainstorm with Team IT Audit before placing reliance on this control.

### **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

# State of Washington

**Statements on Auditing Standards [AU-C 315](#) Understanding the Entity and Its Environment and Assessing the Risks of Material Misstatement** - paragraphs .A106-.A109 describe general and application controls and how they relate to audit risks

**Statements on Auditing Standards [AU-C 330](#) Performaing Audit Procedures in Response to Assessed Risks and Evaluating the Audit Evidence Obtained** - paragraphs .10b and .A33-.A34 describe requirements and guidance for testing indirect controls in conjunction with tests of controls, that is, testing key general controls in conjunction with a test of a key automated control

Record of Work Done.

**This record may contain information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited.**

**Key Control 1 (Automated):** The taxable wage base and the Flat Social Cost factor for the year is determined using the computer generated financial activity report or calculated in accordance with RCWs, to ensure that insurance premiums and assessments are calculated correctly using these factors (**Valuation**).

## **STEP 1: Understand Automated Key Control**

The understanding for this system is documented above in the "Controls - NGTS" step.

## **STEP 2: Confirm and Test Automated Key Control:**

On 5/29/24, we spoke to Jeff Robinson, Labor Market Analysis/UI Research & Forecasting Manager, to discuss the identified key control.

We identified a computer generated report (Jeff called this report the LMPA\_AAW) used by the Employment Security Department (ESD) which it relies on to completely and accurately identify the financial activity. The financial activity report is pulled by the Quarterly Census of Employment and Wages (QCEW) Unit of ESD (Jeff obtained us this report from Molly Webster, Management Analyst 5). The QCEW collects the quarterly unemployment insurance tax reports from employers and then processes/verifies the wage and employment records. This information is then used as the basis for calculating the average annual wage.

We confirmed that the data total by quarter sums in total to that used for the year within the calculations related to Key Control 1.

We verified that the query pulled the appropriate data from the database by examining the field of the source data totaled that on the report by the specific sources listed within the query. We determined this to be reasonable, because no sources outside of the query were pulled into the totals used.

Taxable Wage Base:

## State of Washington

The taxable wage base is the maximum amount of an employee total wages that is taxable under the unemployment insurance program. The maximum amount is set each year based on the average annual wage for contribution purposes (AAWCP) for the previous year. By state law, the amount of wages subject to tax for each individual shall be 115 percent of the wages subject to tax for the previous year rounded to the next lower \$100, except that the amount shall not exceed 80 percent of the "average annual wage for contributions purposes" for the second preceding calendar year rounded to the next lower \$100.

Beginning January 1, 2024, employers will pay unemployment taxes on the first \$68,500 paid to each employee. The calculation is as follows based on an Average Annual Wage in 2022 of \$85,667:

round down (115% times \$67,600) = \$77,700

This exceeds the 80% maximum

round down (80% times \$85,667) = \$68,500

See details of our recalculation on tab, "AAWCP" at: [\[Yearly Rates Recalculation\]](#). ***No issues noted.***

### Total Taxable Wage Base for the Year:

2024 - \$68,500

2023 - \$67,600

2022 - \$62,500

2021 - \$56,500

2020 - \$52,700

### Social Flat Cost Factor:

The flat social tax rate is set using [RCW 50.29.025](#).

The flat social cost factor is run for a rate year by dividing the total social cost by the total taxable payroll. The division shall be carried to the second decimal place with the remaining fraction disregarded unless it amounts to five hundredths or more, in which case the second decimal place shall be rounded to the next higher digit. The flat social cost factor shall be expressed as a percentage.

If, on the cut-off date, the balance in the unemployment compensation fund is determined by the commissioner to be an amount that will provide more than ten months of unemployment benefits, the commissioner shall calculate the flat social cost factor for the rate year immediately following the cut-off date by reducing the total social cost by the dollar amount that represents the number of months for which the balance in the unemployment compensation fund on the cut-off date will provide benefits above ten months and dividing the result by the total taxable payroll. Prior to June 30, 2021, for rate year 2011 and thereafter, the calculation may not result in a flat social cost factor that is more than one and twenty-two one-hundredths percent.

## State of Washington

During FY22, [Senate Bill 5873](#) became law and stated that for rate year 2011 and thereafter, the calculation may not result in a flat social cost factor that is more than one and twenty-two one-hundredths percent except for rate years:

- 2021 the calculation may not result in a flat social cost factor that is more than five-tenths percent (.5%)
- 2022 the calculation may not result in a flat social cost factor that is more than five-tenths percent (.5%)
- 2023 the calculation may not result in a flat social cost factor that is more than seven-tenth percent (.7%)
- 2024 the calculation may not result in a flat social cost factor that is more than eighty-five one-hundredths percent (.85%)
- 2025 the calculation may not result in a flat social cost factor that is more than nine-tenths percent (.9%)

Note: When the trust fund has at least 15 months of benefits but less than 17 months, the minimum shall be .25%.

We confirmed that the Flat Social Cost factor for the year is determined in accordance with the RCW guidelines and Senate Bill. See calculation of the Social Cost Factor on tab, "Flat Social Cost" at: [[Yearly Rates Recalculation](#)].

### **STEP 3: Understand General IT Controls**

We met with Samantha Hill, Senior Business Systems Analyst Supervisor, and Abhishek Gupta, Solutions Architect, on June 6, 2024 to gain an understanding of the general IT controls for NGTS.

ESD utilizes a Microsoft software project management platform called Azure. Azure allows for staff members of the Information Technology Services, Business Department, and Software Developers group to work together to monitor the work flow of a project. For each step of the process there is someone assigned to work on that portion of the process and leave comments and notes on the progress. ESD uses Azure to manage the software development work-flow process for NGTS. ESD ensures that no unnecessary or accidental changes are made to the NGTS system by limiting the amount of individuals that have permission to perform changes to the system. Samantha Hill mentioned that six ESD individuals act as NGTS "Owners" that have the ability to grant access for business systems analytics department, application developers, or systems administrators to the NGTS system. The NGTS owners can add people as a "members" who have the permission to edit and view items in NGTS or a "visitor" who can only view the information in NGTS. Samantha stated there were only 5 current NGTS "members". The list is monitored by ESD to ensure that no additional users have been granted permissions without prior approval from an NGTS system owner **(General IT Control 1)**.

When NGTS needs to be changed or updated a system administrator or business systems analyst will submit a change request to Information Technology Services that will initiate the request. ESD refers to change requests for NGTS as "stories" and bug fix request as "bugs", the process for both is the same. The requests are analyzed and reviewed by a Business Systems Analyst to ensure the change is necessary and possible to implement. After the review is complete the next step would be to assign a developer to the story and move it to the development stage. The assigned developer will make the requested changes to NGTS. Once the changes have been completed the story is moved to a test environment where members of a software engineer will run tests to ensure the change is functioning as expected. The tests will differ based on the complexity of the story. After the story has passed testing the next step is move it into a staging process verification process in where the story is

## State of Washington

duplicated and place it into a second testing environment where it will be tested to ensure its functioning properly by the Business Department. The Business Department will also conduct a test called the User Acceptance Test (UAT) which ensures the changes meet the end users' expectations. A Business Systems Analyst will review that the change request is completed and will move it into development to be published. A Business Systems Analyst performs a final confirmation that the change request has been completed by sending a request for verification to end users that interact with recently changed portion of NGTS to ensure the change is now functional and working as expected (**General IT Control 2**). If there were any errors or changes at this step of the work flow process they would close the story and reopen a new one to restart the process from the beginning.

### Summary of General IT Control

**General IT Control 1** - The NGTS owners can add people as a "members" who have the permission to edit and view items in NGTS, owners can also add "visitors" who can only view the information in NGTS. The permissions list is monitored by ESD to ensure that no additional users have been made without prior approval from an NGTS system owner.

**General IT Control 2** - A Business Systems Analyst will review that the change request is completed and will move it into development to be published. A Business Systems Analyst performs a final confirmation that the change request has been completed by sending a request for verification to end users that interact with recently changed portion of NGTS.

### **STEP 4: Confirm Key General IT Controls**

**General IT Control 1** - The NGTS owners can add people as a "members" who have the permission to edit and view items in NGTS or a "visitor" who can only view the information in NGTS. The list is monitored by ESD to ensure that no additional users have been made without prior approval from an NGTS system owner.

On June 6, 2024 Samantha Hill and Abhishek Gupta provided us with a walk through of the change request process with report NGTS. During the walkthrough we were able to observe the NGTS permissions process to confirm general IT control one. Samantha showed us the "People and Groups" for NGTS Owners and Members. We were able to confirm that 6 people had the permissions to add or remove members from NGTS.

The following individuals had access as a NGTS "Owners"

- Goutham Vijay Chodapuneedi, Database Specialist
- Judy Dew, Tax and Wage Systems Manager
- Samantha Hill, Sr. Business Systems Analyst Supervisor
- Tami Hummel, Sr. Business Systems Analyst
- Bruce Randell, Enterprise Software Administration Team Specialist
- Bonnie Tennyson, Office Manager

The following individuals have NGTS access as "Members"

- Michelle Belcher, Business Systems Analyst

## State of Washington

Son Le, IT Business Systems Analyst  
Mary MacLennan, Business Systems Analyst  
Robert Parris, Business Systems Analyst  
Michael Rogers, Business Systems Analyst

Based on our understanding of the general IT controls for NGTS we can confirm the NGTS permissions process matches what was described by ESD staff. No issues noted.

**General IT Control 2 - A Business Systems Analyst will review that the change request is completed and will move it into development to published. A Business Systems Analyst performs a final confirmation that the change request has been completed by sending a request for verification to end users that interact with recently changed portion of NGTS.**

On June 6, 2024 Samantha Hill, and Abhishek Gupta provided us with a walk through of the change request process within NGTS. During the walkthrough we were able to observe the Azure work flow process to confirm the general IT controls are in place. We observed the change request assigned to the work item number "191145". The request was to create a fix for an error during the process of assessment for an employer which caused that employer's information to show a canadian address. We were able to identify that the story was created on March 9th 2024 by Nathan Bode, ESD, System Administrator. On March 20, 2024 the story was reviewed and approved by Robert Parris, ESD, Business Systems Analyst. Robert moved the story to the development work flow step and assigned Jason Brewer, ESD, Application Developer, to the task on March 25, 2024. Jason completed the development process and moved the testing workflow process and stage verification on April 16, 2024. Bhanu Prakash Karumuri, Software Engineer, in the test environment completed the testing verification on May 23, 2024 and moved the story to the next workflow step. Robert Parris conducted a UAT on behalf of the business department to ensure the changes are functioning as expected. On May 28, 2024 Robert approved the story and moved to production. On June 4, 2024 Robert Parris conducted a request for verification for work item 191145 by inquiring with Cali Cook, Tax Specialist 4. Cali confirmed that the requested fix is functional and running as expected. **No issues noted.**

### **STEP 5: Test Key General IT Controls**

Not applicable - we are not planning to rely on automated controls and therefore do not need to test general controls; control risk will be assessed at MAX.

### **E.3.PRG - Premiums and Assessments**

*Procedure Step:* Key Control 2 (Automated)  
*Prepared By:* CJM, 7/11/2024  
*Reviewed By:* RKM, 8/6/2024

# State of Washington

Purpose/Conclusion:

**Purpose:**

To determine whether tax rates are calculated by NGTS as specific in RCW 50.29.025 (**Key Control 2 for NGTS**) was in place in order to assess control risk.

**Conclusion:**

Based on our understanding and test results, we concluded that the automated control **was** in place and operating effectively.

Based on our understanding, related general IT controls **were** in place and adequately designed to ensure that the control operated consistently during the audit period. However, we did not test the operating effectiveness of general IT controls.

Our understanding and control risk assessment, which incorporates these conclusions, is documented at [\[Controls - NGTS\]](#).

Testing Strategy:

The following procedures are **required** for all automated key controls for financial and single audits:

**STEP 1: Understand Automated Key Control**

Gain an understanding of the automated key control. The understanding can either be documented in the control system step or could be documented here in this step. Auditors should consider the following aspects of the automated control when gaining an understanding:

**Software Calculation:**

Is there written documentation of the calculation, and/or the source rates and factors used in the calculation?

*We would expect written documentation that defines the calculation and is an official, approved source for the formulas, rates and factors. This may be an approved policy or could be system documentation.*

What formulas are used to make the calculation?

What values or factors are used to make the calculation? For example:

- Rate tables used by the calculation

- Profile fields (i.e., applicable transaction types)

- Programmed/set formulas and/or values

- Constraints (i.e., effective date, minimums/maximums, etc.)

How is the calculation triggered or initiated?

How is the calculation recorded in the accounting system (or used in an end result)?

## State of Washington

*g monitoring controls if personnel are responsible for both application settings and transaction processing controls.*

### **STEP 2: Confirm and Test Automated Key Control**

Confirm and test the automated control. To test the automated control, consider the following procedures:

#### **Software Calculation:**

Re-perform the calculation for selected transactions.

*Auditors would NOT normally use sampling for automated controls. Instead, auditors should judgmentally select one instance of each significant variation of the calculation. If the number of potential variations is large, auditors would judgmentally select based on risk factors (for example, the most common scenarios, or scenarios associated with identified risks, or scenarios that are not addressed by the entity's testing procedures).*

*In some cases, it may be possible for the auditor to reperform the calculation for the entire population.*

If any rate tables or values were updated during the period, view the current values (by observing the rate table or values in an admin menu or from a printed system report) and compare to approved sources.

*If no updates were made or there are only a few values, this risk could be addressed by re-performing the calculation. However, if source rate tables or values are large or complex, it may be more efficient to test these values directly than to recalculate a larger number of transactions.*

Consider the use of analytical procedures such as trends or descriptive statistics on the population (like average, minimum and maximum values, or a graph of values across the population) and follow up on any unexpected values or trends. *Analytical procedures would normally also count as a substantive test.*

#### **Software Calculation:**

Inquire if the entity has experienced any errors or irregularities with the calculation. Also how often changes are made to the calculation, and how many changes (if any) were made during the year.

How can the software calculation (formulas, rates/values, settings/configurations) be changed or customized?

*Software calculations will usually have one or more administrative menus that allow the government to modify rate tables or other calculation values, or to configure the calculation or apply settings.*

*In other cases, software calculation formulas and/or values may be hard-coded into the system and require programmers to make the changes. If the government has access to source code, then it needs internal procedures for program changes. If the program is controlled by vendors, we would expect program change procedures and expectations to be included in the contract.*

## State of Washington

What are the procedures to authorize and make program changes or configuration/setting changes to the software calculation?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

*If utilizing a test environment, there should be controls to ensure that the live environment is updated and is consistent with the live production environment. As management is responsible for the accuracy of their automated controls (i.e., in the live environment), we would expect there to be a procedure to confirm each key automated control once it is in the live environment. This could be manually re-performing the calculation, reviewing reports against known expectations, etc.*

How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change programming, but they may be responsible for patch management, master table data, and/or configurations.*

### **STEP 4: Confirm Key General IT Controls**

Confirm your understanding of key general IT controls to determine whether they have been placed in operation (*whether the entity has actually implemented key controls*).

### **STEP 5: Test Key General IT Controls**

Document whether general IT controls will be tested. Option 1 would result in control risk at MAX for the automated control. Either option 2 or 3 is necessary in order to set control risk at LOW. If general IT controls are tested, consider the following procedures:

### **Software Calculation:**

## State of Washington

If program changes or setting/configuration changes are logged, review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the calculation may also provide this evidence if the re-performance tests address all states of the calculation during the period. If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel. If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

### **STEP 6: Final Control Risk**

Evaluate the results and document a final control risk assessment in the control system step. Consider whether any deficiencies identified with either the automated control or related general IT controls represent material weaknesses or significant deficiencies.

*Note: general IT control deficiencies do not necessarily mean the automated control is not properly functioning. General IT control deficiencies would normally be considered a significant deficiency or material weakness only if it caused an issue with the compliance requirement or assertion.*

### **Recommendation Review Requirement**

IT Security related information is considered category 3 data protected by Public Request Exemption RCW 42.56.420. Issues related to IT Security require the following special handling:

[Instructions](#) are located in Team IT Audit's System's Sharepoint page.

Details of IT Security related issues should NOT be included in any emails or helpdesks.

Exit, ML and Findings should be separately communicated in an IT Security Results Document.

Findings will be referenced, but not included in the audit report.

All IT security-related recommendations must be reviewed by [Team IT Audit](#).

Template language for common IT related recommendations can be found in [ARS Part 5 Chapter 8](#).

### **PUBLIC REQUEST EXEMPTION**

Some IT related information is protected by Public Request Exemption RCW 42.56.420 for cyber security purposes. The details documented in the record of work and support workpapers may qualify for this exemption. If so, auditors must include this statement in the record of work done and any related workpapers: **"This record contains information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited "**.

# State of Washington

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

### **Information Technology Planning Guide**

Auditors may contact [Team IT Audit](#) with any testing strategy or control assessment questions or to request assistance from an IT Specialist.

**Software Calculation:** A **software calculation control** exists when the value of a transaction is determined by a software application. This process can be a key control when the entity relies on the system to generate calculations correctly to determine the amount of transactions (i.e., summarizing/account code allocation to post to general ledger, calculate student, utility, other charges, etc.).

**Automated Interfaces:** An interface is a process that moves information from one computer application to another. The interface can occur internally between systems maintained by a single agency, or between systems maintained by different agencies or private companies. The interface can also occur between modules within the same computer application.

The data transferred might be a file consisting of one or more records processed at a later time (batch), or it can be a real-time update. Risk associated with interfaces increases as the number of transactions or the number of other services and systems supported by the interfaced data increases.

Poor design or inadequate oversight can affect the transfer of transaction data among the systems. Interface controls are automated and/or manual processes designed to ensure transmission and processing of information is complete and accurate.

### **Manual vs. Automated Interfaces**

A “manual interface” is the transfer of data from one system or module to another system or module, initiated and controlled by a user. An example of a manual interface is when customer accounts are downloaded from a utility billing system to be used to perform meter readings. When complete, the file with meter readings may be uploaded and posted to the customer accounts.

An “automated interface” is the transfer of data from one system or module to another system or module that happens automatically based on a schedule, or other predefined criteria. A common example of an automated interface is the payroll module of a system. Typically, a payroll batch is created in the payroll module. Once approved, the batch is automatically sent by the system to the general ledger or other applicable modules,

## State of Washington

such as accounts payable.

Entities should have reconciliation controls between their various applications regardless of the method used for interfacing.

*Auditors should have determined whether system interfaces are automated as part of the Key Software Applications workpaper. **If not**, ask the following question to determine whether the system interface is manual or automated.*

*Is the data transferred from one system/module to another system/module by a user using an uploading and posting technique? For example, data is pulled from one system into a text file or other format, that is then uploaded into a different system or module by posting or in an upload feature of the module. If the answer to this question is yes, the interface would be considered "manual" since it is initiated and controlled by manually rather than through an automated process.*

**Edit Checks:** An **edit check** is a programmed routine designed to check input data or processing results for accuracy, compliance, or reasonableness. Types of edit checks include:

Range Checks: ensure that numeric values fall within specified ranges, minimums and/or maximums. For example, ensuring that a capital asset can only be entered as a positive amount, or a purchase order can only be submitted without secondary approval for less than a certain threshold.

Consistency Checks: verify that related data fields are consistent with each other. For example, ensuring that a patient's age matches their date of birth.

Format Checks: validate data formats (for example, dates as MM/DD/YYYY or phone numbers as ###-###-####).

Logical Checks: assess logical relationships between data fields. For instance, verifying that total debits equals total credits in a journal entry.

Duplicate Checks: identify duplicate records or entries. For example, preventing the same invoice from being entered twice.

Cross-Field Checks: compare data across different fields. For instance, ensuring that the start date of a project is before the end date.

Required Field Checks: ensure that mandatory fields are filled out. For instance, making sure that a patient's name and date of birth are provided.

Referential Integrity Checks: validate relationships between data tables. For example, confirming that a vendor number exists in the vendor master file as an active entity.

Outlier Checks: detect extreme or unexpected values. For instance, flagging water meter reading values that are extreme outliers for the customer type or account history.

Pattern Checks: look for specific patterns in data. For example, verifying that email addresses follow a valid format.

Edit checks may result in automatic rejection of a transaction, inability to proceed with a transaction, trigger for additional processing or review, or may simply result in a warning message to the user.

Edit checks may be identified as a key control when they are sufficiently relevant (ie: addressing the risk), precise (ie: able to catch all errors,

## State of Washington

rather than just being only reasonableness or limit check), and sufficiently strong (ie: prevent invalid transactions, rather than just generating a warning messages). Auditors may identify an individual edit or a group of edit checks together as a key control.

**Computer Generated Reports:** A **computer-generated report** is a report that is created by a computer program. The computer program, also referred to as a report generator or tool, takes data from a data source, such as a database, and displays it in a specified format. The process to generate a report often includes performing calculations on the data, such as summarizing, classifying, etc., before displaying, or can display the calculations on the report.

There are two types of computer-generated reports, pre-programmed and ad-hoc or customized reports.

Pre-programmed or canned reports are pre-defined reports where criteria and specifications are hard coded in the system. A canned report may allow limited parameters, (month/year, for example), but in general the information that will be displayed is pre-determined.

Ad-hoc or customized reports allow the user to drill down and customize what information is displayed on the report based on some allowed criteria, such as account codes, dollar amounts minimum, etc).

In contrast, a **manual report** is one that is created outside the system using data exports or is created ad hoc by a user. An example of a manual report is one that is created by copying data from a data source and pasting the data in an Excel spreadsheet or Word document or Powerpoint presentation where it is then processed further. With manual reports, each time a report is created, the data could be incorrect due to user error, such as not copying all relevant data, or processing errors. Therefore, these types of reports should be understood and tested similar to manual controls.

**Electronic Approvals:** Electronic approvals, electronic signatures and digital signatures are technically different, although often these terms are used interchangeably by entities.

Auditors should have determined whether the electronic approval is an automated control as part of the overall understanding of controls. For automated control purposes, an electronic approval is a software system functionality that:

Permits a user to approve transaction(s) within the software system

The system automatically documents, or logs, the data approved by the user and any subsequent manipulation

The acceptance or rejection of the transaction by the approver will trigger an additional software system process, such as posting of a transaction.

E-mail, scanned-in pictures of signatures, or font-changed signatures, etc. may be part of a control activity but are generally not considered an automated control and are not covered by this testing strategy.

### Electronic Signature vs Digital Signature

An “**electronic signature**” can look like a handwritten signature that has been scanned and then pasted into an electronic document. The

## State of Washington

reliability of this type of approval is variable. Recommend gaining an understanding of the process used to store and affix the signature to the document and then discuss the process with Team IT Audit before placing reliance on this control.

A “**digital signature**” is a legal signature with a formal certification process that documents who approved the document and ensures the document is not modified after certification. Reliability of this process is very high but has significant technical features. Recommend brainstorm with Team IT Audit before placing reliance on this control.

### **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

**Statements on Auditing Standards [AU-C 315](#) Understanding the Entity and Its Environment and Assessing the Risks of Material Misstatement** - paragraphs .A106-.A109 describe general and application controls and how they relate to audit risks

**Statements on Auditing Standards [AU-C 330](#) Performing Audit Procedures in Response to Assessed Risks and Evaluating the Audit Evidence Obtained** - paragraphs .10b and .A33-.A34 describe requirements and guidance for testing indirect controls in conjunction with tests of controls, that is, testing key general controls in conjunction with a test of a key automated control

Record of Work Done:

**This record may contain information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited.**

**Key Control 2 (Automated):** Tax rates are calculated by NGTS as specified in [RCW 50.29.025 \(Valuation\)](#).

### **STEP 1: Understand Automated Key Control**

The understanding for this system is documented above in the "Controls - NGTS" step.

### **STEP 2: Confirm and Test Automated Key Control:**

We reviewed the NGTS screens and re-performed the calculations for the employer below:

Pacific Air Systems, ESD Number 000-720231-00-1

First, we reviewed the Experience Rating & Benefit Charging - Tax Rates tab. The screen showed the 2024 tax rate. The Total Employer Tax Rate was set at .27, based on various factors (social cost and EAF). See below for the various factors:

Total UI Tax Rate: .93  
UI Tax Rate: .54  
Social Cost: .36

## State of Washington

EAF (Employment Administrative Fund): .03  
Rate Method: RATE-CLASS-06

Note: Tax rates are based on the calendar year.

We then reviewed the Employer Tax Account Quarter History - Q1/2024 Tax and Wages Quarter Summary/Details - Taxable Screen, which provided the following information:

Total Employer Tax Rate:  
Processed Date: 4/25/24  
Report Received Date: 4/23/23  
Report Type: Tax/Wage  
Report Source: EAMS Bilk Filing  
Gross Wages: \$2,437,031.17  
Excess Wages: \$17,498.75  
Taxable Wages: \$2,419,532.42  
UI Tax Amount: \$21,775.80  
EAF Amount: \$725.86  
Total Amount: \$22,501.66

Auditor's Recalculation:  
 $\$2,419,532.42 \times .0093 \text{ tax rate} = \$22,501.66$

There were no exceptions in the recalculation. We have determined that NGTS calculated the employer's total tax due and tax rate accurately. *No issues noted.*

### **STEP 3: Understand General IT Controls**

See our documentation of General IT Controls here [\[Key Control 1 \(Automated\)\]](#)

### **STEP 5: Test Key General IT Controls**

Not applicable - we are not planning to rely on automated controls and therefore do not need to test general controls; control risk will be assessed at MAX.

### **E.3.PRG - Premiums and Assessments**

*Procedure Step:* Key Control 3 (Manual)

# State of Washington

*Prepared By:* CJM, 6/28/2024

*Reviewed By:* RKM, 7/5/2024

## Purpose/Conclusion:

### **Purpose:**

To confirm a daily reconciliation is preformed to ensure that the deposits posted by the bank agrees to the NGTS receipts and all items expected are received by the ESD (**Key Control 3 for NGTS**) in order to assess control risk.

### **Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

## Testing Strategy:

**tep 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

## State of Washington

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency.*

***All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.***

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:*

## State of Washington

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*

*D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if con*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

**Key Control 3 (Manual):** A daily reconciliation is performed by a Tax Specialist to ensure the deposits posted by the bank agrees to the NGTS receipts and all items expected are received by the ESD (**Completeness/Valuation**).

The understanding for this system is documented above in the "Controls - NGTS" step.

### **1. Confirmation of Key Manual Control:**

On 5/22/24, we met with Tina Drew, Tax Specialist 4, and Meredith Cole, Benefit Specialist 4, to discuss the reconciliation.

To perform the reconciliation between NGTS and the bank, Tina pulled the Daily Bank Deposit Worksheet into her work queue. After she has reconciled all the items, she clicks the <approve> button which will complete her process and remove the item from her queue.

During our review, we noticed that she verifies that the total bank deposit amount agrees between the Daily Bank Deposit Worksheet and the bank statement. This verification is important as it will confirm that the bank's total deposit for the day is complete and accurate in NGTS.

## State of Washington

We selected the date of 3/11/2024 to: (1) determine whether the reconciliation was completed (that is no variance between NGTS and US bank) and (2) verify total deposit on Daily Bank Deposit Worksheet agrees to bank statement and agrees to NGTS. The amount reported on the Daily Bank Deposit Worksheet was \$620,825.38. The amount on the Bank Statement Report was reported as \$611,078.40. The amount of ACH dishonored (returned ACH transaction) was \$9,746.98. The variance between the Daily Deposit Worksheet and the US Bank statement was due to US Bank returning checks and not having the ACH dishonored amount in it's statement. The ACH dishonored amount equals the variance between the Daily Bank Deposit Worksheet and the Key Bank statement. We determined this to be reasonable since the ACH dishonored checks were a credit. ***No issues noted.***

### **Noted Weaknesses are as follows:**

"None"

### **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

### **E.3.PRG - Premiums and Assessments**

*Procedure Step:* Key Control 4 (Manual)

*Prepared By:* CJM, 10/2/2024

*Reviewed By:* RKM, 7/5/2024

Purpose/Conclusion.
---------------------

#### **Purpose:**

To confirm a monthly reconciliation is preformed between the bank and AFRS (**Key Control 4 for NGTS**) in order to assess control risk.

#### **Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

## State of Washington

### Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

Guidance/Criteria.†

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

# State of Washington

## SAO Audit Policy [2310](#) - Reporting Identified Audit Issues

## SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk

Record of Work Done:

**Key Control 4 (Manual):** Monthly, the Treasury Manager reviews the AFRS to bank reconciliation to ensure accuracy and completeness in AFRS. The Manager does this by comparing the Monthly AFRS JV, UC Clearance Journal and daily deposits to the total recorded in AFRS **(Completeness/Valuation)**.

The understanding for this system is documented above in the "Controls - NGTS" step.

### **1. Confirmation of Key Manual Control:**

On June 27, 2024, Meghan Phelps, Treasury Manager, provided us with the March 2024 Monthly AFRS JV and Tina Drew, Tax Specialist 4, provided us with the BAI2 report for March 11, 2024. The Clearance tab of the March 2024 Monthly AFRS JV records the daily amounts for transactions and totals them for the month. For March 11, 2024 there was a total of \$611,078.40 received and \$9,746.98 in ACH debts. The amounts in the clearance tab agreed to the amounts declared on the March 11, 2024 BIA2 report. We were able to determine the monthly totals in the Clearance tab tie directly to the amounts recorded in the March 2024 AFRS JV and bank. **No issues noted.**

We confirmed the Treasury Manager's review of bank statements in our control confirmations for Cash and Cash Equivalents here [[Key Control 1 \(Cash Reconciliations\)](#)].

### **2. Preliminary Control Risk Assessment**

Based on our understanding and anticipated audit strategy, we assessed preliminary control risk as follows:

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning to rely on controls and therefore do not need to test controls; control risk will be assessed at maximum.

# State of Washington

## E.3.PRG - Premiums and Assessments

*Procedure Step:* Key Control 5 (Manual)

*Prepared By:* CJM, 7/22/2024

*Reviewed By:* RKM, 8/6/2024

Purpose/Conclusion:

**Purpose:**

To confirm ESD accurately records accrued revenue to recognize during their accounts receivable process and books the entry to the AR and accrued revenue as part of the quarterly journal voucher (Key Control 5 for NGTS) in order to assess control risk.

**Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence*

## State of Washington

*about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*

*D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if con*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

**Key Control 5 (Manual):** The ESD determines the amount of accrued revenue to recognize during their accounts receivable process and books the entry to the AR and Accrued revenue as part of the quarterly journal voucher (**Completeness/Valuation**).

The understanding for this system is documented above in the "Controls - NGTS" step.

### **1. Confirmation of Key Manual Control:**

On 7/16/2024, we obtained the information on how journal vouchers are prepared and reviewed before being uploaded into AFRS, from Meghan Phelps, Treasury Manager and Son Pham, Fiscal Analyst.

### **Accrued Revenue**

Son showed us the "Monthly AFRS JV" spreadsheet that they use as support for recording the monthly journal entry for the month ending March

## State of Washington

2024. There are tables showing the following:

Schedule of Accounts Receivable which calculates the amount of receivables accrued for the month.

The Allowance for Uncollectible Accounts for the quarter, which shows how much allowance for uncollectible accounts should be accumulated as of the quarter ending 3/31/2024.

The amounts determined for the Accounts Receivable and Allowance for Uncollectible Accounts entry ultimately result in a change in the Accrued revenues for the period.

We verified that the amount listed on the March 2024 UC Clearance Journal matched the amounts reported on the JV. Son Pham, Fiscal Analyst, reconciles the total month's cash receipts to the Clearance Account.

The JV totals were traced to the UC Clearance Journal. No exceptions were noted.

We agreed the amount of \$32,658,822.41 in the journal voucher to the spreadsheet provided. *No issues noted.*

### **2. Preliminary Control Risk Assessment**

Based on our understanding and anticipated audit strategy, we assessed preliminary control risk as follows:

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning to rely on controls and therefore do not need to test controls; control risk will be assessed at maximum.

### **E.3.PRG - Premiums and Assessments**

*Procedure Step:* Risk Assessment

*Prepared By:* CJM, 10/2/2024

*Reviewed By:* RKM, 10/18/2024

Purpose/Conclusion:
---------------------

# State of Washington

## **Purpose / Conclusion:**

To assess inherent risk, control risk, and the risk of material misstatement in order to design an initial testing strategy for each assertion.

## Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

### **STEP 1: Inherent Risk (IR)**

Assess inherent risk for each relevant assertion. This assessment is based on understanding of the entity and the nature of the account balance or class of transactions.

*Inherent risk is the susceptibility of an assertion to material misstatement. It is our assessment of "total threat", which includes both "natural risk" and identified risk indicators, without any regard to any potential control activities. As inherent risk is fully independent of control risk, any understanding of controls cannot be used to increase/decrease the assessment of inherent risk. Consider the following factors as your basis for this assessment:*

#### *General Considerations*

*Does the balance include transactions that are difficult to audit or involve complex accounting issues?*

*Were there significant misstatements identified in previous audits or prior-period adjustments in the account balance or transaction class? If so, analyzing the cause of prior period misstatements will help in analyzing inherent risk.*

*Are there any inherent risk factors at the entity or industry level, such as changes in regulation or accounting rules, unique transactions or accounting practices, use of information technology, etc that affect the balance?*

#### *Inherent Risk due to Error*

*How large are the transactions making up the balance? If the balance has only a few large transactions, even a single error may mean a significant misstatement.*

*Have there been changes in the transactions making up the balance that may increase risk? For example, significantly different composition, nature or volume of transactions may inherently disrupt established controls.*

*Are financial events originated or identified by accounting personnel or non-accounting personnel? This consideration is mainly for the completeness assertion.*

*Does the process to account for transactions involve judgment or estimation, complex calculations, numerous steps or significant manual steps?*

*Do transactions have widely varying attributes that need to be manually identified? For example, grant loans that are accounted for in one of several ways depending on the terms of the agreement.*

#### *Inherent Risk due to Fraudulent Reporting (intentional misstatements)*

*Are there substantial pressures or motivations to misstate the balance?*

#### *Inherent Risk due to Misappropriation*

## State of Washington

*Is the account balance or transaction class susceptible to sizable misappropriation?*

*Inherent Risk due to Non-Compliance*

*Are there any laws, contracts or grant agreements affecting the balance? If so, would non-compliance lead to sizable misstatements?*

*Are compliance requirements complex, hard to understand, subject to judgment or otherwise difficult to comply with?*

*Are there any motivations or pressures to not comply?*

### **STEP 2: Control Risk (CR)**

Assess control risk by system and assertion. This assessment should be based on the results of the control understanding, confirmation, and (if setting control risk to LOW) testing. If applicable, auditors will evaluate any control deficiencies and determine whether those deficiencies, individually or in combination, are significant deficiencies or material weaknesses.

*Control risk is the risk that material misstatements would not be prevented or detected timely by the system of internal control. Control risk could be thought of as the "vulnerability" of an entity to misstatements. Control risk exists independently of the inherent risk (the level of vulnerability exists independent of the level of threat).*

*Control risk is MAX in both of the following situations: (1) controls aren't tested or (2) controls are problematic and cannot be relied upon. In order to set control risk to LOW, the auditor must test that controls operated effectively throughout the period.*

*A material weakness exists when the design or operation of controls results in a reasonable possibility a material misstatement will not be prevented or detected and corrected in a timely manner. A significant deficiency is less severe than a material weakness, yet important enough to merit the attention of the governing body. **All potential material weaknesses and significant deficiencies should be discussed with the AIC, since they must be reported as findings.***

### **STEP 3: Risk of Material Misstatement (RMM)**

Assess the risk of material misstatement for each relevant assertion for each significant line item. The risk of material misstatement (RMM) is a combination of the auditor's separate assessment of inherent and control risk.

*In practice, the RMM is the amount of substantive evidence that's needed, and the only way to reduce the amount of needed substantive evidence (equal to the inherent risk) is to test controls. As such, when control risk is MAX, the RMM must always equal the inherent risk (IR).*

*When controls are tested & can be relied upon (are determined to be effective) it is a matter of professional judgment how much the RMM should be set lower than inherent risk (1 or 2 steps).*

*Auditors should assess RMM by assertion, if different. For example, if RMM is assessed at MOD for the existence assertion, but LOW for the rights & obligations assertion, then document "MOD – existence and LOW – rights & obligations".*

# State of Washington

## **STEP 4: Design Substantive Testing**

Design a substantive testing strategy that addresses the relevant assertion (identified risk) in the portion of the line item that relates to that risk.

*Planning identifies where to audit (significant balances, classes of transactions & disclosures) what to audit for (relevant assertions), and how much to audit (RMM). The quantity and quality of evidence obtained by substantive tests needs to match the level of risk. The higher the risk of material misstatement, the greater evidence needed. "Greater evidence" could either be greater quantity of evidence, greater quality of evidence, or some combination of greater quality and quantity.*

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6210](#) – Planning Financial Statement Audits**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits Planning Guide](#)**

Record of Work Done:

## **(1) Inherent Risk (IR):**

Based on our understanding of the line item, we assessed inherent risk as follows for each relevant assertion and significant class of transactions:

Valuation - **High**

Completeness - **High**

## **(2) Control Risk (CR):**

We assessed control risk as follows for each system and relevant assertion:

**NGTS** - Valuation

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

## State of Washington

### **NGTS - Completeness**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **(3) Risk of Material Misstatement (RMM):**

We considered both inherent and control risk and assessed the risk of material misstatement as follows for each relevant assertion and significant class of transactions:

Valuation - **HIGH**

Completeness - **HIGH**

### **(4) Testing Strategy:**

We designed our substantive testing strategy based on our assessment of the risk of material misstatement. We plan to perform the following tests:

#### **Completeness:**

We will select a sample of deposits and ensure they are complete by tracing the deposits to reconciliations and NGTS.

We will review the year-end bank statement reconciliation through our testing of the cash and cash equivalents balance.

#### **Valuation:**

We will review the employer wage reports (in NGTS) for two samples of employers (delinquent and non-delinquent) and recalculate the tax rate and premiums due for those employers. Additionally, we will review the amount estimated for accrued revenues through our testing of our account receivable balance.

We anticipate that these tests will provide sufficient appropriate audit evidence to address the assessed risk of material misstatement for relevant assertions in significant classes of transactions.

### **E.3.PR.G - Premiums and Assessments**

*Procedure Step:* Substantive Test

*Prepared By:* CJM, 10/22/2024

*Reviewed By:* RKM, 10/28/2024

# State of Washington

## Purpose/Conclusion:

### **Purpose:**

To determine whether all revenues relating to the period were reported (**Completeness**).

To determine whether revenues were reported at properly valued or calculated amounts (**Valuation**).

### **Conclusion:**

During our completeness testing we identified an issue related to the NGTS deposit testing. See issue here: [[E: ESD Misstatement of NGTS Deposits Reporting to AFRS](#)]. See AOM here: [[Aggregation of Misstatements \(GAAP\)](#)].

We determined revenues were reported at properly valued or calculated amounts. *No issues noted.*

## Testing Strategy:

### **Valuation**

The following is a list of **considerations** for testing the valuation assertion for revenues. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

### **Calculation**

Recalculate billed revenues on a check (one of each variation), CAATS or sample basis.

For large populations of standard billings, perform CAATS tests to identify unexpected or outlier transactions for further review.

Review related-party transactions to determine whether revenue transactions were correctly calculated.

### **Realizable Value**

Re-calculate a sample or selection of billings. If billings are calculated by software, the auditor could test and substantiate the automated control and also consider any risks associated with manual inputs used by software.

Evaluate the entity's calculation of the allowance amount for reasonableness. This evaluation should include comparing the entity's estimate to the entity's actual historical experience of collecting or writing-off receivables.

Trace the amount of bad debt approved by the governing body (per minutes) to reductions of receivables and bad debt expense to verify it was properly accounted for. *Note: approvals may be slightly more, as customers may pay after the bad debt has been approved but before it is written off.*

### **Estimation / Recognition**

Review calculation and support for assumptions of any estimated revenues.

## State of Washington

Accounting research to verify that revenues were reported in conformity with revenue recognition policies reported in the financial statement notes.

### **Property Tax Revenues** - see separate step

The following is a list of **considerations** for testing the completeness assertion for revenues. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

Identify expected revenue streams based on understanding of fund activities and scan to see if revenue is reported for all such streams. Follow up on any unexpectedly missing streams.

Identify new revenues (ex: new grants or programs) and follow up to verify that expected revenues have been reported.

Perform a multi-year trend of revenues and follow up on unexpected decreases.

Compare revenues to budgeted amounts and follow up on unexpectedly low actual amounts.

Search for manual journal entries that debit (decrease) revenues. Consider testing if any risk indicators are noted.

### **Cut-Off**

Scan revenue transactions recorded 1-3 months before and/or after fiscal year end. Based on the scan, test selected or sampled revenues to determine if they were reported in the correct period.

### **Detail Roll-up**

Compare year-end totals from general ledger to subsidiary software modules for selected revenues.

Review the government's reconciliation of general ledger to subsidiary ledgers.

*Detail roll-up testing is not sufficient audit evidence by itself since it only entails comparing different sets of the entity's own accounting records. However, it may be combined with other substantive tests to address identified risks. For example, if substantive testing is performed at the subledger level, it may be combined with a test that the subledger detail accurately rolls up to the general ledger or financial statements.*

Guidance/Criteria.†

### **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

### **BARS [3.6.11](#) Suspense Funds**

# State of Washington

Record of Work Done:

## **Substantive tests performed to meet the Completeness assertion:**

We used the Nonstatistical Sample of Population 365 or less spreadsheet with a tolerable misstatement and assurance levels dictated by the material balance workpaper for a planned sample size of 24. We randomly selected a sample of 24 business days throughout FY24, excluding days that fell on a weekend or a state/federal holiday.

We obtained Daily Bank Deposit Worksheet Reconciliations (from NGTS) and Key Bank Statement screenshots to ensure that bank deposits (revenue) are complete. We ensured that the bank deposits coming through US Bank agreed to amounts reported within NGTS.

See substantive testing at: [\[FS Sampling - NGTS Deposits Testing\]](#). Based on our evaluation of results and sampling risk, we determined the sample provided a reasonable basis for conclusions about the population. We determined there to be a known misstatement of \$122,737.33 and a total misstatement of \$1,635,945. On October 10, 2024, we inquired with Stephanie Eskesen, External Audit Liaison, and she stated that NGTS had double posted a bank deposits when the bank had only received one deposit. **See issue here** [\[E: ESD\\_Misstatement of NGTS Deposits Reporting to AFRS\]](#)

We also reviewed the year-end bank reconciliation through our testing of the cash and cash equivalents balance. See record of work done at: [\[Substantive Test\]](#).

## **Substantive tests performed to meet the Valuation assertion:**

We performed the following procedures to determine whether revenues were reported at properly valued or calculated amounts:

### Delinquent Employers Testing:

We used the Financial Audit Substantive Statistical Sample spreadsheet with a tolerable misstatement and assurance levels dictated by the material balance workpaper for a planned sample size of 39. We decided to expand the testing by 17 additional samples due to the risk associated with premiums and assessments. We randomly selected a sample of 56 delinquent employers. We reviewed the employer tax rate transaction to determine whether revenue transactions were correctly calculated. We recalculated the employers UI tax rate in effect for the 2024 Fiscal Year. The employer had two UI tax rates in effect for the year. One for the period of July 1, 2023 through December 31, 2023 and a second for the period of January 1, 2024 to June 30, 2024. This is due to tax rates being assigned based on calendar year.

The Employer's UI Tax rates are automatically calculated by NGTS and employers are notified of their rates in December of each year. The UI tax rate for an employer is dependent on several factors:

- Employer's Benefit Ratio
- Delinquent Balance
- Social Cost Rate

# State of Washington

Legislative Limit  
Employment Administration Fund (EAF) Tax Rate

During testing, we determined the following factors of the Employers UI rate through verification or recalculation based on NGTS:

Employer's Benefit Ratio (Experience Rating)

Amount of unemployment benefits paid to former employees over the past 4 years and payroll size. It's determined by taking the benefit charges associated with the employer and dividing that by the total wages paid by the employer. Each employer is then assigned to one of 40 rate classes based on this number.

Social Cost Rate

Delinquent Balance

EAF Tax Rate

Using the data obtained at [\[Population Methodology\]](#), we were able to recalculate the recorded amount of charges. For delinquent employers we used the formula of Taxable Wages \* Total Tax Rate to recalculate premiums. We compared this recalculation to another recalculation of premiums from within NGTS where we verified that tax rates and the amounts of payments were correct. See substantive testing performed at: [\[FS Sampling - Premiums & Assessments Testing\]](#). Tabs, "Delinquent NGTS Testing" and "Delinquent Testing Detail". ***No issues noted.***

## Non-Delinquent Employers Testing:

We used the Financial Audit Substantive Statistical Sample spreadsheet with a tolerable misstatement and assurance levels dictated by the material balance workpaper for a planned sample size of 39. We decided to expand the testing by 18 additional samples due to the risk associated with premiums and assessments. We randomly selected a sample of 57 non-delinquent employers. We reviewed the employer tax rate transaction to determine whether revenue transactions were correctly calculated. We recalculated the employers UI tax rate in effect for the 2024 Fiscal Year. The employer had two UI tax rates in effect for the year. One for the period of July 1, 2023 through December 31, 2023 and a second for the period of January 1, 2024 to June 30, 2024. This is due to the tax rates being assigned based on the calendar year.

Tax rates are calculated every calendar year. The Employers UI Tax rates are automatically calculated by NGTS and employers are notified of their rates in December of each year. The UI tax rate for an employer is dependent on several factors:

Employer's Benefit Ratio

Delinquent Balance

Social Cost Rate

Legislative Limit

EAF Tax Rate

During testing, we determined the following factors of the Employers UI rate through verification or recalculation based on NGTS:

Employer's Benefit Ratio (Experience Rating)

## State of Washington

Amount of unemployment benefits paid to former employees over the past 4 years and payroll size. It's determined by taking the benefit charges associated with the employer and dividing that by the total wages paid by the employer. Each employer is then assigned to one of 40 rate classes based on this number.

Social Cost Rate

Delinquent Balance

EAF Tax Rate

Using the data obtained at [[Population Methodology](#)], we were able to recalculate the recorded amount of charges. For non-delinquent employers we used the formula of Taxable Wages \* Total Tax Rate to recalculate premiums. We compared this to a recalculation of premiums from within NGTS where we verified that tax rates and the amounts of payments were correct. See substantive testing performed at: [[FS Sampling - Premiums & Assessments Testing](#)]. Tabs, "Non-Delinquent NGTS Testing" and "Non-Delinquent Testing Detail". ***No issues noted.***

### Accrued Revenue:

We reviewed the amount estimated for accrued revenues through our testing of the accounts receivable (net of allowance) balance. See record of work done at: [[Substantive Test](#)].

Note: Penalties and Interest are reported under Miscellaneous Revenue and are not part of this line item.

### E.3.PRG - Premiums and Assessments

*Procedure Step:* Population Methodology

*Prepared By:* PS, 8/27/2024

*Reviewed By:* RKM, 10/18/2024

Purpose/Conclusion.*
----------------------

### **Purpose:**

To created a population of delinquent taxable employers and a population of non-delinquent taxable employers.

### **Conclusion:**

We have provided the delinquent and non-delinquent taxable employers populations to the audit team.

# State of Washington

Testing Strategy:

Guidance/Criteria:

Record of Work Done:

## **Import NGTS Data**

IT Audit emailed Stephanie Eskesen, ESD External Audit Liaison, and Sam Havens, ESD Data Architecture, Transformation and Analytics Manager, to request for NGTS data. This included the NGTS wage report data, NGTS tax report data, tax rate data, and employer data.

An email was sent on May 1st, 2024, to request for the fiscal year 2024 datasets. ESD provided the fiscal year 2024 NGTS datasets text format to us on August 21st, 2024. The files were sent to SAO via the WaTech managed file transfer site (mft.wa.gov). Files were saved to the SAO network drive and imported into SQL database. We have confirmed the record count of each file received to the record count provided by ESD staff. No exception. We performed procedures at [Reasonableness NGTS 2024](#) and determined that the data are reasonable.

## **Document Test Objective and Methodology**

Team FA submitted helpdesk 68025 to request for a population of delinquent employers and a population of non-delinquent employers.

The following describes the steps taken to meet the test objective:

- Create a table of delinquent employers from the Tax Rate file, those with DelinquentTaxRate field of greater than zero.
- Create a table of non-delinquent employers from the Tax Rate file, those with DelinquentTaxRate field equal to zero.
- Add details to delinquent and non-delinquent employers by joining to the NGTS wage table or tax rate table.
- Create a summary table of delinquent employers from the detail table.
- Create a summary table of non-delinquent employers from the detail table.

As we perform our testing, we will make adjustments to this plan as necessary.

## **Queries**

The queries written to complete the testing can be seen at [Testings NGTS 2024](#).

# State of Washington

## **Reasonableness**

The reasonableness of test results has been performed and documented in the above queries. Based upon our checks, we consider our test results to be complete and reasonable.

## **Results**

Test results were provided to Team FA, through an Excel spreadsheet titled, *!2024\_Tax\_Rates\_Populations.xlsx*. The results provided contain CONFIDENTIAL DATA.

A population of FY2024 delinquent employers, with details.	42339records
A population of FY2024 delinquent employers, summary.	21324 records
A population of FY2024 non-delinquent employers, with details.	339915 records
A population of FY2024 non-delinquent employers, summary.	176334 records

## **E.3.PRG - Premiums and Assessments**

*Procedure Step:* Permanent File  
*Prepared By:* CJM, 10/29/2024  
*Reviewed By:* RKM, 11/5/2024

Purpose/Conclusion.:

### **Purpose/Conclusion:**

To document relevant information obtained during our audit which can be applicable to future audits.

Testing Strategy.:

### **Purpose/Conclusion:**

To document relevant information obtained during our audit which can be applicable to future audits.

Guidance/Criteria.:

# State of Washington

## Record of Work Done:

### **Perpetual Note**

As it relates to the contribution rates determined by ESD, we noted that [RCW 50.29.025](#), prescribes the procedures of the department in calculating their Contribution Rates. We noted there were two separate sections of the same RCW as legislature had enacted two acts amending the same section during the same year. As such, we inquired of our Assistant Attorney General (AAG) to determine the appropriate RCW which the Department should be following.

Per our inquiry, we are documenting the conclusion which the Department should be following [RCW 50.29.025](#) (as amended by 2011 c 4).

We have included the correspondence as support within the attached email at: [\[FW ESD Contacts \(re SAO inquiry re RCW 50.29.025\)\]](#), documenting this conclusion and our understanding.

### **E.4.PRG - Premiums and Claims**

*Procedure Step:* Summary & Conclusion

*Prepared By:* DRR, 9/24/2024

*Reviewed By:* CJG, 11/21/2024

## Purpose/Conclusion:

### **Purpose:**

To evaluate risk assessments and the sufficiency and appropriateness of evidence obtained based on results of substantive work.

### **Conclusion:**

We determined that **no** modifications were necessary to inherent risk, control risk, or the risk of material misstatement as assessed in planning.

We also determined that evidence obtained was sufficient and appropriate in response to the risk of material misstatement.

## Testing Strategy:

Auditors are **required** to evaluate conclusions for substantive testing as follows:

# State of Washington

*Auditors may wish to use the optional Lead Sheet available in the Store to summarize testing related to each balance and assertion.*

1. Determine whether the results of substantive testing indicate a need to modify the inherent risk assessment (IR), control risk assessment (CR), risk of material misstatement (RMM) or other aspects of planning (such as material balances or assertions). If so, document changes and consider the need for additional testing.

*If the results of substantive testing indicate a need to change control risk, auditors should also update the **Permanent File** by either correcting the documentation or by adding an update section describing changes to the top of the record of work done. For all changes to IR, CR, or RMM the **Material Balances** spreadsheet should be updated.*

*More significant changes to other aspects of planning (such as material balances or assertions) should be referenced in this step and documented in detail in the **Changes to FS Audit Plan** step.*

2. Evaluate whether the quality and quantity of evidence obtained is sufficient and appropriate in response to the risk of material misstatement. In making this determination, auditors should evaluate:

## Information to be used as audit evidence:

- Does evidence relate to the population, period of time and risk (assertion and "what could go wrong" from the Material Balance Spreadsheet)? If there are any gaps or uncertainties in the logical connection between the evidence and conclusions, is there a documented consideration and explanation?
- Are the sources of information sufficiently reliable and appropriate for the risk (whether internal to the government, external, or auditor developed)? If key information is not from a sufficiently reliable source (for example, inquiry), then is it corroborated by information that is?
- Are there any concerns about accuracy, completeness, authenticity, or bias in information? If so, did the auditor perform sufficient procedures to confirm reliability of that information?
- Is information precise enough to catch if misstatements exceeded the tolerable level?
- Is information detailed enough to conclude on whether or not there were misstatements?
- Was there any information that appeared contradictory or inconsistent? If so, was there a documented response to the inconsistencies or doubts about the reliability of evidence?

## Results:

- How much misstatement was identified by testing, and the likelihood and magnitude of further potential misstatement?
- How did misstatements occur and how often might they occur again in the population?
- Were misstatements caused by control deficiencies or circumvention of controls?

## State of Washington

If control deficiencies, is there a need to re-evaluate our understanding of controls in the [Permanent File](#) folder or assessment of control risk?

If circumvention, the [Management Override of Controls](#) step should address or reference this area. Auditors should also consider whether a fraud risk has been identified.

Did tests identify a different level or type of risk than the planned audit response was designed to address?

If likely misstatements are identified, are further procedures necessary to improve the precision of our estimate?

*To support the overall evaluation of audit risk and provide a basis for concluding on the overall sufficiency and appropriateness of evidence in the [FS Summary & Report](#) step, auditors should conclude in each area whether the auditor continues to believe that the tests performed and quality and quantity of evidence obtained are commensurate with RMM for all relevant risks (the "what could go wrong", in the [Material Balances](#) spreadsheet).*

If the auditor determines that evidence is not sufficient or appropriate, additional substantive testing should be done. If sufficient, appropriate evidence is not available for audit, the AIC should discuss the effect on our audit report with the AAM and AM.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6310](#) – Determining the Nature, Timing and Extent of Substantive Testing**

**SAO Audit Policy [3210](#) – Audit Evidence**

Record of Work Done:

Based on test results, we re-evaluated risk assessments, procedures, evidence obtained and conclusions as follows:

### **(1) Do the results of substantive tests indicate a need to modify our risk assessment (IR, CR and RMM)?**

The results of substantive tests do **not** indicate a need to modify our risk assessment.

### **(2) Was the quality and quantity of evidence obtained sufficient and appropriate?**

The quality and quantity of evidence obtained was sufficient and appropriate.

### **E.4.PR.G - Premiums and Claims**

# State of Washington

*Procedure Step:* Understanding of Line Item  
*Prepared By:* DRR, 5/21/2024  
*Reviewed By:* SHW, 7/31/2024

Purpose/Conclusion:

Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

## **STEP 1: Prior Audit Exceptions**

Document any exceptions noted during the prior audit. Follow-up to determine how the agency has responded to or corrected the issue, unless this work is anticipated as part of the testing strategy.

## **STEP 2: Analyze Composition and Changes of Line Item**

Include link to the line item leadsheet. This will be completed at the end of the audit. Leadsheet analysis should be documented in this spreadsheet.

Inquire with agency staff about the activities and transactions that make up the balance and any changes to those activities or transactions in relation to the prior year.

Determine relevant classes of transactions or account balances within the line item to analyze (such as agencies, funds, programs, departments, accounts, and/or objects), and use AFRS to create trends of those elements. This step should not include any specific dollar amounts associate with the line item.

Evaluate trends to identify:

- (1) What classes of transactions or account balances are primary to the identified risk. Auditors should specifically consider what elements are primary to the line item (comprising a large percentage of the line item), and which elements the identified risk would apply to, and which elements might be most susceptible to the identified risk (having a high risk of non-trivial misstatement for a relevant assertion, considering likelihood and impact of potential for misstatement).
- (2) What changes are primary to the identified risk, if applicable. Auditors should specifically consider whether the overall change to the line item from the prior year was significant, what elements were the primary drivers of overall change, whether any elements changed

## State of Washington

significantly from the prior year, and which changes (if any) might relate to the identified risk.

(3) Any unusual or unexpected elements, amounts, or changes that may indicate a risk, whether the one identified in planning or a new one that may need to be considered for a change to the plan.

**Consider** other procedures to gain an understanding of the line item, such as review of key policy documents, review of program information or reports, inquiry of staff, budget information, or other analytical procedures.

### STEP 3: Update Significant Account Matrix

Based on your understanding of the line item, update the Significant Account Matrix with final conclusions on the agencies covered, account description, significant accounting systems, and risk (what could go wrong and relevant assertions). The account description should reflect the significant transaction streams or account balances relevant to the risk.

*The description of agencies, significant accounting systems, and what could go wrong in the Significant Account Matrix constitute the overall scope of substantive testing.*

*A transaction stream is significant based on the potential for misstatement. This is often due in part to its size (ie: comprising a large percentage of the total line item), but is ultimately a judgment about the susceptibility to the identified risk (for example, when the risk is understatement a small or omitted account may hold the most potential for the largest misstatement).*

*Significant accounting system(s) are those that contain key controls over significant classes of transactions included in the line item. Control systems identified in this step must match the Significant Account Matrix and have a separate control understanding documented.*

*Talk with the AIC if you identify any changes to the Significant Account Matrix.*

Guidance/Criteria.:

Record of Work Done.:

#### **(1) Prior Audit Exceptions:**

No prior audit exceptions were noted for this line item.

#### **(2) Composition & Change Analysis:**

Line Item Leadsheet: [[Line Item Lead Sheet](#)].

We noted the balance included activity from the following funds:

620: Unemployment Compensation Account

622: Unemployment Compensation Federal Employees' Benefit Payment Account

We evaluated the funds and determined transactions from fund 620 make up most of the account balance. We noted the following significant

## State of Washington

changes to the line item:

- Fund 622 GL6505 decreased by \$118 million or 121.5%
- Fund 622 GL6510 decreased by \$1.3 billion or 98.5%
- Fund 620 GL6505 decreased by \$51 million or 101.3%
- Fund 620 GL6510 increased by \$162 million or 15.8%

The Premiums & Claims line item is composed of the payments made by warrant and direct deposit to recipients of unemployment insurance benefits. We expect this balance to agree with the Unemployment Compensation Benefit expenditures issued by the Unemployment Tax and Benefits (UTAB) platform and recorded in AFRS. Unemployment payments include unemployment for all eligible recipients.

The primary control systems covering the relevant assertions is UTAB. Activities performed by UTAB include:

- Interfacing with NGTS
- Making an initial determination of eligibility
- Calculating benefit amounts
- Issuing payments to claimants

UI benefit payments are made out of the trust fund. See below for the benefit types:

Regular Unemployment Compensation (State and Federal: UCFE, and UCX)

Weekly Benefit Amount (WBA): Dependent on state law.

Duration: 26 weeks maximum, or until the claimant reaches the end of the benefit year.

This program is for claimants that are out of work due to no fault of their own.

Pandemic Emergency Unemployment Compensation (PEUC)

WBA: Based on regular unemployment compensation.

Duration: 13 weeks.

PEUC was a federal program created in response to the COVID-19 pandemic. It provided additional benefits through Sept. 4, 2021, to workers who:

Exhausted their regular UI claim with a benefit year that ended on or after the week ending July 6, 2019.

Have left work through no fault of their own.

Are able to work, available for work, and actively seeking work as directed.

Extended Benefits (EB)

WBA: Based on regular unemployment compensation.

Duration: On December 13, 2021, federal law reduced the number of EB benefits from 20 to 13 weeks.

This program was triggered by a high unemployment rate in Washington. Claimants can get Extended Benefits only after their regular unemployment benefits and other extensions, like PEUC, have run out.

## State of Washington

Due to the lower unemployment rate in Washington state, the U.S. Department of Labor has notified ESD that Washington's Extended Benefits program was ended on March 13, 2021.

### Pandemic Unemployment Assistance (PUA)

WBA: Calculated by state accordance in Unemployment Insurance Program Letter (UIPL) No. 16-20

Duration: February 2, 2020 to September 4, 2021 (up to 39 weeks)

PUA is a benefit program that provides a financial safety net to many people who do not qualify for regular unemployment, including:

- Self-employed people

- Independent contractors

- Part-time workers (with fewer than 680 hours)

To be eligible for this program the claimant must have a COVID-19 related reason.

### Federal Pandemic Unemployment Compensation (FPUC)

WBA:

- \$600 (until July 25, 2020)

- \$300 (until September 4, 2021)

Duration:

- \$600: March 29, 2020 to July 25, 2020

- \$300: January 2, 2021 to September 4, 2021

FPUC was an additional amount that was added to the claimant's weekly benefit.

### Lost Wages Assistance (LWA)

WBA: \$300

Duration: Weeks ending August 1, 2020 to September 5, 2020

ESD was approved for the LWA program through the Federal Emergency Management Agency (FEMA). LWA was a federal program that added \$300 for each week the program was federally funded. If the claimant received unemployment benefits for the approved weeks and they were unemployed or working fewer hours due to disruption by COVID-19, then they were eligible for the benefits.

### Pandemic Relief Payments (PRP)

Amount: \$550

Duration: One-time payment for week ending November 21, 2020

On December 27, 2020, Governor Jay Inslee authorized the use of federal CARES Act funds to help Washington claimants whose PUA benefits expired on December 26, 2020 and were waiting for federal legislation to extend those benefits. Federal legislation was signed into law on December 27, 2020 which extended, expanded, and changed the CARES Act provisions. Regardless, claimants eligible for the one-time Pandemic Relief Payment still received it.

### Shared Work

## State of Washington

WBA: \$201 - \$844

Duration: 1 year

Shared Work allows the employer to reduce a claimant's hours by as much as 50 percent, while the claimant collects benefits to replace a portion of their lost wages.

### Trade Readjustment Allowances (TRA)

WBA:

Dependent on petition number.

Duration:

Dependent on petition number.

This program assists workers who have become unemployed as a result of increased imports from, or shifts in production to, foreign countries. The goal of the Trade Act programs is to help trade-affected workers return to suitable employment as quickly as possible.

### Reemployment Trade Adjustment Assistance (RTAA)

WBA:

Dependent on petition number.

Duration:

Dependent on petition number.

This program assists workers who have become unemployed as a result of increased imports from, or shifts in production to, foreign countries. The goal of the Trade Act programs is to help trade-affected workers return to suitable employment as quickly as possible.

### Disaster Unemployment Assistance (DUA)

WBA: Dependent on gross wages. It is calculated using the same formula as regular UI.

Duration: January 5, 2022 - July 9, 2022

DUA provides temporary benefits to people who lost or experienced interruptions in employment or self-employment as a direct result of a major disaster and don't qualify for regular UI. There was a declaration of a major disaster on January 5, 2022.

### Mixed Earners Unemployment Compensation (MEUC)

WBA: Extra \$100 a week for eligible programs

Duration: December 27, 2020 - September 4, 2021

ESD is implementing MEUC retroactively. Claimants are considered a mixed earner if they are using both self-employment and employment to apply for unemployment benefits.

Note: Several programs have ended, however we left information for the programs due to the Department still paying out benefits retroactively.

# State of Washington

**(3) Updates to Significant Account Matrix:**

None

**E.4.PRG - Premiums and Claims**

*Procedure Step:* Understanding of Line Item

*Prepared By:* DRR, 5/21/2024

*Reviewed By:* SHW, 7/31/2024

Purpose/Conclusion:

Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

**STEP 1: Prior Audit Exceptions**

Document any exceptions noted during the prior audit. Follow-up to determine how the agency has responded to or corrected the issue, unless this work is anticipated as part of the testing strategy.

**STEP 2: Analyze Composition and Changes of Line Item**

Include link to the line item leadsheet. This will be completed at the end of the audit. Leadsheet analysis should be documented in this spreadsheet.

Inquire with agency staff about the activities and transactions that make up the balance and any changes to those activities or transactions in relation to the prior year.

## State of Washington

Determine relevant classes of transactions or account balances within the line item to analyze (such as agencies, funds, programs, departments, accounts, and/or objects), and use AFRS to create trends of those elements. This step should not include any specific dollar amounts associate with the line item.

Evaluate trends to identify:

- (1) What classes of transactions or account balances are primary to the identified risk. Auditors should specifically consider what elements are primary to the line item (comprising a large percentage of the line item), and which elements the identified risk would apply to, and which elements might be most susceptible to the identified risk (having a high risk of non-trivial misstatement for a relevant assertion, considering likelihood and impact of potential for misstatement).
- (2) What changes are primary to the identified risk, if applicable. Auditors should specifically consider whether the overall change to the line item from the prior year was significant, what elements were the primary drivers of overall change, whether any elements changed significantly from the prior year, and which changes (if any) might relate to the identified risk.
- (3) Any unusual or unexpected elements, amounts, or changes that may indicate a risk, whether the one identified in planning or a new one that may need to be considered for a change to the plan.

**Consider** other procedures to gain an understanding of the line item, such as review of key policy documents, review of program information or reports, inquiry of staff, budget information, or other analytical procedures.

### STEP 3: Update Significant Account Matrix

Based on your understanding of the line item, update the Significant Account Matrix with final conclusions on the agencies covered, account description, significant accounting systems, and risk (what could go wrong and relevant assertions). The account description should reflect the significant transaction streams or account balances relevant to the risk.

*The description of agencies, significant accounting systems, and what could go wrong in the Significant Account Matrix constitute the overall scope of substantive testing.*

*A transaction stream is significant based on the potential for misstatement. This is often due in part to its size (ie: comprising a large percentage of the total line item), but is ultimately a judgment about the susceptibility to the identified risk (for example, when the risk is understatement a small or omitted account may hold the most potential for the largest misstatement).*

*Significant accounting system(s) are those that contain key controls over significant classes of transactions included in the line item. Control systems identified in this step must match the Significant Account Matrix and have a separate control understanding documented.*

*Talk with the AIC if you identify any changes to the Significant Account Matrix.*

Guidance/Criteria:

Record of Work Done:

### Disaster Unemployment Assistance (DUA)

WBA: Dependent on gross wages. It is calculated using the same formula as regular UI.

Duration: January 5, 2022 - July 9, 2022

## State of Washington

DUA provides temporary benefits to people who lost or experienced interruptions in employment or self-employment as a direct result of a major disaster and don't qualify for regular UI. There was a declaration of a major disaster on January 5, 2022.

Mixed Earners Unemployment Compensation (MEUC)

WBA: Extra \$100 a week for eligible programs

Duration: December 27, 2020 - September 4, 2021

ESD is implementing MEUC retroactively. Claimants are considered a mixed earner if they are using both self-employment and employment to apply for unemployment benefits.

Note: Several programs have ended, however we left information for the programs due to the Department still paying out benefits retroactively.

### **(3) Updates to Significant Account Matrix:**

None

### **E.4.PRG - Premiums and Claims**

*Procedure Step:* Key Control 1 (System Calculation - Automated)

*Prepared By:* DRR, 6/14/2024

*Reviewed By:* SHW, 8/22/2024

Purpose/Conclusion.

#### **Purpose:**

To determine whether the UTAB system determines if claimants meet the hourly eligibility requirements (at least 680 hours) to receive UI benefits **(Key Control #1 for UTAB system)** was in place and operating effectively and to consider related general IT controls in order to assess control risk.

#### **Conclusion:**

Based on our understanding and test results, we concluded that the automated control **was** in place and operating effectively.

# State of Washington

Based on our understanding, related general IT controls **were** in place and adequately designed to ensure that the control operated consistently during the audit period. However, we did not test the operating effectiveness of general IT controls.

Our understanding and control risk assessment, which incorporates these conclusions, is documented at [\[Risk Assessment\]](#).

Testing Strategy:

The following procedures are **required** for all automated key controls for financial and single audits:

## **STEP 1: Understand Automated Key Control**

Gain an understanding of the automated key control. The understanding can either be documented in the control system step or could be documented here in this step. Auditors should consider the following aspects of the automated control when gaining an understanding:

### **Software Calculation:**

Is there written documentation of the calculation, and/or the source rates and factors used in the calculation?

*We would expect written documentation that defines the calculation and is an official, approved source for the formulas, rates and factors. This may be an approved policy or could be system documentation.*

What formulas are used to make the calculation?

What values or factors are used to make the calculation? For example:

- Rate tables used by the calculation
- Profile fields (i.e., applicable transaction types)
- Programmed/set formulas and/or values
- Constraints (i.e., effective date, minimums/maximums, etc.)

How is the calculation triggered or initiated?

How is the calculation recorded in the accounting system (or used in an end result)?

### **Automated Interfaces:**

Is data transferred in real time (immediately) or in a batch? If batched, how often does the interface occur (daily, monthly, quarterly, etc.)?

What triggers the data transfer?

*Transfers could be manually initiated, could be hardcoded into either the sending or receiving system's programming, could be controlled by administrative menus (for integrated software modules), or could be run as automated jobs with third party software or programming.*

## State of Washington

Could the interface process fail? If so, how would the entity recognize that the process failed?

*This may not be a relevant risk for integrated software, but may be the case for custom interfaces designed outside the software which may be subject to various points of failure.*

Will the interface process reject transactions or batches with errors? If so, who monitors rejections and follows up on rejected transactions to ensure correction (either in the sending or receiving systems) and how are corrections tracked and monitored?

*For example, information that could trigger a rejection or isolated transaction and batch can include: invalid data, duplicate data, or missing factors. If errors are possible, we would expect the isolated data is reviewed, tracked and corrected in a timely manner.*

Are any reconciliations done to provide assurance that data transfer was complete and accurate?

*We would expect the local government to perform a reconciliation between source and destination systems to ensure the interfaced data is complete and accurate. This may be a manual reconciliation or spot-check, a system or dashboard report, or automated edit check. Depending on how often errors (if any) are expected, the reconciliation could be done each time the interface occurs, or on a monitoring basis, like annually.*

### Edit Checks:

Inquire if the entity has a written policy or documentation describing the approval process and protocols for reviewers?

What is the approval process in the application?

What transactions, data, tasks, or documents are approved?

Who are the preparers? How do preparers submit for approval?

Who are the authorized approvers? Are there backup approvers?

What documents or information are required to make approval judgment?

What is the next step once a transaction/data/ task/document is approved or denied?

Is there any exception situations where approval can be by-passed or waived?

Can the approver make changes to information during the approval stage? If so, is the preparer notified of the changes?

Can anyone make changes to the approved information after the approval stage? If so, are changes captured in an audit trail and is the audit trail (log) regularly reviewed and monitored to detect any unauthorized changes?

Does the application prevent users from approving their own work (self-approval)?

*Some applications have a feature preventing self-approval. If an application does not have a feature preventing self-approval, we would expect manual controls in place to ensure the segregation of duties between preparer and approver, if relevant to the risk.*

## State of Washington

Does the application have high-level users that can also approve?

*High-Level Users (aka Users with elevated privileges, system or application "Administrators", "Super Users", etc.) typically have full access to change system settings and may have extensive function rights of software applications. Depending on entity's size and complexity, different high-level users may be responsible for the network vs. application level. High-level users represent a heightened risk for overriding segregation of duties and normal control processes.*

*We would expect entities to have compensating monitoring controls if personnel are responsible for both application settings and transaction processing controls.*

### Computer Generated Reports:

What information or exceptions is the report designed to identify (what is the purpose of the report)?

How is the report used and by whom?

For exception reports, who reviews the report and how do they follow up on exceptions?

*Auditors should consider whether the exception report reviewer has appropriate authority and information to effectively follow-up on report results. For fraud-related risks, also consider whether the review position is appropriately segregated from positions that can initiate transactions. For exception reports that regularly identify many transactions needing multi-step follow-up, the manual review and follow-up may be identified as a separate key control rather than documented and evaluated as an aspect of the automated exception report control.*

What are the report parameters or criteria? Does the report have any calculated fields? If so, what are the calculations?

*The ideal method of documenting an understanding of a computer generated report is to get a screenshot or printout of the report parameters. If using a report writer, this may be printed with the report, or may be accessed from a design view or intermediary screen. For custom or complex reports, this may be the SQL code.*

*For exception reports, auditors should pay special attention to the definition of an exception embodied in the report parameters.*

*NOTE: observation of the report parameters will also count as a confirmation of the report and could also be used to test the report.*

### Electronic Approvals:

Inquire if the entity has a written policy or documentation describing the approval process and protocols for reviewers?

What is the approval process in the application?

## State of Washington

What transactions, data, tasks, or documents are approved?  
Who are the preparers? How do preparers submit for approval?  
Who are the authorized approvers? Are there backup approvers?  
What documents or information are required to make approval judgment?  
What is the next step once a transaction/data/ task/document is approved or denied?  
Is there any exception situations where approval can be by-passed or waived?

Can the approver make changes to information during the approval stage? If so, is the preparer notified of the changes?

Can anyone make changes to the approved information after the approval stage? If so, are changes captured in an audit trail and is the audit trail (log) regularly reviewed and monitored to detect any unauthorized changes?

Does the application prevent users from approving their own work (self-approval)?

*Some applications have a feature preventing self-approval. If an application does not have a feature preventing self-approval, we would expect manual controls in place to ensure the segregation of duties between preparer and approver, if relevant to the risk.*

Does the application have high-level users that can also approve?

*High-Level Users (aka Users with elevated privileges, system or application "Administrators", "Super Users", etc.) typically have full access to change system settings and may have extensive function rights of software applications. Depending on entity's size and complexity, different high-level users may be responsible for the network vs. application level. High-level users represent a heightened risk for overriding segregation of duties and normal control processes.*

*We would expect entities to have compensating monitoring controls if personnel are responsible for both application settings and transaction processing controls.*

### **STEP 2: Confirm and Test Automated Key Control**

Confirm and test the automated control. To test the automated control, consider the following procedures:

#### **Software Calculation:**

Re-perform the calculation for selected transactions.

*Auditors would NOT normally use sampling for automated controls. Instead, auditors should judgmentally select one instance of each significant variation of the calculation. If the number of potential variations is large, auditors would judgmentally select based on risk factors (for example, the most common scenarios, or scenarios associated with identified risks, or scenarios that are not addressed by the entity's testing procedures).*

*In some cases, it may be possible for the auditor to reperform the calculation for the entire population.*

## State of Washington

If any rate tables or values were updated during the period, view the current values (by observing the rate table or values in an admin menu or from a printed system report) and compare to approved sources.

*If no updates were made or there are only a few values, this risk could be addressed by re-performing the calculation. However, if source rate tables or values are large or complex, it may be more efficient to test these values directly than to recalculate a larger number of transactions.*

Consider the use of analytical procedures such as trends or descriptive statistics on the population (like average, minimum and maximum values, or a graph of values across the population) and follow up on any unexpected values or trends. *Analytical procedures would normally also count as a substantive test.*

### Automated Interfaces:

Re-perform a reconciliation, comparison or analytical procedure between both systems to determine whether data interfaced completely and accurately. Alternatively, review the entity's reconciliation or comparison if they perform one.

*For example, auditors could perform count totals and summarize the data to determine whether the same number of transactions reside in both systems, or the total amount from the sending system was posted to the receiving system. Whether this takes the form of a comparison (numbers expected to match exactly), reconciliation (when reconciling items are expected) or analytical procedure (if numerous adjustments or reconciling items are expected) will depend on the nature of the interface and client documentation.*

*Note: these procedures would also provide substantive evidence.*

Observe documentation, such as interface logs or email notifications, to determine whether interfaces complete per expected interval (daily, monthly, quarterly, etc.).

*We would expect the data transfer to be consistent based on the programmed schedule. If data is expected to be transferred on a weekly basis, we would expect to see some form of documentation showing the weekly transfer.*

Observe evidence that batch jobs are monitored such as tracking spreadsheets or emails.

When interfaces did not occur as expected, determine whether procedures were followed to resubmit job or that there was a logical reason no data was received/sent for the interval (for example, it was a holiday so there was no interface for that day).

### Edit Checks:

Re-perform the edit check for selected transactions.

*Auditors would NOT normally use sampling for automated controls. Instead, auditors should judgmentally select one instance of each*

## State of Washington

*significant variation of the check. If the number of potential variations is large, auditors would judgmentally select based on risk factors (for example, the most common scenarios, or scenarios associated with identified risks, or scenarios that are not addressed by the entity's testing procedures).*

*In some cases, it may be possible for the auditor to reperform the edit check for the entire population.*

Consider the use of analytical procedures such as trends or descriptive statistics on the population (like average, minimum and maximum values, or a graph of values across the population) and follow up on any unexpected values or trends. Analytical procedures would normally also count as a substantive test.

### Computer Generated Reports:

For exception reports, inquire with the person assigned to review the report how frequently exceptions are noted by the report. Trace identified exceptions to documentation of correction or resolution.

Re-perform the report by either (a) generating it yourself in the entity's system (if the auditor has direct access to the system), (b) recreating the report using CAATS, or (c) by observing the report be generated in your presence. If observing, note any user-entered values or parameters and determine whether entered parameters were appropriate. Compare re-performed report to the one being tested.

### Electronic Approvals:

Observe a transaction to see the approval process and verify any key aspects of the process or limits.

If transaction data or reports include approval information, use CAATS to confirm that all transactions met authorization rules.

### **STEP 3: Understand General IT Controls**

Gain an understanding of the general IT controls that support the continued proper operation of the automated control. Identify key general IT controls and note any control weaknesses. Auditors should consider the following aspects of general IT controls when gaining an understanding:

#### Software Calculation:

Inquire if the entity has experienced any errors or irregularities with the calculation. Also how often changes are made to the calculation, and how many changes (if any) were made during the year.

How can the software calculation (formulas, rates/values, settings/configurations) be changed or customized?

*Software calculations will usually have one or more administrative menus that allow the government to modify rate tables or other calculation values, or to configure the calculation or apply settings.*

*In other cases, software calculation formulas and/or values may be hard-coded into the system and require programmers to make the changes. If the government has access to source code, then it needs internal procedures for program changes. If the program is*

## State of Washington

*controlled by vendors, we would expect program change procedures and expectations to be included in the contract.*

What are the procedures to authorize and make program changes or configuration/setting changes to the software calculation?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

*If utilizing a test environment, there should be controls to ensure that the live environment is updated and is consistent with the live production environment. As management is responsible for the accuracy of their automated controls (i.e., in the live environment), we would expect there to be a procedure to confirm each key automated control once it is in the live environment. This could be manually re-performing the calculation, reviewing reports against known expectations, etc.*

How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change programming, but they may be responsible for patch management, master table data, and/or configurations.*

### Automated Interfaces:

Inquire if the entity has experienced any errors or irregularities with the interface. Also how often changes are made to the interface, and how many changes (if any) were made during the year.

What are the procedures to authorize and make changes to the interface?

*Except for the most simple situations, we would normally expect update procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

## State of Washington

What are the procedures to test that program changes are properly working?

*If the data transfer is already going to be checked or reconciled, then there may be less need for specific test procedures on program changes since any errors will be identified right away.*

How are program changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

*If the program is controlled by a third-party, we would expect a process between the government and vendor that allows the government to make requests and receive communication at the completion of the request.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to vendor developed/supported coding that controls how the system processes the interfaced data, but they may be responsible for working the interface error queues and reconciling the interfaced data.*

### Edit Checks:

Inquire if the entity has experienced any errors or irregularities with the edit checks. Also how often changes are made to the checks, and how many changes (if any) were made during the year.

How can the edit check be changed or customized?

*Edit checks may be hard-coded into the system and require programmers to make the changes. If the government has access to source code, then it needs internal procedures for program changes. If the program is controlled by vendors, we would expect program change procedures and expectations to be included in the contract.*

*In other cases, edit checks may be established or configured through one or more administrative menus.*

What are the procedures to authorize and make program changes or configuration/setting changes?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change*

## State of Washington

*management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

*If utilizing a test environment, there should be controls to ensure that the live environment is updated and is consistent with the live production environment. As management is responsible for the accuracy of their automated controls (i.e., in the live environment), we would expect there to be a procedure to confirm each key automated control once it is in the live environment. This could be manually re-performing the edit check, reviewing reports against known expectations, etc.*

How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change programming, but they may be responsible for patch management, master table data, and/or configurations.*

### Computer Generated Reports:

Inquire if the entity has experienced any errors or irregularities with the report. Also how often changes are made to the report, and how many changes (if any) were made during the year.

How is the report triggered or initiated?

*For reports that are automatically triggered, the auditor would normally not identify job scheduling or monitoring as a general control since we would expect failure of the report to generate*

Is the report hardcoded into the program, or is it a custom or ad hoc report? Also, what manual inputs (if any) are required to run the report?

*What parameters, criteria (date ranges, fund number, departments) or instructions are entered by the user to generate the exception report. The more options entity personnel have to customize or modify the report, the higher the risk of human error and inaccurate or incomplete reports. Pre-programmed reports provide less flexibility than ad-hoc reports; however, if program change controls are in*

## State of Washington

*place, they are more consistent.*

If the report is hardcoded into the system, how are program changes made?

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change vendor developed reports, but they may be responsible for triggering, setting certain parameters, and/or following up on exception report results.*

NOTE: if the auditor cannot identify sufficiently effective general IT controls, the automated control will need to be tested using the same methods as a manual control (ie: sampling throughout the period). For example, if the report is manually generated and highly dependent on a number of manual inputs each time, or if the report does not have formal change controls, such as an ad hoc report or excel-based report. In such cases, the automated report is controlled by limited access and the judgment of the report writer – that is, while the report is an automated component, there is also an integrated manual component to the control.

### Electronic Approvals:

How are users assigned preparer and approver roles? Are user accounts periodically checked for needed changes? See the [User Access](#) step in the Accountability folder for more control considerations.

If configurations or settings relevant to the approval process are controlled by an admin menu, who has access to this menu?

If the entity has access to source coding for approval controls, what are the procedures to authorize and make program changes?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

## State of Washington

*For example, local governments may not have access to vendor developed/supported coding that controls how the electronic approval works, but they may be responsible for approval configurations or settings and/or user account management.*

### **STEP 4: Confirm Key General IT Controls**

Confirm your understanding of key general IT controls to determine whether they have been placed in operation (*whether the entity has actually implemented key controls*).

### **STEP 5: Test Key General IT Controls**

Document whether general IT controls will be tested. Option 1 would result in control risk at MAX for the automated control. Either option 2 or 3 is necessary in order to set control risk at LOW. If general IT controls are tested, consider the following procedures:

#### **Software Calculation:**

If program changes or setting/configuration changes are logged, review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the calculation may also provide this evidence if the re-performance tests address all states of the calculation during the period.

If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

#### **Automated Interfaces:**

Review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, reconciling or comparing the data transfer (or reviewing the entity's reconciliation or comparison) may also provide this evidence if tests address all states of the interface during the period.

## State of Washington

Inspect job processing error logs/reports. Observe evidence that errors in processing were isolated and resolved. For example, select a sample of rejected transactions and observe evidence to determine whether errors were appropriately corrected and the corrections were timely.

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

### Edit Checks:

If program changes or setting/configuration changes are logged, review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the edit check may also provide this evidence if the re-performance tests address all states of the edit check during the period.

If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

### Computer Generated Reports:

If the report is subject to program change controls (either due to being hardcoded or by being automatically triggered), review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

If the report is subject to program change controls, review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the report may also provide this evidence if the re-performance tests address all states of the report during the period.

If the report relies on manual inputs and report copies saved show the parameters entered, the auditor can check a selection or sample of reports to confirm that the report was run correctly.

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

### Electronic Approvals:

## State of Washington

Review user access report to verify that current users are appropriate. Also consider review of user access change logs (if available) to evaluate user account management throughout the period. See the User Access step in the Accountability folder for more testing considerations.

If approvals are governed by significant settings/configurations, and such changes are logged, review the change log to verify the population of changes for the year.

*Verification that no configuration changes were made, along with the auditor's evaluation that no such changes are expected, would normally be sufficient evidence to conclude that no further testing is necessary.*

If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.

If the entity has access to source code, review the change log to verify the population of changes for the year. Then review programming change documentation or the entity's test documentation for selected or sampled changes.

*Verification that no program changes were made, along with the auditor's evaluation that no such changes are expected, would normally be sufficient evidence to conclude that no further testing is necessary.*

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the SOC Report Reliance worksheet in the Store.

### **STEP 6: Final Control Risk**

Evaluate the results and document a final control risk assessment in the control system step. Consider whether any deficiencies identified with either the automated control or related general IT controls represent material weaknesses or significant deficiencies.

*Note: general IT control deficiencies do not necessarily mean the automated control is not properly functioning. General IT control deficiencies would normally be considered a significant deficiency or material weakness only if it caused an issue with the compliance requirement or assertion.*

### **Recommendation Review Requirement**

IT Security related information is considered category 3 data protected by Public Request Exemption RCW 42.56.420. Issues related to IT Security require the following special handling:

[Instructions](#) are located in Team IT Audit's System's Sharepoint page.

Details of IT Security related issues should NOT be included in any emails or helpdesks.

Exit, ML and Findings should be separately communicated in an IT Security Results Document.

Findings will be referenced, but not included in the audit report.

All IT security-related recommendations must be reviewed by [Team IT Audit](#).

# State of Washington

Template language for common IT related recommendations can be found in [ARS Part 5 Chapter 8](#).

## **PUBLIC REQUEST EXEMPTION**

Some IT related information is protected by Public Request Exemption RCW 42.56.420 for cyber security purposes. The details documented in the record of work and support workpapers may qualify for this exemption. If so, auditors must include this statement in the record of work done and any related workpapers: "**This record contains information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited**".

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

## **Information Technology Planning Guide**

Auditors may contact [Team IT Audit](#) with any testing strategy or control assessment questions or to request assistance from an IT Specialist.

**Software Calculation:** A **software calculation control** exists when the value of a transaction is determined by a software application. This process can be a key control when the entity relies on the system to generate calculations correctly to determine the amount of transactions (i.e., summarizing/account code allocation to post to general ledger, calculate student, utility, other charges, etc.).

**Automated Interfaces:** An interface is a process that moves information from one computer application to another. The interface can occur internally between systems maintained by a single agency, or between systems maintained by different agencies or private companies. The interface can also occur between modules within the same computer application.

The data transferred might be a file consisting of one or more records processed at a later time (batch), or it can be a real-time update. Risk associated with interfaces increases as the number of transactions or the number of other services and systems supported by the interfaced data increases.

Poor design or inadequate oversight can affect the transfer of transaction data among the systems. Interface controls are automated and/or manual processes designed to ensure transmission and processing of information is complete and accurate.

## **Manual vs. Automated Interfaces**

## State of Washington

A “manual interface” is the transfer of data from one system or module to another system or module, initiated and controlled by a user. An example of a manual interface is when customer accounts are downloaded from a utility billing system to be used to perform meter readings. When complete, the file with meter readings may be uploaded and posted to the customer accounts.

An “automated interface” is the transfer of data from one system or module to another system or module that happens automatically based on a schedule, or other predefined criteria. A common example of an automated interface is the payroll module of a system. Typically, a payroll batch is created in the payroll module. Once approved, the batch is automatically sent by the system to the general ledger or other applicable modules, such as accounts payable.

Entities should have reconciliation controls between their various applications regardless of the method used for interfacing.

*Auditors should have determined whether system interfaces are automated as part of the Key Software Applications workpaper. **If not**, ask the following question to determine whether the system interface is manual or automated.*

*Is the data transferred from one system/module to another system/module by a user using an uploading and posting technique? For example, data is pulled from one system into a text file or other format, that is then uploaded into a different system or module by posting or in an upload feature of the module. If the answer to this question is yes, the interface would be considered “manual” since it is initiated and controlled by manually rather than through an automated process.*

**Edit Checks:** An **edit check** is a programmed routine designed to check input data or processing results for accuracy, compliance, or reasonableness. Types of edit checks include:

Range Checks: ensure that numeric values fall within specified ranges, minimums and/or maximums. For example, ensuring that a capital asset can only be entered as a positive amount, or a purchase order can only be submitted without secondary approval for less than a certain threshold.

Consistency Checks: verify that related data fields are consistent with each other. For example, ensuring that a patient’s age matches their date of birth.

Format Checks: validate data formats (for example, dates as MM/DD/YYYY or phone numbers as ###-###-####).

Logical Checks: assess logical relationships between data fields. For instance, verifying that total debits equals total credits in a journal entry.

Duplicate Checks: identify duplicate records or entries. For example, preventing the same invoice from being entered twice.

Cross-Field Checks: compare data across different fields. For instance, ensuring that the start date of a project is before the end date.

Required Field Checks: ensure that mandatory fields are filled out. For instance, making sure that a patient’s name and date of birth are provided.

Referential Integrity Checks: validate relationships between data tables. For example, confirming that a vendor number exists in the vendor master file as an active entity.

Outlier Checks: detect extreme or unexpected values. For instance, flagging water meter reading values that are extreme outliers for the customer type or account history.

# State of Washington

Pattern Checks: look for specific patterns in data. For example, verifying that email addresses follow a valid format.

Edit checks may result in automatic rejection of a transaction, inability to proceed with a transaction, trigger for additional processing or review, or may simply result in a warning message to the user.

Edit checks may be identified as a key control when they are sufficiently relevant (ie: addressing the risk), precise (ie: able to catch all errors, rather than just being only reasonableness or limit check), and sufficiently strong (ie: prevent invalid transactions, rather than just generating a warning messages). Auditors may identify an individual edit or a group of edit checks together as a key control.

**Computer Generated Reports:** A **computer-generated report** is a report that is created by a computer program. The computer program, also referred to as a report generator or tool, takes data from a data source, such as a database, and displays it in a specified format. The process to generate a report often includes performing calculations on the data, such as summarizing, classifying, etc., before displaying, or can display the calculations on the report.

There are two types of computer-generated reports, pre-programmed and ad-hoc or customized reports.

Pre-programmed or canned reports are pre-defined reports where criteria and specifications are hard coded in the system. A canned report may allow limited parameters, (month/year, for example), but in general the information that will be displayed is pre-determined.

Ad-hoc or customized reports allow the user to drill down and customize what information is displayed on the report based on some allowed criteria, such as account codes, dollar amounts minimum, etc).

In contrast, a **manual report** is one that is created outside the system using data exports or is created ad hoc by a user. An example of a manual report is one that is created by copying data from a data source and pasting the data in an Excel spreadsheet or Word document or Powerpoint presentation where it is then processed further. With manual reports, each time a report is created, the data could be incorrect due to user error, such as not copying all relevant data, or processing errors. Therefore, these types of reports should be understood and tested similar to manual controls.

**Electronic Approvals:** Electronic approvals, electronic signatures and digital signatures are technically different, although often these terms are used interchangeably by entities.

Auditors should have determined whether the electronic approval is an automated control as part of the overall understanding of controls. For automated control purposes, an electronic approval is a software system functionality that:

Permits a user to approve transaction(s) within the software system

The system automatically documents, or logs, the data approved by the user and any subsequent manipulation

The acceptance or rejection of the transaction by the approver will trigger an additional software system process, such as posting of a transaction.

## State of Washington

E-mail, scanned-in pictures of signatures, or font-changed signatures, etc. may be part of a control activity but are generally not considered an automated control and are not covered by this testing strategy.

### Electronic Signature vs Digital Signature

An “**electronic signature**” can look like a handwritten signature that has been scanned and then pasted into an electronic document. The reliability of this type of approval is variable. Recommend gaining an understanding of the process used to store and affix the signature to the document and then discuss the process with Team IT Audit before placing reliance on this control.

A “**digital signature**” is a legal signature with a formal certification process that documents who approved the document and ensures the document is not modified after certification. Reliability of this process is very high but has significant technical features. Recommend brainstorm with Team IT Audit before placing reliance on this control.

### **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

**Statements on Auditing Standards [AU-C 315](#) Understanding the Entity and Its Environment and Assessing the Risks of Material Misstatement** - paragraphs .A106-.A109 describe general and application controls and how they relate to audit risks

**Statements on Auditing Standards [AU-C 330](#) Performaing Audit Procedures in Response to Assessed Risks and Evaluating the Audit Evidence Obtained** - paragraphs .10b and .A33-.A34 describe requirements and guidance for testing indirect controls in conjunction with tests of controls, that is, testing key general controls in conjunction with a test of a key automated control

Record of Work Done.:

**This record may contain information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited.**

### **Premiums and Claims - Rights & Obligations**

**Key Control 1 (Rights & Obligations - Automated):** The UTAB system determines if claimants meet the hourly eligibility requirements (at least 680 hours) to receive UI benefits.

The understanding for this system is documented above in the "Controls - UTAB" step.

### **STEP 1: Understand Automated Key Control**

The understanding for this automated key control is documented above in the "Controls -UTAB" step.

# State of Washington

## **STEP 2: Confirm and Test Automated Key Control:**

The initial eligibility requirement for unemployment insurance (UI) benefits is that claimants must have worked at least 680 hours in their base year. A claimant can file for UI benefits through an agent, online, or by using an automated phone system. UTAB determines if the claimant is eligible or not based on hours and wage data in the system. NGTS is the system of record for wage and hours data, submitted by employers.

On 5/23/2024, Amanda Rouse, Business Systems Analyst (UTAB), provided us information from UTAB. The screens we saw are the ones the agents would use when claimants call. We tested three scenarios:

1. Claimant has worked less than 680 hours during base year, and
2. Claimant has worked more than 680 hours during base year, and
3. Claimant has worked 680 hours during base year.

Amanda provided a claimant for each scenario indicated above. See below:

1. We reviewed the Monetary Determination section of UTAB, Benefit Summary tab. The case number was 0-075-339-711. UTAB showed 81 hours in the base year and was listed as "Monetarily Ineligible". Weekly Benefit Amount (WBA) showed \$0.
2. We reviewed the Monetary Determination section of UTAB, Benefit Summary tab. The case number was 0-073-965-675. UTAB showed 720 hours in the base year and was listed as "Monetarily Eligible". WBA showed \$323.
3. We reviewed the Monetary Determination section of UTAB, Benefit Summary tab. The case number was 0-072-705-885. UTAB showed 680 hours in the base year and was listed as "Monetarily Eligible". WBA showed \$323.

For the three scenarios above, UTAB appropriately assessed eligibility of each claimant tested. **No issues noted.**

This key control is applicable to regular UI benefits. This does not apply to Pandemic Unemployment Assistance (PUA) benefits. PUA is a separate benefit program, that ended in September 2021, and provided a financial safety net to many people who did not qualify for regular unemployment, including:

- Self-employed people
- Independent contractors
- Part-time workers (with fewer than 680 hours)

ESD had a minimum payment that claimants received without documentation, however, ESD began validating self-employment or partial employment claims starting December 2020.

## **STEP 3: Understand General IT Controls**

We met with Zachary McInroy, Security Analyst, and Adarsh Jnawali, IS Governance, Compliance, & Risk Analyst, on May 13, 2024 to gain an understanding of general IT controls over the UTAB system.

## State of Washington

Any changes to the UTAB system flow must go through the pre-production (test) environment before they are implemented in the production (live) environment. Major changes that would change the architecture of the UTAB system require a review from the Office of Cyber Security. A change request would be filled out by the system owner and would be sent to the Security Team. The system owner would meet with the Security team to discuss the requested changes, provide architecture diagrams and to answer any questions. The Security team would then create a risk assessment and send it to the Office of Cyber Security for their review. The Office of Cyber Security will then issue a summary of the changes and this document will need to be signed by the system owner and other business leaders. After these approvals, the change will be communicated to other ESD departments and the Change Advisory Board so they can review the changes to determine if the change will affect other ESD IT systems. The Change Advisory Board has representatives from every major IT system at ESD. Any questions from the Board will be directed at the UTAB developers and this process helps work through any potential problems that were not thought of during the change request process. Once all this is completed, the work to implement the changes will begin.

Quality and security updates do not go through the change approval process mentioned above. Quality and security updates are regular updates that ESD makes to their software to remove any bugs that have been identified, and to correct any security vulnerabilities. As mentioned above, all changes must go through testing before going into production. The first stage of testing is performed by the QA Team. If the programming passes the initial testing with dummy data, the developer will request a migration to the staging environment, which is a mirror of the production environment (live) and uses real data. This testing process ensures that the changes function as intended using real world data. All changes to the system are recorded, including who made the changes. Once the changes have gone through the testing process, there is a UTAB team that will review the testing results and approve the changes for production. Once the UTAB team approves the changes for production, the Change Advisory Board will review the test results. If approved by the Board, ESD will schedule the changes to go to production.

Before the scheduled update to production, ESD has a plan in place in case the "go live" update has errors and a "roll-back" to prior code is required. Automated emails are sent to appropriate staff informing them of the date and time of the update. Once the changes have been implemented, there is another email that will state whether the changes have been successfully implemented or whether ESD is going to roll-back the change and re-schedule the update. Once the changes have been successfully implemented in production, there is a UTAB Team that will perform QA testing to ensure the implemented changes are functioning as intended (**Key Control #1**).

### **STEP 4: Confirm Key General IT Controls**

**Key Control #1 - All changes to the UTAB system must go through a standard change process, where changes are tested, reviewed and approved before migrating to production.**

We requested and received ESD's SQR screenshots for the most recent quality control update (SQR 12654), which was provided by Stephanie Eskesen, Audit Liaison. This update was requested by Wendy Yunker, Fraud Systems Management Analyst, on January 19, 2024, and was assigned to Jason Sikorski, Lead Applications Developer. The purpose of the update is to provide the ability to mark and add notes to claimant's eServices/Secure Access Washington (SAW) web sessions as potentially hijacked by bad actors to aid Investigators in reviewing web session activity without having to scour through past notes. As of the time the ticket was created, the development team had higher priority projects to work on, which is why the development took approximately 5 months. Development began on February 21, 2024, and was completed on June 3,

## State of Washington

2024. Jason's request to migrate to testing was approved by Matt Sleipness, Investigator 3 - On Project, who also completed the testing. Jason requested migration to the staging environment on June 3, 2024 which was approved by Mark Beck, FAST Contractor, on June 4, 2024. The update migrated to staging on June 5, 2024. Jason Sikorski requested the migration from staging to production on June 10, 2024 and Mark Beck approved the migration to production on June 10, 2024 and the update was migrated to production on June 12, 2024. We have confirmed that changes to the UTAB system must go through the standard process of development, testing, and approval to migrate between environments. **No issues noted.**

### **STEP 5: Test Key General IT Controls**

Not applicable - we are not planning to rely on automated controls and therefore do not need to test general controls; control risk will be assessed at MAX.

### **E.4.PR.G - Premiums and Claims**

*Procedure Step:* Key Control 2 (System Determination - Automated)

*Prepared By:* DRR, 6/14/2024

*Reviewed By:* SHW, 8/22/2024

Purpose/Conclusion.*
----------------------

#### **Purpose:**

To determine whether through UTAB and ESD's Fraud Unit, ESD runs initial and weekly claims through the discovery process before payment goes out (**Key Control #2 for UTAB system**) was in place and operating effectively and to consider related general IT controls in order to assess control risk.

#### **Conclusion:**

Based on our understanding and test results, we concluded that the automated control **was** in place and operating effectively.

Based on our understanding, related general IT controls **were** in place and adequately designed to ensure that the control operated consistently during the audit period. However, we did not test the operating effectiveness of general IT controls.

Our understanding and control risk assessment, which incorporates these conclusions, is documented at [[Risk Assessment](#)].

# State of Washington

## Testing Strategy:

The following procedures are **required** for all automated key controls for financial and single audits:

### **STEP 1: Understand Automated Key Control**

Gain an understanding of the automated key control. The understanding can either be documented in the control system step or could be documented here in this step. Auditors should consider the following aspects of the automated control when gaining an understanding:

#### **Software Calculation:**

Is there written documentation of the calculation, and/or the source rates and factors used in the calculation?

*We would expect written documentation that defines the calculation and is an official, approved source for the formulas, rates and factors. This may be an approved policy or could be system documentation.*

What formulas are used to make the calculation?

What values or factors are used to make the calculation? For example:

- Rate tables used by the calculation
- Profile fields (i.e., applicable transaction types)
- Programmed/set formulas and/or values
- Constraints (i.e., effective date, minimums/maximums, etc.)

How is the calculation triggered or initiated?

How is the calculation recorded in the accounting system (or used in an end result)?

#### **Automated Interfaces:**

Is data transferred in real time (immediately) or in a batch? If batched, how often does the interface occur (daily, monthly, quarterly, etc.)?

What triggers the data transfer?

*Transfers could be manually initiated, could be hardcoded into either the sending or receiving system's programming, could be controlled by administrative menus (for integrated software modules), or could be run as automated jobs with third party software or programming.*

Could the interface process fail? If so, how would the entity recognize that the process failed?

*This may not be a relevant risk for integrated software, but may be the case for custom interfaces designed outside the software which may be subject to various points of failure.*

## State of Washington

Will the interface process reject transactions or batches with errors? If so, who monitors rejections and follows up on rejected transactions to ensure correction (either in the sending or receiving systems) and how are corrections tracked and monitored?

*For example, information that could trigger a rejection or isolated transaction and batch can include: invalid data, duplicate data, or missing factors. If errors are possible, we would expect the isolated data is reviewed, tracked and corrected in a timely manner.*

Are any reconciliations done to provide assurance that data transfer was complete and accurate?

*We would expect the local government to perform a reconciliation between source and destination systems to ensure the interfaced data is complete and accurate. This may be a manual reconciliation or spot-check, a system or dashboard report, or automated edit check. Depending on how often errors (if any) are expected, the reconciliation could be done each time the interface occurs, or on a monitoring basis, like annually.*

### Edit Checks:

Inquire if the entity has a written policy or documentation describing the approval process and protocols for reviewers?

What is the approval process in the application?

What transactions, data, tasks, or documents are approved?

Who are the preparers? How do preparers submit for approval?

Who are the authorized approvers? Are there backup approvers?

What documents or information are required to make approval judgment?

What is the next step once a transaction/data/ task/document is approved or denied?

Is there any exception situations where approval can be by-passed or waived?

Can the approver make changes to information during the approval stage? If so, is the preparer notified of the changes?

Can anyone make changes to the approved information after the approval stage? If so, are changes captured in an audit trail and is the audit trail (log) regularly reviewed and monitored to detect any unauthorized changes?

Does the application prevent users from approving their own work (self-approval)?

*Some applications have a feature preventing self-approval. If an application does not have a feature preventing self-approval, we would expect manual controls in place to ensure the segregation of duties between preparer and approver, if relevant to the risk.*

Does the application have high-level users that can also approve?

*High-Level Users (aka Users with elevated privileges, system or application "Administrators", "Super Users", etc.) typically have full access to change system settings and may have extensive function rights of software applications. Depending on entity's size and complexity,*

## State of Washington

*different high-level users may be responsible for the network vs. application level. High-level users represent a heightened risk for overriding segregation of duties and normal control processes.*

*We would expect entities to have compensating monitoring controls if personnel are responsible for both application settings and transaction processing controls.*

### Computer Generated Reports:

What information or exceptions is the report designed to identify (what is the purpose of the report)?

How is the report used and by whom?

For exception reports, who reviews the report and how do they follow up on exceptions?

*Auditors should consider whether the exception report reviewer has appropriate authority and information to effectively follow-up on report results. For fraud-related risks, also consider whether the review position is appropriately segregated from positions that can initiate transactions. For exception reports that regularly identify many transactions needing multi-step follow-up, the manual review and follow-up may be identified as a separate key control rather than documented and evaluated as an aspect of the automated exception report control.*

What are the report parameters or criteria? Does the report have any calculated fields? If so, what are the calculations?

*The ideal method of documenting an understanding of a computer generated report is to get a screenshot or printout of the report parameters. If using a report writer, this may be printed with the report, or may be accessed from a design view or intermediary screen. For custom or complex reports, this may be the SQL code.*

*For exception reports, auditors should pay special attention to the definition of an exception embodied in the report parameters.*

*NOTE: observation of the report parameters will also count as a confirmation of the report and could also be used to test the report.*

### Electronic Approvals:

Inquire if the entity has a written policy or documentation describing the approval process and protocols for reviewers?

What is the approval process in the application?

What transactions, data, tasks, or documents are approved?

Who are the preparers? How do preparers submit for approval?

Who are the authorized approvers? Are there backup approvers?

What documents or information are required to make approval judgment?

What is the next step once a transaction/data/ task/document is approved or denied?

## State of Washington

Is there any exception situations where approval can be by-passed or waived?  
Can the approver make changes to information during the approval stage? If so, is the preparer notified of the changes?  
Can anyone make changes to the approved information after the approval stage? If so, are changes captured in an audit trail and is the audit trail (log) regularly reviewed and monitored to detect any unauthorized changes?  
Does the application prevent users from approving their own work (self-approval)?

*Some applications have a feature preventing self-approval. If an application does not have a feature preventing self-approval, we would expect manual controls in place to ensure the segregation of duties between preparer and approver, if relevant to the risk.*

Does the application have high-level users that can also approve?

*High-Level Users (aka Users with elevated privileges, system or application "Administrators", "Super Users", etc.) typically have full access to change system settings and may have extensive function rights of software applications. Depending on entity's size and complexity, different high-level users may be responsible for the network vs. application level. High-level users represent a heightened risk for overriding segregation of duties and normal control processes.*

*We would expect entities to have compensating monitoring controls if personnel are responsible for both application settings and transaction processing controls.*

### **STEP 2: Confirm and Test Automated Key Control**

Confirm and test the automated control. To test the automated control, consider the following procedures:

#### **Software Calculation:**

Re-perform the calculation for selected transactions.

*Auditors would NOT normally use sampling for automated controls. Instead, auditors should judgmentally select one instance of each significant variation of the calculation. If the number of potential variations is large, auditors would judgmentally select based on risk factors (for example, the most common scenarios, or scenarios associated with identified risks, or scenarios that are not addressed by the entity's testing procedures).*

*In some cases, it may be possible for the auditor to reperform the calculation for the entire population.*

If any rate tables or values were updated during the period, view the current values (by observing the rate table or values in an admin menu or from a printed system report) and compare to approved sources.

*If no updates were made or there are only a few values, this risk could be addressed by re-performing the calculation. However, if source rate tables or values are large or complex, it may be more efficient to test these values directly than to recalculate a larger number of transactions.*

## State of Washington

Consider the use of analytical procedures such as trends or descriptive statistics on the population (like average, minimum and maximum values, or a graph of values across the population) and follow up on any unexpected values or trends. *Analytical procedures would normally also count as a substantive test.*

### Automated Interfaces:

Re-perform a reconciliation, comparison or analytical procedure between both systems to determine whether data interfaced completely and accurately. Alternatively, review the entity's reconciliation or comparison if they perform one.

*For example, auditors could perform count totals and summarize the data to determine whether the same number of transactions reside in both systems, or the total amount from the sending system was posted to the receiving system. Whether this takes the form of a comparison (numbers expected to match exactly), reconciliation (when reconciling items are expected) or analytical procedure (if numerous adjustments or reconciling items are expected) will depend on the nature of the interface and client documentation.*

*Note: these procedures would also provide substantive evidence.*

Observe documentation, such as interface logs or email notifications, to determine whether interfaces complete per expected interval (daily, monthly, quarterly, etc.).

*We would expect the data transfer to be consistent based on the programmed schedule. If data is expected to be transferred on a weekly basis, we would expect to see some form of documentation showing the weekly transfer.*

Observe evidence that batch jobs are monitored such as tracking spreadsheets or emails.

When interfaces did not occur as expected, determine whether procedures were followed to resubmit job or that there was a logical reason no data was received/sent for the interval (for example, it was a holiday so there was no interface for that day).

### Edit Checks:

Re-perform the edit check for selected transactions.

*Auditors would NOT normally use sampling for automated controls. Instead, auditors should judgmentally select one instance of each significant variation of the check. If the number of potential variations is large, auditors would judgmentally select based on risk factors (for example, the most common scenarios, or scenarios associated with identified risks, or scenarios that are not addressed by the entity's testing procedures).*

*In some cases, it may be possible for the auditor to reperform the edit check for the entire population.*

## State of Washington

Consider the use of analytical procedures such as trends or descriptive statistics on the population (like average, minimum and maximum values, or a graph of values across the population) and follow up on any unexpected values or trends. Analytical procedures would normally also count as a substantive test.

### Computer Generated Reports:

For exception reports, inquire with the person assigned to review the report how frequently exceptions are noted by the report. Trace identified exceptions to documentation of correction or resolution.

Re-perform the report by either (a) generating it yourself in the entity's system (if the auditor has direct access to the system), (b) recreating the report using CAATS, or (c) by observing the report be generated in your presence. If observing, note any user-entered values or parameters and determine whether entered parameters were appropriate. Compare re-performed report to the one being tested.

### Electronic Approvals:

Observe a transaction to see the approval process and verify any key aspects of the process or limits.

If transaction data or reports include approval information, use CAATS to confirm that all transactions met authorization rules.

### **STEP 3: Understand General IT Controls**

Gain an understanding of the general IT controls that support the continued proper operation of the automated control. Identify key general IT controls and note any control weaknesses. Auditors should consider the following aspects of general IT controls when gaining an understanding:

### Software Calculation:

Inquire if the entity has experienced any errors or irregularities with the calculation. Also how often changes are made to the calculation, and how many changes (if any) were made during the year.

How can the software calculation (formulas, rates/values, settings/configurations) be changed or customized?

*Software calculations will usually have one or more administrative menus that allow the government to modify rate tables or other calculation values, or to configure the calculation or apply settings.*

*In other cases, software calculation formulas and/or values may be hard-coded into the system and require programmers to make the changes. If the government has access to source code, then it needs internal procedures for program changes. If the program is controlled by vendors, we would expect program change procedures and expectations to be included in the contract.*

What are the procedures to authorize and make program changes or configuration/setting changes to the software calculation?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change*

## State of Washington

*management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

*If utilizing a test environment, there should be controls to ensure that the live environment is updated and is consistent with the live production environment. As management is responsible for the accuracy of their automated controls (i.e., in the live environment), we would expect there to be a procedure to confirm each key automated control once it is in the live environment. This could be manually re-performing the calculation, reviewing reports against known expectations, etc.*

How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change programming, but they may be responsible for patch management, master table data, and/or configurations.*

### Automated Interfaces:

Inquire if the entity has experienced any errors or irregularities with the interface. Also how often changes are made to the interface, and how many changes (if any) were made during the year.

What are the procedures to authorize and make changes to the interface?

*Except for the most simple situations, we would normally expect update procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

*If the data transfer is already going to be checked or reconciled, then there may be less need for specific test procedures on program changes since any errors will be identified right away.*

## State of Washington

How are program changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

*If the program is controlled by a third-party, we would expect a process between the government and vendor that allows the government to make requests and receive communication at the completion of the request.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to vendor developed/supported coding that controls how the system processes the interfaced data, but they may be responsible for working the interface error queues and reconciling the interfaced data.*

### Edit Checks:

Inquire if the entity has experienced any errors or irregularities with the edit checks. Also how often changes are made to the checks, and how many changes (if any) were made during the year.

How can the edit check be changed or customized?

*Edit checks may be hard-coded into the system and require programmers to make the changes. If the government has access to source code, then it needs internal procedures for program changes. If the program is controlled by vendors, we would expect program change procedures and expectations to be included in the contract.*

*In other cases, edit checks may be established or configured through one or more administrative menus.*

What are the procedures to authorize and make program changes or configuration/setting changes?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

*If utilizing a test environment, there should be controls to ensure that the live environment is updated and is consistent with the live*

## State of Washington

*production environment. As management is responsible for the accuracy of their automated controls (i.e., in the live environment), we would expect there to be a procedure to confirm each key automated control once it is in the live environment. This could be manually re-performing the edit check, reviewing reports against known expectations, etc.*

How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change programming, but they may be responsible for patch management, master table data, and/or configurations.*

### Computer Generated Reports:

Inquire if the entity has experienced any errors or irregularities with the report. Also how often changes are made to the report, and how many changes (if any) were made during the year.

How is the report triggered or initiated?

*For reports that are automatically triggered, the auditor would normally not identify job scheduling or monitoring as a general control since we would expect failure of the report to generate*

Is the report hardcoded into the program, or is it a custom or ad hoc report? Also, what manual inputs (if any) are required to run the report?

*What parameters, criteria (date ranges, fund number, departments) or instructions are entered by the user to generate the exception report. The more options entity personnel have to customize or modify the report, the higher the risk of human error and inaccurate or incomplete reports. Pre-programmed reports provide less flexibility than ad-hoc reports; however, if program change controls are in place, they are more consistent.*

If the report is hardcoded into the system, how are program changes made?

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

## State of Washington

*For example, local governments may not have access to change vendor developed reports, but they may be responsible for triggering, setting certain parameters, and/or following up on exception report results.*

NOTE: if the auditor cannot identify sufficiently effective general IT controls, the automated control will need to be tested using the same methods as a manual control (ie: sampling throughout the period). For example, if the report is manually generated and highly dependent on a number of manual inputs each time, or if the report does not have formal change controls, such as an ad hoc report or excel-based report. In such cases, the automated report is controlled by limited access and the judgment of the report writer – that is, while the report is an automated component, there is also an integrated manual component to the control.

### Electronic Approvals:

How are users assigned preparer and approver roles? Are user accounts periodically checked for needed changes? See the [User Access](#) step in the Accountability folder for more control considerations.

If configurations or settings relevant to the approval process are controlled by an admin menu, who has access to this menu?

If the entity has access to source coding for approval controls, what are the procedures to authorize and make program changes?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to vendor developed/supported coding that controls how the electronic approval works, but they may be responsible for approval configurations or settings and/or user account management.*

### **STEP 4: Confirm Key General IT Controls**

Confirm your understanding of key general IT controls to determine whether they have been placed in operation (*whether the entity has actually*

## State of Washington

*implemented key controls).*

### **STEP 5: Test Key General IT Controls**

Document whether general IT controls will be tested. Option 1 would result in control risk at MAX for the automated control. Either option 2 or 3 is necessary in order to set control risk at LOW. If general IT controls are tested, consider the following procedures:

#### **Software Calculation:**

If program changes or setting/configuration changes are logged, review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the calculation may also provide this evidence if the re-performance tests address all states of the calculation during the period.

If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

#### **Automated Interfaces:**

Review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, reconciling or comparing the data transfer (or reviewing the entity's reconciliation or comparison) may also provide this evidence if tests address all states of the interface during the period.

Inspect job processing error logs/reports. Observe evidence that errors in processing were isolated and resolved. For example, select a sample of rejected transactions and observe evidence to determine whether errors were appropriately corrected and the corrections were timely.

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

#### **Edit Checks:**

## State of Washington

If program changes or setting/configuration changes are logged, review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the edit check may also provide this evidence if the re-performance tests address all states of the edit check during the period.

If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

### Computer Generated Reports:

If the report is subject to program change controls (either due to being hardcoded or by being automatically triggered), review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

If the report is subject to program change controls, review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the report may also provide this evidence if the re-performance tests address all states of the report during the period.

If the report relies on manual inputs and report copies saved show the parameters entered, the auditor can check a selection or sample of reports to confirm that the report was run correctly.

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

### Electronic Approvals:

Review user access report to verify that current users are appropriate. Also consider review of user access change logs (if available) to evaluate user account management throughout the period. See the User Access step in the Accountability folder for more testing considerations.

If approvals are governed by significant settings/configurations, and such changes are logged, review the change log to verify the population of changes for the year.

*Verification that no configuration changes were made, along with the auditor's evaluation that no such changes are expected, would*

## State of Washington

*normally be sufficient evidence to conclude that no further testing is necessary.*

If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.

If the entity has access to source code, review the change log to verify the population of changes for the year. Then review programming change documentation or the entity's test documentation for selected or sampled changes.

*Verification that no program changes were made, along with the auditor's evaluation that no such changes are expected, would normally be sufficient evidence to conclude that no further testing is necessary.*

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the SOC Report Reliance worksheet in the Store.

### **STEP 6: Final Control Risk**

Evaluate the results and document a final control risk assessment in the control system step. Consider whether any deficiencies identified with either the automated control or related general IT controls represent material weaknesses or significant deficiencies.

*Note: general IT control deficiencies do not necessarily mean the automated control is not properly functioning. General IT control deficiencies would normally be considered a significant deficiency or material weakness only if it caused an issue with the compliance requirement or assertion.*

### **Recommendation Review Requirement**

IT Security related information is considered category 3 data protected by Public Request Exemption RCW 42.56.420. Issues related to IT Security require the following special handling:

[Instructions](#) are located in Team IT Audit's System's Sharepoint page.

Details of IT Security related issues should NOT be included in any emails or helpdesks.

Exit, ML and Findings should be separately communicated in an IT Security Results Document.

Findings will be referenced, but not included in the audit report.

All IT security-related recommendations must be reviewed by [Team IT Audit](#).

Template language for common IT related recommendations can be found in [ARS Part 5 Chapter 8](#).

### **PUBLIC REQUEST EXEMPTION**

Some IT related information is protected by Public Request Exemption RCW 42.56.420 for cyber security purposes. The details documented in the record of work and support workpapers may qualify for this exemption. If so, auditors must include this statement in the record of work done and any related workpapers: **"This record contains information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited "**.

# State of Washington

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

### **Information Technology Planning Guide**

Auditors may contact [Team IT Audit](#) with any testing strategy or control assessment questions or to request assistance from an IT Specialist.

**Software Calculation:** A **software calculation control** exists when the value of a transaction is determined by a software application. This process can be a key control when the entity relies on the system to generate calculations correctly to determine the amount of transactions (i.e., summarizing/account code allocation to post to general ledger, calculate student, utility, other charges, etc.).

**Automated Interfaces:** An interface is a process that moves information from one computer application to another. The interface can occur internally between systems maintained by a single agency, or between systems maintained by different agencies or private companies. The interface can also occur between modules within the same computer application.

The data transferred might be a file consisting of one or more records processed at a later time (batch), or it can be a real-time update. Risk associated with interfaces increases as the number of transactions or the number of other services and systems supported by the interfaced data increases.

Poor design or inadequate oversight can affect the transfer of transaction data among the systems. Interface controls are automated and/or manual processes designed to ensure transmission and processing of information is complete and accurate.

### **Manual vs. Automated Interfaces**

A “manual interface” is the transfer of data from one system or module to another system or module, initiated and controlled by a user. An example of a manual interface is when customer accounts are downloaded from a utility billing system to be used to perform meter readings. When complete, the file with meter readings may be uploaded and posted to the customer accounts.

An “automated interface” is the transfer of data from one system or module to another system or module that happens automatically based on a schedule, or other predefined criteria. A common example of an automated interface is the payroll module of a system. Typically, a payroll batch is created in the payroll module. Once approved, the batch is automatically sent by the system to the general ledger or other applicable modules,

## State of Washington

such as accounts payable.

Entities should have reconciliation controls between their various applications regardless of the method used for interfacing.

*Auditors should have determined whether system interfaces are automated as part of the Key Software Applications workpaper. **If not**, ask the following question to determine whether the system interface is manual or automated.*

*Is the data transferred from one system/module to another system/module by a user using an uploading and posting technique? For example, data is pulled from one system into a text file or other format, that is then uploaded into a different system or module by posting or in an upload feature of the module. If the answer to this question is yes, the interface would be considered "manual" since it is initiated and controlled by manually rather than through an automated process.*

**Edit Checks:** An **edit check** is a programmed routine designed to check input data or processing results for accuracy, compliance, or reasonableness. Types of edit checks include:

Range Checks: ensure that numeric values fall within specified ranges, minimums and/or maximums. For example, ensuring that a capital asset can only be entered as a positive amount, or a purchase order can only be submitted without secondary approval for less than a certain threshold.

Consistency Checks: verify that related data fields are consistent with each other. For example, ensuring that a patient's age matches their date of birth.

Format Checks: validate data formats (for example, dates as MM/DD/YYYY or phone numbers as ###-###-####).

Logical Checks: assess logical relationships between data fields. For instance, verifying that total debits equals total credits in a journal entry.

Duplicate Checks: identify duplicate records or entries. For example, preventing the same invoice from being entered twice.

Cross-Field Checks: compare data across different fields. For instance, ensuring that the start date of a project is before the end date.

Required Field Checks: ensure that mandatory fields are filled out. For instance, making sure that a patient's name and date of birth are provided.

Referential Integrity Checks: validate relationships between data tables. For example, confirming that a vendor number exists in the vendor master file as an active entity.

Outlier Checks: detect extreme or unexpected values. For instance, flagging water meter reading values that are extreme outliers for the customer type or account history.

Pattern Checks: look for specific patterns in data. For example, verifying that email addresses follow a valid format.

Edit checks may result in automatic rejection of a transaction, inability to proceed with a transaction, trigger for additional processing or review, or may simply result in a warning message to the user.

Edit checks may be identified as a key control when they are sufficiently relevant (ie: addressing the risk), precise (ie: able to catch all errors,

## State of Washington

rather than just being only reasonableness or limit check), and sufficiently strong (ie: prevent invalid transactions, rather than just generating a warning messages). Auditors may identify an individual edit or a group of edit checks together as a key control.

**Computer Generated Reports:** A **computer-generated report** is a report that is created by a computer program. The computer program, also referred to as a report generator or tool, takes data from a data source, such as a database, and displays it in a specified format. The process to generate a report often includes performing calculations on the data, such as summarizing, classifying, etc., before displaying, or can display the calculations on the report.

There are two types of computer-generated reports, pre-programmed and ad-hoc or customized reports.

Pre-programmed or canned reports are pre-defined reports where criteria and specifications are hard coded in the system. A canned report may allow limited parameters, (month/year, for example), but in general the information that will be displayed is pre-determined.

Ad-hoc or customized reports allow the user to drill down and customize what information is displayed on the report based on some allowed criteria, such as account codes, dollar amounts minimum, etc).

In contrast, a **manual report** is one that is created outside the system using data exports or is created ad hoc by a user. An example of a manual report is one that is created by copying data from a data source and pasting the data in an Excel spreadsheet or Word document or Powerpoint presentation where it is then processed further. With manual reports, each time a report is created, the data could be incorrect due to user error, such as not copying all relevant data, or processing errors. Therefore, these types of reports should be understood and tested similar to manual controls.

**Electronic Approvals:** Electronic approvals, electronic signatures and digital signatures are technically different, although often these terms are used interchangeably by entities.

Auditors should have determined whether the electronic approval is an automated control as part of the overall understanding of controls. For automated control purposes, an electronic approval is a software system functionality that:

Permits a user to approve transaction(s) within the software system

The system automatically documents, or logs, the data approved by the user and any subsequent manipulation

The acceptance or rejection of the transaction by the approver will trigger an additional software system process, such as posting of a transaction.

E-mail, scanned-in pictures of signatures, or font-changed signatures, etc. may be part of a control activity but are generally not considered an automated control and are not covered by this testing strategy.

### Electronic Signature vs Digital Signature

An "**electronic signature**" can look like a handwritten signature that has been scanned and then pasted into an electronic document. The

## State of Washington

reliability of this type of approval is variable. Recommend gaining an understanding of the process used to store and affix the signature to the document and then discuss the process with Team IT Audit before placing reliance on this control.

A “**digital signature**” is a legal signature with a formal certification process that documents who approved the document and ensures the document is not modified after certification. Reliability of this process is very high but has significant technical features. Recommend brainstorm with Team IT Audit before placing reliance on this control.

### **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

**Statements on Auditing Standards [AU-C 315](#) Understanding the Entity and Its Environment and Assessing the Risks of Material Misstatement** - paragraphs .A106-.A109 describe general and application controls and how they relate to audit risks

**Statements on Auditing Standards [AU-C 330](#) Performing Audit Procedures in Response to Assessed Risks and Evaluating the Audit Evidence Obtained** - paragraphs .10b and .A33-.A34 describe requirements and guidance for testing indirect controls in conjunction with tests of controls, that is, testing key general controls in conjunction with a test of a key automated control

Record of Work Done:

**This record may contain information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited.**

### **Premiums and Claims - Rights & Obligations**

**Key Control 2 (Rights & Obligations - Automated):** Through UTAB and their Fraud Unit, ESD runs initial and weekly claims through the discovery process before payment goes out. The discovery process is when claims are run through a variety of cross matches and queries, both internally, with other agencies, and partners to identify and flag suspicious claims for identity verification.

The understanding for this system is documented above in the "Controls - UTAB" step.

### **STEP 1: Understand Automated Key Control**

The understanding for this automated key control is documented above in the "Controls -UTAB" step.

### **STEP 2: Confirm and Test Automated Key Control:**

On 5/23/2024, Amanda Rouse, Business Systems Analyst (UTAB), provided us screenshots from UTAB. We viewed screens from the UTAB user interface and a query from the UTAB database to show that the discovery process is being run before payment goes out.

Screenshots from the UTAB User Interface:

## State of Washington

### 1. Claimant with No Issues:

Claim ID: C9CD9S-010

Under customer screen we reviewed the Task - Cases Tab

Claim Registration - Create Claim: January 18, 2024

No Discovery issues noted.

We noted that the first payment was not made until February 6, 2024. **No issues noted.**

### 2. Claimant with Issue:

Claim ID: GNGWSS-001

Under customer screen we reviewed the Task - Cases Tab

Claim Registration - Create Claim: January 12, 2024

Non-Sep - Identity - Re-Determined:

The issue was initially created on January 12, 2024

An ID theft claim was made by an investigator on January 17, 2024.

A presumptive determination was issued on January 21, 2024.

We clicked on the non-sep - identity theft claim was made by an investigator on January 17, 2024. It stated that the claimant did not verify identity and the identity issue must be referred to OSI. The claimant did not respond to the letter that was sent in order to confirm their identity, so a presumptive determination was made on January 21, 2024 and their claim was denied.

Outcome: Deny

We noted that there were no payments made to the claimant. **No issues noted.**

### Query from the UTAB Database:

#### 1. Claim ID: C9CD9S-010

Discovery Process ran on January 18, 2024

Discovery score was 350

#### 2. Claim ID: GNGWSS-001

Discovery Process ran on January 12, 2024

Discovery score was 1,250

We determined that the discovery process was ran before payment was made, if applicable. **No issues noted.**

### **STEP 3: Understand General IT Controls**

We gained an understanding of general IT controls in the "Key Control 1 (System Calculation - Automated)" step here [[Key Control 1 \(System Calculation - Automated\)](#)].

# State of Washington

## **STEP 4: Confirm Key General IT Controls**

**Key Control #1 - All changes to the UTAB system must go through a standard change process, where changes are tested, reviewed and approved before migrating to production.**

We confirmed this key control as part of the "Key Control 1 (System Calculation - Automated)" step linked above.

## **STEP 5: Test Key General IT Controls**

Not applicable - we are not planning to rely on automated controls and therefore do not need to test general controls; control risk will be assessed at MAX.

## **E.4.PRG - Premiums and Claims**

*Procedure Step:* Key Control 3 (Manual - RSI Review)

*Prepared By:* DRR, 6/10/2024

*Reviewed By:* SHW, 7/31/2024

Purpose/Conclusion:

### **Purpose:**

To confirm UTAB sends a Request for Separation Information (RSI) form to the last employer, and when returned, is reviewed by the Adjudicator to confirm that the claimant worked for the employer and the reason for the separation (**Key Control 3 for the UTAB system**) in order to assess control risk.

### **Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

## State of Washington

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency.*

***All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.***

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

## State of Washington

*If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

# State of Washington

Record of Work Done:

## **Premiums & Claims - Rights & Obligations**

**Key Control 3 (Rights & Obligations - Manual):** When a claim is filed, UTAB sends a Request for Separation Information (RSI) form to the last employer (only covered employment) and any employer that has a separation issue and does not meet purge requirements. The returned RSI is reviewed by the assigned claim Adjudicator to confirm that the claimant worked for the employer and the reason for the separation.

The understanding for this system is documented above in the "Controls - UTAB" step.

### **1. Confirmation of Key Manual Control:**

On 5/23/2024, Amanda Rouse, Business Systems Analyst (UTAB), provided us information from the UTAB test environment. We reviewed screens to show that a Request for Separation Information (RSI) form is sent out before payment is made to the claimant. See below:

#### Regular UI - Disqualified:

Case Number: 0-075-095-568

Claim ID: 5GB7CX-001

Program Type: UI

Under the claim ID screen we reviewed the Task – Cases tab and noted that there was one separation case (excluding purge). See below:

Quiroga Law Office PLLC – RSI form was sent on March 29, 2024

The employer responded on April 8, 2024. The Adjudicator confirmed the employee worked for the employer on the claim.

The UI claim was denied, as the claimant quit for personal reasons.

Under the claim ID screen we reviewed the Benefits - Weekly Summary tab. We noted the following:

The claimant had not been paid, since they had a "Disqualified" status.

#### Regular UI - Not Disqualified:

Case Number: 0-075-356-495

Claim ID: JSVP59-004

Program Type: UI

Under the claim ID screen we reviewed the Task – Cases tab and noted that there was one separation case (excluding purge). See below:

Schuss Cafe – RSI form was sent on May 3, 2024

The employer did not respond to the RSI. ESD would expect an employer to fight the claim if the claimant was not employed by the employer. The Adjudicator's ultimate determination was to allow the separation and pay the claimant due to being un-employed through no fault of their own.

Under the claim ID screen we reviewed the Benefits - Weekly Summary tab. We noted the following:

The claimant had received their first payment on May 17, 2024, after the RSI form had been sent out.

# State of Washington

**No issues noted.**

## **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

## **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

## **E.4.PRG - Premiums and Claims**

*Procedure Step:* Key Control 4 (System Determination - Automated)

*Prepared By:* DRR, 6/14/2024

*Reviewed By:* SHW, 8/22/2024

Purpose/Conclusion:

### **Purpose:**

To determine whether the UTAB system properly assesses claimant's eligibility based on claimant's responses to the questions asked during weekly filing (**Key Control #4 for UTAB**) was in place and operating effectively and to consider related general IT controls in order to assess control risk.

### **Conclusion:**

Based on our understanding and test results, we concluded that the automated control **was** in place and operating effectively.

Based on our understanding, related general IT controls **were** in place and adequately designed to ensure that the control operated consistently during the audit period. However, we did not test the operating effectiveness of general IT controls.

Our understanding and control risk assessment, which incorporates these conclusions, is documented at [\[Risk Assessment\]](#).

Testing Strategy:

# State of Washington

The following procedures are **required** for all automated key controls for financial and single audits:

## **STEP 1: Understand Automated Key Control**

Gain an understanding of the automated key control. The understanding can either be documented in the control system step or could be documented here in this step. Auditors should consider the following aspects of the automated control when gaining an understanding:

### **Software Calculation:**

Is there written documentation of the calculation, and/or the source rates and factors used in the calculation?

*We would expect written documentation that defines the calculation and is an official, approved source for the formulas, rates and factors. This may be an approved policy or could be system documentation.*

What formulas are used to make the calculation?

What values or factors are used to make the calculation? For example:

- Rate tables used by the calculation

- Profile fields (i.e., applicable transaction types)

- Programmed/set formulas and/or values

- Constraints (i.e., effective date, minimums/maximums, etc.)

How is the calculation triggered or initiated?

How is the calculation recorded in the accounting system (or used in an end result)?

### **Automated Interfaces:**

Is data transferred in real time (immediately) or in a batch? If batched, how often does the interface occur (daily, monthly, quarterly, etc.)?

What triggers the data transfer?

*Transfers could be manually initiated, could be hardcoded into either the sending or receiving system's programming, could be controlled by administrative menus (for integrated software modules), or could be run as automated jobs with third party software or programming.*

Could the interface process fail? If so, how would the entity recognize that the process failed?

*This may not be a relevant risk for integrated software, but may be the case for custom interfaces designed outside the software which may be subject to various points of failure.*

## State of Washington

Will the interface process reject transactions or batches with errors? If so, who monitors rejections and follows up on rejected transactions to ensure correction (either in the sending or receiving systems) and how are corrections tracked and monitored?

*For example, information that could trigger a rejection or isolated transaction and batch can include: invalid data, duplicate data, or missing factors. If errors are possible, we would expect the isolated data is reviewed, tracked and corrected in a timely manner.*

Are any reconciliations done to provide assurance that data transfer was complete and accurate?

*We would expect the local government to perform a reconciliation between source and destination systems to ensure the interfaced data is complete and accurate. This may be a manual reconciliation or spot-check, a system or dashboard report, or automated edit check. Depending on how often errors (if any) are expected, the reconciliation could be done each time the interface occurs, or on a monitoring basis, like annually.*

### Edit Checks:

Inquire if the entity has a written policy or documentation describing the approval process and protocols for reviewers?

What is the approval process in the application?

What transactions, data, tasks, or documents are approved?

Who are the preparers? How do preparers submit for approval?

Who are the authorized approvers? Are there backup approvers?

What documents or information are required to make approval judgment?

What is the next step once a transaction/data/ task/document is approved or denied?

Is there any exception situations where approval can be by-passed or waived?

Can the approver make changes to information during the approval stage? If so, is the preparer notified of the changes?

Can anyone make changes to the approved information after the approval stage? If so, are changes captured in an audit trail and is the audit trail (log) regularly reviewed and monitored to detect any unauthorized changes?

Does the application prevent users from approving their own work (self-approval)?

*Some applications have a feature preventing self-approval. If an application does not have a feature preventing self-approval, we would expect manual controls in place to ensure the segregation of duties between preparer and approver, if relevant to the risk.*

Does the application have high-level users that can also approve?

*High-Level Users (aka Users with elevated privileges, system or application "Administrators", "Super Users", etc.) typically have full access to change system settings and may have extensive function rights of software applications. Depending on entity's size and complexity, different high-level users may be responsible for the network vs. application level. High-level users represent a heightened risk for*

# State of Washington

*overriding segregation of duties and normal control processes.*

*We would expect entities to have compensating monitoring controls if personnel are responsible for both application settings and transaction processing controls.*

## Computer Generated Reports:

What information or exceptions is the report designed to identify (what is the purpose of the report)?

How is the report used and by whom?

For exception reports, who reviews the report and how do they follow up on exceptions?

*Auditors should consider whether the exception report reviewer has appropriate authority and information to effectively follow-up on report results. For fraud-related risks, also consider whether the review position is appropriately segregated from positions that can initiate transactions. For exception reports that regularly identify many transactions needing multi-step follow-up, the manual review and follow-up may be identified as a separate key control rather than documented and evaluated as an aspect of the automated exception report control.*

What are the report parameters or criteria? Does the report have any calculated fields? If so, what are the calculations?

*The ideal method of documenting an understanding of a computer generated report is to get a screenshot or printout of the report parameters. If using a report writer, this may be printed with the report, or may be accessed from a design view or intermediary screen. For custom or complex reports, this may be the SQL code.*

*For exception reports, auditors should pay special attention to the definition of an exception embodied in the report parameters.*

*NOTE: observation of the report parameters will also count as a confirmation of the report and could also be used to test the report.*

## Electronic Approvals:

Inquire if the entity has a written policy or documentation describing the approval process and protocols for reviewers?

What is the approval process in the application?

What transactions, data, tasks, or documents are approved?

Who are the preparers? How do preparers submit for approval?

Who are the authorized approvers? Are there backup approvers?

What documents or information are required to make approval judgment?

What is the next step once a transaction/data/ task/document is approved or denied?

Is there any exception situations where approval can be by-passed or waived?

## State of Washington

Can the approver make changes to information during the approval stage? If so, is the preparer notified of the changes?  
Can anyone make changes to the approved information after the approval stage? If so, are changes captured in an audit trail and is the audit trail (log) regularly reviewed and monitored to detect any unauthorized changes?  
Does the application prevent users from approving their own work (self-approval)?

*Some applications have a feature preventing self-approval. If an application does not have a feature preventing self-approval, we would expect manual controls in place to ensure the segregation of duties between preparer and approver, if relevant to the risk.*

Does the application have high-level users that can also approve?

*High-Level Users (aka Users with elevated privileges, system or application "Administrators", "Super Users", etc.) typically have full access to change system settings and may have extensive function rights of software applications. Depending on entity's size and complexity, different high-level users may be responsible for the network vs. application level. High-level users represent a heightened risk for overriding segregation of duties and normal control processes.*

*We would expect entities to have compensating monitoring controls if personnel are responsible for both application settings and transaction processing controls.*

### **STEP 2: Confirm and Test Automated Key Control**

Confirm and test the automated control. To test the automated control, consider the following procedures:

#### **Software Calculation:**

Re-perform the calculation for selected transactions.

*Auditors would NOT normally use sampling for automated controls. Instead, auditors should judgmentally select one instance of each significant variation of the calculation. If the number of potential variations is large, auditors would judgmentally select based on risk factors (for example, the most common scenarios, or scenarios associated with identified risks, or scenarios that are not addressed by the entity's testing procedures).*

*In some cases, it may be possible for the auditor to reperform the calculation for the entire population.*

If any rate tables or values were updated during the period, view the current values (by observing the rate table or values in an admin menu or from a printed system report) and compare to approved sources.

*If no updates were made or there are only a few values, this risk could be addressed by re-performing the calculation. However, if source rate tables or values are large or complex, it may be more efficient to test these values directly than to recalculate a larger number of transactions.*

## State of Washington

Consider the use of analytical procedures such as trends or descriptive statistics on the population (like average, minimum and maximum values, or a graph of values across the population) and follow up on any unexpected values or trends. *Analytical procedures would normally also count as a substantive test.*

### Automated Interfaces:

Re-perform a reconciliation, comparison or analytical procedure between both systems to determine whether data interfaced completely and accurately. Alternatively, review the entity's reconciliation or comparison if they perform one.

*For example, auditors could perform count totals and summarize the data to determine whether the same number of transactions reside in both systems, or the total amount from the sending system was posted to the receiving system. Whether this takes the form of a comparison (numbers expected to match exactly), reconciliation (when reconciling items are expected) or analytical procedure (if numerous adjustments or reconciling items are expected) will depend on the nature of the interface and client documentation.*

*Note: these procedures would also provide substantive evidence.*

Observe documentation, such as interface logs or email notifications, to determine whether interfaces complete per expected interval (daily, monthly, quarterly, etc.).

*We would expect the data transfer to be consistent based on the programmed schedule. If data is expected to be transferred on a weekly basis, we would expect to see some form of documentation showing the weekly transfer.*

Observe evidence that batch jobs are monitored such as tracking spreadsheets or emails.

When interfaces did not occur as expected, determine whether procedures were followed to resubmit job or that there was a logical reason no data was received/sent for the interval (for example, it was a holiday so there was no interface for that day).

### Edit Checks:

Re-perform the edit check for selected transactions.

*Auditors would NOT normally use sampling for automated controls. Instead, auditors should judgmentally select one instance of each significant variation of the check. If the number of potential variations is large, auditors would judgmentally select based on risk factors (for example, the most common scenarios, or scenarios associated with identified risks, or scenarios that are not addressed by the entity's testing procedures).*

*In some cases, it may be possible for the auditor to reperform the edit check for the entire population.*

# State of Washington

Consider the use of analytical procedures such as trends or descriptive statistics on the population (like average, minimum and maximum values, or a graph of values across the population) and follow up on any unexpected values or trends. Analytical procedures would normally also count as a substantive test.

## Computer Generated Reports:

For exception reports, inquire with the person assigned to review the report how frequently exceptions are noted by the report. Trace identified exceptions to documentation of correction or resolution.

Re-perform the report by either (a) generating it yourself in the entity's system (if the auditor has direct access to the system), (b) recreating the report using CAATS, or (c) by observing the report be generated in your presence. If observing, note any user-entered values or parameters and determine whether entered parameters were appropriate. Compare re-performed report to the one being tested.

## Electronic Approvals:

Observe a transaction to see the approval process and verify any key aspects of the process or limits.

If transaction data or reports include approval information, use CAATS to confirm that all transactions met authorization rules.

## **STEP 3: Understand General IT Controls**

Gain an understanding of the general IT controls that support the continued proper operation of the automated control. Identify key general IT controls and note any control weaknesses. Auditors should consider the following aspects of general IT controls when gaining an understanding:

## Software Calculation:

Inquire if the entity has experienced any errors or irregularities with the calculation. Also how often changes are made to the calculation, and how many changes (if any) were made during the year.

How can the software calculation (formulas, rates/values, settings/configurations) be changed or customized?

*Software calculations will usually have one or more administrative menus that allow the government to modify rate tables or other calculation values, or to configure the calculation or apply settings.*

*In other cases, software calculation formulas and/or values may be hard-coded into the system and require programmers to make the changes. If the government has access to source code, then it needs internal procedures for program changes. If the program is controlled by vendors, we would expect program change procedures and expectations to be included in the contract.*

What are the procedures to authorize and make program changes or configuration/setting changes to the software calculation?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying*

## State of Washington

*communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

*If utilizing a test environment, there should be controls to ensure that the live environment is updated and is consistent with the live production environment. As management is responsible for the accuracy of their automated controls (i.e., in the live environment), we would expect there to be a procedure to confirm each key automated control once it is in the live environment. This could be manually re-performing the calculation, reviewing reports against known expectations, etc.*

How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change programming, but they may be responsible for patch management, master table data, and/or configurations.*

### Automated Interfaces:

Inquire if the entity has experienced any errors or irregularities with the interface. Also how often changes are made to the interface, and how many changes (if any) were made during the year.

What are the procedures to authorize and make changes to the interface?

*Except for the most simple situations, we would normally expect update procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

*If the data transfer is already going to be checked or reconciled, then there may be less need for specific test procedures on program changes since any errors will be identified right away.*

How are program changes monitored or reviewed?

## State of Washington

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

*If the program is controlled by a third-party, we would expect a process between the government and vendor that allows the government to make requests and receive communication at the completion of the request.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to vendor developed/supported coding that controls how the system processes the interfaced data, but they may be responsible for working the interface error queues and reconciling the interfaced data.*

### Edit Checks:

Inquire if the entity has experienced any errors or irregularities with the edit checks. Also how often changes are made to the checks, and how many changes (if any) were made during the year.

How can the edit check be changed or customized?

*Edit checks may be hard-coded into the system and require programmers to make the changes. If the government has access to source code, then it needs internal procedures for program changes. If the program is controlled by vendors, we would expect program change procedures and expectations to be included in the contract.*

*In other cases, edit checks may be established or configured through one or more administrative menus.*

What are the procedures to authorize and make program changes or configuration/setting changes?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

*If utilizing a test environment, there should be controls to ensure that the live environment is updated and is consistent with the live production environment. As management is responsible for the accuracy of their automated controls (i.e., in the live environment), we*

## State of Washington

*would expect there to be a procedure to confirm each key automated control once it is in the live environment. This could be manually re-performing the edit check, reviewing reports against known expectations, etc.*

How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change programming, but they may be responsible for patch management, master table data, and/or configurations.*

### Computer Generated Reports:

Inquire if the entity has experienced any errors or irregularities with the report. Also how often changes are made to the report, and how many changes (if any) were made during the year.

How is the report triggered or initiated?

*For reports that are automatically triggered, the auditor would normally not identify job scheduling or monitoring as a general control since we would expect failure of the report to generate*

Is the report hardcoded into the program, or is it a custom or ad hoc report? Also, what manual inputs (if any) are required to run the report?

*What parameters, criteria (date ranges, fund number, departments) or instructions are entered by the user to generate the exception report. The more options entity personnel have to customize or modify the report, the higher the risk of human error and inaccurate or incomplete reports. Pre-programmed reports provide less flexibility than ad-hoc reports; however, if program change controls are in place, they are more consistent.*

If the report is hardcoded into the system, how are program changes made?

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

## State of Washington

*For example, local governments may not have access to change vendor developed reports, but they may be responsible for triggering, setting certain parameters, and/or following up on exception report results.*

NOTE: if the auditor cannot identify sufficiently effective general IT controls, the automated control will need to be tested using the same methods as a manual control (ie: sampling throughout the period). For example, if the report is manually generated and highly dependent on a number of manual inputs each time, or if the report does not have formal change controls, such as an ad hoc report or excel-based report. In such cases, the automated report is controlled by limited access and the judgment of the report writer – that is, while the report is an automated component, there is also an integrated manual component to the control.

### Electronic Approvals:

How are users assigned preparer and approver roles? Are user accounts periodically checked for needed changes? See the [User Access](#) step in the Accountability folder for more control considerations.

If configurations or settings relevant to the approval process are controlled by an admin menu, who has access to this menu?

If the entity has access to source coding for approval controls, what are the procedures to authorize and make program changes?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to vendor developed/supported coding that controls how the electronic approval works, but they may be responsible for approval configurations or settings and/or user account management.*

### **STEP 4: Confirm Key General IT Controls**

Confirm your understanding of key general IT controls to determine whether they have been placed in operation (*whether the entity has actually implemented key controls*).

# State of Washington

## **STEP 5: Test Key General IT Controls**

Document whether general IT controls will be tested. Option 1 would result in control risk at MAX for the automated control. Either option 2 or 3 is necessary in order to set control risk at LOW. If general IT controls are tested, consider the following procedures:

### **Software Calculation:**

If program changes or setting/configuration changes are logged, review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the calculation may also provide this evidence if the re-performance tests address all states of the calculation during the period.

If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

### **Automated Interfaces:**

Review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, reconciling or comparing the data transfer (or reviewing the entity's reconciliation or comparison) may also provide this evidence if tests address all states of the interface during the period.

Inspect job processing error logs/reports. Observe evidence that errors in processing were isolated and resolved. For example, select a sample of rejected transactions and observe evidence to determine whether errors were appropriately corrected and the corrections were timely.

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

### **Edit Checks:**

If program changes or setting/configuration changes are logged, review the change log to verify the population of changes for the year.

## State of Washington

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

- Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the edit check may also provide this evidence if the re-performance tests address all states of the edit check during the period.
- If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.
- If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

### Computer Generated Reports:

- If the report is subject to program change controls (either due to being hardcoded or by being automatically triggered), review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

- If the report is subject to program change controls, review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the report may also provide this evidence if the re-performance tests address all states of the report during the period.
- If the report relies on manual inputs and report copies saved show the parameters entered, the auditor can check a selection or sample of reports to confirm that the report was run correctly.
- If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

### Electronic Approvals:

- Review user access report to verify that current users are appropriate. Also consider review of user access change logs (if available) to evaluate user account management throughout the period. See the User Access step in the Accountability folder for more testing considerations.
- If approvals are governed by significant settings/configurations, and such changes are logged, review the change log to verify the population of changes for the year.

*Verification that no configuration changes were made, along with the auditor's evaluation that no such changes are expected, would normally be sufficient evidence to conclude that no further testing is necessary.*

## State of Washington

If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.

If the entity has access to source code, review the change log to verify the population of changes for the year. Then review programming change documentation or the entity's test documentation for selected or sampled changes.

*Verification that no program changes were made, along with the auditor's evaluation that no such changes are expected, would normally be sufficient evidence to conclude that no further testing is necessary.*

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the SOC Report Reliance workpaper in the Store.

### **STEP 6: Final Control Risk**

Evaluate the results and document a final control risk assessment in the control system step. Consider whether any deficiencies identified with either the automated control or related general IT controls represent material weaknesses or significant deficiencies.

*Note: general IT control deficiencies do not necessarily mean the automated control is not properly functioning. General IT control deficiencies would normally be considered a significant deficiency or material weakness only if it caused an issue with the compliance requirement or assertion.*

### **Recommendation Review Requirement**

IT Security related information is considered category 3 data protected by Public Request Exemption RCW 42.56.420. Issues related to IT Security require the following special handling:

[Instructions](#) are located in Team IT Audit's System's Sharepoint page.

Details of IT Security related issues should NOT be included in any emails or helpdesks.

Exit, ML and Findings should be separately communicated in an IT Security Results Document.

Findings will be referenced, but not included in the audit report.

All IT security-related recommendations must be reviewed by [Team IT Audit](#).

Template language for common IT related recommendations can be found in [ARS Part 5 Chapter 8](#).

### **PUBLIC REQUEST EXEMPTION**

Some IT related information is protected by Public Request Exemption RCW 42.56.420 for cyber security purposes. The details documented in the record of work and support workpapers may qualify for this exemption. If so, auditors must include this statement in the record of work done and any related workpapers: **"This record contains information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited "**.

Guidance/Criteria:

# State of Washington

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

## **Information Technology Planning Guide**

Auditors may contact [Team IT Audit](#) with any testing strategy or control assessment questions or to request assistance from an IT Specialist.

**Software Calculation:** A **software calculation control** exists when the value of a transaction is determined by a software application. This process can be a key control when the entity relies on the system to generate calculations correctly to determine the amount of transactions (i.e., summarizing/account code allocation to post to general ledger, calculate student, utility, other charges, etc.).

**Automated Interfaces:** An interface is a process that moves information from one computer application to another. The interface can occur internally between systems maintained by a single agency, or between systems maintained by different agencies or private companies. The interface can also occur between modules within the same computer application.

The data transferred might be a file consisting of one or more records processed at a later time (batch), or it can be a real-time update. Risk associated with interfaces increases as the number of transactions or the number of other services and systems supported by the interfaced data increases.

Poor design or inadequate oversight can affect the transfer of transaction data among the systems. Interface controls are automated and/or manual processes designed to ensure transmission and processing of information is complete and accurate.

## **Manual vs. Automated Interfaces**

A “manual interface” is the transfer of data from one system or module to another system or module, initiated and controlled by a user. An example of a manual interface is when customer accounts are downloaded from a utility billing system to be used to perform meter readings. When complete, the file with meter readings may be uploaded and posted to the customer accounts.

An “automated interface” is the transfer of data from one system or module to another system or module that happens automatically based on a schedule, or other predefined criteria. A common example of an automated interface is the payroll module of a system. Typically, a payroll batch is created in the payroll module. Once approved, the batch is automatically sent by the system to the general ledger or other applicable modules, such as accounts payable.

## State of Washington

Entities should have reconciliation controls between their various applications regardless of the method used for interfacing.

*Auditors should have determined whether system interfaces are automated as part of the Key Software Applications workpaper. **If not**, ask the following question to determine whether the system interface is manual or automated.*

*Is the data transferred from one system/module to another system/module by a user using an uploading and posting technique? For example, data is pulled from one system into a text file or other format, that is then uploaded into a different system or module by posting or in an upload feature of the module. If the answer to this question is yes, the interface would be considered "manual" since it is initiated and controlled by manually rather than through an automated process.*

**Edit Checks:** An **edit check** is a programmed routine designed to check input data or processing results for accuracy, compliance, or reasonableness. Types of edit checks include:

Range Checks: ensure that numeric values fall within specified ranges, minimums and/or maximums. For example, ensuring that a capital asset can only be entered as a positive amount, or a purchase order can only be submitted without secondary approval for less than a certain threshold.

Consistency Checks: verify that related data fields are consistent with each other. For example, ensuring that a patient's age matches their date of birth.

Format Checks: validate data formats (for example, dates as MM/DD/YYYY or phone numbers as ###-###-####).

Logical Checks: assess logical relationships between data fields. For instance, verifying that total debits equals total credits in a journal entry.

Duplicate Checks: identify duplicate records or entries. For example, preventing the same invoice from being entered twice.

Cross-Field Checks: compare data across different fields. For instance, ensuring that the start date of a project is before the end date.

Required Field Checks: ensure that mandatory fields are filled out. For instance, making sure that a patient's name and date of birth are provided.

Referential Integrity Checks: validate relationships between data tables. For example, confirming that a vendor number exists in the vendor master file as an active entity.

Outlier Checks: detect extreme or unexpected values. For instance, flagging water meter reading values that are extreme outliers for the customer type or account history.

Pattern Checks: look for specific patterns in data. For example, verifying that email addresses follow a valid format.

Edit checks may result in automatic rejection of a transaction, inability to proceed with a transaction, trigger for additional processing or review, or may simply result in a warning message to the user.

Edit checks may be identified as a key control when they are sufficiently relevant (ie: addressing the risk), precise (ie: able to catch all errors, rather than just being only reasonableness or limit check), and sufficiently strong (ie: prevent invalid transactions, rather than just generating a warning messages). Auditors may identify an individual edit or a group of edit checks together as a key control.

## State of Washington

**Computer Generated Reports:** A **computer-generated report** is a report that is created by a computer program. The computer program, also referred to as a report generator or tool, takes data from a data source, such as a database, and displays it in a specified format. The process to generate a report often includes performing calculations on the data, such as summarizing, classifying, etc., before displaying, or can display the calculations on the report.

There are two types of computer-generated reports, pre-programmed and ad-hoc or customized reports.

Pre-programmed or canned reports are pre-defined reports where criteria and specifications are hard coded in the system. A canned report may allow limited parameters, (month/year, for example), but in general the information that will be displayed is pre-determined.

Ad-hoc or customized reports allow the user to drill down and customize what information is displayed on the report based on some allowed criteria, such as account codes, dollar amounts minimum, etc).

In contrast, a **manual report** is one that is created outside the system using data exports or is created ad hoc by a user. An example of a manual report is one that is created by copying data from a data source and pasting the data in an Excel spreadsheet or Word document or Powerpoint presentation where it is then processed further. With manual reports, each time a report is created, the data could be incorrect due to user error, such as not copying all relevant data, or processing errors. Therefore, these types of reports should be understood and tested similar to manual controls.

**Electronic Approvals:** Electronic approvals, electronic signatures and digital signatures are technically different, although often these terms are used interchangeably by entities.

Auditors should have determined whether the electronic approval is an automated control as part of the overall understanding of controls. For automated control purposes, an electronic approval is a software system functionality that:

Permits a user to approve transaction(s) within the software system

The system automatically documents, or logs, the data approved by the user and any subsequent manipulation

The acceptance or rejection of the transaction by the approver will trigger an additional software system process, such as posting of a transaction.

E-mail, scanned-in pictures of signatures, or font-changed signatures, etc. may be part of a control activity but are generally not considered an automated control and are not covered by this testing strategy.

### Electronic Signature vs Digital Signature

An “**electronic signature**” can look like a handwritten signature that has been scanned and then pasted into an electronic document. The reliability of this type of approval is variable. Recommend gaining an understanding of the process used to store and affix the signature to the document and then discuss the process with Team IT Audit before placing reliance on this control.

## State of Washington

A “**digital signature**” is a legal signature with a formal certification process that documents who approved the document and ensures the document is not modified after certification. Reliability of this process is very high but has significant technical features. Recommend brainstorm with Team IT Audit before placing reliance on this control.

### **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

**Statements on Auditing Standards [AU-C 315](#) Understanding the Entity and Its Environment and Assessing the Risks of Material Misstatement** - paragraphs .A106-.A109 describe general and application controls and how they relate to audit risks

**Statements on Auditing Standards [AU-C 330](#) Performing Audit Procedures in Response to Assessed Risks and Evaluating the Audit Evidence Obtained** - paragraphs .10b and .A33-.A34 describe requirements and guidance for testing indirect controls in conjunction with tests of controls, that is, testing key general controls in conjunction with a test of a key automated control

Record of Work Done.

**This record may contain information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited.**

### **Premiums & Claims - Rights & Obligations**

**Key Control 4 (Rights & Obligations - Automated):** The UTAB system assesses claimant's eligibility based on claimant's responses to the questions asked during weekly filing.

The understanding for this system is documented above in the "Controls - UTAB" step.

### **STEP 1: Understand Automated Key Control**

The understanding for this automated key control is documented above in the "Controls -UTAB" step.

### **STEP 2: Confirm and Test Automated Key Control:**

On 5/23/2024, Amanda Rouse, Business Systems Analyst (UTAB), provided us screenshots from the UTAB test environment related to five questions that we expect to create an issue and put a claim on hold (pending) or contingently paid depending on the answer. The screenshots provided are the screens the agents would use when claimants call to file for weekly benefits.

A payment is on hold (pending) when there is an issue that arises for a new claimant filing a new claim. A claim is only contingently paid when claimants are on "continued claim status". This means that the claimant has previously filed a claim without any issues.

## State of Washington

1. Did you begin attending a school or training program?

The claimant answered **yes** to this and we expected an issue to be created (UI Claim Number QQ33GC-003).

Week Ending December 2, 2023: We noted that an issue was created for this claim. As this individual had an active claim and had been receiving benefit payments (continued claim status) in the weeks prior, the issue created did not automatically stop payment. We noted the activity tab shows the reason for the denial was due to school attendance, the claimant received a benefit decrease and the benefit payment was an overpayment.

2. Were you physically able and available for work each day of the week?

The claimant answered **no** to this and we expected an issue to be created (UI Claim Number K662BW-001).

Week Ending April 6, 2024: We noted there was an issue created for this claim. As this individual had an active claim and had been receiving benefit payments (continued claim status) in the weeks prior, the issue created did not automatically stop payment. Due to the hours available for work the claimant entered into the weekly claim, the claimant received a reduced benefit amount. Additional fact finding was completed on April 29, 2024, and it was determined the claim should be denied and the benefit payment was an overpayment.

3. Did you complete at least three job search activities and keep a written record as required?

The claimant answered **no** to this and we expected an issue to be created (CBP7RT-002).

Week Ending October 28, 2023: We noted there was an issue created for this claim and that this claim was denied. No payment was made to the claimant.

4. Did you refuse any offer of work?

The claimant answered **yes** to this and we expected an issue to be created (UI Claim Number 9RP24G-002).

Week Ending February 10, 2024: We noted there was an issue created for this claim and that this claim was adjudicated, and ultimately denied. No payment was made to the claimant after the denial.

5. Did you turn down a job offer, or fail to go to a job interview that you were referred to by WorkSource?

The claimant answered **yes** to this and we expected an issue to be created (UI Claim Number BMN7WB-001).

Week Ending July 8, 2023: We noted there was an issue created for this claim and that there has been a presumptive determination for this claim. The claim was denied and no payment was made to the claimant.

We looked at the Adjudicator tab, that shows the issue, which includes the source of where the issue originated (i.e. Weekly Claim), and the benefit week from and to date. An issue was created for each question as expected. **No issues noted.**

### **STEP 3: Understand General IT Controls**

We gained an understanding of general IT controls in the "Key Control 1 (System Calculation - Automated)" step here [[Key Control 1 \(System Calculation - Automated\)](#)].

# State of Washington

## **STEP 4: Confirm Key General IT Controls**

**Key Control #1 - All changes to the UTAB system must go through a standard change process, where changes are tested, reviewed and approved before migrating to production.**

We confirmed this key control as part of the "Key Control 1 (System Calculation - Automated)" step linked above.

## **STEP 5: Test Key General IT Controls**

Not applicable - we are not planning to rely on automated controls and therefore do not need to test general controls; control risk will be assessed at MAX.

## **E.4.PRG - Premiums and Claims**

*Procedure Step:* Key Control 5 (System Calculation - Automated)

*Prepared By:* DRR, 6/18/2024

*Reviewed By:* RKM, 11/8/2024

Purpose/Conclusion:

### **Purpose:**

To determine whether the UTAB system automatically and accurately calculates the unemployment benefit payment amounts (**Key Control #5 for UTAB**) was in place and operating effectively and to consider related general IT controls in order to assess control risk.

### **Conclusion:**

Based on our understanding and test results, we concluded that the automated control **was** in place and operating effectively.

Based on our understanding, related general IT controls **were** in place and adequately designed to ensure that the control operated consistently during the audit period. However, we did not test the operating effectiveness of general IT controls.

Our understanding and control risk assessment, which incorporates these conclusions, is documented at [\[Risk Assessment\]](#).

Testing Strategy:

The following procedures are **required** for all automated key controls for financial and single audits:

# State of Washington

## **STEP 1: Understand Automated Key Control**

Gain an understanding of the automated key control. The understanding can either be documented in the control system step or could be documented here in this step. Auditors should consider the following aspects of the automated control when gaining an understanding:

### **Software Calculation:**

Is there written documentation of the calculation, and/or the source rates and factors used in the calculation?

*We would expect written documentation that defines the calculation and is an official, approved source for the formulas, rates and factors. This may be an approved policy or could be system documentation.*

What formulas are used to make the calculation?

What values or factors are used to make the calculation? For example:

- Rate tables used by the calculation

- Profile fields (i.e., applicable transaction types)

- Programmed/set formulas and/or values

- Constraints (i.e., effective date, minimums/maximums, etc.)

How is the calculation triggered or initiated?

How is the calculation recorded in the accounting system (or used in an end result)?

### **Automated Interfaces:**

Is data transferred in real time (immediately) or in a batch? If batched, how often does the interface occur (daily, monthly, quarterly, etc.)?

What triggers the data transfer?

*Transfers could be manually initiated, could be hardcoded into either the sending or receiving system's programming, could be controlled by administrative menus (for integrated software modules), or could be run as automated jobs with third party software or programming.*

Could the interface process fail? If so, how would the entity recognize that the process failed?

*This may not be a relevant risk for integrated software, but may be the case for custom interfaces designed outside the software which may be subject to various points of failure.*

Will the interface process reject transactions or batches with errors? If so, who monitors rejections and follows up on rejected transactions to ensure correction (either in the sending or receiving systems) and how are corrections tracked and monitored?

## State of Washington

*For example, information that could trigger a rejection or isolated transaction and batch can include: invalid data, duplicate data, or missing factors. If errors are possible, we would expect the isolated data is reviewed, tracked and corrected in a timely manner.*

Are any reconciliations done to provide assurance that data transfer was complete and accurate?

*We would expect the local government to perform a reconciliation between source and destination systems to ensure the interfaced data is complete and accurate. This may be a manual reconciliation or spot-check, a system or dashboard report, or automated edit check. Depending on how often errors (if any) are expected, the reconciliation could be done each time the interface occurs, or on a monitoring basis, like annually.*

### Edit Checks:

Inquire if the entity has a written policy or documentation describing the approval process and protocols for reviewers?

What is the approval process in the application?

What transactions, data, tasks, or documents are approved?

Who are the preparers? How do preparers submit for approval?

Who are the authorized approvers? Are there backup approvers?

What documents or information are required to make approval judgment?

What is the next step once a transaction/data/ task/document is approved or denied?

Is there any exception situations where approval can be by-passed or waived?

Can the approver make changes to information during the approval stage? If so, is the preparer notified of the changes?

Can anyone make changes to the approved information after the approval stage? If so, are changes captured in an audit trail and is the audit trail (log) regularly reviewed and monitored to detect any unauthorized changes?

Does the application prevent users from approving their own work (self-approval)?

*Some applications have a feature preventing self-approval. If an application does not have a feature preventing self-approval, we would expect manual controls in place to ensure the segregation of duties between preparer and approver, if relevant to the risk.*

Does the application have high-level users that can also approve?

*High-Level Users (aka Users with elevated privileges, system or application "Administrators", "Super Users", etc.) typically have full access to change system settings and may have extensive function rights of software applications. Depending on entity's size and complexity, different high-level users may be responsible for the network vs. application level. High-level users represent a heightened risk for overriding segregation of duties and normal control processes.*

*We would expect entities to have compensating monitoring controls if personnel are responsible for both application settings and*

# State of Washington

*transaction processing controls.*

## Computer Generated Reports:

What information or exceptions is the report designed to identify (what is the purpose of the report)?

How is the report used and by whom?

For exception reports, who reviews the report and how do they follow up on exceptions?

*Auditors should consider whether the exception report reviewer has appropriate authority and information to effectively follow-up on report results. For fraud-related risks, also consider whether the review position is appropriately segregated from positions that can initiate transactions. For exception reports that regularly identify many transactions needing multi-step follow-up, the manual review and follow-up may be identified as a separate key control rather than documented and evaluated as an aspect of the automated exception report control.*

What are the report parameters or criteria? Does the report have any calculated fields? If so, what are the calculations?

*The ideal method of documenting an understanding of a computer generated report is to get a screenshot or printout of the report parameters. If using a report writer, this may be printed with the report, or may be accessed from a design view or intermediary screen. For custom or complex reports, this may be the SQL code.*

*For exception reports, auditors should pay special attention to the definition of an exception embodied in the report parameters.*

*NOTE: observation of the report parameters will also count as a confirmation of the report and could also be used to test the report.*

## Electronic Approvals:

Inquire if the entity has a written policy or documentation describing the approval process and protocols for reviewers?

What is the approval process in the application?

What transactions, data, tasks, or documents are approved?

Who are the preparers? How do preparers submit for approval?

Who are the authorized approvers? Are there backup approvers?

What documents or information are required to make approval judgment?

What is the next step once a transaction/data/ task/document is approved or denied?

Is there any exception situations where approval can be by-passed or waived?

Can the approver make changes to information during the approval stage? If so, is the preparer notified of the changes?

Can anyone make changes to the approved information after the approval stage? If so, are changes captured in an audit trail and is the audit trail (log) regularly reviewed and monitored to detect any unauthorized changes?

## State of Washington

Does the application prevent users from approving their own work (self-approval)?

*Some applications have a feature preventing self-approval. If an application does not have a feature preventing self-approval, we would expect manual controls in place to ensure the segregation of duties between preparer and approver, if relevant to the risk.*

Does the application have high-level users that can also approve?

*High-Level Users (aka Users with elevated privileges, system or application "Administrators", "Super Users", etc.) typically have full access to change system settings and may have extensive function rights of software applications. Depending on entity's size and complexity, different high-level users may be responsible for the network vs. application level. High-level users represent a heightened risk for overriding segregation of duties and normal control processes.*

*We would expect entities to have compensating monitoring controls if personnel are responsible for both application settings and transaction processing controls.*

### **STEP 2: Confirm and Test Automated Key Control**

Confirm and test the automated control. To test the automated control, consider the following procedures:

#### **Software Calculation:**

Re-perform the calculation for selected transactions.

*Auditors would NOT normally use sampling for automated controls. Instead, auditors should judgmentally select one instance of each significant variation of the calculation. If the number of potential variations is large, auditors would judgmentally select based on risk factors (for example, the most common scenarios, or scenarios associated with identified risks, or scenarios that are not addressed by the entity's testing procedures).*

*In some cases, it may be possible for the auditor to reperform the calculation for the entire population.*

If any rate tables or values were updated during the period, view the current values (by observing the rate table or values in an admin menu or from a printed system report) and compare to approved sources.

*If no updates were made or there are only a few values, this risk could be addressed by re-performing the calculation. However, if source rate tables or values are large or complex, it may be more efficient to test these values directly than to recalculate a larger number of transactions.*

Consider the use of analytical procedures such as trends or descriptive statistics on the population (like average, minimum and maximum values, or a graph of values across the population) and follow up on any unexpected values or trends. *Analytical procedures would normally also count as a substantive test.*

# State of Washington

## Automated Interfaces:

Re-perform a reconciliation, comparison or analytical procedure between both systems to determine whether data interfaced completely and accurately. Alternatively, review the entity's reconciliation or comparison if they perform one.

*For example, auditors could perform count totals and summarize the data to determine whether the same number of transactions reside in both systems, or the total amount from the sending system was posted to the receiving system. Whether this takes the form of a comparison (numbers expected to match exactly), reconciliation (when reconciling items are expected) or analytical procedure (if numerous adjustments or reconciling items are expected) will depend on the nature of the interface and client documentation.*

*Note: these procedures would also provide substantive evidence.*

Observe documentation, such as interface logs or email notifications, to determine whether interfaces complete per expected interval (daily, monthly, quarterly, etc.).

*We would expect the data transfer to be consistent based on the programmed schedule. If data is expected to be transferred on a weekly basis, we would expect to see some form of documentation showing the weekly transfer.*

Observe evidence that batch jobs are monitored such as tracking spreadsheets or emails.

When interfaces did not occur as expected, determine whether procedures were followed to resubmit job or that there was a logical reason no data was received/sent for the interval (for example, it was a holiday so there was no interface for that day).

## Edit Checks:

Re-perform the edit check for selected transactions.

*Auditors would NOT normally use sampling for automated controls. Instead, auditors should judgmentally select one instance of each significant variation of the check. If the number of potential variations is large, auditors would judgmentally select based on risk factors (for example, the most common scenarios, or scenarios associated with identified risks, or scenarios that are not addressed by the entity's testing procedures).*

*In some cases, it may be possible for the auditor to reperform the edit check for the entire population.*

Consider the use of analytical procedures such as trends or descriptive statistics on the population (like average, minimum and maximum values, or a graph of values across the population) and follow up on any unexpected values or trends. Analytical procedures would normally also count as a substantive test.

# State of Washington

## Computer Generated Reports:

For exception reports, inquire with the person assigned to review the report how frequently exceptions are noted by the report. Trace identified exceptions to documentation of correction or resolution.

Re-perform the report by either (a) generating it yourself in the entity's system (if the auditor has direct access to the system), (b) recreating the report using CAATS, or (c) by observing the report be generated in your presence. If observing, note any user-entered values or parameters and determine whether entered parameters were appropriate. Compare re-performed report to the one being tested.

## Electronic Approvals:

Observe a transaction to see the approval process and verify any key aspects of the process or limits.

If transaction data or reports include approval information, use CAATS to confirm that all transactions met authorization rules.

## **STEP 3: Understand General IT Controls**

Gain an understanding of the general IT controls that support the continued proper operation of the automated control. Identify key general IT controls and note any control weaknesses. Auditors should consider the following aspects of general IT controls when gaining an understanding:

## Software Calculation:

Inquire if the entity has experienced any errors or irregularities with the calculation. Also how often changes are made to the calculation, and how many changes (if any) were made during the year.

How can the software calculation (formulas, rates/values, settings/configurations) be changed or customized?

*Software calculations will usually have one or more administrative menus that allow the government to modify rate tables or other calculation values, or to configure the calculation or apply settings.*

*In other cases, software calculation formulas and/or values may be hard-coded into the system and require programmers to make the changes. If the government has access to source code, then it needs internal procedures for program changes. If the program is controlled by vendors, we would expect program change procedures and expectations to be included in the contract.*

What are the procedures to authorize and make program changes or configuration/setting changes to the software calculation?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

## State of Washington

*If utilizing a test environment, there should be controls to ensure that the live environment is updated and is consistent with the live production environment. As management is responsible for the accuracy of their automated controls (i.e., in the live environment), we would expect there to be a procedure to confirm each key automated control once it is in the live environment. This could be manually re-performing the calculation, reviewing reports against known expectations, etc.*

How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change programming, but they may be responsible for patch management, master table data, and/or configurations.*

### Automated Interfaces:

Inquire if the entity has experienced any errors or irregularities with the interface. Also how often changes are made to the interface, and how many changes (if any) were made during the year.

What are the procedures to authorize and make changes to the interface?

*Except for the most simple situations, we would normally expect update procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

*If the data transfer is already going to be checked or reconciled, then there may be less need for specific test procedures on program changes since any errors will be identified right away.*

How are program changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables*

## State of Washington

*or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

*If the program is controlled by a third-party, we would expect a process between the government and vendor that allows the government to make requests and receive communication at the completion of the request.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to vendor developed/supported coding that controls how the system processes the interfaced data, but they may be responsible for working the interface error queues and reconciling the interfaced data.*

### Edit Checks:

Inquire if the entity has experienced any errors or irregularities with the edit checks. Also how often changes are made to the checks, and how many changes (if any) were made during the year.

How can the edit check be changed or customized?

*Edit checks may be hard-coded into the system and require programmers to make the changes. If the government has access to source code, then it needs internal procedures for program changes. If the program is controlled by vendors, we would expect program change procedures and expectations to be included in the contract.*

*In other cases, edit checks may be established or configured through one or more administrative menus.*

What are the procedures to authorize and make program changes or configuration/setting changes?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

*If utilizing a test environment, there should be controls to ensure that the live environment is updated and is consistent with the live production environment. As management is responsible for the accuracy of their automated controls (i.e., in the live environment), we would expect there to be a procedure to confirm each key automated control once it is in the live environment. This could be manually re-performing the edit check, reviewing reports against known expectations, etc.*

## State of Washington

How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change programming, but they may be responsible for patch management, master table data, and/or configurations.*

### Computer Generated Reports:

Inquire if the entity has experienced any errors or irregularities with the report. Also how often changes are made to the report, and how many changes (if any) were made during the year.

How is the report triggered or initiated?

*For reports that are automatically triggered, the auditor would normally not identify job scheduling or monitoring as a general control since we would expect failure of the report to generate*

Is the report hardcoded into the program, or is it a custom or ad hoc report? Also, what manual inputs (if any) are required to run the report?

*What parameters, criteria (date ranges, fund number, departments) or instructions are entered by the user to generate the exception report. The more options entity personnel have to customize or modify the report, the higher the risk of human error and inaccurate or incomplete reports. Pre-programmed reports provide less flexibility than ad-hoc reports; however, if program change controls are in place, they are more consistent.*

If the report is hardcoded into the system, how are program changes made?

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change vendor developed reports, but they may be responsible for triggering, setting certain parameters, and/or following up on exception report results.*

## State of Washington

NOTE: if the auditor cannot identify sufficiently effective general IT controls, the automated control will need to be tested using the same methods as a manual control (ie: sampling throughout the period). For example, if the report is manually generated and highly dependent on a number of manual inputs each time, or if the report does not have formal change controls, such as an ad hoc report or excel-based report. In such cases, the automated report is controlled by limited access and the judgment of the report writer – that is, while the report is an automated component, there is also an integrated manual component to the control.

### Electronic Approvals:

How are users assigned preparer and approver roles? Are user accounts periodically checked for needed changes? See the [User Access](#) step in the Accountability folder for more control considerations.

If configurations or settings relevant to the approval process are controlled by an admin menu, who has access to this menu?

If the entity has access to source coding for approval controls, what are the procedures to authorize and make program changes?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to vendor developed/supported coding that controls how the electronic approval works, but they may be responsible for approval configurations or settings and/or user account management.*

### **STEP 4: Confirm Key General IT Controls**

Confirm your understanding of key general IT controls to determine whether they have been placed in operation (*whether the entity has actually implemented key controls*).

### **STEP 5: Test Key General IT Controls**

Document whether general IT controls will be tested. Option 1 would result in control risk at MAX for the automated control. Either option 2 or 3

## State of Washington

is necessary in order to set control risk at LOW. If general IT controls are tested, consider the following procedures:

### Software Calculation:

If program changes or setting/configuration changes are logged, review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the calculation may also provide this evidence if the re-performance tests address all states of the calculation during the period.

If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

### Automated Interfaces:

Review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, reconciling or comparing the data transfer (or reviewing the entity's reconciliation or comparison) may also provide this evidence if tests address all states of the interface during the period.

Inspect job processing error logs/reports. Observe evidence that errors in processing were isolated and resolved. For example, select a sample of rejected transactions and observe evidence to determine whether errors were appropriately corrected and the corrections were timely.

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

### Edit Checks:

If program changes or setting/configuration changes are logged, review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

## State of Washington

- Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the edit check may also provide this evidence if the re-performance tests address all states of the edit check during the period.
- If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.
- If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

### Computer Generated Reports:

- If the report is subject to program change controls (either due to being hardcoded or by being automatically triggered), review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

- If the report is subject to program change controls, review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the report may also provide this evidence if the re-performance tests address all states of the report during the period.
- If the report relies on manual inputs and report copies saved show the parameters entered, the auditor can check a selection or sample of reports to confirm that the report was run correctly.
- If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

### Electronic Approvals:

- Review user access report to verify that current users are appropriate. Also consider review of user access change logs (if available) to evaluate user account management throughout the period. See the User Access step in the Accountability folder for more testing considerations.
- If approvals are governed by significant settings/configurations, and such changes are logged, review the change log to verify the population of changes for the year.

*Verification that no configuration changes were made, along with the auditor's evaluation that no such changes are expected, would normally be sufficient evidence to conclude that no further testing is necessary.*

- If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.

## State of Washington

If the entity has access to source code, review the change log to verify the population of changes for the year. Then review programming change documentation or the entity's test documentation for selected or sampled changes.

*Verification that no program changes were made, along with the auditor's evaluation that no such changes are expected, would normally be sufficient evidence to conclude that no further testing is necessary.*

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the SOC Report Reliance workpaper in the Store.

### **STEP 6: Final Control Risk**

Evaluate the results and document a final control risk assessment in the control system step. Consider whether any deficiencies identified with either the automated control or related general IT controls represent material weaknesses or significant deficiencies.

*Note: general IT control deficiencies do not necessarily mean the automated control is not properly functioning. General IT control deficiencies would normally be considered a significant deficiency or material weakness only if it caused an issue with the compliance requirement or assertion.*

### **Recommendation Review Requirement**

IT Security related information is considered category 3 data protected by Public Request Exemption RCW 42.56.420. Issues related to IT Security require the following special handling:

[Instructions](#) are located in Team IT Audit's System's Sharepoint page.

Details of IT Security related issues should NOT be included in any emails or helpdesks.

Exit, ML and Findings should be separately communicated in an IT Security Results Document.

Findings will be referenced, but not included in the audit report.

All IT security-related recommendations must be reviewed by [Team IT Audit](#).

Template language for common IT related recommendations can be found in [ARS Part 5 Chapter 8](#).

### **PUBLIC REQUEST EXEMPTION**

Some IT related information is protected by Public Request Exemption RCW 42.56.420 for cyber security purposes. The details documented in the record of work and support workpapers may qualify for this exemption. If so, auditors must include this statement in the record of work done and any related workpapers: **"This record contains information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited "**.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

# State of Washington

## SAO Audit Policy [2310](#) - Reporting Identified Audit Issues

## SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk

### [Information Technology](#) Planning Guide

Auditors may contact [Team IT Audit](#) with any testing strategy or control assessment questions or to request assistance from an IT Specialist.

**Software Calculation:** A **software calculation control** exists when the value of a transaction is determined by a software application. This process can be a key control when the entity relies on the system to generate calculations correctly to determine the amount of transactions (i.e., summarizing/account code allocation to post to general ledger, calculate student, utility, other charges, etc.).

**Automated Interfaces:** An interface is a process that moves information from one computer application to another. The interface can occur internally between systems maintained by a single agency, or between systems maintained by different agencies or private companies. The interface can also occur between modules within the same computer application.

The data transferred might be a file consisting of one or more records processed at a later time (batch), or it can be a real-time update. Risk associated with interfaces increases as the number of transactions or the number of other services and systems supported by the interfaced data increases.

Poor design or inadequate oversight can affect the transfer of transaction data among the systems. Interface controls are automated and/or manual processes designed to ensure transmission and processing of information is complete and accurate.

#### Manual vs. Automated Interfaces

A “manual interface” is the transfer of data from one system or module to another system or module, initiated and controlled by a user. An example of a manual interface is when customer accounts are downloaded from a utility billing system to be used to perform meter readings. When complete, the file with meter readings may be uploaded and posted to the customer accounts.

An “automated interface” is the transfer of data from one system or module to another system or module that happens automatically based on a schedule, or other predefined criteria. A common example of an automated interface is the payroll module of a system. Typically, a payroll batch is created in the payroll module. Once approved, the batch is automatically sent by the system to the general ledger or other applicable modules, such as accounts payable.

Entities should have reconciliation controls between their various applications regardless of the method used for interfacing.

*Auditors should have determined whether system interfaces are automated as part of the Key Software Applications workpaper. **If not**, ask the*

# State of Washington

*following question to determine whether the system interface is manual or automated.*

*Is the data transferred from one system/module to another system/module by a user using an uploading and posting technique? For example, data is pulled from one system into a text file or other format, that is then uploaded into a different system or module by posting or in an upload feature of the module. If the answer to this question is yes, the interface would be considered "manual" since it is initiated and controlled by manually rather than through an automated process.*

**Edit Checks:** An **edit check** is a programmed routine designed to check input data or processing results for accuracy, compliance, or reasonableness. Types of edit checks include:

Range Checks: ensure that numeric values fall within specified ranges, minimums and/or maximums. For example, ensuring that a capital asset can only be entered as a positive amount, or a purchase order can only be submitted without secondary approval for less than a certain threshold.

Consistency Checks: verify that related data fields are consistent with each other. For example, ensuring that a patient's age matches their date of birth.

Format Checks: validate data formats (for example, dates as MM/DD/YYYY or phone numbers as ###-###-####).

Logical Checks: assess logical relationships between data fields. For instance, verifying that total debits equals total credits in a journal entry.

Duplicate Checks: identify duplicate records or entries. For example, preventing the same invoice from being entered twice.

Cross-Field Checks: compare data across different fields. For instance, ensuring that the start date of a project is before the end date.

Required Field Checks: ensure that mandatory fields are filled out. For instance, making sure that a patient's name and date of birth are provided.

Referential Integrity Checks: validate relationships between data tables. For example, confirming that a vendor number exists in the vendor master file as an active entity.

Outlier Checks: detect extreme or unexpected values. For instance, flagging water meter reading values that are extreme outliers for the customer type or account history.

Pattern Checks: look for specific patterns in data. For example, verifying that email addresses follow a valid format.

Edit checks may result in automatic rejection of a transaction, inability to proceed with a transaction, trigger for additional processing or review, or may simply result in a warning message to the user.

Edit checks may be identified as a key control when they are sufficiently relevant (ie: addressing the risk), precise (ie: able to catch all errors, rather than just being only reasonableness or limit check), and sufficiently strong (ie: prevent invalid transactions, rather than just generating a warning messages). Auditors may identify an individual edit or a group of edit checks together as a key control.

**Computer Generated Reports:** A **computer-generated report** is a report that is created by a computer program. The computer program, also referred to as a report generator or tool, takes data from a data source, such as a database, and displays it in a specified format. The process

## State of Washington

to generate a report often includes performing calculations on the data, such as summarizing, classifying, etc., before displaying, or can display the calculations on the report.

There are two types of computer-generated reports, pre-programmed and ad-hoc or customized reports.

Pre-programmed or canned reports are pre-defined reports where criteria and specifications are hard coded in the system. A canned report may allow limited parameters, (month/year, for example), but in general the information that will be displayed is pre-determined.

Ad-hoc or customized reports allow the user to drill down and customize what information is displayed on the report based on some allowed criteria, such as account codes, dollar amounts minimum, etc).

In contrast, a **manual report** is one that is created outside the system using data exports or is created ad hoc by a user. An example of a manual report is one that is created by copying data from a data source and pasting the data in an Excel spreadsheet or Word document or Powerpoint presentation where it is then processed further. With manual reports, each time a report is created, the data could be incorrect due to user error, such as not copying all relevant data, or processing errors. Therefore, these types of reports should be understood and tested similar to manual controls.

**Electronic Approvals:** Electronic approvals, electronic signatures and digital signatures are technically different, although often these terms are used interchangeably by entities.

Auditors should have determined whether the electronic approval is an automated control as part of the overall understanding of controls. For automated control purposes, an electronic approval is a software system functionality that:

Permits a user to approve transaction(s) within the software system

The system automatically documents, or logs, the data approved by the user and any subsequent manipulation

The acceptance or rejection of the transaction by the approver will trigger an additional software system process, such as posting of a transaction.

E-mail, scanned-in pictures of signatures, or font-changed signatures, etc. may be part of a control activity but are generally not considered an automated control and are not covered by this testing strategy.

### Electronic Signature vs Digital Signature

An “**electronic signature**” can look like a handwritten signature that has been scanned and then pasted into an electronic document. The reliability of this type of approval is variable. Recommend gaining an understanding of the process used to store and affix the signature to the document and then discuss the process with Team IT Audit before placing reliance on this control.

A “**digital signature**” is a legal signature with a formal certification process that documents who approved the document and ensures the document is not modified after certification. Reliability of this process is very high but has significant technical features. Recommend brainstorm

# State of Washington

with Team IT Audit before placing reliance on this control.

## **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

**Statements on Auditing Standards [AU-C 315](#) Understanding the Entity and Its Environment and Assessing the Risks of Material Misstatement** - paragraphs .A106-.A109 describe general and application controls and how they relate to audit risks

**Statements on Auditing Standards [AU-C 330](#) Performaing Audit Procedures in Response to Assessed Risks and Evaluating the Audit Evidence Obtained** - paragraphs .10b and .A33-.A34 describe requirements and guidance for testing indirect controls in conjunction with tests of controls, that is, testing key general controls in conjunction with a test of a key automated control

Record of Work Done.

**This record may contain information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited.**

## **Premiums & Claims - Valuation**

**Key Control 5 (Valuation - Automated):** The UTAB system automatically and accurately calculates the unemployment benefit payment amounts.

The understanding for this system is documented above in the "Controls - UTAB" step.

## **STEP 1: Understand Automated Key Control**

The understanding for this automated key control is documented above in the "Controls -UTAB" step.

## **STEP 2: Confirm and Test Automated Key Control:**

Per [RCW 50.20.120](#), the total amount of maximum benefits payable on the claim is found by taking the smaller of 1/3 of the total gross wages in all four quarters of the base year or 26 times the weekly benefit amount (WBA) determined.

The calculation uses two limits for the maximum benefits amount/payable (MBA):

WBA x 26

Total Base Wages / 3

We reviewed the UTAB screen and re-performed the calculations for instances of both limits as detailed below:

On 5/23/2024, Amanda Rouse, Business Systems Analyst (UTAB), provided us with information to test automated calculations in UTAB. See

## State of Washington

details below:

### **[WBA x 26] Maximum Benefits Amount/Payable**

1) We reviewed case number 0-073-792-880. We reviewed the Monetary Determination screen, Maximum Benefit Amount (MBA) & Weekly Benefit Amount (WBA) Calculations tab, in UTAB:

High Quarter Wage 1	High Quarter Wage 2	High Quarter Wage Avg
\$53,035.38	+	\$51,560.58
<hr/>		=
2		\$52,297.98
High Quarter Wage Avg.	State Multiplier from RCW	Weekly Benefit Amount
\$52,297.98	X	0.0385
		=
		\$1,019
Total Base Wages		Max Benefits Payable
\$201,451.71	/3	
		=
		\$67,150.57
Weekly Benefit Amount		Max Benefits Payable
\$1,019	X 26	
		=
		\$26,494

The MBA was \$26,494. The system correctly calculated the MBA using the WBA times 26 as it produced the smaller MBA.

### **[Total Base Wages / 3] Maximum Benefits Amount/Payable**

2) We reviewed case number 0-071-932-487. We reviewed the Monetary Determination screen, MBA & WBA Calculations tab, in UTAB:

High Quarter Wage 1	High Quarter Wage 2	High Quarter Wage Avg
\$8,778.48	+	\$3,477
<hr/>		=
2		\$6,127.74
High Quarter Wage Avg.	State Multiplier from RCW	Weekly Benefit Amount
\$6,127.74	X	0.0385
		=
		\$323
Total Base Wages		Max Benefits Payable

## State of Washington

$$\$12,255.48 \quad /3 \quad = \quad \$4,085$$

Weekly Benefit Amount				Max Benefits Payable
\$323	X 26	=		\$8,398

The MBA was \$4,085.00. The system correctly calculated the MBA by using the total base wages divided by three as it produced the smaller amount.

### **STEP 3: Understand General IT Controls**

We gained an understanding of general IT controls in the "Key Control 1 (System Calculation - Automated)" step here [[Key Control 1 \(System Calculation - Automated\)](#)].

### **STEP 4: Confirm Key General IT Controls**

**Key Control #1 - All changes to the UTAB system must go through a standard change process, where changes are tested, reviewed and approved before migrating to production.**

We confirmed this key control as part of the "Key Control 1 (System Calculation - Automated)" step linked above.

### **STEP 5: Test Key General IT Controls**

Not applicable - we are not planning to rely on automated controls and therefore do not need to test general controls; control risk will be assessed at MAX.

### **E.4.PRG - Premiums and Claims**

*Procedure Step:* Key Control 6 (Manual - UTAB to AFRS Reconciliation)

*Prepared By:* DRR, 6/27/2024

*Reviewed By:* SHW, 8/22/2024

Purpose/Conclusion.\*

#### **Purpose:**

To confirm the Treasury Manager or Assistant Treasury Manager reviews reconciliations and indicates reconciling items were accurate with tickmarks to ensure AFRS data is accurate and complete (**Key Control #6 for UTAB**) in order to assess control risk.

# State of Washington

## **Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or*

## State of Washington

*detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency.*

***All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.***

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

# State of Washington

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

### **Premiums & Claims - Completeness**

**Key Control 6 (Completeness - Manual):** The Treasury Manager or Assistant Treasury Manager reviews reconciliations and indicates reconciling items were accurate with tickmarks to ensure AFRS data is accurate and complete.

The understanding for this system is documented above in the "Controls - UTAB" step.

#### **1. Confirmation of Key Manual Control:**

This key control is tested as part of Cash and Cash Equivalents at: [[Cash & Cash Equivalents](#)]. ***No issues noted.***

We received the "January 2024 Monthly AFRS JV to Webi TEMPLATE with all GLs" spreadsheet from Meghan Phelps, Treasury Manager. We reviewed the "6510" (Cash Expenditures/Expenses) tab for fund 620. On this tab, we noted on the left it stated "Journal to AFRS" and on the right it stated "Journal to UTAB". The beginning balance of \$815,873,479.33 was the same for both sides of the spreadsheet. Both sides of the spreadsheets had entries that were made to both AFRS and UTAB. The entries on the AFRS side were directly linked to another tab that had the entry for JV 54007804. There was no adjustment needed since AFRS and UTAB had the same entries made this month. The ending balance of \$1,004,538,468.68 matched both on the AFRS and UTAB side for a variance of \$0. Additionally, we noted this spreadsheet was prepared by Son Pham, Fiscal Analyst 4 on February 20, 2024 and reviewed by Shelly Peterson, Assistant Treasury Manager on February 29, 2024. Per Shelly Peterson, Assistant Treasury Manager, this document is too large to convert into a PDF, or sign each page individually, so the preparer and reviewer of the document sign off on the "Federal" tab. **No issues noted.**

Note: The ending and beginning balances for AFRS and UTAB is large. This is due to biennial adjustments to the income statement. OFM rolls balances over after the fiscal year and ESD shows that amount on their reconciliation for expenditures. ESD uses the reconciliation as back-up for their entry into UTAB at fiscal year-end.

#### **2. Preliminary Control Risk Assessment**

## State of Washington

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

### **E.4.PRG - Premiums and Claims**

*Procedure Step:* Key Control 7 (Manual - UTAB Claims Accrual)

*Prepared By:* DRR, 10/1/2024

*Reviewed By:* RKM, 11/7/2024

Purpose/Conclusion:

#### **Purpose:**

To confirm the Treasury Manager, or Assistant Treasury Manager will create the journal voucher to record the claims accrual and the Treasury Director, or Treasury Manager will review the journal voucher and calculation to ensure that the calculation is complete and correct (**Key Control #7 for UTAB**) in order to assess control risk.

#### **Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented*

## State of Washington

*key controls).*

*A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency.*

***All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.***

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

## State of Washington

*If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

# State of Washington

Record of Work Done:

## **Premiums & Claims - Completeness/Valuation**

**Key Control 6 (Completeness/Valuation - Manual):** The Treasury Manager, or Assistant Treasury Manager will create the journal voucher to record the claims accrual and the Treasury Director, or Treasury Manager will review the journal voucher and calculation to ensure that the calculation is complete and correct

The understanding for this system is documented above in the "Controls - UTAB" step.

### **1. Confirmation of Key Manual Control:**

We received the "FY 2024 UI Appeal Accrual Entry" spreadsheet from Meghan Phelps, Treasury Manager. In this spreadsheet were various tabs which included screenshots of the "Total Issues and Outcomes" UTAB reports, a screenshot of the U.S. Dept. of Labor's monthly claims data used to calculate the accrual amount of \$203,477,783.17. We reviewed JV 54014803 prepared by Meghan Phelps, Treasury Manager on August 23, 2024 "To record an accrual for estimated unemployment insurance benefit claims incurred but not paid as of June 30, 2024", and was approved by Ibrahim Dembele, Treasury Director on August 23, 2024. The accrual amount calculated ties to the JV amount without exception. **No issues noted.**

Additionally, we re-calculated the accrual amount without exception here [[Claims Accrual Testing](#)]. **No issues noted.**

### **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

## **E.4.PR.G - Premiums and Claims**

*Procedure Step:* Risk Assessment

*Prepared By:* DRR, 7/22/2024

*Reviewed By:* CJG, 11/21/2024

# State of Washington

Purpose/Conclusion:

**Purpose / Conclusion:**

To assess inherent risk, control risk, and the risk of material misstatement in order to design an initial testing strategy for each assertion.

Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

**STEP 1: Inherent Risk (IR)**

Assess inherent risk for each relevant assertion. This assessment is based on understanding of the entity and the nature of the account balance or class of transactions.

*Inherent risk is the susceptibility of an assertion to material misstatement. It is our assessment of "total threat", which includes both "natural risk" and identified risk indicators, without any regard to any potential control activities. As inherent risk is fully independent of control risk, any understanding of controls cannot be used to increase/decrease the assessment of inherent risk. Consider the following factors as your basis for this assessment:*

*General Considerations*

*Does the balance include transactions that are difficult to audit or involve complex accounting issues?*

*Were there significant misstatements identified in previous audits or prior-period adjustments in the account balance or transaction class? If so, analyzing the cause of prior period misstatements will help in analyzing inherent risk.*

*Are there any inherent risk factors at the entity or industry level, such as changes in regulation or accounting rules, unique transactions or accounting practices, use of information technology, etc that affect the balance?*

*Inherent Risk due to Error*

*How large are the transactions making up the balance? If the balance has only a few large transactions, even a single error may mean a significant misstatement.*

*Have there been changes in the transactions making up the balance that may increase risk? For example, significantly different composition, nature or volume of transactions may inherently disrupt established controls.*

*Are financial events originated or identified by accounting personnel or non-accounting personnel? This consideration is mainly for the completeness assertion.*

*Does the process to account for transactions involve judgment or estimation, complex calculations, numerous steps or significant manual steps?*

*Do transactions have widely varying attributes that need to be manually identified? For example, grant loans that are accounted for in one of several ways depending on the terms of the agreement.*

## State of Washington

*Inherent Risk due to Fraudulent Reporting (intentional misstatements)*

*Are there substantial pressures or motivations to misstate the balance?*

*Inherent Risk due to Misappropriation*

*Is the account balance or transaction class susceptible to sizable misappropriation?*

*Inherent Risk due to Non-Compliance*

*Are there any laws, contracts or grant agreements affecting the balance? If so, would non-compliance lead to sizable misstatements?*

*Are compliance requirements complex, hard to understand, subject to judgment or otherwise difficult to comply with?*

*Are there any motivations or pressures to not comply?*

### **STEP 2: Control Risk (CR)**

Assess control risk by system and assertion. This assessment should be based on the results of the control understanding, confirmation, and (if setting control risk to LOW) testing. If applicable, auditors will evaluate any control deficiencies and determine whether those deficiencies, individually or in combination, are significant deficiencies or material weaknesses.

*Control risk is the risk that material misstatements would not be prevented or detected timely by the system of internal control. Control risk could be thought of as the "vulnerability" of an entity to misstatements. Control risk exists independently of the inherent risk (the level of vulnerability exists independent of the level of threat).*

*Control risk is MAX in both of the following situations: (1) controls aren't tested or (2) controls are problematic and cannot be relied upon. In order to set control risk to LOW, the auditor must test that controls operated effectively throughout the period.*

*A material weakness exists when the design or operation of controls results in a reasonable possibility a material misstatement will not be prevented or detected and corrected in a timely manner. A significant deficiency is less severe than a material weakness, yet important enough to merit the attention of the governing body. **All potential material weaknesses and significant deficiencies should be discussed with the AIC, since they must be reported as findings.***

### **STEP 3: Risk of Material Misstatement (RMM)**

Assess the risk of material misstatement for each relevant assertion for each significant line item. The risk of material misstatement (RMM) is a combination of the auditor's separate assessment of inherent and control risk.

*In practice, the RMM is the amount of substantive evidence that's needed, and the only way to reduce the amount of needed substantive evidence (equal to the inherent risk) is to test controls. As such, when control risk is MAX, the RMM must always equal the inherent risk (IR).*

*When controls are tested & can be relied upon (are determined to be effective) it is a matter of professional judgment how much the RMM should be set lower than inherent risk (1 or 2 steps).*

## State of Washington

*Auditors should assess RMM by assertion, if different. For example, if RMM is assessed at MOD for the existence assertion, but LOW for the rights & obligations assertion, then document "MOD – existence and LOW – rights & obligations".*

### **STEP 4: Design Substantive Testing**

Design a substantive testing strategy that addresses the relevant assertion (identified risk) in the portion of the line item that relates to that risk.

*Planning identifies where to audit (significant balances, classes of transactions & disclosures) what to audit for (relevant assertions), and how much to audit (RMM). The quantity and quality of evidence obtained by substantive tests needs to match the level of risk. The higher the risk of material misstatement, the greater evidence needed. "Greater evidence" could either be greater quantity of evidence, greater quality of evidence, or some combination of greater quality and quantity.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6210](#) – Planning Financial Statement Audits**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits Planning Guide](#)**

Record of Work Done:

### **(1) Inherent Risk (IR):**

Based on our understanding of the line item, we assessed inherent risk as follows for each relevant assertion and significant class of transactions:

Completeness – **High**

Rights & Obligations – **High**

Valuation – **High**

### **(2) Control Risk (CR):**

We assessed control risk as follows for each system and relevant assertion:

**UTAB** – Completeness, Rights & Obligations, and Valuation

## State of Washington

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **(3) Risk of Material Misstatement (RMM):**

We considered both inherent and control risk and assessed the risk of material misstatement as follows for each relevant assertion and significant class of transactions:

Completeness – **High**

Rights & Obligations – **High**

Valuation – **High**

### **(4) Testing Strategy:**

We designed our substantive testing strategy based on our assessment of the risk of material misstatement. We plan to perform the following tests:

#### **Completeness:**

We will select a sample of cash draws and ensure that bank deposits are complete and tie to UTAB.

#### **Valuation and Rights & Obligations:**

We will select a sample of FY24 benefit payments and perform the following:

Recalculate the benefit payments for selected accounts (Valuation)

Verify hours worked during the base year to determine the State's obligation (Rights & Obligations)

Determine whether the Department verified the claimant's ID prior to payment (Rights & Obligations)

Determine whether the Department sent a Request for Separation Information (RSI) form to the claimant's employer prior to payment (Rights & Obligations)

Determine whether the claimant is eligible for benefits (Rights & Obligations)

#### **Valuation/Completeness:**

We will determine if the yearly claims accrual estimate is complete and calculated correctly.

We anticipate that these tests will provide sufficient appropriate audit evidence to address the assessed risk of material misstatement for relevant assertions in significant classes of transactions.

# State of Washington

## E.4.PRG - Premiums and Claims

*Procedure Step:* Substantive Test

*Prepared By:* DRR, 9/24/2024

*Reviewed By:* CJG, 11/21/2024

### Purpose/Conclusion:

#### **Purpose:**

To determine whether all expenses/expenditures incurred during the period were reported.  
To determine whether the entity would have legal authority to make reported expenses/expenditures.  
To determine whether expenses/expenditures were reported at properly valued or calculated amounts.

#### **Conclusion:**

We determined all expenses/expenditures incurred during the period were reported.  
We determined the entity had legal authority to make reported expenses/expenditures.  
We determined expenses/expenditures were reported at properly valued or calculated amounts. **No issues noted.**

### Testing Strategy:

The following is a list of **considerations** for testing the completeness assertion for expenses/expenditures. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

#### **Detail Roll-Up**

Compare totals from general ledger to accounts payable, payroll or other subsidiary software modules.  
Review the government's reconciliation of general ledger to subsidiary systems.

*Detail roll-up testing is not sufficient audit evidence by itself since it only entails comparing different sets of the entity's own accounting records. However, it may be combined with other substantive tests to address identified risks. For example, if substantive testing is performed at the subledger level, it may be combined with a test that the subledger detail accurately rolls up to the general ledger or financial statements.*

#### **Cut off / Improper Expense Recognition**

# State of Washington

Scan expenditures recorded 1-3 months before and/or after fiscal year end (expenditures not charged to the current period). Based on the scan, test selected or sampled expenditures to determine if the expense should have been reported in the current period. Inquire with AP clerks regarding invoices held, but not entered as of year-end (ie: due to pending litigation or disputes).

## **Unrecorded Expenses**

If the entity reconciles recorded revenues and expenses to bank activity, then reviewing monthly reconciliations and evaluating or testing reconciling items.

## **Accounts Payable**

If entity uses a warrant clearing account for vendor payments, review the entity's year-end reconciliation of recorded vendor payments with disbursements from the clearing account.

Review edit check reports from the AP system that might indicate missing payments.

## **Payroll**

If entity uses a payroll clearing account, review the entity's year-end reconciliation of recorded payroll with disbursements from the payroll clearing account.

Perform an expected payroll test by taking the prior audited payroll amount and adjusting it for expected changes.

*The analysis should consider changes in employees, COLA increases, salary scale increases if automatic, changes wages or benefits due to changes in policy or union negotiations changes, etc. Sources for these expectations should be obtained apart from the payroll records that are being tested. Since the auditor would not expect to be able to precisely predict payroll, the auditor should document a reasonable range within which actual payroll is expected to vary from the auditor's prediction.*

If the board directly approves salaries for a significant amount of employees, verify whether the actual salaries for these employees is within an expected reasonable range of the approved salary.

For small entities, compare payroll by employee to known employees per observation, organization charts or a phone list.

Review edit check reports from the payroll system that might indicate missing payments.

## **Unrecorded Liabilities**

Evaluate liabilities directly related to expenses for completeness. See the completeness steps for current and non-current liabilities for testing considerations.

*For example, if the entity reports a self-insurance liability, the auditor might evaluate whether the change in the liability (and related expense) was determined and recorded. If no liability was reported, then the auditor might determine whether such a liability (and associated expense) should have been reported.*

# State of Washington

**OPEB** - auditors should use the OPEB Testing Strategy workpaper available in the Store for auditing OPEB expenses.

**Pollution Remediation** - auditors should use the Pollution Liability Testing Strategy workpaper available in the Store for auditing pollution remediation expenses.

## **Removing Expenses from Accounting Records**

Search for manual journal entries that credit (decrease) expenditures. Consider testing selected transactions.

Identify transactions that void, cancel, or manually adjust transactions in subsidiary AP or payroll systems. Auditors may conclude that the total amount of such transactions are trivial or otherwise reasonably small. Or auditors may sample or select transactions for testing.

*Also see considerations under the "Not recording expenses" section.*

## **Interfund Expenses**

For internal service fund charges, see testing strategies for internal service funds in the Accountability folder. For other types of internal charges, see testing strategies for Internal Activities.

The following is a list of **considerations** for testing the valuation assertion for expenses/expenditures. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests:

Verify that payroll calculations are correct.

If not already covered as part of control testing, verify that payroll software used correct rates.

If not already covered as part of control testing, verify that accounts payable software used correct rates for calculating sales tax.

Review calculation of any estimated expenses.

Review related-party transactions to determine whether expense/expenditure transactions were correctly calculated.

## **Landfill Closure & Post-Closure Expenses**

*See the valuation testing strategy for non-current liabilities..*

**OPEB** - Auditors should use the OPEB Testing Strategy workpaper available in the Store for auditing OPEB expenses.

**Pollution Remediation** - Auditors should use the Pollution Liability Testing Strategy workpaper available in the Store for auditing pollution remediation expenses.

The following is a list of **considerations** for testing the rights and obligations assertion for expenses/expenditures. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

## State of Washington

Review selected expenses/expenditures to determine whether the entity had legal authority to make the payments or incur the liability.

If disbursements for different entities are made out of the same bank account, review the entity's reconciliation of accounting records to disbursements to verify that only expenditures of the entity were reported by that entity.

Compare vouchers audited and certified by the auditing officer to the warrant register or review documentation for selected or sampled vouchers to determine whether expenses/expenditures were audited and certified in accordance with RCW 42.24.080.

Compare board-approved vouchers to the warrant register or review documentation for selected or sampled vouchers to determine whether expenses/expenditures were properly approved by the governing body.

Test selected or sampled transactions for compliance (allowability, eligibility, etc) with applicable restrictions or requirements.

*NOTE: this test may be combined with expenditure tests for other attributes. For example, expenditure testing for accountability or single audit purposes would normally also be considered testing for the rights & obligations assertion.*

### Expenditures related to Joint Ventures or Other Arrangements

Review forming documents and agreements to verify expenditures for obligations of the venture.

**OPEB** - Auditors should use the OPEB Testing Strategy workpaper available in the Store for auditing OPEB expenses.

**Pollution Remediation** - Auditors should use the Pollution Liability Testing Strategy workpaper available in the Store for auditing pollution remediation expenses.

Guidance/Criteria.*
---------------------

#### **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

**BARS 3.6.13 Utility Tax (*applies only to cities*)** - should be accounted for as a revenue in the general fund (3164000) and expenditure in the utility fund (53P0040), if the utility passes the tax on to its customers then the additional charges should be recognized as revenue (343P000) directly in the utility fund not in the general fund

#### **BARS 3.8.6 Use of Payroll and Claims Funds**

#### **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

# State of Washington

## **BARS [3.8.6](#) Use of Payroll and Claims Funds**

### **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

**BARS [3.8.5](#) Voucher Certification and Approval** - prescribes the form and manner of the audit and certification

## **BARS [3.8.6](#) Use of Payroll and Claims Funds**

**RCW [42.24.080](#)** - describes statutory audit, certification and approval requirements

Record of Work Done:

### **Substantive tests performed to meet the Completeness assertion:**

#### Daily Cash Draws:

We used the Nonstatistical Sample of Population 365 or less spreadsheet [[Daily Cash Draw Testing](#)] with a tolerable misstatement and assurance levels dictated by the material balance workpaper for a planned sample size of 24. We used the random number generator to randomly select 24 sample dates throughout FY24.

We obtained UTAB general ledger postings (Daily Draw Worksheet section), all supporting documentation (UTAB Daily Draw Adjustments sections and AFRS posting), and payment transaction confirmations (US Bank account ending 9548 statements) from Stephanie Eskesen, ESD External Audit Liaison.

We performed the following procedures:

- We tested the general ledger posting for the presence of a signature indicating supervisory review.

- We tested that the review was done in a timely manner.

- We manually calculated the amounts on the general ledger posting from the supporting documentation (adjustments) to ensure that the worksheet was programmed correctly and to develop an expectation of the results of supervisory review.

- We confirmed that the US Bank confirmation tied to the total in UTAB.

See substantive testing at: [[Daily Cash Draw Testing](#)]. ***No issues noted.***

#### Bank Reconciliations:

We rely on testing of the bank reconciliations related to benefits at: [[Cash & Cash Equivalents](#)].

# State of Washington

## Claims Accrual:

See testing: [[Claims Accrual Testing](#)]. Meghan Phelps, Treasury Manager, provided us with excel worksheet "FY 2024 UI Appeal Accrual Entry GL5118" in which we noted that ESD used UTAB "Total Issues and Outcomes" reports and U.S. Department of Labor data in order to calculate the yearly estimate of claim accrual.

The UTAB reports were used to find the number of allowable cases, the "total bucket" of cases (all cases less any open cases at the end of the fiscal year), and the amount of open cases. The reports aren't labeled with dates, but both reports are for issues created from 7/1/23 through 6/30/24. The difference between the two reports is that the one of the reports is for issues closed from 7/1/23 through 6/30/24, while the other report is for issues closed from 7/1/24 through 8/23/24. ESD uses the first report to identify the amount of claims in the backlog that were allowed. ESD then runs the second report, with a date range of 7/1/24 through the day before they calculate the estimate (8/23/24). They assume these cases were in backlog as of 6/30/24. They apply the ratio calculated from the first report to estimate how many open claims from the second report will most likely be allowed and therefore paid out. We determined that this is a reasonable way to determine the ratio of open cases that will be allowed. We ran these reports in UTAB and determined that the dataset is complete. **No issues noted.**

Finally, we noted that ESD used monthly program and financial data retrieved from the U.S. Department of Labor's website in order to arrive at the "weekly amount" and "# of weeks" figures used in the calculation of the yearly estimate. We retrieved this data from the website ourselves and determined that ESD used all monthly program data from FY24. We determined that this dataset was complete.

On the "SAO Accrual Re-Calc" tab, we used the two UTAB "Total Issues and Outcomes" reports, and the U.S. DOL data to recalculate the claims accrual.

On the "SAO-ESD Accrual Calc. Compare" tab, we compared the total estimated accrual amount per ESD's workbook, to our own recalculation and noted they tied without exception. We then confirmed the accrual tied to the JV posted to AFRS. **No issues noted.**

## **Substantive tests performed to meet the Valuation assertion:**

### UI Benefits:

We used the Financial Audit Substantive Statistical Sample spreadsheet with a tolerable misstatement of 7.5%, and high assurance levels, and we arrived at a planned sample size of 39. We determined we would test 19 additional sample items due to the risk associated with claims payments. Priscilla Soh, IT Auditor (Team IT Audit), randomly pulled these samples using the benefit week payment date. The data is received by quarter, so we asked them to randomly select the following:

- 15 claimants from Q3 2023 (July - Sept 2023)
- 15 claimants from Q4 2023 (Oct - Dec 2023)
- 14 claimants from Q1 2024 (Jan - March 2024)
- 14 claimants from Q2 2024 (April - June 2024)

## State of Washington

To verify that UTAB is calculating benefit payments and maximum benefits payable accurately, we reviewed screens within UTAB and recalculated benefit payments for the sample. We reviewed the calculations for the following:

Weekly Benefit Amount (WBA)

We added together the gross wages in the two highest quarters during the period, divided by 2, and then multiplied by 0.0385 (RCW 50.20.120).

Earnings Deduction (if applicable)

If the claimant has earnings during the week, ESD deducts part of the earning from the WBA.

We take the gross earning minus \$5.00 multiplied by 75%. All deductions are rounds up to the next highest dollar.

Intercepts (if applicable)

This is money taken out of the benefit payment for the following reasons:

Income Tax Withholding

Repaying a Debt to ESD

Child Support

Maximum Benefits Payable

The total amount of benefits potentially payable on the claim is found by taking the smaller of:

26 times the claimants's weekly benefit amount or

1/3 of the total gross wages in all four quarters of the claimant's base year

See substantive testing performed at: [Regular UI Claims Testing]. **No issues noted.**

Claims Accrual [Claims Accrual Testing]:

On the "SAO Accrual Re-Calc" tab, we recalculated the "weekly amount" and "# of weeks" figures used to calculate the yearly estimate of claim accruals. We were able to properly recalculate these figures using data retrieved from the U.S. Department of Labor's website. We used these figures to recalculate the total estimated accrual amount. We were able to properly recalculate the amount using the "Total Issues and Outcomes" Reports from UTAB, the "average duration of benefits (weeks)" amount, and the "average WBA" amount without exception. **No issues noted.**

**Substantive tests performed to meet the Rights & Obligations assertion:**

UI Benefits:

We used the Financial Audit Substantive Statistical Sample spreadsheet with a tolerable misstatement of 7.5%, and a high assurance level, this arrived us at a planned sample size of 39. We determined we would test 19 additional sample items due to the risk associated with claims payments. Priscilla Soh, IT Auditor (Team IT Audit), randomly pulled these samples using the benefit week payment date. The data is received by quarter, so we asked them to randomly select the following:

15 claimants from Q3 2023 (July - Sept 2023)

15 claimants from Q4 2023 (Oct - Dec 2023)

14 claimants from Q1 2024 (Jan - March 2024)

# State of Washington

14 claimants from Q2 2024 (April - June 2024)

We reviewed screens within UTAB to verify the following:

If ESD verified the claimant's ID before payment was sent.

If ESD verified the claimant's hours worked during the base year, which determines the claimant's eligibility and ESD's obligation to pay.

If ESD sent a Request for Separation Information (RSI) form before paying the claimant.

If the payment is allowable.

See substantive testing performed at: [[Regular UI Claims Testing](#)]. ***No issues noted.***

## E.4.PR.G - Premiums and Claims

*Procedure Step:* Sample Methodology

*Prepared By:* PS, 8/7/2024

*Reviewed By:* RKM, 10/18/2024

Purpose/Conclusion.:

### **Purpose:**

To randomly selected samples from UTAB benefits paid during FY2024.

To provide the total amount and total number of transactions for FY2024.

### **Conclusion:**

Sample population are provided to audit team in Excel.

Testing Strategy.:

Guidance/Criteria.:

# State of Washington

Record of Work Done:

## **Import UTAB Data**

IT Audit emailed Stephanie Eskesen, ESD External Audit Liaison, and Samuel Havens, ESD Reporting, Accessibility, and Performance Manager, to request for UTAB data. This included the UTAB benefit payments, base year employer data and base year wage data.

The email was sent on 5/1/2024 to request fiscal year 2024 data. ESD provided the fiscal year 2024 UTAB data files in .csv format on 7/23/2024. The files were sent to SAO via the WaTech secure file transfer site (MFT.wa.gov). Files were saved to the SAO network drive and imported into SQL database. We have confirmed the record count of each file to the record count provided by ESD staff. No exception. We had also performed procedures at Reasonableness UTAB 2024 and have determined that the data are reasonable.

## **Document Test Objective**

This request was submitted by Team FA via Helpdesk 68024.

1. To randomly select 59 UTAB payment samples for testing as follow:
  - 15 payments from Q3-2024 (July - Sept 2023)
  - 15 payments from Q4-2024 (Oct - Dec 2023)
  - 14 payments from Q1-2024 (Jan - March 2024)
  - 14 payments from Q2-2024 (April - June 2024)
2. Provide the total number of payments and total dollars of UTAB payment population for FY2024.

## **Methodology**

We will randomly select samples from the UTAB UI benefit paid during the fiscal year 2024. As we perform our testing, we will make adjustments to this plan as necessary.

## **Queries**

The queries to complete the sample selection are at Testings UTAB 2024.

## **Reasonableness**

The reasonableness of test results has been performed and documented in the above queries. Based upon our checks, we consider our test results to be complete and reasonable.

## **Results**

# State of Washington

In fiscal year 2024, there are 2,848,409 UTAB payments for a total amount of \$1,716,586,963.76. This includes all entitlement types. The samples are provided to audit team in an Excel spreadsheet, !2024\_UTAB\_Samples.xlsx. The results provided contain CONFIDENTIAL DATA.

## F.1.PR.G - Claims and Judgments Payable

*Procedure Step:* Summary & Conclusion

*Prepared By:* EZM, 10/11/2024

*Reviewed By:* RKM, 11/21/2024

Purpose/Conclusion:

### **Purpose:**

To evaluate risk assessments and the sufficiency and appropriateness of evidence obtained based on results of substantive work.

### **Conclusion:**

We determined that **no** modifications were necessary to inherent risk, control risk, or the risk of material misstatement as assessed in planning.

We also determined that evidence obtained was sufficient and appropriate in response to the risk of material misstatement.

Testing Strategy:

Auditors are **required** to evaluate conclusions for substantive testing as follows:

*Auditors may wish to use the optional Lead Sheet available in the Store to summarize testing related to each balance and assertion.*

**1.** Determine whether the results of substantive testing indicate a need to modify the inherent risk assessment (IR), control risk assessment (CR), risk of material misstatement (RMM) or other aspects of planning (such as material balances or assertions). If so, document changes and consider the need for additional testing.

*If the results of substantive testing indicate a need to change control risk, auditors should also update the **Permanent File** by either correcting the documentation or by adding an update section describing changes to the top of the record of work done. For all changes to IR, CR, or*

## State of Washington

*RMM the **Material Balances** spreadsheet should be updated.*

*More significant changes to other aspects of planning (such as material balances or assertions) should be referenced in this step and documented in detail in the **Changes to FS Audit Plan** step.*

2. Evaluate whether the quality and quantity of evidence obtained is sufficient and appropriate in response to the risk of material misstatement. In making this determination, auditors should evaluate:

Information to be used as audit evidence:

- Does evidence relate to the population, period of time and risk (assertion and “what could go wrong” from the Material Balance Spreadsheet)? If there are any gaps or uncertainties in the logical connection between the evidence and conclusions, is there a documented consideration and explanation?
- Are the sources of information sufficiently reliable and appropriate for the risk (whether internal to the government, external, or auditor developed)? If key information is not from a sufficiently reliable source (for example, inquiry), then is it corroborated by information that is?
- Are there any concerns about accuracy, completeness, authenticity, or bias in information? If so, did the auditor perform sufficient procedures to confirm reliability of that information?
- Is information precise enough to catch if misstatements exceeded the tolerable level?
- Is information detailed enough to conclude on whether or not there were misstatements?
- Was there any information that appeared contradictory or inconsistent? If so, was there a documented response to the inconsistencies or doubts about the reliability of evidence?

Results:

- How much misstatement was identified by testing, and the likelihood and magnitude of further potential misstatement?
- How did misstatements occur and how often might they occur again in the population?
- Were misstatements caused by control deficiencies or circumvention of controls?
  - If control deficiencies, is there a need to re-evaluate our understanding of controls in the **Permanent File** folder or assessment of control risk?
  - If circumvention, the **Management Override of Controls** step should address or reference this area. Auditors should also consider whether a fraud risk has been identified.
  - Did tests identify a different level or type of risk than the planned audit response was designed to address?
  - If likely misstatements are identified, are further procedures necessary to improve the precision of our estimate?

*To support the overall evaluation of audit risk and provide a basis for concluding on the overall sufficiency and appropriateness of evidence in the **FS Summary & Report** step, auditors should conclude in each area whether the auditor continues to believe that the tests performed and*

## State of Washington

*quality and quantity of evidence obtained are commensurate with RMM for all relevant risks (the "what could go wrong", in the [Material Balances](#) spreadsheet).*

If the auditor determines that evidence is not sufficient or appropriate, additional substantive testing should be done. If sufficient, appropriate evidence is not available for audit, the AIC should discuss the effect on our audit report with the AAM and AM.

Guidance/Criteria.:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6310](#) – Determining the Nature, Timing and Extent of Substantive Testing**

**SAO Audit Policy [3210](#) – Audit Evidence**

Record of Work Done.:

Based on test results, we re-evaluated risk assessments, procedures, evidence obtained and conclusions as follows:

**(1) Do the results of substantive tests indicate a need to modify our risk assessment (IR, CR and RMM)?**

No, the results of substantive tests do not indicate a need to modify our risk assessment.

**(2) Was the quality and quantity of evidence obtained sufficient and appropriate?**

Yes, the quality and quantity of evidence obtained was sufficient and appropriate.

### **F.1.PRG - Claims and Judgments Payable**

*Procedure Step:* Understanding of Line Item

*Prepared By:* EZM, 9/13/2024

*Reviewed By:* RKM, 10/2/2024

Purpose/Conclusion.:

# State of Washington

## **Purpose / Conclusion:**

To gain an understanding of the line item and confirm the scope of testing as documented in the Significant Account Matrix.

## Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

### **STEP 1: Prior Audit Exceptions**

Document any exceptions noted during the prior audit. Follow-up to determine how the agency has responded to or corrected the issue, unless this work is anticipated as part of the testing strategy.

### **STEP 2: Analyze Composition and Changes of Line Item**

Include link to the line item leadsheet. This will be completed at the end of the audit. Leadsheet analysis should be documented in this spreadsheet.

Inquire with agency staff about the activities and transactions that make up the balance and any changes to those activities or transactions in relation to the prior year.

Determine relevant classes of transactions or account balances within the line item to analyze (such as agencies, funds, programs, departments, accounts, and/or objects), and use AFRS to create trends of those elements. This step should not include any specific dollar amounts associate with the line item.

Evaluate trends to identify:

- (1) What classes of transactions or account balances are primary to the identified risk. Auditors should specifically consider what elements are primary to the line item (comprising a large percentage of the line item), and which elements the identified risk would apply to, and which elements might be most susceptible to the identified risk (having a high risk of non-trivial misstatement for a relevant assertion, considering likelihood and impact of potential for misstatement).
- (2) What changes are primary to the identified risk, if applicable. Auditors should specifically consider whether the overall change to the line item from the prior year was significant, what elements were the primary drivers of overall change, whether any elements changed significantly from the prior year, and which changes (if any) might relate to the identified risk.
- (3) Any unusual or unexpected elements, amounts, or changes that may indicate a risk, whether the one identified in planning or a new one that may need to be considered for a change to the plan.

**Consider** other procedures to gain an understanding of the line item, such as review of key policy documents, review of program information or reports, inquiry of staff, budget information, or other analytical procedures.

## State of Washington

### STEP 3: Update Significant Account Matrix

Based on your understanding of the line item, update the Significant Account Matrix with final conclusions on the agencies covered, account description, significant accounting systems, and risk (what could go wrong and relevant assertions). The account description should reflect the significant transaction streams or account balances relevant to the risk.

*The description of agencies, significant accounting systems, and what could go wrong in the Significant Account Matrix constitute the overall scope of substantive testing.*

*A transaction stream is significant based on the potential for misstatement. This is often due in part to its size (ie: comprising a large percentage of the total line item), but is ultimately a judgment about the susceptibility to the identified risk (for example, when the risk is understatement a small or omitted account may hold the most potential for the largest misstatement).*

*Significant accounting system(s) are those that contain key controls over significant classes of transactions included in the line item. Control systems identified in this step must match the Significant Account Matrix and have a separate control understanding documented.*

*Talk with the AIC if you identify any changes to the Significant Account Matrix.*

Guidance/Criteria:

Record of Work Done:

#### **(1) Prior Audit Exceptions:**

We noted **the following** prior audit exceptions:

Claims Data Accuracy - We reported an exit item due to the fact that HCA did not have a documented process in place to review the accuracy of claims data provided to their external actuary, Milliman. Milliman uses this data for the SEBB Receivables Risk Adjustment calculation and the incurred but not reported (IBNR) liability. HCA relies on Milliman's procedures alone to determine these balances, but Milliman does not audit the claims data used in these calculations and relies on HCA and its vendors to provide accurate data and information. We recommended that HCA perform and document a review of accuracy of key claims data used in actuary calculations for receivables and the IBNR liability.

We inquired with Sara Whitley, ERB Finance Manager, about this prior audit issue on April 26, 2024, and she informed us that there's sections of HIPPA that restrict the "plan sponsor" (HCA) from reviewing claims data passed directly from "group health plans" (third party administrators [TPA]). Specifically, these sections are [45 CFR 164.504, sections f\(2\) and \(3\)](#). Sara stated that the Authority contracts with Milliman to check for reasonableness of the raw claims data, that the Authority depends on TPAs to provide accurate claims data to Milliman, and as a compensating control, HCA compares claims reports from TPAs and compares the amounts in those reports to prior period amounts to ensure that trends are aligning with the Authority's expectations (see our control understanding and the confirmation work we did for key control #1 for more details on this last item). Considering that HCA is not allowed to review the claims data in detail, per HIPPA, and considering HCA's compensating control of reviewing TPA

## State of Washington

reports to ensure the claims amounts align with HCA's expectations, we've determined that it's reasonable for HCA to not review key claims data in detail. **No issues noted.**

Claims and Judgments Payable Error - We issued a verbal recommendation due to the fact that HCA and OFM understated the IBNR liability by \$8.645 million. Claims and Judgments Payable in the Health Insurance Fund within Note 7 (Long Term Liabilities) was also affected by this error by the same amount. We recommended that HCA correct this error and thoroughly review any IBNR adjustments for accuracy before posting. We also recommended that OFM work together with HCA during the concluding process to ensure note disclosures are accurate.

When we communicated this issue to Kelly Diaz, OFM Statewide Accountant, she informed us that this error would be corrected in FY24 with a prior period adjustment. We requested and received documentation from William Sogge, External Audit Liaison, and Rita Homan, Deputy Accounting Section Manager, showing that this prior period adjustment was performed in FY24, and when we analyzed the adjustments made (see [Adjustments to Correct Prior Year Understatement]), we found that the \$8.645 million understatement was fully corrected. **No issues noted.**

### **(2) Composition & Change Analysis:**

Line Item Leadsheet: [Line Item Lead Sheet]. See understanding of HCA's Employee Retiree Benefits (ERB) operations at [Health Insurance Activities Updated 2024].

The Claims and judgements payable balance is made up of HCA's incurred but not paid (IBNP) liability. This estimate is required for all self-insurance plans in Washington State and ensured solvency requirements. This liability is the estimate of self-insured medical, pharmaceutical, and dental claims that existed at the end of the period but have not been processed (billed) by HCA's third party administrators (TPAs), Regence (medical), MODA (pharmaceutical), and Delta Dental (dental). The estimate is prepared from quarterly actuary studies performed by Milliman using Regence, MODA, Delta Dental and HCA data. The estimate amount is provided to HCA through a quarterly memo. The estimate is typically 7% of rolling annual medical and pharmaceutical claims and 4% of dental claims for all of HCA's self-insured plans offered through Uniform Medical Plans offered to PEBB and SEBB subscribers. This balance acts as an accrual account for premiums and claims.

#### *ACFR Database*

We performed an analysis to review the composition of this ACFR line item. Total claims and judgments payable (GL\_Sort Code = NY) for FY23 at HCA were \$164,037,000, see [Interim Planning Significant Account Matrix] for details. We analyzed the reserve amounts in the line item lead sheet and identified fund 473 (SEBB) and 730 (PEBB) in GL account 5119 make up the balance of this line item with an insignificant portion attributed to OFM fund FFJ (year-end entry prepared by OFM).

We analyzed the reserve amounts and noted that the fund percentage compositions from 2023 were in line with 2022. There were dollar amount decreases in FY23 with fund 473 decreasing approximately 8 percent and fund 730 decreasing approximately 34 percent with a total decrease to this line item of approximately 32% from 2022 to 2023.

# State of Washington

## **(3) Updates to Significant Account Matrix:**

None.

## **F.1.PR.G - Claims and Judgments Payable**

*Procedure Step:* Controls - Actuarial Report

*Prepared By:* EZM, 5/6/2024

*Reviewed By:* RKM, 7/5/2024

Purpose/Conclusion:

### **Purpose:**

To gain an understanding of internal controls.

### **Conclusion:**

We gained an understanding of internal controls as documented in the record of work done.

Testing Strategy:

### **The following procedures are required for all material systems:**

1. List the financial statement balance(s) and relevant assertion(s) addressed by the understanding.
2. Gain an understanding of the internal control process, identify how transactions are recorded in AFRS, identify key controls over relevant assertion(s), and note any control weaknesses.
  - In gaining an understanding of controls, consider the overall understanding of State-Level control elements as documented in the "State-Level Controls" step as they relate to this particular system.
  - Identify controls systems covering all relevant assertions for all significant classes of transactions.
  - Standards require the auditor to gain an understanding of the significant accounting system(s) that contain key controls over significant classes of transactions included in the line item.
  - Control systems identified in this step must match the Material Account Matrix and have a separate control understanding documented.
  - Talk with the ACFR Specialist or AIC if you identify different systems than the ones anticipated in the Material Account Matrix.

# State of Washington

For each material system, auditors must document:

- A brief outline of the transaction flow from beginning to end.

- An expanded description of key controls.

- Business processes relevant to financial reporting of the relevant assertion for the material balance. Processes should encompass automated and manual procedures by which transactions or events are identified or initiated, authorized as needed, recorded, processed and corrected as needed.

- Original accounting records and how records are rolled-up to intermediary ledgers and transferred to the general ledger (AFRS) or financial statements.

- Detailed descriptions of key controls. Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

The following is information to **consider** when identifying key controls and transaction flow.

“Key controls” refer to the few controls that together provide reasonable assurance that material misstatements will be prevented or detected and corrected. This is contrasted with ancillary or supporting controls, which – although helpful and recommended – would provide less than reasonable assurance by themselves.

The focus of the write-up is on the key controls. Key controls should be specifically identified (as “key controls”) in the write-up. This can be done in whatever way the auditor prefers, so long as it is obvious. Details that the auditor should document regarding key controls may include:

- Who or what initiates the control

- When (or how often) is the control applied

- Who performs the control

- As needed, the experience, knowledge and attitude of the person applying the control

- Detailed description of the control process or activity. For example, if the control is a review: what exactly is reviewed, what is the reviewer looking at or for and what are the reviewer’s criteria?

- How the key control is documented or evidenced

- If not obvious from the description, how the control prevents or timely detects and corrects misstatements

- Any exceptions or alternative processing to the normal process

- What happens when misstatements or issues are identified by the control

The “transaction flow” refers to the process by which transactions are initiated, authorized, recorded, processed and reported (as applicable).

## State of Washington

Outlining the transaction flow gives context to key controls, especially how transactions become subject to controls in the first place. If a control inherently ensures that all applicable transactions are included (ex: bank reconciliation where the assertion is existence), the auditor may decide to just start the write-up with the initiation of the control procedure and go from there.

Elements of the transaction flow are defined informally as follows:

*Initiation:* How are transactions initiated?

*Authorization:* How are transactions and accounting record maintenance authorized?

*Recording:* How are transactions or balances identified and recorded in financial accounting systems?

*Processing:* How are the transactions or balances processed after they are recorded (if at all)? Processing may be manual or automated and may occur at a subsidiary system level or at the general ledger level.

*Reporting:* How are records translated into the financial statements? This part of the transaction flow extends the understanding to the actual financial statements that the audit is opining on. Since we already document an understanding of the financial reporting process in general, it is usually enough to simply reference this overall understanding. However, if there are important steps unique to the covered balances, it may be more appropriate to mention them here.

Although transaction flow is a good way to think about understanding and documenting a control system, auditors should not worry too much about documenting "each element, in order" because often elements may be combined, not noticeable, not applicable or occur in a different order.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits](#) Planning Guide**

Record of Work Done:

Internal controls in the Actuarial Report address the following balance(s):

Claims and Judgements Payable - Current

# State of Washington

For the following assertions:

Valuation - Estimated claim payables (incurred but not reported liability) may be under-reported or not supported by amounts determined by actuaries; HCA used actuaries that were not creditable or lacked experience (educational and professional) to determine estimate; assumptions based on unaudited attestations made by HCA were not accurate (e.g. information relied on by Milliman did not reflect actual operations or benefits provided); and claim history information provided to Milliman was not complete (i.e. multiple sources of claims)

## **Gain an Understanding of Internal Controls**

We gained an understanding over the incurred but not reported (IBNR) with the following HCA staff on 4/26/2024:

Rita Homan, Deputy Accounting Section Manager  
Sara Whitley, ERB Finance Manager  
Lisa Kolle, PEB Accounting Manager  
Grant Stromsdorfer, Pay1 Mainframe Support  
Samantha Zimmerman, Internal Control Officer  
William Sogge, External Audit Liaison

HCA used Milliman for actuary services for operating the PEBB and SEBB Uniform Medical Plans (medical and dental). We performed the "Rely on Specialist" step in TeamMate to assess the competence, capabilities, and objectivity of the Milliman actuaries. See the Rely on Specialist step here [[Rely on Specialist](#)]. Milliman provides HCA a quarterly memo that summarizes the calculations for the incurred but not paid (IBNP) estimate using raw claims feed data from third-party administrators including Regence, MODA and Delta Dental and census data from HCA.

Due to HIPPA compliance rules as the plan sponsor and employer, HCA has limited access to the raw claims feeds from the third-party administrators. To ensure the amounts reported by the third-party administrators to Milliman are complete and accurate, HCA reviews multiple reports and compares them to prior periods to ensure that trends are aligning with expectations (**Key Control #1 - Manual - Valuation**). Some of these reports are the weekly "tracker" (internally generated) that includes the lump sum claims amounts due to Regence for medical claims, Regence Monthly Operations Report, and the MODA Rebate Report. The Regence Monthly Operations Report provided by Regence includes a tracking of claims processed to date as well as a claims inventory, claims incurred but not yet paid, and general claims seasonality for both PEBB and SEBB claims. HCA often shares this report with Milliman to ensure their amounts are in alignment with claims that Regence is reporting for the period. One of the reports that HCA reviews is the MODA Rebate Report provided by MODA, which details the projected rebate amounts, and rebates to be received for the pharmacy benefit. This report is reviewed and compared to what the Employee Retiree Benefits (ERB) accounting department and Milliman have recorded and is also shared with Milliman to ensure the amounts are in alignment with what MODA is reporting.

HCA meets with Milliman approximately once a week to update assumptions, projections, and various other items that may affect the IBNP estimate. After the end of the quarter, the ERB team and Milliman meet to discuss trends, drivers of assumptions and compare the memo to prior

## State of Washington

quarters before Tanya Duel, Section Manager, approves the memo (**Key Control #2 - Manual - Valuation**). Milliman will often provide a draft memo for discussion before providing the finalized memo, but due to conflicting timelines with receiving insurance carrier data, this is not always possible. The ERB finance team has full discretion to request updates to the memo if needed. If updates to the memo are necessary, Sara Whitley, ERB Finance Manager, would notify Milliman and the ERB accounting department and provide them with the updated memo. The ERB finance team consists of the following: Tanya Deuel, Section Manager; Sara Whitley, ERB Finance Manager; Molly Christie, Fiscal Information Data Analyst; Izzy Uong, Fiscal Information Data Analyst, and Kodi Campbell, Fiscal Information Data Analyst,

After the ERB Finance approves the memo, the memo is emailed to Katherine Plaquet, Fiscal Analyst 5, in the accounting department. Quarterly, Katherine prepares the journal voucher based on the IBNR summary charts in the Milliman memo. Rita Homan, Deputy Accounting Section Manager, or Lisa Kolle, ERB Accounting Manager, would review and post the journal voucher to ensure amounts were accurate and supported by the actuary memo (**Key Control #3 - Manual - Valuation**).

Note: HCA called the IBNP liability the IBNR liability. IBNP and IBNR were used interchangeably.

### **How Transactions are Recorded in AFRS:**

General journal vouchers were used to make quarterly adjustments to the IBNR estimate. A Fiscal Analyst 5 prepares the JV using the IBNR summary charts in the Milliman memo, and the Deputy Accounting Manager, or the PEB Accounting Manager would review and approve the JV.

### **Key Controls are as Follows:**

- Key Control #1: Valuation - The ERB Finance Team reviews multiple reports, such as their internal weekly paid claims tracker, Regence Monthly Operations Report, and MODA Rebate Report and compares them to prior periods to ensure that trends are aligning with expectations and that the amounts reported by third-party administrators to Milliman are complete and accurate.
- Key Control #2: Valuation - Milliman calculates and prepares the memo that summarizes the calculations for the incurred but not paid (IBNP) estimate in accordance with the data provided by Regence, MODA, Delta Dental and HCA, then meets with the ERB finance team to discuss the memo and compare it to prior quarters before the ERB Section Manager approves it.
- Key Control #3: Valuation – Quarterly, a Fiscal Analyst 5 prepares the journal voucher based on the IBNR summary charts in the Milliman memo. The Deputy Accounting Section Manager reviews the journal vouchers to adjust the incurred but not reported liability to ensure the amount is supported by the memo from Milliman, HCA agrees with the conclusions and analysis in the memo, and the IBNR amount is correctly calculated.

### **Noted Weaknesses are as Follows:**

None.

# State of Washington

## F.1.PR.G - Claims and Judgments Payable

*Procedure Step:* Key Control #1 (Manual)

*Prepared By:* EZM, 5/6/2024

*Reviewed By:* RKM, 5/29/2024

Purpose/Conclusion:

**Purpose:**

To confirm whether the ERB Finance Team reviews their internal weekly paid claims tracker, Regence Monthly Operations Report, and MODA Rebate Report to ensure that trends are aligning with expectations and that amounts reported by third-party administrators to Milliman are complete and accurate (key control #1 for Actuarial Report) in order to assess control risk.

**Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

## State of Washington

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency.*

***All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.***

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

## State of Washington

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

**Key Control #1 (Valuation):** The ERB Finance Team reviews multiple reports, such as their internal weekly paid claims tracker, Regence Monthly Operations Report, and MODA Rebate Report and compares them to prior periods to ensure that trends are aligning with expectations and that the amounts reported by third-party administrators to Milliman are complete and accurate.

The understanding for this system is documented above in the "Controls - Actuarial Report" step.

### **1. Confirmation of Key Manual Control:**

# State of Washington

We received a copy of the Monthly Operations Report from March 2024, which was a PDF file that had multiple comments on it indicating review. We also reviewed the MODA rebate report, which was an excel file featuring rebate data from FY21-23 and we inspected a screenshot of HCA's weekly claims tracker workbook – both of these documents had rebate/claims data from FY21-23, denoting that current rebate/claim trends are being compared to prior periods to ensure trends align with expectations. **No issues noted.**

## **Noted Weaknesses are as follows:**

None.

## **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

## **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

## **F.1.PR.G - Claims and Judgments Payable**

*Procedure Step:* Key Control #2 (Manual)

*Prepared By:* EZM, 5/6/2024

*Reviewed By:* RKM, 5/29/2024

Purpose/Conclusion.*
----------------------

### **Purpose:**

To confirm HCA reviewed Milliman's incurred but not paid memo to ensure accuracy (Key Control #2 for Actuarial Report) in order to assess control risk.

### **Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

# State of Washington

## Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified*

## State of Washington

*issue represents a material weakness or significant deficiency.*

***All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.***

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

# State of Washington

## SAO Audit Policy [2310](#) - Reporting Identified Audit Issues

## SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk

Record of Work Done:

**Key Control #2 (Valuation):** Milliman calculates and prepares the memo that summarizes the calculations for the incurred but not paid (IBNP) estimate in accordance with the data provided by Regence, MODA, Delta Dental and HCA, then meets with the ERB finance team to discuss the memo and compare it to prior quarters before the ERB Section Manager approves it.

The understanding for this system is documented above in the "Controls - Actuarial Report" step.

### **1. Confirmation of Key Manual Control:**

For the December 31, 2023 reserve, HCA was provided the finalized memo on January 31, 2024. The ERB Finance Team met with Milliman on January 12, 2024. We confirmed this meeting took place by inspecting a copy of the Weekly Milliman Call agenda for the same date. Milliman and the ERB Finance Team discussed the general trends observed in the reserve memo, differences from prior periods for both the PEBB and SEBB programs, and discussed general seasonality of claims trends. The ERB finance team approved the memo. **No issues noted.**

### **Noted Weaknesses are as follows:**

None.

### **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

### **F.1.PR.G - Claims and Judgments Payable**

## State of Washington

*Procedure Step:* Key Control #3 (Manual)  
*Prepared By:* EZM, 5/2/2024  
*Reviewed By:* RKM, 5/6/2024

### Purpose/Conclusion:

#### **Purpose:**

To confirm the preparation and review of JV adjustments to the incurred but not paid liability (Key Control #3 for Actuarial Report) in order to assess control risk.

#### **Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

### Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

**Key Control #3 (Valuation): Quarterly, a Fiscal Analyst 5 prepares the journal voucher based on the IBNR summary charts in the Milliman memo. The Deputy Accounting Section Manager reviews the journal vouchers to adjust the incurred but not reported liability to ensure the amount is supported by the memo from Milliman, HCA agrees with the conclusions and analysis in the memo, and the IBNR amount is correctly calculated.**

The understanding for this system is documented above in the "Controls - Actuarial Report" step.

### **1. Confirmation of Key Manual Control:**

We reviewed PAJV6033 which adjusted the PEBB IBNP liability. We reviewed the the JV cover sheet, Milliman's memo, and the excel workbook (PAJV6033-file0002-FY24 Q2-PEBB IBNR balances.xlsx) used to calculate the adjustment with account codes. The PEBB IBNP liability totaled \$142,763,000 as of December 31, 2023. We noted the JV was prepared by Kathy Plaquet, FA 5, on 2/5/2024. We noted Rita Homan, Deputy

# State of Washington

Accounting Section Manager, reviewed and approved PAJV6033. IBNP adjustments tied to the memo without exception.

We reviewed SAJV1441 which adjusted the SEBB IBNP liability. We reviewed the the JV cover sheet, Milliman's memo, and the excel workbook (SAJV1441-file0002-FY24Q2-SEBB IBNR balances.xlsx) used to calculate the adjustment with account codes. The IBNP liability totaled \$68,303,000 as of December 31, 2023. We noted the JV was prepared by Kathy Plaquet, FA 5, on 2/6/2024. We noted Rita Homan, Deputy Accounting Section Manager, reviewed and approved SAJV1441. IBNP adjustments tied to the memo without exception.

## Noted Weaknesses are as follows:

None.

## **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

## **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

## **F.1.PR.G - Claims and Judgments Payable**

*Procedure Step:* Rely on Specialist

*Prepared By:* EZM, 10/16/2024

*Reviewed By:* RKM, 10/17/2024

Purpose/Conclusion.\*

### **Purpose:**

To determine if we can rely on the work of HCA's external health care actuary, Milliman, to provide audit evidence for the Incurred But Not Paid (IBNP) liability (claims and judgments payable) estimate.

### **Conclusion:**

We determined that we **can** rely on the work of the specialist.

# State of Washington

## Testing Strategy:

To determine whether the audit can rely on the work of the outside specialist and whether the specialist's work supports the financial statements, the following procedures are **required** to be performed:

Auditor should check with their supervisor whenever they determine that the use of a specialist may be necessary.

*A specialist is an individual or organization possessing expertise in a field other than accounting or auditing (for example, information technology specialists, engineers and actuaries). Specialists may be contracted or employed by entity management to assist them in performing their responsibilities (management's specialist) or contracted or employed by our Office (auditor's specialist).*

*This step does not need to be completed when consulting with attorney general assistants, LGS, TAS, LISA, STAT, DSI or "Subject Matter Experts" designated on the intranet. Contact TAS for assistance if needed to determine whether someone would be considered a specialist or not.*

Assess the specialist's competence, capability and objectivity as it relates to the work that we intend to rely on for the audit.

*Competence refers to the specialist's relevant qualifications and experience. In assessing competence, auditors should consider:*

*The education, professional certifications or licenses of the specialist in his or her field, as appropriate.*

*The reputation and standing of the specialist.*

*The specialist's experience in the type of work under consideration.*

*Our Office's experience in using the specialist's work, if applicable.*

*Capability refers to effect of any access, resource or other limitations on the specialist's work. In assessing capability, auditors should consider:*

*Timing of the specialists work*

*Any significant limitations on the specialist's access to needed information or people*

*Any significant limitations on the time the specialist was able to devote to the work*

*Our Office's experience in using the specialist's work, if applicable.*

*Objectivity refers to the possible effects of any bias, conflicts of interest or undue influence on the specialist's judgment. If the*

## State of Washington

*specialist's objectivity is impaired, the auditor may not rely on the work of the specialist. In assessing objectivity, auditors should consider:*

*Any pressures or incentives on either specialists or management to misstate*

*Threats to objectivity of the specialist (including self-interest, advocacy, familiarity, self-review or intimidation threats) and any safeguards in place (segregation of duties, lines of reporting, professional standards, formality and consistency of methods and assumptions, retrospective reviews, etc)*

*Our Office's experience in using the specialist's work, if applicable.*

*Auditors should contact TAS if the auditor has any concerns with assessing the competence, capabilities or objectivity of specialists.*

Obtain an understanding of the work and conclusions of the specialist. This understanding should include the following elements:

- Objectives and scope of the specialist's work
- Intended use of the specialist's work to support the audit objective
- Specialist procedures and conclusions
- Assumptions and methods used by the specialist

*The objectives and scope of the specialists work and intended use of the specialist's work to support our audit objective should have already been included in the audit plan or else will need to be documented as a change to the audit plan.*

Evaluate the work and conclusions of the specialist. This evaluation should include the following elements as applicable:

Relevance and reasonableness of the specialist's methods and assumptions

*The appropriateness and reasonableness of methods and assumptions used and their application are the responsibility of the specialist. However, if the auditor concludes that the specialist's findings are unreasonable in the circumstances, the auditor should apply alternative procedures, which may include obtaining the opinion of another specialist.*

*Auditors should specifically consider whether methods and assumptions changed from the preceding period and the reasons for such changes, if applicable.*

Appropriate tests of source data provided by the entity to the specialist.

*If any data used by the specialist was provided by the entity, the auditor should consider the risk that incomplete or inaccurate data may materially affect the specialist's conclusions. This risk may be affected by the auditor's assessment of overall COSO elements*

## State of Washington

*and control risk for the related system.*

*For example: when relying on work of an actuary for self-insurance liabilities, auditors would normally verify the completeness and accuracy of claims information provided to the actuary against claims information per the pool's system. This can be done by comparing the total claim payments per pool's records to total claims paid shown on the actuary reports (in aggregate or on annual basis) – the figures may not match exactly but should be very close.*

Relevance and reasonableness of the specialist's conclusions.

Verifying that the specialist's conclusions are reflected in the financial statements

Add an additional representation to the rep letter if the specialist used was employed or contracted by management (rather than SAO). See the List of Additional Representations located in the Auditor Reference Guide here: [Representation Letter Resource.docx](#)

Guidance/Criteria.:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [3230](#) - Using the Work of Specialists**

Record of Work Done.:

### **Assessment of Competence, Capabilities and Objectivity of Specialist**

We assessed the competence, capabilities and objectivity of the specialist, specifically considering factors described in the testing strategy.

#### *Competence*

To determine competence, we considered:

*The education, professional certifications or licenses of the specialist in his or her field, as appropriate.*

*The reputation and standing of the specialist.*

*The specialist's experience in the type of work under consideration.*

*Our Office's experience in using the specialist's work, if applicable.*

**Aaron Gates, FSA, MAAA**

**Milliman Consulting Actuary**

Mr. Gates was based in Milliman's Seattle, Washington office and he joined the firm in 2011. He was listed on Milliman's web site, see bio link

## State of Washington

[here](#). Mr. Gates graduated with a bachelor of science in mathematics in 2009.

We confirmed Mr. Gates's FSA and MAAA credentials by reviewing the actuary directory on the Society of Actuaries (SOA) website (<https://www.soa.org/>). We noted he received his MAAA in 2013 and his FSA in 2016. We noted he was also listed as compliant (2020-2021 and 2021-2022) for Society of Actuaries continuing professional development (SOA CPD) attestation. These were the most recent CPD cycles. We also noted his listed primary area of practice and specializations were consulting and health. Based on review of Mr. Gate's credentials, we determined Mr. Gates was a competent specialist.

### **Jordan Pettibon, FSA, MAAA** **Associate Actuary**

Mr. Pettibon was based in Milliman's Seattle, Washington office and he joined the firm in 2014. He was listed on Milliman's web site, see bio link [here](#). Mr. Pettibon graduated with a B.A. in Mathematics, and a B.S. in Economics in 2014.

We confirmed Mr. Pettibon's FSA and MAAA credentials by reviewing the actuary directory on the Society of Actuaries (SOA) website (<https://www.soa.org/>). We noted he received his MAAA in 2017 and his FSA in 2021. We also noted he was also listed as compliant (2021-2022 and 2022-2023) for Society of Actuaries continuing professional development (SOA CPD) attestation. These were the most recent CPD cycles. We also noted his listed primary area of practice and specializations were consulting, health and health insurance - commercial. Based on review of Mr. Pettibon's credentials, we determined Mr. Gates was a competent specialist.

As HCA's contracted external health actuary, SAO has years of experience with Milliman. This includes the calculation of the key figure of Transactions Subsequent to the Measurement Date as part of the State's OPEB Schedules. We performed an additional review of Milliman's competence as part of [S1FinancialManagement-FS24]. Based on our Office's experience with Milliman we determined Milliman was a competent specialist.

### *Capability*

To determine capability, we considered:

*Timing of the specialists work*

*Any significant limitations on the specialist's access to needed information or people*

*Any significant limitations on the time the specialist was able to devote to the work*

*Our Office's experience in using the specialist's work, if applicable.*

Milliman is contracted with HCA to perform actuary services for HCA. Milliman is in weekly contact with HCA, primarily the ERB finance department. Sara Whitley, HCA ERB Finance Manager, worked with Milliman regularly. She participated in regular reviews of Milliman's work and deliverables. We inquired with Sara regarding any non-compliance with any deliverables, and she was not aware of any. Services were on-going and had deliverables related to the following through a biennium:

## State of Washington

Generation of financial statement estimates made quarterly (incurred but not paid liability, premium stabilization reserves, restricted fund amounts, etc.),  
Financial record keeping for PEBB operations (historical claim costs for all plans offered),  
Future projections and other budgetary information used by HCA, OFM, the Governor's Office, and the legislature,  
Assisted with determination of premiums for employees, retirees, and other index rates (state agency employer contributions)  
Information shared with various unions and collective bargaining units.

Milliman obtains claim data for all PEBB and SEBB plans on a regular (daily, weekly, and monthly) basis directly from the following providers (used in IBNR reserve estimates):

Regence (claims processor for all Uniform Medical Plans, HCA's self-insurance health care plan family)  
MODA (pharmacy claims processor, HCA's self-insurance health care plan family)  
Kaiser Permanente Northwest  
Kaiser Permanente Washington  
Premera Blue Cross  
United Healthcare  
Delta Dental (claims processor for Uniform Dental Plan or UDP, HCA's self-insurance dental care plan)

Used for other purposes:

Davis Vision  
EyeMed Vision Care  
MetLife  
Delta Care  
Willamette Dental Group

For the IBNR estimate specifically, Milliman follows the industry standard of quarterly IBNR estimates, which helps ensure accurate financial reporting and effective risk management. Based on Milliman's relationship with HCA, direct access to claims data, reasonable performance on all contract deliverables, and our experience with Milliman, we determined Milliman was a capable specialist.

### *Objectivity*

To determine objectivity, we considered:

*Any pressures or incentives on either specialists or management to misstate*

*Threats to objectivity of the specialist (including self-interest, advocacy, familiarity, self-review or intimidation threats) and any safeguards in place (segregation of duties, lines of reporting, professional standards, formality and consistency of methods and assumptions, retrospective reviews, etc)*

*Our Office's experience in using the specialist's work, if applicable.*

## State of Washington

We noted Milliman was a nation-wide actuary firm and leader in employee benefits, pensions, and health care. Milliman was not financially dependent on revenue generated from the Health Care Authority. During our 2024 control meetings, we inquired regarding the relationship between HCA and Milliman. HCA did not disclose any objectivity concerns. We noted HCA contracted with Milliman for professional services (actuary and consulting services) since 2007 (contract awarded in 2006). We considered objectivity risks, specifically risks related to familiarity and self-review. Due to the length of HCA's and Milliman's relationship, the evolution of health care, and reliance on financial tools developed by Milliman, we inquired about safeguards. Per Sara Whitley, ERB Finance Manager, Milliman maintains a strict review policy, where all deliverables and analyses are reviewed by actuaries outside of the Seattle Health practice. Beyond the standard Milliman peer review process internal to each practice, external review requires that they have the deliverables reviewed by a principle from another practice that is financially independent from Seattle Health. Finally, Milliman also produces retroactive reserve estimates so that both Milliman and HCA may be aware of any consistent bias in their estimates (i.e. whether they consistently overestimate, underestimate, or have a mix of both). **Auditor Note:** We did not meet directly with Milliman, as we would be charged an hourly fee.

Milliman uses nation-wide health care trends in their models to ensure results produced relevant information that was not financially skewed (i.e. future health care costs did not exceed national GDP, future costs were capped at a percent of national GDP, nation wide trends prevented skewed regional data). We noted Milliman used their internally developed national trends. We reviewed descriptions of Milliman's Health Cost Guidelines (HCG) on their website at <https://us.milliman.com/en/products/hcgsuite>. National trends included the following products: Ages 65 and Over, Commercial, Dental, Grouper, Prescription Drug Rating Manual, and Reinsurance.

Based on our experience, inquiry, and review of assumptions, we determined Milliman was an objective as a specialist.

### **Understanding of Specialist's Work and Conclusions**

We gained an understanding of the specialist's procedures and conclusions, including the methods and assumptions used, and noted the following:

Milliman was HCA's external actuary and health care consultants. Milliman prepared the incurred but not paid (IBNP) memo as one of many deliverables and services provided to HCA to manage their self-insurance plans offered under the Uniform Medical Plan group. Milliman obtained claims data directly from Regence, MODA and Delta Dental, HCA's third party administrators for claims processing. HCA provided Milliman AFRS data. AFRS data was provided by Rita Homan, HCA Assistant Accounting Section Manager, and Sara Whitley, HCA ERB Financial and Data Analyst. The IBNP report was used by Rita Homan to prepare and support journal vouchers to quarterly adjust AFRS.

We reviewed the forecast memo that described the general assumptions and methodologies used by Milliman for both PEBB and SEBB. See [\[Milliman Trend Model\]](#). Milliman noted specific assumption and methodology adjustments in the IBNP memo. The IBNP estimate was based on historic and projected trends in claims. SAO determined that Milliman's assumptions and methodologies were reasonable and produced a reasonable IBNP estimate. Based on SAO's understanding, Milliman's work included all self-insurance plans operated by HCA (PEBB and SEBB) and

## State of Washington

reflected the benefits offered. **No issues noted.**

### **Evaluation of Specialist's Work**

See Milliman's incurred but not paid (IBNP) estimate for June 30, 2024 at [[PEBB and SEBB Reserve Analysis - June 30 2024 Reserve Adjustments](#)]. We also reviewed the assumptions and methodology used by Milliman at [[Milliman Trend Model](#)]. We tested the consistency of the report and source data used at [[Claims and Judgements Payable Testing](#)].

We inquired with Sara Whitley, HCA ERB Finance Unit Manager, about their processes for evaluating source data provided to the specialist and Milliman's work and conclusions. She noted the following:

As the sponsor and employer for the plans, HIPPA compliance rules limit the amount of access HCA has to the raw claims feed from the third-party administrators. As such, HCA relies on Milliman to complete the necessary analytical checks and balances on the raw data feeds to complete their analysis.

HCA (Specifically the Employee Retiree Benefits unit) and Milliman have a "Weekly Milliman Check-in" meeting that includes a discussion and review of Milliman deliverables, discussion of general program management topics, etc. At these meetings, Milliman will generally review documents with HCA ERB and the underlying conclusions, including the IBNR adjustment memo.

Following these meetings, ERB then reads and reviews the memos for reasonableness, compares the final calculations to previous interim analyses and follows up on any changes.

HCA does perform a review of the memo for general misrepresentations of information, reasonableness and ensures the underlying results are to be expected given their understanding of the data and detailed description of methodology.

HCA does have other tools and reports available that allow for comparisons to be made between Milliman's raw data and the information used to complete the IBNR memo each quarter. Some of these tools are:

Weekly lump-sum claims invoicing amounts - Generated internally based on invoiced amounts provided by Regence

Regency Monthly Operations Report - Provided by Regence

MODA Rebate Reporting - Provided by MODA

HCA uses these reports and compares them to prior periods to ensure that claims trends are aligning with expectations. HCA has limited access to raw claims feed data due to HIPPA compliance rules as the plan sponsor and employer.

We performed the following tests:

Tied the IBNP liability to the financial statements/general ledger [See tab "Step 1" here: [Claims and Judgements Payable Testing](#)] to ensure Milliman's conclusion were reflected in the financial statements (Valuation).

Tied the summary IBNP liability from the summary tables [See tab "Step 2" here: [Claims and Judgements Payable Testing](#)] presented in the narrative to the detailed attachments that presented IBNP liabilities by plan. This step was performed to ensure Milliman's conclusions were consistent throughout the memo which was an exception from the FY21 ACFR.

Tied claim data reported in lag tables to the general ledger [See tab "Step 3" here: [Claims and Judgements Payable Testing](#)] to ensure accurate and complete source data was provided to Milliman.

## State of Washington

SAO noted the following results from our tests:

We tied the IBNP reported in Milliman's memo to the leadsheet and financial statements. **No issues noted.**

We tied the summary IBNP estimate to the supporting attachments which listed the IBNP by plan and by significant claim type (medical, pharmacy, and dental). Amounts tied within rounding. **No issues noted.**

We tied self-insurance claim expenses (Premiums and Claims) from AFRS to the lag tables in Attachment 15 by plan and significant claim type. **No issues noted.**

Based on our test results and other procedures performed above, SAO determined we could rely on Milliman's work and that Milliman's conclusions were relevant and reasonable. **No issues noted.**

We will include the following additional representation as part of the management representation letter [[FS Letter of Representation](#)]:

We adequately considered the qualifications of Milliman and agree with conclusions regarding:

Health Insurance Fund - Claims and Judgments Payable

### F.1.PRG - Claims and Judgments Payable

*Procedure Step:* Risk Assessment

*Prepared By:* EZM, 5/17/2024

*Reviewed By:* RKM, 7/5/2024

Purpose/Conclusion.:

#### **Purpose / Conclusion:**

To assess inherent risk, control risk, and the risk of material misstatement in order to design an initial testing strategy for each assertion.

Testing Strategy.:

Auditors are **required** to perform the following procedures for each line item:

#### **STEP 1: Inherent Risk (IR)**

## State of Washington

Assess inherent risk for each relevant assertion. This assessment is based on understanding of the entity and the nature of the account balance or class of transactions.

*Inherent risk is the susceptibility of an assertion to material misstatement. It is our assessment of "total threat", which includes both "natural risk" and identified risk indicators, without any regard to any potential control activities. As inherent risk is fully independent of control risk, any understanding of controls cannot be used to increase/decrease the assessment of inherent risk. Consider the following factors as your basis for this assessment:*

### *General Considerations*

*Does the balance include transactions that are difficult to audit or involve complex accounting issues?*

*Were there significant misstatements identified in previous audits or prior-period adjustments in the account balance or transaction class? If so, analyzing the cause of prior period misstatements will help in analyzing inherent risk.*

*Are there any inherent risk factors at the entity or industry level, such as changes in regulation or accounting rules, unique transactions or accounting practices, use of information technology, etc that affect the balance?*

### *Inherent Risk due to Error*

*How large are the transactions making up the balance? If the balance has only a few large transactions, even a single error may mean a significant misstatement.*

*Have there been changes in the transactions making up the balance that may increase risk? For example, significantly different composition, nature or volume of transactions may inherently disrupt established controls.*

*Are financial events originated or identified by accounting personnel or non-accounting personnel? This consideration is mainly for the completeness assertion.*

*Does the process to account for transactions involve judgment or estimation, complex calculations, numerous steps or significant manual steps?*

*Do transactions have widely varying attributes that need to be manually identified? For example, grant loans that are accounted for in one of several ways depending on the terms of the agreement.*

### *Inherent Risk due to Fraudulent Reporting (intentional misstatements)*

*Are there substantial pressures or motivations to misstate the balance?*

### *Inherent Risk due to Misappropriation*

*Is the account balance or transaction class susceptible to sizable misappropriation?*

### *Inherent Risk due to Non-Compliance*

*Are there any laws, contracts or grant agreements affecting the balance? If so, would non-compliance lead to sizable misstatements?*

*Are compliance requirements complex, hard to understand, subject to judgment or otherwise difficult to comply with?*

*Are there any motivations or pressures to not comply?*

## **STEP 2: Control Risk (CR)**

Assess control risk by system and assertion. This assessment should be based on the results of the control understanding, confirmation, and (if

## State of Washington

setting control risk to LOW) testing. If applicable, auditors will evaluate any control deficiencies and determine whether those deficiencies, individually or in combination, are significant deficiencies or material weaknesses.

*Control risk is the risk that material misstatements would not be prevented or detected timely by the system of internal control. Control risk could be thought of as the "vulnerability" of an entity to misstatements. Control risk exists independently of the inherent risk (the level of vulnerability exists independent of the level of threat).*

*Control risk is MAX in both of the following situations: (1) controls aren't tested or (2) controls are problematic and cannot be relied upon. In order to set control risk to LOW, the auditor must test that controls operated effectively throughout the period.*

*A material weakness exists when the design or operation of controls results in a reasonable possibility a material misstatement will not be prevented or detected and corrected in a timely manner. A significant deficiency is less severe than a material weakness, yet important enough to merit the attention of the governing body. **All potential material weaknesses and significant deficiencies should be discussed with the AIC, since they must be reported as findings.***

### **STEP 3: Risk of Material Misstatement (RMM)**

Assess the risk of material misstatement for each relevant assertion for each significant line item. The risk of material misstatement (RMM) is a combination of the auditor's separate assessment of inherent and control risk.

*In practice, the RMM is the amount of substantive evidence that's needed, and the only way to reduce the amount of needed substantive evidence (equal to the inherent risk) is to test controls. As such, when control risk is MAX, the RMM must always equal the inherent risk (IR).*

*When controls are tested & can be relied upon (are determined to be effective) it is a matter of professional judgment how much the RMM should be set lower than inherent risk (1 or 2 steps).*

*Auditors should assess RMM by assertion, if different. For example, if RMM is assessed at MOD for the existence assertion, but LOW for the rights & obligations assertion, then document "MOD – existence and LOW – rights & obligations".*

### **STEP 4: Design Substantive Testing**

Design a substantive testing strategy that addresses the relevant assertion (identified risk) in the portion of the line item that relates to that risk.

*Planning identifies where to audit (significant balances, classes of transactions & disclosures) what to audit for (relevant assertions), and how much to audit (RMM). The quantity and quality of evidence obtained by substantive tests needs to match the level of risk. The higher the risk of material misstatement, the greater evidence needed. "Greater evidence" could either be greater quantity of evidence, greater quality of evidence, or some combination of greater quality and quantity.*

# State of Washington

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6210](#) – Planning Financial Statement Audits**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits](#) Planning Guide**

Record of Work Done:

### **(1) Inherent Risk (IR):**

Based on our understanding of the line item, we assessed inherent risk as follows for each relevant assertion and significant class of transactions:

Valuation – **HIGH**

### **(2) Control Risk (CR):**

We assessed control risk as follows for each system and relevant assertion:

Actuarial Report (Valuation) –

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **(3) Risk of Material Misstatement (RMM):**

We considered both inherent and control risk and assessed the risk of material misstatement as follows for each relevant assertion and significant class of transactions:

Valuation – **HIGH**

### **(4) Testing Strategy:**

We designed our substantive testing strategy based on our assessment of the risk of material misstatement. We plan to perform the following tests:

## State of Washington

We will complete the testing strategy for relying on the work of specialists [Rely on Specialist] to ensure the actuary was competent. Standard procedures include assessing the competency of Milliman, obtaining and reviewing the data used by the actuary, reviewing assumptions, and concluding on the work performed by specialists. We will obtain the FY24 Q4 Milliman reserve memo. We will tie tables in the reserve memo's narrative to detailed exhibits by plan (triangle tables). We will also tie the claims in the detailed exhibits by plan to the claims expenses in AFRS, within reason.

We anticipate that these tests will provide sufficient appropriate audit evidence to address the assessed risk of material misstatement for relevant assertions in significant classes of transactions.

### F.1.PRG - Claims and Judgments Payable

*Procedure Step:* Substantive Test

*Prepared By:* EZM, 10/11/2024

*Reviewed By:* RKM, 10/16/2024

Purpose/Conclusion.\*

#### **Purpose:**

To determine whether current liabilities were reported at properly valued or calculated amounts.

#### **Conclusion:**

We determined that current liabilities were reported at properly valued or calculated amounts. **No issues noted.**

Testing Strategy.\*

The following is a list of **considerations** for testing the valuation assertion for current liabilities. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

*For current portions of long-term liabilities*, see the valuation testing strategy for non-current liabilities. The same strategies can be applied to the entire liability, covering both current and non-current portions.

Recalculate or review entity calculations of accruals (such as withholding taxes, accrued payroll, payroll taxes, accrued interest payable, etc).

## State of Washington

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**Certificate of Participation (COP) Confirmations** (*applies to state agencies, including community colleges and universities*) - listing of outstanding COP debt at fiscal year end obtained directly from the State Treasurer

### **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

**BARS 3.4.1 Leases** - includes accounting procedures applicable to municipal leases

**BARS 3.4.4 Refunding Debt**

**BARS 3.4.9 Risk Management Principles**

**BARS 3.4.15 Legal and Other Contingencies**

Record of Work Done:

### **Substantive tests performed to meet the Valuation assertion:**

We completed the testing strategy for relying on the work of specialists [Rely on Specialist] to ensure the actuary was competent. We followed standard procedures including assessing the competency of Milliman, obtain/review data used by the actuary, review assumptions, and conclude on the work performed by specialists. We tied the tables in the reserve memo's narrative to detailed attachments by plan (lag triangle tables) and tied the claims in the detailed attachments by plan to the claims expenses in AFRS, within reason.

Testing Results: [Claims and Judgements Payable Testing]. We tested this balance for the valuation assertion and we determined that the balance was properly valued. **No issues noted.**

### **F.2.PR.G - Premiums and Assessments**

# State of Washington

*Procedure Step:* Summary & Conclusion

*Prepared By:* MRF, 10/3/2024

*Reviewed By:* RKM, 11/26/2024

Purpose/Conclusion.

**Purpose:**

To evaluate risk assessments and the sufficiency and appropriateness of evidence obtained based on results of substantive work.

**Conclusion:**

We determined that **no** modifications were necessary to inherent risk, control risk, or the risk of material misstatement as assessed in planning.

We also determined that evidence obtained was sufficient and appropriate in response to the risk of material misstatement.

Testing Strategy.

Auditors are **required** to evaluate conclusions for substantive testing as follows:

*Auditors may wish to use the optional Lead Sheet available in the Store to summarize testing related to each balance and assertion.*

**1.** Determine whether the results of substantive testing indicate a need to modify the inherent risk assessment (IR), control risk assessment (CR), risk of material misstatement (RMM) or other aspects of planning (such as material balances or assertions). If so, document changes and consider the need for additional testing.

*If the results of substantive testing indicate a need to change control risk, auditors should also update the **Permanent File** by either correcting the documentation or by adding an update section describing changes to the top of the record of work done. For all changes to IR, CR, or RMM the **Material Balances** spreadsheet should be updated.*

*More significant changes to other aspects of planning (such as material balances or assertions) should be referenced in this step and documented in detail in the **Changes to FS Audit Plan** step.*

**2.** Evaluate whether the quality and quantity of evidence obtained is sufficient and appropriate in response to the risk of material misstatement. In making this determination, auditors should evaluate:

# State of Washington

## Information to be used as audit evidence:

- Does evidence relate to the population, period of time and risk (assertion and “what could go wrong” from the Material Balance Spreadsheet)? If there are any gaps or uncertainties in the logical connection between the evidence and conclusions, is there a documented consideration and explanation?
- Are the sources of information sufficiently reliable and appropriate for the risk (whether internal to the government, external, or auditor developed)? If key information is not from a sufficiently reliable source (for example, inquiry), then is it corroborated by information that is?
- Are there any concerns about accuracy, completeness, authenticity, or bias in information? If so, did the auditor perform sufficient procedures to confirm reliability of that information?
- Is information precise enough to catch if misstatements exceeded the tolerable level?
- Is information detailed enough to conclude on whether or not there were misstatements?
- Was there any information that appeared contradictory or inconsistent? If so, was there a documented response to the inconsistencies or doubts about the reliability of evidence?

## Results:

- How much misstatement was identified by testing, and the likelihood and magnitude of further potential misstatement?
- How did misstatements occur and how often might they occur again in the population?
- Were misstatements caused by control deficiencies or circumvention of controls?
  - If control deficiencies, is there a need to re-evaluate our understanding of controls in the [Permanent File](#) folder or assessment of control risk?
  - If circumvention, the [Management Override of Controls](#) step should address or reference this area. Auditors should also consider whether a fraud risk has been identified.
- Did tests identify a different level or type of risk than the planned audit response was designed to address?
- If likely misstatements are identified, are further procedures necessary to improve the precision of our estimate?

*To support the overall evaluation of audit risk and provide a basis for concluding on the overall sufficiency and appropriateness of evidence in the [FS Summary & Report](#) step, auditors should conclude in each area whether the auditor continues to believe that the tests performed and quality and quantity of evidence obtained are commensurate with RMM for all relevant risks (the “what could go wrong”, in the [Material Balances](#) spreadsheet).*

If the auditor determines that evidence is not sufficient or appropriate, additional substantive testing should be done. If sufficient, appropriate evidence is not available for audit, the AIC should discuss the effect on our audit report with the AAM and AM.

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

# State of Washington

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6310](#) – Determining the Nature, Timing and Extent of Substantive Testing**

**SAO Audit Policy [3210](#) – Audit Evidence**

Record of Work Done:

Based on test results, we re-evaluated risk assessments, procedures, evidence obtained and conclusions as follows:

**(1) Do the results of substantive tests indicate a need to modify our risk assessment (IR, CR and RMM)?**

We determined the results of substantive tests do not indicate a need to modify our risk assessment.

**(2) Was the quality and quantity of evidence obtained sufficient and appropriate?**

We determined the quality and quantity of evidence obtained was sufficient and appropriate.

## **F.2.PRG - Premiums and Assessments**

*Procedure Step:* Understanding of Line Item

*Prepared By:* MRF, 5/22/2024

*Reviewed By:* RKM, 5/29/2024

Purpose/Conclusion:

### **Purpose / Conclusion:**

To gain an understanding of the line item and confirm the scope of testing as documented in the Significant Account Matrix.

Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

### **STEP 1: Prior Audit Exceptions**

# State of Washington

Document any exceptions noted during the prior audit. Follow-up to determine how the agency has responded to or corrected the issue, unless this work is anticipated as part of the testing strategy.

## **STEP 2: Analyze Composition and Changes of Line Item**

Include link to the line item leadsheet. This will be completed at the end of the audit. Leadsheet analysis should be documented in this spreadsheet.

Inquire with agency staff about the activities and transactions that make up the balance and any changes to those activities or transactions in relation to the prior year.

Determine relevant classes of transactions or account balances within the line item to analyze (such as agencies, funds, programs, departments, accounts, and/or objects), and use AFRS to create trends of those elements. This step should not include any specific dollar amounts associate with the line item.

Evaluate trends to identify:

- (1) What classes of transactions or account balances are primary to the identified risk. Auditors should specifically consider what elements are primary to the line item (comprising a large percentage of the line item), and which elements the identified risk would apply to, and which elements might be most susceptible to the identified risk (having a high risk of non-trivial misstatement for a relevant assertion, considering likelihood and impact of potential for misstatement).
- (2) What changes are primary to the identified risk, if applicable. Auditors should specifically consider whether the overall change to the line item from the prior year was significant, what elements were the primary drivers of overall change, whether any elements changed significantly from the prior year, and which changes (if any) might relate to the identified risk.
- (3) Any unusual or unexpected elements, amounts, or changes that may indicate a risk, whether the one identified in planning or a new one that may need to be considered for a change to the plan.

**Consider** other procedures to gain an understanding of the line item, such as review of key policy documents, review of program information or reports, inquiry of staff, budget information, or other analytical procedures.

## **STEP 3: Update Significant Account Matrix**

Based on your understanding of the line item, update the Significant Account Matrix with final conclusions on the agencies covered, account description, significant accounting systems, and risk (what could go wrong and relevant assertions). The account description should reflect the significant transaction streams or account balances relevant to the risk.

*The description of agencies, significant accounting systems, and what could go wrong in the Significant Account Matrix constitute the overall scope of substantive testing.*

*A transaction stream is significant based on the potential for misstatement. This is often due in part to its size (ie: comprising a large percentage of the total line item), but is ultimately a judgment about the susceptibility to the identified risk (for example, when the risk is*

## State of Washington

*understatement a small or omitted account may hold the most potential for the largest misstatement).*

*Significant accounting system(s) are those that contain key controls over significant classes of transactions included in the line item. Control systems identified in this step must match the Significant Account Matrix and have a separate control understanding documented.*

*Talk with the AIC if you identify any changes to the Significant Account Matrix.*

Guidance/Criteria.:

Record of Work Done.:

**(1) Prior Audit Exceptions:**

We noted **no** prior audit exceptions.

**(2) Composition & Change Analysis:**

Line Item Leadsheet: [[Line Item Lead Sheet](#)].

This line item primarily consists of premiums collected for medical insurance, dental insurance, and other insurances (i.e. life, long-term disability, etc.). HCA collects premiums for both purchased and self-insurance premiums, most of which are from participating employers. The amount participating employers pay is the employer premium (the State Index Rate for most employers) and the premiums withheld from employees through payroll deductions. Most state agencies pay through account transfers and non-state agencies remit payments to a lock box. COBRA and other self-pay subscribers remit payments to a lock box service. HCA uses an individual lock box for each fund to ensure payments are accurately reported.

Pay1 calculates and prepares monthly bills for participating employers. Invoices are delivered as follows:

HRMS employers - delivered via paper print out or EOS report distribution system (electronic) which is automated by the Pay1 IT team

K-12 actives, Political Sub-Divisions - printed and delivered via US mail, or electronically through MFT if electronic delivery is requested by the employer. The MFT registration is managed by the Pay1 IT team.

*ACFR Database*

We analyzed the revenue amounts in the line item lead sheet and identified funds 493 (School Employees' Insurance Account) and 721 (Public Employees' and Retirees Insurance Account) as the significant funds for this line item.

We identified no unusual or unexpected elements, amounts, or changes that may indicate risk.

**(3) Updates to Significant Account Matrix:**

None.

# State of Washington

## F.2.PR.G - Premiums and Assessments

*Procedure Step:* Controls - Pay1  
*Prepared By:* MRF, 5/16/2024  
*Reviewed By:* RKM, 9/11/2024

Purpose/Conclusion:

**Purpose:**

To gain an understanding of internal controls.

**Conclusion:**

We gained an understanding of internal controls as documented in the record of work done.

Testing Strategy:

**The following procedures are required for all material systems:**

1. List the financial statement balance(s) and relevant assertion(s) addressed by the understanding.
2. Gain an understanding of the internal control process, identify how transactions are recorded in AFRS, identify key controls over relevant assertion(s), and note any control weaknesses.
  - In gaining an understanding of controls, consider the overall understanding of State-Level control elements as documented in the "State-Level Controls" step as they relate to this particular system.
  - Identify controls systems covering all relevant assertions for all significant classes of transactions.
  - Standards require the auditor to gain an understanding of the significant accounting system(s) that contain key controls over significant classes of transactions included in the line item.
  - Control systems identified in this step must match the Material Account Matrix and have a separate control understanding documented.
  - Talk with the ACFR Specialist or AIC if you identify different systems than the ones anticipated in the Material Account Matrix.

For each material system, auditors must document:

## State of Washington

A brief outline of the transaction flow from beginning to end.

An expanded description of key controls.

Business processes relevant to financial reporting of the relevant assertion for the material balance. Processes should encompass automated and manual procedures by which transactions or events are identified or initiated, authorized as needed, recorded, processed and corrected as needed.

Original accounting records and how records are rolled-up to intermediary ledgers and transferred to the general ledger (AFRS) or financial statements.

Detailed descriptions of key controls. Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

The following is information to **consider** when identifying key controls and transaction flow.

“Key controls” refer to the few controls that together provide reasonable assurance that material misstatements will be prevented or detected and corrected. This is contrasted with ancillary or supporting controls, which – although helpful and recommended – would provide less than reasonable assurance by themselves.

The focus of the write-up is on the key controls. Key controls should be specifically identified (as “key controls”) in the write-up. This can be done in whatever way the auditor prefers, so long as it is obvious. Details that the auditor should document regarding key controls may include:

- Who or what initiates the control

- When (or how often) is the control applied

- Who performs the control

- As needed, the experience, knowledge and attitude of the person applying the control

- Detailed description of the control process or activity. For example, if the control is a review: what exactly is reviewed, what is the reviewer looking at or for and what are the reviewer’s criteria?

- How the key control is documented or evidenced

- If not obvious from the description, how the control prevents or timely detects and corrects misstatements

- Any exceptions or alternative processing to the normal process

- What happens when misstatements or issues are identified by the control

The “transaction flow” refers to the process by which transactions are initiated, authorized, recorded, processed and reported (as applicable). Outlining the transaction flow gives context to key controls, especially how transactions become subject to controls in the first place. If a control inherently ensures that all applicable transactions are included (ex: bank reconciliation where the assertion is existence), the auditor may decide to

## State of Washington

just start the write-up with the initiation of the control procedure and go from there.

Elements of the transaction flow are defined informally as follows:

*Initiation:* How are transactions initiated?

*Authorization:* How are transactions and accounting record maintenance authorized?

*Recording:* How are transactions or balances identified and recorded in financial accounting systems?

*Processing:* How are the transactions or balances processed after they are recorded (if at all)? Processing may be manual or automated and may occur at a subsidiary system level or at the general ledger level.

*Reporting:* How are records translated into the financial statements? This part of the transaction flow extends the understanding to the actual financial statements that the audit is opining on. Since we already document an understanding of the financial reporting process in general, it is usually enough to simply reference this overall understanding. However, if there are important steps unique to the covered balances, it may be more appropriate to mention them here.

Although transaction flow is a good way to think about understanding and documenting a control system, auditors should not worry too much about documenting "each element, in order" because often elements may be combined, not noticeable, not applicable or occur in a different order.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits](#) Planning Guide**

Record of Work Done:

Internal controls in the Pay1 system address the following balance(s):

Health Insurance - Premiums and Assessments

Business-Type Activities - Charges for Services: Health Insurance

For the following assertions:

# State of Washington

Occurrence - There is a risk that recorded revenue is more than source records.

Valuation - There is a risk that insurance premiums (employer and employee) for the various plans were not calculated correctly by Pay1.

## **Gain an Understanding of Internal Controls**

See Health Insurance Activities [[Health Insurance Activities Updated 2024](#)] for the following:

How contribution rates were established for PEBB and SEBB (required premiums from employers or all eligible employees regardless of the employee's participation in PEBB or SEBB)

Rate factors for subscribers and the different dependents they could enroll.

Surcharges (i.e. tobacco surcharge)

Listing of insurance products offered for plan (calendar) year 2023 and 2024

Eligibility requirements for PEBB and SEBB

Key information maintained in Pay1

We met with the following HCA staff on 05/07/2024 to gain an understanding of internal controls relating to Pay1:

Rita Homan, Deputy Accounting Section Manager

Lisa Kolle, PEB Accounting Manager

William Sogge, Audit Liaison

Pay1 maintains key information for all subscribers and dependents. Participating employers are responsible for accuracy of demographic information and elections maintained in Pay1. Based on current month elections entered or imported into Pay1 by the participating employer and rate tables maintained in Pay1, Pay1 automatically calculates the amount due for each individual subscriber in an itemized monthly bill by SSN (**Key Control #1 - Automated Software Calculation - Valuation and Occurrence**). The subscriber premiums are added to the employer premiums to calculate the total amount owed to HCA per subscriber. The employer premiums are determined by the State Index Rate, or for Political Sub-Divisions, a contracted rate. The State Index Rate is determined semi-annually by the Legislature.

Currently, Political Sub-Divisions are the only participating employers that do not pay the state index rate. HCA bills these groups monthly based on a contracted rate. The amount the employers pay is dependent on the number of subscribers they have enrolled, and it is the employer's responsibility to determine and maintain subscriber eligibility. Invoices are reviewed by a Contract Manager, an HCA employee that specializes in specific contracts with participating employers, for reasonableness.

Bills are prepared for each participating employer on the following cycles:

23rd of each month - self-pays (i.e. COBRA subscribers, self-pay, retirees not paid with DRS deductions, and K-12)

26th of each month - all other employer groups, retirees with DRS deductions, higher education

Last day of each month - state agencies that used HRMS

## State of Washington

Note: Bills are prepared and remitted prior to the month of service. HCA expects participating employers to reconcile their respective bills to ensure accuracy of listed subscribers.

HCA prepares participating employers' invoices prior to the month of service. To ensure that billings existed, Pay1 reflected each respective agency's subscribers, and that Pay1 accurately exported activity to AFRS, HCA relies on matching payments with invoices. Payments come via lockbox from US Bank and are automatically processed by Pay1 unless an error occurs. ERB accountants review lockbox reports daily, and match payments for completeness and accuracy. The ERB accountants monitor revenues and cash receipts to ensure bills prepared by Pay1 are accurate and match the amounts in AFRS. If the amount in AFRS does not match the amount collected in Pay1, an In-Process Report is automatically generated. This report provides details on any discrepancies between the amount in AFRS to the amount in Pay1. The ERB Accountants review this report daily, and address any discrepancies (**Key Control #2 - Manual - Occurrence**).

### **Adjusting Entries - Prepayments/Credit Balances**

At the end of the month, Pay1 automatically generated aging reports based on customer type. Pay1 generated the following reports:

- bh#grp.txt
- bh#ind.txt
- pebb#grp.txt
- pebb#ind.txt, PAY1 report HRISD-B5519-R01
- sebb#ind.txt, Pay1 report SEBB-B5519-R01
- excrpt.txt

Monthly, IT generates printed receivable reports from Pay1 titled HRISD-B5519-R01 and SEBB-B5519-R01. ERB Fiscal Analyst 4s review reports for reasonableness and convert the reports to Excel for retention purposes. These reports summarize all receivables and unearned revenue (pre-paid) for each group (Self-Pay Agencies, K-12 Agencies, Retirees, etc.). Rita Homan, Assistant Accounting Section Manager, reviews the reports manually at the end of every month to ensure the reports are free of errors.

FA4's use the HRISD-B5519-R01 and the SEBB-B5519-R01 reports to prepare backup for unearned revenue journal vouchers. The FA4 uses the Excel workbook to prepare the journal vouchers to post prepaid receivables to unearned revenue. FA5s, ERB Accounting Manager, or the Assistant Accounting Section Manager will review the JVs and aging reports to ensure the unearned revenue balances were accurate and represented actual amounts from Pay1 prior to posting (**Key Control #3 – Manual – Valuation**).

### **How Transactions are Recorded in AFRS:**

Pay1 automatically posts transactions to AFRS in a nightly batch. General ledger balances are reviewed in detail for reasonableness by a FA5, Assistant Accounting Section Manager, or ERB Accounting Section Manager when ERB prepares the quarterly financial statements.

# State of Washington

## Key Controls are as Follows:

Key Control #1 (Automated Software Calculation) - Valuation & Occurrence: Pay1 automatically calculates and prepares monthly billings based on current month subscriber elections maintained in Pay1. Pay1 automatically prepares billings based on approved employer and employee rates.

Key Control #2 (Manual) - Occurrence: Daily, ERB accountants review payments automatically processed and not automatically processed, in Pay1, and reconcile payments to AFRS to ensure that revenues/receivables occurred and are accurately classified in the Pay1 System.

Key Control #3 (Manual) - Valuation: Monthly, ERB FA4s manually record unearned revenue (and receivables) related to PEBB/SEBB premiums by journal voucher. Entries to record unearned revenue (and receivables) are based on Pay1 aging reports HRISD-B5519-R01 and SEBB-B5519-R01. The entry is reviewed by the FA5, ERB Accounting Section Manager, or Deputy Accounting Section Manager to ensure accuracy of entries.

## Noted Weaknesses are as Follows:

None

## F.2.PRG - Premiums and Assessments

*Procedure Step:* Key Control #1 (Automated)

*Prepared By:* MRF, 5/22/2024

*Reviewed By:* RKM, 6/5/2024

Purpose/Conclusion.*
----------------------

### **Purpose:**

To determine whether Pay1 automatically calculates and prepares monthly billings based on current month subscriber elections maintained in Pay1 and prepares billings based on approved employer and employee rates (**Key Control #1 for Pay1**) was in place and operating effectively and to consider related general IT controls in order to assess control risk.

### **Conclusion:**

Based on our understanding and test results, we concluded that the automated control **was** in place and operating effectively.

# State of Washington

Based on our understanding, related general IT controls **were** in place and adequately designed to ensure that the control operated consistently during the audit period. However, we did not test the operating effectiveness of general IT controls.

Our understanding and control risk assessment, which incorporates these conclusions, is documented at [\[Risk Assessment\]](#).

Testing Strategy:

The following procedures are **required** for all automated key controls for financial and single audits:

## **STEP 1: Understand Automated Key Control**

Gain an understanding of the automated key control. The understanding can either be documented in the control system step or could be documented here in this step. Auditors should consider the following aspects of the automated control when gaining an understanding:

### **Software Calculation: This is the one for the control- Need ERB finance team for information?**

Is there written documentation of the calculation, and/or the source rates and factors used in the calculation?

*We would expect written documentation that defines the calculation and is an official, approved source for the formulas, rates and factors. This may be an approved policy or could be system documentation.*

What formulas are used to make the calculation?

What values or factors are used to make the calculation? For example:

- Rate tables used by the calculation
- Profile fields (i.e., applicable transaction types)
- Programmed/set formulas and/or values
- Constraints (i.e., effective date, minimums/maximums, etc.)

How is the calculation triggered or initiated?

How is the calculation recorded in the accounting system (or used in an end result)?

Deleted other sections for clarity.

## **STEP 2: Confirm and Test Automated Key Control**

Confirm and test the automated control. To test the automated control, **consider** the following procedures:

### **Software Calculation:**

Re-perform the calculation for selected transactions.

## State of Washington

*Auditors would NOT normally use sampling for automated controls. Instead, auditors should judgmentally select one instance of each significant variation of the calculation. If the number of potential variations is large, auditors would judgmentally select based on risk factors (for example, the most common scenarios, or scenarios associated with identified risks, or scenarios that are not addressed by the entity's testing procedures).*

*In some cases, it may be possible for the auditor to reperform the calculation for the entire population.*

If any rate tables or values were updated during the period, view the current values (by observing the rate table or values in an admin menu or from a printed system report) and compare to approved sources.

*If no updates were made or there are only a few values, this risk could be addressed by re-performing the calculation. However, if source rate tables or values are large or complex, it may be more efficient to test these values directly than to recalculate a larger number of transactions.*

Consider the use of analytical procedures such as trends or descriptive statistics on the population (like average, minimum and maximum values, or a graph of values across the population) and follow up on any unexpected values or trends. *Analytical procedures would normally also count as a substantive test.*

### **STEP 3: Understand General IT Controls**

Gain an understanding of the general IT controls that support the continued proper operation of the automated control. Identify key general IT controls and note any control weaknesses. Auditors should consider the following aspects of general IT controls when gaining an understanding:

**"What is the single most important General IT control related to this calculation?"**

Like they make a change annually with rate tables, what is the verification process? Who performs what review, when, and how is it documented?

### **Software Calculation:**

Inquire if the entity has experienced any errors or irregularities with the calculation. Also how often changes are made to the calculation, and how many changes (if any) were made during the year.

How can the software calculation (formulas, rates/values, settings/configurations) be changed or customized?

*Software calculations will usually have one or more administrative menus that allow the government to modify rate tables or other calculation values, or to configure the calculation or apply settings.*

*In other cases, software calculation formulas and/or values may be hard-coded into the system and require programmers to make the changes. If the government has access to source code, then it needs internal procedures for program changes. If the program is controlled by vendors, we would expect program change procedures and expectations to be included in the contract.*

What are the procedures to authorize and make program changes or configuration/setting changes to the software calculation?

## State of Washington

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

*If utilizing a test environment, there should be controls to ensure that the live environment is updated and is consistent with the live production environment. As management is responsible for the accuracy of their automated controls (i.e., in the live environment), we would expect there to be a procedure to confirm each key automated control once it is in the live environment. This could be manually re-performing the calculation, reviewing reports against known expectations, etc.*

How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change programming, but they may be responsible for patch management, master table data, and/or configurations.*

### **STEP 4: Confirm Key General IT Controls**

Confirm your understanding of key general IT controls to determine whether they have been placed in operation (*whether the entity has actually implemented key controls*).

### **STEP 5: Test Key General IT Controls**

Document whether general IT controls will be tested. Option 1 would result in control risk at MAX for the automated control. Either option 2 or 3 is necessary in order to set control risk at LOW. If general IT controls are tested, consider the following procedures:

#### **Software Calculation:**

If program changes or setting/configuration changes are logged, review the change log to verify the population of changes for the year.

## State of Washington

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the calculation may also provide this evidence if the re-performance tests address all states of the calculation during the period. If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel. If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

### **STEP 6: Final Control Risk**

Evaluate the results and document a final control risk assessment in the control system step. Consider whether any deficiencies identified with either the automated control or related general IT controls represent material weaknesses or significant deficiencies.

*Note: general IT control deficiencies do not necessarily mean the automated control is not properly functioning. General IT control deficiencies would normally be considered a significant deficiency or material weakness only if it caused an issue with the compliance requirement or assertion.*

### **Recommendation Review Requirement**

IT Security related information is considered category 3 data protected by Public Request Exemption RCW 42.56.420. Issues related to IT Security require the following special handling:

[Instructions](#) are located in Team IT Audit's System's Sharepoint page.

Details of IT Security related issues should NOT be included in any emails or helpdesks.

Exit, ML and Findings should be separately communicated in an IT Security Results Document.

Findings will be referenced, but not included in the audit report.

All IT security-related recommendations must be reviewed by [Team IT Audit](#).

Template language for common IT related recommendations can be found in [ARS Part 5 Chapter 8](#).

### **PUBLIC REQUEST EXEMPTION**

Some IT related information is protected by Public Request Exemption RCW 42.56.420 for cyber security purposes. The details documented in the record of work and support workpapers may qualify for this exemption. If so, auditors must include this statement in the record of work done and any related workpapers: **"This record contains information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited "**.

Guidance/Criteria:
--------------------

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

# State of Washington

## SAO Audit Policy [2310](#) - Reporting Identified Audit Issues

## SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk

### [Information Technology](#) Planning Guide

Auditors may contact [Team IT Audit](#) with any testing strategy or control assessment questions or to request assistance from an IT Specialist.

**Software Calculation:** A **software calculation control** exists when the value of a transaction is determined by a software application. This process can be a key control when the entity relies on the system to generate calculations correctly to determine the amount of transactions (i.e., summarizing/account code allocation to post to general ledger, calculate student, utility, other charges, etc.).

**Automated Interfaces:** An interface is a process that moves information from one computer application to another. The interface can occur internally between systems maintained by a single agency, or between systems maintained by different agencies or private companies. The interface can also occur between modules within the same computer application.

The data transferred might be a file consisting of one or more records processed at a later time (batch), or it can be a real-time update. Risk associated with interfaces increases as the number of transactions or the number of other services and systems supported by the interfaced data increases.

Poor design or inadequate oversight can affect the transfer of transaction data among the systems. Interface controls are automated and/or manual processes designed to ensure transmission and processing of information is complete and accurate.

#### Manual vs. Automated Interfaces

A “manual interface” is the transfer of data from one system or module to another system or module, initiated and controlled by a user. An example of a manual interface is when customer accounts are downloaded from a utility billing system to be used to perform meter readings. When complete, the file with meter readings may be uploaded and posted to the customer accounts.

An “automated interface” is the transfer of data from one system or module to another system or module that happens automatically based on a schedule, or other predefined criteria. A common example of an automated interface is the payroll module of a system. Typically, a payroll batch is created in the payroll module. Once approved, the batch is automatically sent by the system to the general ledger or other applicable modules, such as accounts payable.

Entities should have reconciliation controls between their various applications regardless of the method used for interfacing.

## State of Washington

*Auditors should have determined whether system interfaces are automated as part of the Key Software Applications workpaper. **If not**, ask the following question to determine whether the system interface is manual or automated.*

*Is the data transferred from one system/module to another system/module by a user using an uploading and posting technique? For example, data is pulled from one system into a text file or other format, that is then uploaded into a different system or module by posting or in an upload feature of the module. If the answer to this question is yes, the interface would be considered "manual" since it is initiated and controlled by manually rather than through an automated process.*

**Edit Checks:** An **edit check** is a programmed routine designed to check input data or processing results for accuracy, compliance, or reasonableness. Types of edit checks include:

Range Checks: ensure that numeric values fall within specified ranges, minimums and/or maximums. For example, ensuring that a capital asset can only be entered as a positive amount, or a purchase order can only be submitted without secondary approval for less than a certain threshold.

Consistency Checks: verify that related data fields are consistent with each other. For example, ensuring that a patient's age matches their date of birth.

Format Checks: validate data formats (for example, dates as MM/DD/YYYY or phone numbers as ###-###-####).

Logical Checks: assess logical relationships between data fields. For instance, verifying that total debits equals total credits in a journal entry.

Duplicate Checks: identify duplicate records or entries. For example, preventing the same invoice from being entered twice.

Cross-Field Checks: compare data across different fields. For instance, ensuring that the start date of a project is before the end date.

Required Field Checks: ensure that mandatory fields are filled out. For instance, making sure that a patient's name and date of birth are provided.

Referential Integrity Checks: validate relationships between data tables. For example, confirming that a vendor number exists in the vendor master file as an active entity.

Outlier Checks: detect extreme or unexpected values. For instance, flagging water meter reading values that are extreme outliers for the customer type or account history.

Pattern Checks: look for specific patterns in data. For example, verifying that email addresses follow a valid format.

Edit checks may result in automatic rejection of a transaction, inability to proceed with a transaction, trigger for additional processing or review, or may simply result in a warning message to the user.

Edit checks may be identified as a key control when they are sufficiently relevant (ie: addressing the risk), precise (ie: able to catch all errors, rather than just being only reasonableness or limit check), and sufficiently strong (ie: prevent invalid transactions, rather than just generating a warning messages). Auditors may identify an individual edit or a group of edit checks together as a key control.

**Computer Generated Reports:** A **computer-generated report** is a report that is created by a computer program. The computer program,

## State of Washington

also referred to as a report generator or tool, takes data from a data source, such as a database, and displays it in a specified format. The process to generate a report often includes performing calculations on the data, such as summarizing, classifying, etc., before displaying, or can display the calculations on the report.

There are two types of computer-generated reports, pre-programmed and ad-hoc or customized reports.

Pre-programmed or canned reports are pre-defined reports where criteria and specifications are hard coded in the system. A canned report may allow limited parameters, (month/year, for example), but in general the information that will be displayed is pre-determined.

Ad-hoc or customized reports allow the user to drill down and customize what information is displayed on the report based on some allowed criteria, such as account codes, dollar amounts minimum, etc).

In contrast, a **manual report** is one that is created outside the system using data exports or is created ad hoc by a user. An example of a manual report is one that is created by copying data from a data source and pasting the data in an Excel spreadsheet or Word document or Powerpoint presentation where it is then processed further. With manual reports, each time a report is created, the data could be incorrect due to user error, such as not copying all relevant data, or processing errors. Therefore, these types of reports should be understood and tested similar to manual controls.

**Electronic Approvals:** Electronic approvals, electronic signatures and digital signatures are technically different, although often these terms are used interchangeably by entities.

Auditors should have determined whether the electronic approval is an automated control as part of the overall understanding of controls. For automated control purposes, an electronic approval is a software system functionality that:

Permits a user to approve transaction(s) within the software system

The system automatically documents, or logs, the data approved by the user and any subsequent manipulation

The acceptance or rejection of the transaction by the approver will trigger an additional software system process, such as posting of a transaction.

E-mail, scanned-in pictures of signatures, or font-changed signatures, etc. may be part of a control activity but are generally not considered an automated control and are not covered by this testing strategy.

### Electronic Signature vs Digital Signature

An "**electronic signature**" can look like a handwritten signature that has been scanned and then pasted into an electronic document. The reliability of this type of approval is variable. Recommend gaining an understanding of the process used to store and affix the signature to the document and then discuss the process with Team IT Audit before placing reliance on this control.

A "**digital signature**" is a legal signature with a formal certification process that documents who approved the document and ensures the

## State of Washington

document is not modified after certification. Reliability of this process is very high but has significant technical features. Recommend brainstorm with Team IT Audit before placing reliance on this control.

### **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

**Statements on Auditing Standards [AU-C 315](#) Understanding the Entity and Its Environment and Assessing the Risks of Material Misstatement** - paragraphs .A106-.A109 describe general and application controls and how they relate to audit risks

**Statements on Auditing Standards [AU-C 330](#) Performaing Audit Procedures in Response to Assessed Risks and Evaluating the Audit Evidence Obtained** - paragraphs .10b and .A33-.A34 describe requirements and guidance for testing indirect controls in conjunction with tests of controls, that is, testing key general controls in conjunction with a test of a key automated control

Record of Work Done.

**This record may contain information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited.**

### **Premiums and Assessments- Valuation and Occurrence**

**Key Control #1 - Automated Software Calculation** - Pay1 automatically calculates and prepares monthly billings based on current month subscriber elections maintained in Pay1. Pay1 automatically prepares billings based on approved employer and employee rates.

### **STEP 1: Understand Automated Key Control**

The understanding for this key control is documented above in the "Controls - Pay1" step.

### **STEP 2: Confirm and Test Automated Key Control:**

We received a walk through by Rita Homan, Deputy Accounting Section Manager, for the recalculation for selected transactions on May 7, 2024.

We selected four categories and then selected an individual for recalculation of their monthly billing:

- Regular PEBB state agency - DSHS
- SEBB - School employee at agency 600 H01
- Political sub-division/group - Olympic Medical Center
- Retiree, no specific employer

For each, we reviewed the Pay 1 system for elections and total, compared the published rate tables on HCAs website, and compared the totals to the billing invoice generated in Pay1.

## State of Washington

### PEBB (DSHS)

We recalculated the elections made by employee XXX-XX-1826 for May 2024. We did this by taking the PEBB base employer premium of \$1,145 from the [HCA website](#) and adding the employee premium based on their election. Their election included the \$124 basic rate for Uniform Medical Plan (UMP) which ties to the rate tables published, with a \$25 tobacco surcharge for a total election of \$149, for a total of \$1,294. We noted their "HSA Family Comp" in Pay1 was listed as "1" meaning only the subject was covered, with no spouse or children on the plan. Premium tied without exception between billing statement, pay1, and rate tables. We also noted the May coverage period was invoiced on April 25, 2024. **No issues noted.**

### SEBB

We recalculated the elections made by employee XXX-XX-2091 for May 2024. We noted their Pay1 elections listed "PH" as their health carrier, which is Premera Blue Cross High PPO, and their "HSA Family Comp" was "4" meaning it was the subscriber, spouse, and at least one child, which is also categorized as "full family" in the rate tables. Per the rate tables on the [HCA website](#), the employer premium is \$1,100 and the employee premium was \$345, which matched the amount billed in Pay 1, for a total billed invoice of \$1,445. Premium tied without exception. We also noted the May coverage period was invoiced on April 15, 2024. **No issues noted.**

### PEBB Political SubDivision (Olympia Medical Center)

We tied the elections made by employee XXX-XX-0448 for May 2024 to the premium charts on the [HCA website](#). We noted the Pay1 elections listed Carrier U for coverage which is Uniform Medical Basic, and their "HSA Family Comp" was "4" meaning it was the subscriber, spouse, and at least one child, which is also categorized as "full family" in the rate tables. We tied the UMP classic full family tiered rate listed on the website, the amount billed which was \$2,428 with a \$33 surcharge. We noted the May coverage was billed on April 26, 2024. **No issues noted.**

### Retiree

We recalculated the elections made by self-pay employee XXX-XX-7641 for May 2024. We reviewed the Pay1 screen and noted their elections were for carrier "F" which is Medicare Plan F, and they elected to have dental. Their "HSA Family Comp" was "1" meaning only the subscriber was covered. We compared this information to the rate tables on the [HCA website](#) where we tied medical to \$119 and dental to \$49, for a total billing amount of \$168. We tied this to the billed premium which was invoiced on April 23, 2024. **No issues noted.**

### **Noted Weaknesses are as follows:**

None

### **STEP 3: Understand General IT Controls**

We met with the following HCA staff on 05/15/2024 to gain an understanding of general controls for the automated calculation performed by Pay1:

Grant Stromsdorfer, Pay1 mainframe IT developer

# State of Washington

Sara Whitley, Employee Benefits Board (ERB) finance manager

Rates are updated throughout the year depending on the coverage type. PEBB and SEBB rate premiums update on an annual basis in June/July, state share rates in May, and composite rates update in September. Each year, the finance team reaches out to the carriers in the "request for renewal" cycle. Each carrier that would like to continue must provide updated rates to HCA. HCA requires these rates to be "actuarially sound" and signed off by an actuary. Milliman performs this service for Uniform Medical Plan (UMP) classic. Once each carrier has submitted their new premium rates to ERB, ERB compiles the information into a large excel file named the "rate book". The rate book is presented to the appropriate board (Public Employees Benefits Board, or School Employee Benefits Board) for adoption.

After approval, the rate book is submitted to the Pay1 mainframe IT team via email. This email triggers a help desk ticket that pulls the IT team into the workflow and all correspondence is maintained within the email thread to ensure all details and actions are recorded. A Pay1 contractor will update the rates in a Pay1 test environment. Only the Pay1 contractors have the ability to update the information, the HCA IT team is responsible only for testing the new information.

Grant Stromsdorfer, Pay1 Mainframe IT Developer, then pulls the rate information out of the test environment as a txt file and converts it back into an excel workbook. He reviews the newly generated rate tables, to the tables submitted by the ERB team to confirm the data has been correctly entered. He also performs summation tests to confirm the new totals match. Each type of coverage, medical, dental, vision, etc. gets reviewed in its own tab. If everything is correct, he sends his excel workbook via email with any notes to Tanya Deuel, ERB Finance Manager, for secondary review to ensure updates are correct (**General IT Control #1**).

After the ERB Finance Manager confirms the information is correct, the HCA IT team will set a release date for the updated rate tables from the testing environment, to go into live production. As HCA is not aware of any instances of post verification software corruption that occurs between the test environment, and live status, they do not run an additional check in the live environment.

## **STEP 4: Confirm Key General IT Controls**

**General IT Control #1 (Manual) - Valuation:** The HCA Pay1 mainframe IT team reviews the updated rate tables pulled from a Pay1 testing environment and compares rates and totals to the original tables submitted by the ERB team. If updates have loaded correctly, Pay1 mainframe employees send a notification of review and their workpaper back to the ERB Finance Manager for secondary review to ensure updates are correct, before the updates are released into production.

We received a walk through of the rate table update for PEBB composite state shares by Grant Stromsdorfer, Pay1 Mainframe IT Developer, on May 15, 2024.

Grant walked us through the email thread detailing the conversations between Pay1 contractors, HCA IT staff, and the ERB finance team. We noted on May 3, 2024, Joselito Almazora (Pay1 Contractor) sent an email to his team, and cc'd Grant, which noted the had uploaded the 2024 PEBB State Share rate, and attached relevant text files such as

## State of Washington

"N:\IS\Operations\PEBB\Pay1\Mainframe\INSURANC\RATES\StateShare\2024StateShare\PEBB\_2024\_Health\_State\_Share.txt"

Grant then walked us through the original ERB submitted workbook "2024 PEBB Composite Rate Book", the txt file where the data is converted into a Pay1 usable format, and his resulting converted excel workbook "PEBB FY 25 State Share gs review 20240506.xlsx". We noted the review workbook had multiple tabs, one for each type of coverage, and columns for the carrier codes, tobacco surcharge, and other coverage information. For ease of comparison to the original book, Grant had added additional columns which included the carrier names, the coverage description, and additional notes such as political subdivision. Grant demonstrated that the columns in green were the reviewed information and included the employer premiums for higher education (HIED), general education (EMP K12), and political subdivisions (POL SUB). We also noted the effective date column for each of these changes was listed as 07/01/2024, which is when the new rates will be effective. We traced the rate for Kaiser Permanente NW classic (effective 07/01/2024 through 06/30/2025) from the original ERB rate book, into the text file, and the review workbook. We noted the effective date (07/01/2024), carrier premium (\$1,040) subscriber share (\$226), tobacco (\$25), and spouse surcharge (\$50) all tied with no variance.

We then reviewed the email chain, and confirmed the "PEBB FY 25 State Share gs review 20240506.xlsx" workbook had been sent to Tanya Deuel, ERB Finance Manager, on May 6, 2024 with a note stating it was ready for review. **No issues noted.**

### **STEP 5: Test Key General IT Controls**

Not applicable - we are not planning to rely on automated controls and therefore do not need to test general controls; control risk will be assessed at MAX.

### **F.2.PRG - Premiums and Assessments**

*Procedure Step:* Key Control #2 (Manual)

*Prepared By:* MRF, 5/16/2024

*Reviewed By:* RKM, 5/29/2024

Purpose/Conclusion:
---------------------

#### **Purpose:**

To confirm ERB Accountants are reviewing payments automatically processed, and not automatically processed, in Pay1 and reconciling payments to AFRS to ensure the revenues occurred each day (key control #2 for Pay 1), in order to assess control risk.

# State of Washington

## **Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*

## State of Washington

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency.*

***All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.***

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*

*D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

# State of Washington

Guidance/Criteria:

Record of Work Done:

**Key Control #2 (Occurrence) Daily, ERB accountants review payments automatically processed, and not automatically processed, in Pay1, and reconcile payments to AFRS to ensure that revenues/receivables occurred and are accurately classified in the Pay1 System.**

The understanding for this system is documented above in the "Controls - Pay1" step.

## **1. Confirmation of Key Manual Control:**

We received a walk through from Rita Homan, Deputy Accounting Section Manager, on 05/01/2024. We received the lockbox reports, US Bank statements, TMS report, and the A7-A (Cash receipting JV) for the automatic lockbox report from HCA, for revenue received on April 10, 2024. We noted a total of \$2,640,203.69 was automatically processed in Pay1 from the following sources:

- PEBB E-Lockbox - Fund 721- \$89,442.06
- SD Benefits (box #94194) - Fund 493- \$1,971,398.00
- SEBB Retail (box #94115) - Fund 493- \$26,017.42
- Flex Spend (box #84245) - Fund 802- \$77,307.37
- Political Sub (box #84265) - Fund 721- \$256,076.92
- PEBB Retail (box #34270) - Fund 721- \$219,961.92

We noted the total of these payments tied to the total amount processed, \$2,640,203.69, with no exceptions. Additionally, we reviewed bank statements from US Bank and screenshots of Pay1 for each of the revenue sources above and confirmed the amounts tied with no exceptions. We also reviewed email correspondence of approval to upload the batch to TMS on April 11, 2024. The email correspondence of approval included several attachments such as a PDF report of the Lockbox amount and a screenshot of the cash receipts journal summary prepared by Diana Dunn, Medical Assistant Specialist 3, in the ProviderOne (Pay1) Accounting Unit.

We also reviewed the Pay1 reports for each of the lock boxes, and confirmed that all inputs were marked "Y" under valid. This indicates that all individual deposits being rolled into the lockbox total, had accurate information for automatic processing. Any deposit with a "N" would indicate the need for a manual review by staff before determining how to deposit.

We noted the Cash Receipts Journal Summary broke the amounts apart by fund to ensure funds were deposited correctly and the reconciliation was sent to Jennifer Adamire, Fiscal Technician 2. Jennifer then prepared the Batch for processing using the A7-A (Current Doc Number PACR4066), which was also approved on 04/11/2024 by Lisa Kolle, PEB Accounting Manager, and ties without issue to the amount processed.

# State of Washington

None of this revenue was manually processed in the Pay1 system. **No issues noted.**

## **Noted Weaknesses are as follows:**

None

## **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

## **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

## **F.2.PRG - Premiums and Assessments**

*Procedure Step:* Key Control #3 (Manual)

*Prepared By:* MRF, 5/16/2024

*Reviewed By:* RKM, 6/5/2024

Purpose/Conclusion.\*

### **Purpose:**

To confirm that monthly, ERB FA4s manually record unearned revenue (and receivables) related to PEBB/SEBB premiums by journal voucher, which is reviewed by the FA5, ERB Accounting Section Manager, or Deputy Accounting Section Manager to ensure accuracy of entries (key control 3 for Pay 1) in order to assess control risk.

### **Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

## State of Washington

### Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified*

## State of Washington

*issue represents a material weakness or significant deficiency.*

***All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.***

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*

*D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

Guidance/Criteria.7
---------------------

# State of Washington

## Record of Work Done:

**Key Control #3 (Valuation):** Monthly, ERB FA4s manually record unearned revenue (and receivables) related to PEBB/SEBB premiums by journal voucher. Entries to record unearned revenue (and receivables) are based on Pay1 aging reports HRISD-B5519-R01 and SEBB-B5519-R01. The entry is reviewed by the FA5, ERB Accounting Section Manager, or Deputy Accounting Section Manager to ensure accuracy of entries.

The understanding for this system is documented above in the "Controls - Pay 1" step.

### **1. Confirmation of Key Manual Control:**

We obtained the March 2024 month end receivable adjusting journal vouchers from Rita Homan, Deputy Accounting Section Manager, for PEBB and SEBB. We received a walkthrough of the process on 05/01/2024 with Rita Homan.

#### **PEBB**

We obtained and reviewed the following JV:

PAJV6157 - To record PEBB unearned revenue for self-pay, prepaid receivables for revenue sources 000020 and 000021 per aging report dated 03/29/2024

We obtained the preparer/approver reporting from HCA IT for the selected JVs. The journal voucher was processed 04/02/2024, prepared by Michael Williamson, Fiscal Analyst 4, and reviewed by Brooke Schofield, Fiscal Analyst 5. The total amount posted was \$1,551,682.

We reviewed the monthly group aging report summary HRISDB5519-R01 with run date 03/29/2024. We noted prepaid amounts for Selfpay agencies was \$725,453 and amounts for retirees totaled \$30,388, for a total of \$725,453. We then reviewed the Summary Report for the JV and noted Revenue for Fund 107 000020 was \$632,433 and fund 107 000021 was \$93,020. These two revenue sources together ties to the \$725,453 determined in the aging report with no variance, and is included in the totals on the adjusting JV. Amounts posted in PAJV6157 tie without exception to Pay1 reports. **No issues noted.**

#### **SEBB**

We obtained and reviewed the following JV:

SAJV1477 - To record SEBB unearned revenue for self-pay, prepaid receivables for revenue source 000021 per aging report dated 03/31/2024

The journal voucher was processed 04/01/2024, prepared by Oanh Pham, Fiscal Analyst 4, and reviewed by Brooke Schofield, Fiscal Analyst 5. The total amount posted was \$145,853.

We reviewed the monthly group aging report summary SEBB-B5519-R01 with run date 03/29/2021. We noted prepaid amounts for Selfpay agencies was \$72,926. Amounts posted in SAJV1477 tie without exception to Pay1 reports. **No issues noted.**

**Noted Weaknesses are as follows:**

# State of Washington

None

## **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

## **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

## **F.2.PR.G - Premiums and Assessments**

*Procedure Step:* Risk Assessment

*Prepared By:* MRF, 10/22/2024

*Reviewed By:* RKM, 9/30/2024

Purpose/Conclusion:

### **Purpose / Conclusion:**

To assess inherent risk, control risk, and the risk of material misstatement in order to design an initial testing strategy for each assertion.

Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

### **STEP 1: Inherent Risk (IR)**

Assess inherent risk for each relevant assertion. This assessment is based on understanding of the entity and the nature of the account balance or class of transactions.

*Inherent risk is the susceptibility of an assertion to material misstatement. It is our assessment of "total threat", which includes both "natural risk" and identified risk indicators, without any regard to any potential control activities. As inherent risk is fully independent of control risk, any understanding of controls cannot be used to increase/decrease the assessment of inherent risk. Consider the following factors as your*

# State of Washington

*basis for this assessment:*

## *General Considerations*

*Does the balance include transactions that are difficult to audit or involve complex accounting issues?*

*Were there significant misstatements identified in previous audits or prior-period adjustments in the account balance or transaction class? If so, analyzing the cause of prior period misstatements will help in analyzing inherent risk.*

*Are there any inherent risk factors at the entity or industry level, such as changes in regulation or accounting rules, unique transactions or accounting practices, use of information technology, etc that affect the balance?*

## *Inherent Risk due to Error*

*How large are the transactions making up the balance? If the balance has only a few large transactions, even a single error may mean a significant misstatement.*

*Have there been changes in the transactions making up the balance that may increase risk? For example, significantly different composition, nature or volume of transactions may inherently disrupt established controls.*

*Are financial events originated or identified by accounting personnel or non-accounting personnel? This consideration is mainly for the completeness assertion.*

*Does the process to account for transactions involve judgment or estimation, complex calculations, numerous steps or significant manual steps?*

*Do transactions have widely varying attributes that need to be manually identified? For example, grant loans that are accounted for in one of several ways depending on the terms of the agreement.*

## *Inherent Risk due to Fraudulent Reporting (intentional misstatements)*

*Are there substantial pressures or motivations to misstate the balance?*

## *Inherent Risk due to Misappropriation*

*Is the account balance or transaction class susceptible to sizable misappropriation?*

## *Inherent Risk due to Non-Compliance*

*Are there any laws, contracts or grant agreements affecting the balance? If so, would non-compliance lead to sizable misstatements?*

*Are compliance requirements complex, hard to understand, subject to judgment or otherwise difficult to comply with?*

*Are there any motivations or pressures to not comply?*

## **STEP 2: Control Risk (CR)**

**Assess control risk by system and assertion.** This assessment should be based on the results of the control understanding, confirmation, and (if setting control risk to LOW) testing. If applicable, auditors will evaluate any control deficiencies and determine whether those deficiencies, individually or in combination, are significant deficiencies or material weaknesses.

*Control risk is the risk that material misstatements would not be prevented or detected timely by the system of internal control. Control risk could be thought of as the "vulnerability" of an entity to misstatements. Control risk exists independently of the inherent risk (the level of vulnerability exists independent of the level of threat).*

## State of Washington

*Control risk is MAX in both of the following situations: (1) controls aren't tested or (2) controls are problematic and cannot be relied upon. In order to set control risk to LOW, the auditor must test that controls operated effectively throughout the period.*

*A material weakness exists when the design or operation of controls results in a reasonable possibility a material misstatement will not be prevented or detected and corrected in a timely manner. A significant deficiency is less severe than a material weakness, yet important enough to merit the attention of the governing body. **All potential material weaknesses and significant deficiencies should be discussed with the AIC, since they must be reported as findings.***

### **STEP 3: Risk of Material Misstatement (RMM)**

Assess the risk of material misstatement for each relevant assertion for each significant line item. The risk of material misstatement (RMM) is a combination of the auditor's separate assessment of inherent and control risk.

*In practice, the RMM is the amount of substantive evidence that's needed, and the only way to reduce the amount of needed substantive evidence (equal to the inherent risk) is to test controls. As such, when control risk is MAX, the RMM must always equal the inherent risk (IR).*

*When controls are tested & can be relied upon (are determined to be effective) it is a matter of professional judgment how much the RMM should be set lower than inherent risk (1 or 2 steps).*

*Auditors should assess RMM by assertion, if different. For example, if RMM is assessed at MOD for the existence assertion, but LOW for the rights & obligations assertion, then document "MOD – existence and LOW – rights & obligations".*

### **STEP 4: Design Substantive Testing**

Design a substantive testing strategy that addresses the relevant assertion (identified risk) in the portion of the line item that relates to that risk.

*Planning identifies where to audit (significant balances, classes of transactions & disclosures) what to audit for (relevant assertions), and how much to audit (RMM). The quantity and quality of evidence obtained by substantive tests needs to match the level of risk. The higher the risk of material misstatement, the greater evidence needed. "Greater evidence" could either be greater quantity of evidence, greater quality of evidence, or some combination of greater quality and quantity.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6210](#) – Planning Financial Statement Audits**

# State of Washington

## SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk

### [Financial Statement Audits](#) Planning Guide

Record of Work Done:

#### **(1) Inherent Risk (IR):**

Based on our understanding of the line item, we assessed inherent risk as follows for each relevant assertion and significant class of transactions:

Valuation - **MOD**

Occurrence - **MOD**

#### **(2) Control Risk (CR):**

We assessed control risk as follows for each system and relevant assertion:

##### **Pay1 (Valuation and Occurrence)**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

#### **(3) Risk of Material Misstatement (RMM):**

We considered both inherent and control risk and assessed the risk of material misstatement as follows for each relevant assertion and significant class of transactions:

Valuation - MOD

Occurrence - MOD

#### **(4) Testing Strategy:**

We designed our substantive testing strategy based on our assessment of the risk of material misstatement. We plan to perform the following tests:

##### **Valuation**

We will use the sampling spreadsheet to determine the amount of transactions for testing. We will use the sample provided by Team IT Audit and re-calculate the total premium associated with our sample using the PEBB/SEBB employer premium, employee premium, tobacco surcharge,

## State of Washington

spouse surcharge, and plan election. The PEBB/SEBB employer/employee premiums, tobacco surcharge and spouse surcharge can be found on the Health Care Authority (HCA) [website](#). The plan election will be provided in the data from Team IT Audit. We will tie the re-calculation of the subscriber's premium (employee and employer portions) to the invoice charged to the participating employer.

### **Occurrence**

We will use the sampling spreadsheet to determine the amount of transactions for testing. We will use the sample provided by Team IT Audit and will test our sample to ensure that the recorded revenue and coverage period occurred in the proper period, by reviewing the invoice.

We anticipate that these tests will provide sufficient appropriate audit evidence to address the assessed risk of material misstatement for relevant assertions in significant classes of transactions.

### **F.2.PRG - Premiums and Assessments**

*Procedure Step:* Substantive Test  
*Prepared By:* MRF, 10/3/2024  
*Reviewed By:* RKM, 10/28/2024

Purpose/Conclusion:

#### **Purpose (Occurance):**

To determine whether reported revenues represent actual amounts relating to the period.

#### **Conclusion:**

We determined the recorded revenues represented actual amounts relating to the period.

#### **Purpose (Valuation):**

To determine whether revenues were reported at properly valued or calculated amounts.

#### **Conclusion:**

We determined the revenue was reported at correctly calculated amounts in the Pay1 system.

Testing Strategy:

### **Occurance**

# State of Washington

The following is a list of **considerations** for testing the **occurrence assertion for revenues**. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

Confirm intergovernmental revenues with the other government or grantor or by reviewing appropriate correspondence.

*Note: intergovernmental revenues received from the State Treasurer should be addressed as part of the State Treasurer Distributions baseline test.*

If revenue is receipted into a specific clearing account, or if third-party lockbox or receipting services are used, compare recorded revenue to a sum of monthly totals from bank, lockbox or service organization reports.

Trace selected or sampled revenues from the GL to supporting billings or subsequent receipts.

Develop sufficiently precise expectations for a substantive analytical to compare to reported revenue amounts.

Search for manual journal entries that credit (increase) revenues. Consider testing if any risk indicators are noted.

## **Cut-Off / Revenue Recognition**

Test transactions recorded in the current period to verify the revenue occurred during the period.

*Transactions recorded at the beginning and end of the current period would generally be considered at highest risk of being improperly recorded in the current period. Consider scanning and selecting transactions if high risk transactions can be identified by description or date fields.*

If revenue is billed at a constant rate, calculate an expectation based on the average monthly billing or re-calculate the year-end accrual journal entry and compare to the reported receivable.

Evaluate revenue recognition against GAAP criteria for selected transactions or revenue streams.

## **Interfund Revenues**

For internal service fund charges, see testing strategies for internal service funds in the Accountability folder. For other types of internal charges, see testing strategies for Internal Activities.

## **Detail Roll-up**

Compare year-end totals from general ledger to subsidiary software modules for selected revenues.

Review the government's reconciliation of general ledger to subsidiary ledgers.

*Detail roll-up testing is not sufficient audit evidence by itself since it only entails comparing different sets of the entity's own accounting records. However, it may be combined with other substantive tests to address identified risks. For example, if substantive testing is performed at the subledger level, it may be combined with a test that the subledger detail accurately rolls up to the general ledger or financial statements.*

# State of Washington

## Valuation

The following is a list of **considerations** for testing the valuation assertion for revenues. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

## Calculation

Recalculate billed revenues on a check (one of each variation), CAATS or sample basis.

For large populations of standard billings, perform CAATS tests to identify unexpected or outlier transactions for further review.

Review related-party transactions to determine whether revenue transactions were correctly calculated.

## Realizable Value

Re-calculate a sample or selection of billings. If billings are calculated by software, the auditor could test and substantiate the automated control and also consider any risks associated with manual inputs used by software.

Evaluate the entity's calculation of the allowance amount for reasonableness. This evaluation should include comparing the entity's estimate to the entity's actual historical experience of collecting or writing-off receivables.

Trace the amount of bad debt approved by the governing body (per minutes) to reductions of receivables and bad debt expense to verify it was properly accounted for. *Note: approvals may be slightly more, as customers may pay after the bad debt has been approved but before it is written off.*

## Estimation / Recognition

Review calculation and support for assumptions of any estimated revenues.

Accounting research to verify that revenues were reported in conformity with revenue recognition policies reported in the financial statement notes.

## Property Tax Revenues - see separate step

Guidance/Criteria.:

**Add the Guidance/Criteria for each relevant assertion from the TeamStore. You may also include other resources that you used for testing.**

Record of Work Done.:

We worked with IT Audit to obtain monthly subscriber data for PEBB and SEBB from Pay1 [\[Pay1 Revenue Selection - Team IT\]](#) and had them pull our testing sample. The request is documented in HelpDesk #68098.

To gain a better understanding of revenue, we prepared a summary of health insurance revenues. See [\[Health Insurance Activities Updated 2024\]](#).

# State of Washington

## **Substantive tests performed to meet the Existence / Occurrence assertion:**

### **Testing Procedures:**

We reviewed the testing strategy for occurrence. We used the Financial Audit Substantive Statistical Sample spreadsheet with a tolerable misstatement of 7.5%, and a mod assurance level, and determined a planned sample size of 30. This sample is determined with both PEBB and SEBB populations blended together as the process is the same, only the employers are different. We determined we would test 29 additional sample items to obtain an additional level of assurance for both populations, 29 in PEBB and 30 in SEBB. Team IT Audit requested the total data population from HCA's database, and randomly selected the transactions for testing.

We provided our revenue sample to Rita Homan, Deputy Accounting Section Manager. She provided us the Pay1 invoices detailing the coverage period and the billing date. We reviewed the dates for the selected charges to determine if the coverage period and billing was within the proper period.

We tested the sample for the following attributes:

Did the recorded revenue earned within fiscal year ended June 30, 2024?

Was the coverage period within fiscal year ended June 30, 2024?

**Testing Results:** [CONFIDENTIAL DATA\_FS Sampling]. We tested our sample to determine if they represented actual amounts relating to the period and noted **no** exceptions.

## **Substantive tests performed to meet the Valuation assertion:**

### **Testing Procedures:**

We used the same sample of 59 transactions to test for the valuation assertion by recalculating the total premium for each subscriber based on their elections and comparing it to the invoiced amount in the Pay1 system. The PEBB/SEBB employer/employee premiums, tobacco surcharge and spouse surcharge were found on the Health Care Authority (HCA) [website](#). The plan election data was provided in the data from Team IT Audit. The Pay1 invoice documentation was provided by Rita Homan, Deputy Accounting Section Manager. We tied the re-calculation of the subscriber's premium (employee and employer portions) to the invoice charged to the participating employer.

We tested our sample for the following attribute:

Did Pay1 accurately calculate the subscriber's premium?

**Testing Results:** [CONFIDENTIAL DATA\_FS Sampling]. We tested our sample to determine if they were reported at properly valued or calculated amounts and noted **no** exceptions.

## **F.2.PRG - Premiums and Assessments**

# State of Washington

*Procedure Step:* Pay1 Revenue Selection - Team IT  
*Prepared By:* PS, 8/14/2024  
*Reviewed By:* RKM, 10/28/2024

## Purpose/Conclusion:

### **Purpose:**

For Team IT Audit to select random samples related to state employee health care information as requested by Team Financial Audit.

### **Conclusion:**

Team IT Audit has selected and provided random samples related to state employee health care information as requested by Team Financial Audit.

## Testing Strategy:

## Guidance/Criteria:

## Record of Work Done:

### **Data Analysis Request**

Michi Fields from Team Financial Audit has submitted helpdesk 68098 to request for the following items:

1. Help obtaining monthly Pay1 data (census data and billing data for PEBB and SEBB)
2. Provide Pay1 data in a format so we can make selections or have Team IT make selections for recalculating billings (amounts calculated by Pay1)

The audit team also provided the following information:

1. WHO: All active PEBB and SEBB subscribers (all participating employers - state, local governments, school districts, local governments, etc.). Please include the participating employer types. We do NOT want retirees. **Note:** We want subscribers for all months. It might be helpful to clarify if the subscriber will appear for each month they are in PEBB and SEBB and their respective elections. Elections can change

# State of Washington

throughout the year. Election may not be consistent through the whole year.

2. YEAR: Fiscal year ended June 30, 2024 (07/01/2023 - 06/30/2024). **Note:** We would like to receive the data once all is available- probably late July.

3. WHAT FIELDS: Basic subscriber information to ensure traceability. Likely need SSN, name, employer/agency, tier (subscriber only, spouse, full family, etc.), election types for all insurances and benefits.

4. OTHER: additional fees or surcharges (tobacco surcharge and spouse surcharge).

5. PHI/PPI TO EXCLUDE: We do not expect to need dependent SSNs or DOBs. We want to be able to filter non-material participating employer types to simplify testing.

We do NOT need additional selections for control confirmations this year.

## Test Objective

The audit team wants to confirm health insurance billings made during fiscal year 2024 were made at the appropriate amounts. They would like to select transactions from Pay1 data to recalculate billings (amounts calculated by Pay1).

## Methodology

Based upon this request, we will complete the following steps:

Request and obtain from HCA the Pay1 FY2024 data; census and billing data for PEBB and SEBB.

Import the datasets into SQL and perform data reliability checks to confirm that the data received are complete and accurate.

Work with Team FA to determine the criteria for the sampling population, as well as the number of samples.

Pull samples from the data and provide to Team FA.

As we proceed with our testing, we will adjust these steps as needed.

## Data Requests

In order to complete the requested testing, two datasets are required, both from HCA's Pay1 system. One will consist of billings related with state employee health benefits and the other will be the enrollment/census information related to state employee health benefits. This request was attached to the ACFR work order for FY 2024.

HCA provided billings files on August 6th, 2024, and enrollments files on August 5th, 2024. The requested files were provided by Will Sogge,

# State of Washington

External Audit Liaison. We received the following:

- 12 PEBB billing files (one for each month of the fiscal year)
- 12 SEBB billing files (one for each month of the fiscal year)
- PEBB enrollment file
- SEBB enrollment file

Enrollment reference file. This included data definitions, record counts, and field names included in the enrollment files.

Additionally, we also have billing/eligibility field descriptions received from prior year audits, which can be seen at [Pay1 Premiums Billed Data Layout](#) and [PEBB Eligibility Monthly File Field Descriptions](#) (Purpose/conclusion: To document the PEBB Eligibility field descriptions Source: Allen Hall, HCA IT Data Management). Also obtained a list of carrier codes not defined in data layout documents, see [AdditionalCarrierCodes](#).

## **Data Reliability**

We have performed procedures to verify that the data received is complete and accurate. These procedures written in SQL are at [FY24 PEBB SEBB Enrollment DataReliability](#) (PEBB and SEBB enrollment reliability) and [FY24 PEBB SEBB Billings DataReliability](#) (PEBB and SEBB billings reliability). HCA has also gave us a reference table for key data fields at [Reference Tables - FY24](#) Below is a summary of the checks completed:

Verify fields have expected/reasonable values based upon our request and the file layouts.

Verify counts of certain fields remain consistent throughout the year.

Comparisons between the billings and enrollment datasets to identify any differences in the employees included.

The following describes items of note identified during our reliability checks:

There are billing transactions with coverage period outside of the fiscal year. They may be included to show that there are credits associated with these billings.

All employees in PEBB enrollment file are in the billing file but 1 employee in the SEBB enrollment file is not the billing file. From prior year discussions with HCA, this may be due to SSN changes since the enrollment file is a picture in time, whereas the billings are dynamic.

3294 PEBB employees and 2416 SEBB employees are in the billings files but not in the enrollment files. Some of the billings are for coverage periods outside of FY24 and there are many credits for current and prior periods that created a net \$0 billing amount. From prior year discussions with HCA, this is likely due to the enrollment file being a picture in time. In browsing the billing files, we see transactions dates for credits between the enrollment update dates (around the 23rd of the month). It is likely the individuals were

## State of Washington

enrolled at the time of the billing, but not at the time the enrollment table was updated. If one of these employees is selected for testing, we may need to obtain enrollment information from HCA for that particular employee.

Within the billing data, some employees appear in both the PEBB and SEBB populations. As seen in other cases, many of these situations appear to include corrections. However, some employees can also be dual eligible and each entity will pay a portion of the benefits. What we are seeing aligns with these expectations.

Based upon our procedures, we have determined the data appears to be complete and accurate for our testing purposes. We will continue to look for signs of incomplete or inaccurate information as we perform our testing.

### **Data Analysis Testing**

The audit team requested 29 PEBB samples and 30 SEBB samples. We will create two populations as follows:

1. PEBB billing population will consist of:  
Distinct subscriber SSN and coverage month.  
Eligibility Type Y (active state and higher-education employees)  
Include all transaction codes (including credits).
2. SEBB billing population will consist of:  
Distinct subscriber SSN and coverage month.  
Eligibility Type Z (active SEBB).  
Include all transaction codes (including credits).

IT Audit created SQL queries to build the population and pull the samples. For each selected employee, we also pulled all associated billing records. Our queries can be seen at [SampleSelection\\_Queries](#).

Throughout the above queries, we performed checks to verify the completeness of our results. Based upon our checks, we consider the results to be complete and accurate based upon the request.

### **Data Analysis Results**

The results of our testing were provided to Team FA in an Excel spreadsheets titled "!2024\_PEBB\_SEBB\_Sample\_Selections" via our internal network. These results contain CONFIDENTIAL INFORMATION. The spreadsheets are password protected and the password is based on the pattern in the DA password safe. The following result tables were included in the spreadsheets:

[Billing Recalculation Samples](#)

## State of Washington

1. PEBB samples with summary billing and enrollment information (73 records)
2. SEBB samples with summary billing and enrollment information (32 records)
3. PEBB detail billing records associated with selected employees (162 records)
4. SEBB detail billing records associated with selected employees (155 records)

We also provided the audit team with the total record counts associated with the PEBB and SEBB populations created for pulling samples. The total record counts were 1,809,168 for PEBB and 1,840,368 for SEBB and included in the sample selection Excel file.

### F.3.PRG - Premiums and Claims

*Procedure Step:* Summary & Conclusion

*Prepared By:* EZM, 10/1/2024

*Reviewed By:* RKM, 11/21/2024

Purpose/Conclusion:

#### **Purpose:**

To evaluate risk assessments and the sufficiency and appropriateness of evidence obtained based on results of substantive work.

#### **Conclusion:**

We determined that **no** modifications were necessary to inherent risk, control risk, or the risk of material misstatement as assessed in planning.

We also determined that evidence obtained was sufficient and appropriate in response to the risk of material misstatement.

Testing Strategy:

Auditors are **required** to evaluate conclusions for substantive testing as follows:

*Auditors may wish to use the optional Lead Sheet available in the Store to summarize testing related to each balance and assertion.*

**1.** Determine whether the results of substantive testing indicate a need to modify the inherent risk assessment (IR), control risk assessment (CR), risk of material misstatement (RMM) or other aspects of planning (such as material balances or assertions). If so, document changes and consider the need for additional testing.

## State of Washington

*If the results of substantive testing indicate a need to change control risk, auditors should also update the [Permanent File](#) by either correcting the documentation or by adding an update section describing changes to the top of the record of work done. For all changes to IR, CR, or RMM the [Material Balances](#) spreadsheet should be updated.*

*More significant changes to other aspects of planning (such as material balances or assertions) should be referenced in this step and documented in detail in the [Changes to FS Audit Plan](#) step.*

2. Evaluate whether the quality and quantity of evidence obtained is sufficient and appropriate in response to the risk of material misstatement. In making this determination, auditors should evaluate:

### Information to be used as audit evidence:

- Does evidence relate to the population, period of time and risk (assertion and “what could go wrong” from the Material Balance Spreadsheet)? If there are any gaps or uncertainties in the logical connection between the evidence and conclusions, is there a documented consideration and explanation?
- Are the sources of information sufficiently reliable and appropriate for the risk (whether internal to the government, external, or auditor developed)? If key information is not from a sufficiently reliable source (for example, inquiry), then is it corroborated by information that is?
- Are there any concerns about accuracy, completeness, authenticity, or bias in information? If so, did the auditor perform sufficient procedures to confirm reliability of that information?
- Is information precise enough to catch if misstatements exceeded the tolerable level?
- Is information detailed enough to conclude on whether or not there were misstatements?
- Was there any information that appeared contradictory or inconsistent? If so, was there a documented response to the inconsistencies or doubts about the reliability of evidence?

### Results:

- How much misstatement was identified by testing, and the likelihood and magnitude of further potential misstatement?
- How did misstatements occur and how often might they occur again in the population?
- Were misstatements caused by control deficiencies or circumvention of controls?
  - If control deficiencies, is there a need to re-evaluate our understanding of controls in the [Permanent File](#) folder or assessment of control risk?
  - If circumvention, the [Management Override of Controls](#) step should address or reference this area. Auditors should also consider whether a fraud risk has been identified.
  - Did tests identify a different level or type of risk than the planned audit response was designed to address?
  - If likely misstatements are identified, are further procedures necessary to improve the precision of our estimate?

## State of Washington

*To support the overall evaluation of audit risk and provide a basis for concluding on the overall sufficiency and appropriateness of evidence in the **FS Summary & Report** step, auditors should conclude in each area whether the auditor continues to believe that the tests performed and quality and quantity of evidence obtained are commensurate with RMM for all relevant risks (the "what could go wrong", in the **Material Balances** spreadsheet).*

If the auditor determines that evidence is not sufficient or appropriate, additional substantive testing should be done. If sufficient, appropriate evidence is not available for audit, the AIC should discuss the effect on our audit report with the AAM and AM.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6310](#) – Determining the Nature, Timing and Extent of Substantive Testing**

**SAO Audit Policy [3210](#) – Audit Evidence**

Record of Work Done:

Based on test results, we re-evaluated risk assessments, procedures, evidence obtained and conclusions as follows:

### **(1) Do the results of substantive tests indicate a need to modify our risk assessment (IR, CR and RMM)?**

No, the results of substantive tests do not indicate a need to modify our risk assessment.

### **(2) Was the quality and quantity of evidence obtained sufficient and appropriate?**

Yes, the quality and quantity of evidence obtained was sufficient and appropriate.

### **F.3.PR.G - Premiums and Claims**

*Procedure Step:* Understanding of Line Item

*Prepared By:* EZM, 5/22/2024

*Reviewed By:* RKM, 6/5/2024

# State of Washington

Purpose/Conclusion:

**Purpose / Conclusion:**

To gain an understanding of the line item and confirm the scope of testing as documented in the Significant Account Matrix.

Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

**STEP 1: Prior Audit Exceptions**

Document any exceptions noted during the prior audit. Follow-up to determine how the agency has responded to or corrected the issue, unless this work is anticipated as part of the testing strategy.

**STEP 2: Analyze Composition and Changes of Line Item**

Include link to the line item leadsheet. This will be completed at the end of the audit. Leadsheet analysis should be documented in this spreadsheet.

Inquire with agency staff about the activities and transactions that make up the balance and any changes to those activities or transactions in relation to the prior year.

Determine relevant classes of transactions or account balances within the line item to analyze (such as agencies, funds, programs, departments, accounts, and/or objects), and use AFRS to create trends of those elements. This step should not include any specific dollar amounts associate with the line item.

Evaluate trends to identify:

- (1) What classes of transactions or account balances are primary to the identified risk. Auditors should specifically consider what elements are primary to the line item (comprising a large percentage of the line item), and which elements the identified risk would apply to, and which elements might be most susceptible to the identified risk (having a high risk of non-trivial misstatement for a relevant assertion, considering likelihood and impact of potential for misstatement).
- (2) What changes are primary to the identified risk, if applicable. Auditors should specifically consider whether the overall change to the line item from the prior year was significant, what elements were the primary drivers of overall change, whether any elements changed significantly from the prior year, and which changes (if any) might relate to the identified risk.
- (3) Any unusual or unexpected elements, amounts, or changes that may indicate a risk, whether the one identified in planning or a new

## State of Washington

one that may need to be considered for a change to the plan.

**Consider** other procedures to gain an understanding of the line item, such as review of key policy documents, review of program information or reports, inquiry of staff, budget information, or other analytical procedures.

### STEP 3: Update Significant Account Matrix

Based on your understanding of the line item, update the Significant Account Matrix with final conclusions on the agencies covered, account description, significant accounting systems, and risk (what could go wrong and relevant assertions). The account description should reflect the significant transaction streams or account balances relevant to the risk.

*The description of agencies, significant accounting systems, and what could go wrong in the Significant Account Matrix constitute the overall scope of substantive testing.*

*A transaction stream is significant based on the potential for misstatement. This is often due in part to its size (ie: comprising a large percentage of the total line item), but is ultimately a judgment about the susceptibility to the identified risk (for example, when the risk is understatement a small or omitted account may hold the most potential for the largest misstatement).*

*Significant accounting system(s) are those that contain key controls over significant classes of transactions included in the line item. Control systems identified in this step must match the Significant Account Matrix and have a separate control understanding documented.*

*Talk with the AIC if you identify any changes to the Significant Account Matrix.*

Guidance/Criteria.:

Record of Work Done.:

#### **(1) Prior Audit Exceptions:**

We noted **no** prior audit exceptions.

#### **(2) Composition & Change Analysis:**

Line Item Leadsheet: [[Line Item Lead Sheet](#)]. Our understanding applies to the health insurance opinion unit premiums and claims expense (sub-object NH Health Services Benefits) and the government wide statements for health insurance expenses. We noted the most significant sub-object for the government-wide expense was sub-object NH. We analyzed the expenditure amounts in the line item lead sheet and identified funds 493 (School Employees' Insurance Account) and 721 (Public Employees' and Retirees Insurance Account) as the significant funds for this line item. We also noted that the fund percentage compositions were in line with FY22. There were dollar amount increases for fund 493, and decreases for fund 721, between the two years, but not excessive when considering the nature of health insurance costs.

See understanding of Employee and Retiree Benefits (ERB) operations at []. ERB managed PEBB and SEBB. ERB offers comprehensive medical (pharmacy and medical), vision, dental, life (basic and supplemental), accidental death and dismemberment (AD&D, basic and supplemental), and

## State of Washington

long-term disability (LTD, basic and supplemental) insurances. ERB also offers dependent care assistance program (DCAP) and medical flexible spending arrangements (FSA) benefits.

Premiums and claims includes payments to insurance carriers, benefit vendors, and self-insurance claims. Expenses were ran through sub-object NH for purchased insurance and self-insurance. Regence is the third-party administrator (TPA) for PEBB and SEBB medical self-insurance benefits offered under Uniform Medical Plan. Regence bills HCA weekly claims for PEBB and SEBB subscribers. MODA is the TPA for pharmaceutical claims and bills HCA about every other week. Delta Dental is the TPA for dental claims. Administrative fees for TPAs (based on contracted amounts and performance requirements) are paid monthly.

Adjustments to incurred but not reported (IBNR) liabilities are offset in premiums and claims (sub-object NH). See [\[Summary & Conclusion\]](#) for IBNR understanding. IBNR calculations are based on actuary studies prepared by Milliman quarterly.

In FY20, HCA (ERB Division) was charged with providing health insurance and other employee benefit type insurance to school districts and other related local governments (i.e. educational service districts) across the state and established SEBB. Benefits started January 2020, which made FY21 the first full year that included SEBB benefits.

We identified no unusual or unexpected elements, amounts, or changes that may indicate risk.

**(3) Updates to Significant Account Matrix:**

None.

### **F.3.PR.G - Premiums and Claims**

*Procedure Step:* Controls - AFRS

*Prepared By:* EZM, 5/3/2024

*Reviewed By:* RKM, 5/6/2024

Purpose/Conclusion.*
----------------------

**Purpose:**

To gain an understanding of internal controls.

**Conclusion:**

# State of Washington

We gained an understanding of internal controls as documented in the record of work done.

Testing Strategy:

## The following procedures are required for all material systems:

1. List the financial statement balance(s) and relevant assertion(s) addressed by the understanding.
2. Gain an understanding of the internal control process, identify how transactions are recorded in AFRS, identify key controls over relevant assertion(s), and note any control weaknesses.
  - In gaining an understanding of controls, consider the overall understanding of State-Level control elements as documented in the "State-Level Controls" step as they relate to this particular system.
  - Identify controls systems covering all relevant assertions for all significant classes of transactions.
  - Standards require the auditor to gain an understanding of the significant accounting system(s) that contain key controls over significant classes of transactions included in the line item.
  - Control systems identified in this step must match the Material Account Matrix and have a separate control understanding documented.
  - Talk with the ACFR Specialist or AIC if you identify different systems than the ones anticipated in the Material Account Matrix.

For each material system, auditors must document:

A brief outline of the transaction flow from beginning to end.

An expanded description of key controls.

Business processes relevant to financial reporting of the relevant assertion for the material balance. Processes should encompass automated and manual procedures by which transactions or events are identified or initiated, authorized as needed, recorded, processed and corrected as needed.

Original accounting records and how records are rolled-up to intermediary ledgers and transferred to the general ledger (AFRS) or financial statements.

Detailed descriptions of key controls. Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

The following is information to **consider** when identifying key controls and transaction flow.

"Key controls" refer to the few controls that together provide reasonable assurance that material misstatements will be prevented or detected and corrected. This is contrasted with ancillary or supporting controls, which – although helpful and recommended – would provide less than reasonable assurance by themselves.

## State of Washington

The focus of the write-up is on the key controls. Key controls should be specifically identified (as "key controls") in the write-up. This can be done in whatever way the auditor prefers, so long as it is obvious. Details that the auditor should document regarding key controls may include:

- Who or what initiates the control
- When (or how often) is the control applied
- Who performs the control
- As needed, the experience, knowledge and attitude of the person applying the control
- Detailed description of the control process or activity. For example, if the control is a review: what exactly is reviewed, what is the reviewer looking at or for and what are the reviewer's criteria?
- How the key control is documented or evidenced
- If not obvious from the description, how the control prevents or timely detects and corrects misstatements
- Any exceptions or alternative processing to the normal process
- What happens when misstatements or issues are identified by the control

The "transaction flow" refers to the process by which transactions are initiated, authorized, recorded, processed and reported (as applicable). Outlining the transaction flow gives context to key controls, especially how transactions become subject to controls in the first place. If a control inherently ensures that all applicable transactions are included (ex: bank reconciliation where the assertion is existence), the auditor may decide to just start the write-up with the initiation of the control procedure and go from there.

Elements of the transaction flow are defined informally as follows:

- Initiation:* How are transactions initiated?
- Authorization:* How are transactions and accounting record maintenance authorized?
- Recording:* How are transactions or balances identified and recorded in financial accounting systems?
- Processing:* How are the transactions or balances processed after they are recorded (if at all)? Processing may be manual or automated and may occur at a subsidiary system level or at the general ledger level.
- Reporting:* How are records translated into the financial statements? This part of the transaction flow extends the understanding to the actual financial statements that the audit is opining on. Since we already document an understanding of the financial reporting process in general, it is usually enough to simply reference this overall understanding. However, if there are important steps unique to the covered balances, it may be more appropriate to mention them here.

Although transaction flow is a good way to think about understanding and documenting a control system, auditors should not worry too much about documenting "each element, in order" because often elements may be combined, not noticeable, not applicable or occur in a different order.

# State of Washington

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits](#) Planning Guide**

Record of Work Done:

## **Material Balance(s) and Assertions**

Internal controls in the AFRS address the following balance(s):

Health Insurance - Premiums and Claims

Business-Type Activities - Health Insurance - Expenses

For the following assertions:

Occurrence - There is a risk that expenses for payments of claims were not supported by invoices or weekly claims requests to support real obligations incurred during the period.

Valuation (related to the IBNR adjustments only) - The offset to incurred but not reported (IBNR) adjustments were made in premium and claims expenses. There is a risk the adjustments were not supported by an actuary report prepared by a qualified and competent actuary using appropriate assumptions. There is also a risk the actuary report was not calculated based on accurate information provided by HCA or complete claims data.

## **Gain an Understanding of Internal Controls**

We met with the following HCA staff members on April 26, 2024 to gain an understanding of Premiums and Claims:

Rita Homan, Deputy Accounting Section Manager

Sara Whitley, ERB Finance Manager

Lisa Kolle, PEB Accounting Manager

Grant Stromsdorfer, Pay1 Mainframe Support

# State of Washington

Samantha Zimmerman, Internal Control Officer  
William Sogge, External Audit Liaison

## *Self-Insurance Weekly Claim Payments and Purchased Insurance*

### Self-Insurance

Regence (UMP medical claims third party administrator) bills HCA for claims at least weekly. Regence provides detailed claims data weekly to HCA's IT team via secure file transfer. HCA's IT Team imports the data, normalizes the claims data, and removes the data protected by HIPPA (claim numbers, claim/procedure coding, and other patient data). Subscriber social security numbers are retained with the data to ensure claim transactions are tied to a specific subscriber. HCA IT team then loads the data into a SQL database (Microsoft Access)

The ERB accounting department receives summarized weekly claim invoices from Regence via email. Summarized invoices are remitted to ensure minimal HIPPA protected data is generated. An Employee and Retiree Benefits (ERB) Fiscal Analyst 3 or 4 reviews the invoice and runs a report from the claims SQL database for the specific date range. If the report and invoice amounts do not tie, the Fiscal Analyst will contact the internal HCA account manager of that third party administrator and will work with them to reconcile the difference. When the claims detail and invoice tie, the Fiscal Analyst reaches out to the internal HCA account manager to get their approval to pay, and once they offer their approval, the Fiscal Analyst prepares the A19, and the SQL claims report to support the payment. The Fiscal Analyst enters the transaction into AFRS and uploads data into WebAX (HCA's digital documentation system). Katherine Plaquet, Fiscal Analyst 5, reviews and releases the transactions in AFRS. She reviews the transactions to ensure they occurred, were supported by appropriate documentation, and that coding and amounts were accurate **(Key Control #1 - Occurrence - Manual)**.

### Purchased Insurance

Typically, payments to purchased insurance carriers are automatically calculated and manually processed within Pay1. See the Pay1 control understanding at the "Controls - Pay 1" step. If Pay1 is unable to process the payments to purchased insurance carriers for any reason, such as, credits on accounts from prior period, or Metlife payments rounding to 3 decimal places, a Fiscal Analyst 4 will prepare the payment to purchased insurance carriers by using an A19, H.47/F.47 Pay1 screens, and Carrier Payment spreadsheets to determine the payment amounts. At the end of each month, if there are any manual payments that need to be processed during that month, the Fiscal Analyst enters the transaction into AFRS and uploads the source documents into WebAX. The Fiscal Analyst will attach the carrier payment data to an email to the Contract Manager for each carrier for approval. Once Contract Managers approve the payment, Katherine Plaquet, Fiscal Analyst 5; Rita Homan, Deputy Accounting Section Manager; or the PEB Accounting Manager reviews the transactions to ensure they occurred, are adequately supported, and the amount was accurate. The Fiscal Analyst 5, Deputy Accounting Section Manager, or PEB Accounting Manager then releases the transactions in AFRS **(Key Control #2 - Occurrence - Manual)**.

### Other Adjustments (Valuation)

See [\[Controls - Actuarial Report\]](#) for understanding and controls related to IBNR adjustments. Adjustments to the IBNR liability were offset with adjustments to self-insurance medical claims.

# State of Washington

## How Transactions are Recorded in AFRS:

The Fiscal Analyst enters the transaction into AFRS and uploads data into WebAX. A Fiscal Analyst 5 reviews and releases the transactions in AFRS.

## Key Controls are as Follows:

Key Control #1 - Occurrence (Manual) - For weekly Regence claims invoices (self-insurance), a Fiscal Analyst prepares the A19 and the SQL claims report to support the payment. This is entered into AFRS and uploaded into WebAX. A Fiscal Analyst 5 reviews the transactions to ensure they existed, were supported by appropriate documentation, and that coding and amounts were accurate before releasing into AFRS.

Key Control #2 - Occurrence (Manual) - Monthly, a Fiscal Analyst prepares the payment to purchased insurance carriers by using an A19, H.47/F.47 Pay1 screens, and Carrier Payment spreadsheets to calculate the payment and enters the transaction into AFRS and uploads the data into WebAX. A Fiscal Analyst 5, the Deputy Accounting Section Manager, or the PEB Accounting Manager reviews to ensure the manual batches occurred and the amount is accurate and release the transactions in AFRS.

## Noted Weaknesses are as Follows:

None.

## F.3.PRG - Premiums and Claims

*Procedure Step:* Controls - AFRS

*Prepared By:* EZM, 5/3/2024

*Reviewed By:* RKM, 5/6/2024

Purpose/Conclusion.\*

### **Purpose:**

To gain an understanding of internal controls.

### **Conclusion:**

We gained an understanding of internal controls as documented in the record of work done.

# State of Washington

Testing Strategy:

**The following procedures are required for all material systems:**

1. List the financial statement balance(s) and relevant assertion(s) addressed by the understanding.
2. Gain an understanding of the internal control process, identify how transactions are recorded in AFRS, identify key controls over relevant assertion(s), and note any control weaknesses.
  - In gaining an understanding of controls, consider the overall understanding of State-Level control elements as documented in the "State-Level Controls" step as they relate to this particular system.
  - Identify controls systems covering all relevant assertions for all significant classes of transactions.
  - Standards require the auditor to gain an understanding of the significant accounting system(s) that contain key controls over significant classes of transactions included in the line item.

*Procedure Step:* Key Control #2 (Manual)  
*Prepared By:* EZM, 5/3/2024  
*Reviewed By:* RKM, 5/6/2024

Purpose/Conclusion.*
----------------------

### **Purpose:**

To confirm purchased insurance claims are prepared by a Fiscal Analyst and reviewed by a Fiscal Analyst 5, Deputy Accounting Section Manager, or PEB Accounting Manager (Key Control #2 for AFRS - Occurrence) in order to assess control risk.

### **Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

# State of Washington

## Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified*

## State of Washington

*issue represents a material weakness or significant deficiency.*

***All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.***

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

# State of Washington

## SAO Audit Policy [2310](#) - Reporting Identified Audit Issues

## SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk

Record of Work Done:

**Key Control #2 (Occurrence): Monthly, a Fiscal Analyst 3-5 prepares the payment to purchased insurance carriers by using an A19, H.47/F.47 Pay1 screens, and Carrier Payment spreadsheets to calculate the payment, and enters the transaction into AFRS and uploads the data into WebAX. A Fiscal Analyst 5, Deputy Accounting Section Manager, or PEB Accounting Manager reviews to ensure the manual batches occurred and the amount is accurate and release the transactions in AFRS.**

The understanding for this system is documented above in the "Controls - AFRS" step.

### **1. Confirmation of Key Manual Control:**

#### PEBB insurance

We reviewed the A19 for Metlife PEBB purchased insurance claims for the month of December 2023 (document - PA060149) in the amount of \$610,197.18, which was prepared by Michael Williamson, Fiscal Analyst 4, and approved by Margee Thompson, PEB Accounting Manager. The payment to Metlife was the only manually processed payment for PEBB purchased insurance in the month of December 2023. We noted the A19, PEBB Carrier payment spreadsheet, and H.47 screenshot from Pay1 totals tied with no exceptions. We also reviewed email correspondence of approval from Kimberly Gazard, Senior Account Manager. **No issues noted.**

#### SEBB insurance

We reviewed the A19 for Metlife SEBB purchased insurance claims for the month of December 2023 (document - SA060072) in the amount of \$592,182.15, which was prepared by Oanh Pham, FA 3, and approved by Margee Thompson, PEB Accounting Manager. The payment to Metlife was the only manually processed payment for SEBB purchased insurance in the month of December 2023. We noted the A19, Carrier payment spreadsheet, and F.47 screenshot from Pay1 totals tied with no exceptions. We also reviewed email correspondence of approval from the Contract Managers: Kimberly Gazard, Senior Account Manager, Beth Heston, Senior Account Manager, and Christine Davis, Senior Account Manager. **No issues noted.**

### **Noted Weaknesses are as follows:**

None.

# State of Washington

## **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

## **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

## **F.3.PRG - Premiums and Claims**

*Procedure Step:* Controls - Pay1

*Prepared By:* EZM, 5/3/2024

*Reviewed By:* RKM, 5/6/2024

Purpose/Conclusion:

### **Purpose:**

To gain an understanding of internal controls.

### **Conclusion:**

We gained an understanding of internal controls as documented in the record of work done.

Testing Strategy:

### **The following procedures are required for all material systems:**

1. List the financial statement balance(s) and relevant assertion(s) addressed by the understanding.
2. Gain an understanding of the internal control process, identify how transactions are recorded in AFRS, identify key controls over relevant assertion(s), and note any control weaknesses.  
In gaining an understanding of controls, consider the overall understanding of State-Level control elements as documented in the "State-Level Controls" step as they relate to this particular system.

## State of Washington

Identify controls systems covering all relevant assertions for all significant classes of transactions.

Standards require the auditor to gain an understanding of the significant accounting system(s) that contain key controls over significant classes of transactions included in the line item.

Control systems identified in this step must match the Material Account Matrix and have a separate control understanding documented.

Talk with the ACFR Specialist or AIC if you identify different systems than the ones anticipated in the Material Account Matrix.

For each material system, auditors must document:

A brief outline of the transaction flow from beginning to end.

An expanded description of key controls.

Business processes relevant to financial reporting of the relevant assertion for the material balance. Processes should encompass automated and manual procedures by which transactions or events are identified or initiated, authorized as needed, recorded, processed and corrected as needed.

Original accounting records and how records are rolled-up to intermediary ledgers and transferred to the general ledger (AFRS) or financial statements.

Detailed descriptions of key controls. Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

The following is information to **consider** when identifying key controls and transaction flow.

“Key controls” refer to the few controls that together provide reasonable assurance that material misstatements will be prevented or detected and corrected. This is contrasted with ancillary or supporting controls, which – although helpful and recommended – would provide less than reasonable assurance by themselves.

The focus of the write-up is on the key controls. Key controls should be specifically identified (as “key controls”) in the write-up. This can be done in whatever way the auditor prefers, so long as it is obvious. Details that the auditor should document regarding key controls may include:

Who or what initiates the control

When (or how often) is the control applied

Who performs the control

As needed, the experience, knowledge and attitude of the person applying the control

Detailed description of the control process or activity. For example, if the control is a review: what exactly is reviewed, what is the reviewer looking at or for and what are the reviewer’s criteria?

How the key control is documented or evidenced

## State of Washington

If not obvious from the description, how the control prevents or timely detects and corrects misstatements  
Any exceptions or alternative processing to the normal process  
What happens when misstatements or issues are identified by the control

The “transaction flow” refers to the process by which transactions are initiated, authorized, recorded, processed and reported (as applicable). Outlining the transaction flow gives context to key controls, especially how transactions become subject to controls in the first place. If a control inherently ensures that all applicable transactions are included (ex: bank reconciliation where the assertion is existence), the auditor may decide to just start the write-up with the initiation of the control procedure and go from there.

Elements of the transaction flow are defined informally as follows:

*Initiation:* How are transactions initiated?

*Authorization:* How are transactions and accounting record maintenance authorized?

*Recording:* How are transactions or balances identified and recorded in financial accounting systems?

*Processing:* How are the transactions or balances processed after they are recorded (if at all)? Processing may be manual or automated and may occur at a subsidiary system level or at the general ledger level.

*Reporting:* How are records translated into the financial statements? This part of the transaction flow extends the understanding to the actual financial statements that the audit is opining on. Since we already document an understanding of the financial reporting process in general, it is usually enough to simply reference this overall understanding. However, if there are important steps unique to the covered balances, it may be more appropriate to mention them here.

Although transaction flow is a good way to think about understanding and documenting a control system, auditors should not worry too much about documenting “each element, in order” because often elements may be combined, not noticeable, not applicable or occur in a different order.

Guidance/Criteria:
--------------------

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits](#) Planning Guide**

# State of Washington

Record of Work Done:

## **Material Balance(s) and Assertions**

Internal controls in the AFRS address the following balance(s):

Health Insurance - Premiums and Claims

Business-Type Activities - Health Insurance - Expenses

For the following assertions:

Occurrence - There is a risk that expenses for payments of claims were not supported by invoices or weekly claims requests to support real obligations incurred during the period.

Valuation (related to the IBNR adjustments only) - The offset to incurred but not reported (IBNR) adjustments were made in premium and claims expenses. There is a risk the adjustments were not supported by an actuary report prepared by a qualified and competent actuary using appropriate assumptions. There is also a risk the actuary report was not calculated based on accurate information provided by HCA or complete claims data.

## **Gain an Understanding of Internal Controls**

We met with the following HCA staff members on April 26, 2024 to gain an understanding of internal controls:

Rita Homan, Deputy Accounting Section Manager

Sara Whitley, ERB Finance Manager

Lisa Kolle, PEB Accounting Manager

Grant Stromsdorfer, Pay1 Mainframe Support

Samantha Zimmerman, Internal Control Officer

William Sogge, External Audit Liaison

## **Reconciliation of Subscribers**

Relation to Balance:

The reconciliation ensured amounts billed by Regence for claims were legitimate expenses for subscribers and that expenses existed. This allowed HCA to rely on summary invoices when paying for weekly claims to Regence.

## **Self-Insurance**

On a quarterly basis, Regence and HCA reconcile subscribers by plan elections (**Key Control #1 - Occurrence - Manual**). Regence starts the process by comparing monthly subscribers from Pay1 to Regence's records. Regence then provides HCA's Outreach and Training IT team (O&T) with exceptions. HCA's O&T team reviews the exceptions and makes corrections as necessary in Pay1. The O&T team may then request the Pay1 team send the corrected information back to Regence. This process is repeated as necessary. Regence corrects their data to ensure it matches

## State of Washington

Pay1 elections, which ensures that medical claims paid by Regence are only for eligible subscribers. Regence sends completed census data to MODA, UMP's pharmaceutical Third Party Administrator (TPA), to ensure pharmaceutical subscribers are correct.

### Purchased Insurance

Payments to purchased insurance vendors are based on Pay1 census data, contracted rates, and any corrections made in the prior month (i.e. special open enrollment events - marriage, birth, death). Typically, payments to purchased insurance carriers are automatically calculated, and manually processed within Pay1 using the H.47 screen from PEBB and the F.47 screen from SEBB.

Monthly in Pay1, when HCA goes to invoice purchased insurance carriers (23rd of each month) a Fiscal Analyst 4 will review the payment summary from the H.47 and F.47 screens and reconcile this amount to a SQL query to ensure the amounts match. If the amounts match, the Fiscal Analyst 4 will upload source documents to WebAX and send an email with the payment information for review to the Contract Managers and the Fiscal Analyst 5, Deputy Accounting Section Manager, or the PEB Accounting Manager, who reviews the source documents to ensure the amount is for the correct month and the amount is accurate and approves the release of the payment (**Key Control #2 - Occurrence - Manual**). The Fiscal Analyst 4 will then release the payment in Pay1. Pay1 will automatically upload the transaction data to AFRS through a nightly upload. For purchased insurance payments that cannot be processed in Pay1 due to credits on the account, or most Metlife Insurance payments, Fiscal Analysts must manually process these payments in AFRS. See the manual process in the "Controls - AFRS" step.

### Other Adjustments (Valuation)

See [Controls - Actuarial Report] for understanding and controls related to IBNR adjustments. Adjustments to the IBNR liability were offset with adjustments to self-insurance medical claims.

### **How Transactions are Recorded in AFRS:**

Invoices for weekly claim payments (self-insurance) are manually entered into AFRS. See the "Controls - AFRS" step.

Monthly premium payments (purchased insurance) processed in Pay1 are automatically uploaded into AFRS through a nightly batch.

No financial transactions directly related to the enrollment or census data reconciliation.

### **Key Controls are as Follows:**

Key Control #1 (Occurrence - Manual) - Quarterly, census data is reconciled between PAY1 and Regence's (UMP TPA) records to ensure claims paid by Regence were for PEBB Uniform Medical Plan (UMP) subscribers.

Key Control #2 (Occurrence - Manual) - Monthly, a Fiscal Analyst 4 or above compares the H.47 and F.47 screens in Pay1 to a SQL query to ensure the automatically batched amounts match and the Contract Managers and Fiscal Analyst 5, Deputy Accounting Section Manager, or PEB Accounting Manager, review to ensure the amount is for the correct month and is accurate before processing the payment.

# State of Washington

## Noted Weaknesses are as Follows:

None.

### F.3.PR.G - Premiums and Claims

*Procedure Step:* Key Control #1 (Manual)

*Prepared By:* EZM, 8/30/2024

*Reviewed By:* RKM, 9/9/2024

Purpose/Conclusion:

#### **Purpose:**

To confirm that census data is reconciled quarterly between Pay1 and Regence's records to ensure claims paid by Regence were for PEBB Uniform Medical Plan subscribers (**key control #1 for Pay1**) in order to assess control risk.

#### **Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

## State of Washington

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

**Key Control #1 (Occurrence): Quarterly, census data is reconciled between PAY1 and Regence's (UMP TPA) records to ensure claims paid by Regence were for PEBB Uniform Medical Plan (UMP) subscribers.**

The understanding for this system is documented above in the "Controls - Pay1" step.

### **1. Confirmation of Key Manual Control:**

## State of Washington

On May 23, 2024, we met with the following HCA staff members so they could walk us through the quarterly census data reconciliation file (excel file titled "Final – Open Items – 1<sup>st</sup> Quarter 2024 HCA Audit") for January 2024 through March 2024:

Rita Homan, Deputy Accounting Section Manager  
Shawna Lang, Section Manager, PEB Portfolio  
Grant Stromsdorfer, Pay1 Mainframe Support  
Lisa Kolle, ERB Accounting Manager  
Kari Summerour, External Audit Manager

We noted this file had three tabs – Audit Discrepancies, Middle Initial Discrepancies, and Suffix Discrepancies. All tabs had columns for Subscriber ID, Carrier Code, Sub SSN, Sub last name, Sub first name, and Audit Issue/Discrepancy. We noted this file contained 159 total accounts with discrepancies between Regence and HCA data (129 in the "Audit Discrepancies" tab and 30 in the "Middle Initial Discrepancies" tab) and Regence described the discrepancies in the "Audit Issue/Discrepancy" column. We inquired with Grant Stromsdorfer, Pay1 Mainframe Support, on whether all of the discrepancies were corrected and he said that correcting these discrepancies was an ongoing daily process between Regence and HCA that is handled through multiple tickets. We inspected an email that showed that, on May 3, 2023, Regence sent over their list of discrepancies to HCA. Because HCA was able to show us documentation that demonstrated that they're actively working with Regence to reconcile subscriber data and resolve any discrepancies, we consider this control to be adequately in place. When we inquired about whether HCA would have these discrepancies fully reconciled as of fiscal year end, Kari Summerour informed us that the O&T team is working on the list of discrepancies with the goal of getting them completed by 6/30/24. Kari stated that when discrepancies are completed, they are removed from the initial spreadsheet, which is how they track how many discrepancies are still outstanding.

On August 30, 2024, we received a spreadsheet titled "Carryover from Q1 2024" which detailed all of the discrepancies between HCA's data and Regence's data. We noted that there were 42 discrepancies still outstanding as of June 30, 2024, and we received email communications between HCA staff and Regence staff showing that they're actively working together on resolving these discrepancies. **No issues noted.**

### **Noted Weaknesses are as follows:**

None.

### **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

# State of Washington

## F.3.PRG - Premiums and Claims

*Procedure Step:* Key Control #2 (Manual)

*Prepared By:* EZM, 5/3/2024

*Reviewed By:* RKM, 5/6/2024

Purpose/Conclusion:

**Purpose:**

To confirm HCA's Fiscal Analyst 4s are comparing Pay1 payment screens to SQL queries to ensure amounts match before sending the supporting documents to the Contract Managers and the Accounting Manager or FA5 for review before processing payments for Pay1 (Key Control #2 for Pay1 - Occurrence) in order to assess control risk.

**Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

# State of Washington

## **Purpose / Conclusion:**

To assess inherent risk, control risk, and the risk of material misstatement in order to design an initial testing strategy for each assertion.

## Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

### **STEP 1: Inherent Risk (IR)**

Assess inherent risk for each relevant assertion. This assessment is based on understanding of the entity and the nature of the account balance or class of transactions.

*Inherent risk is the susceptibility of an assertion to material misstatement. It is our assessment of "total threat", which includes both "natural risk" and identified risk indicators, without any regard to any potential control activities. As inherent risk is fully independent of control risk, any understanding of controls cannot be used to increase/decrease the assessment of inherent risk. Consider the following factors as your basis for this assessment:*

#### *General Considerations*

*Does the balance include transactions that are difficult to audit or involve complex accounting issues?*

*Were there significant misstatements identified in previous audits or prior-period adjustments in the account balance or transaction class? If so, analyzing the cause of prior period misstatements will help in analyzing inherent risk.*

*Are there any inherent risk factors at the entity or industry level, such as changes in regulation or accounting rules, unique transactions or accounting practices, use of information technology, etc that affect the balance?*

#### *Inherent Risk due to Error*

*How large are the transactions making up the balance? If the balance has only a few large transactions, even a single error may mean a significant misstatement.*

*Have there been changes in the transactions making up the balance that may increase risk? For example, significantly different composition, nature or volume of transactions may inherently disrupt established controls.*

*Are financial events originated or identified by accounting personnel or non-accounting personnel? This consideration is mainly for the completeness assertion.*

*Does the process to account for transactions involve judgment or estimation, complex calculations, numerous steps or significant manual steps?*

*Do transactions have widely varying attributes that need to be manually identified? For example, grant loans that are accounted for in one of several ways depending on the terms of the agreement.*

#### *Inherent Risk due to Fraudulent Reporting (intentional misstatements)*

*Are there substantial pressures or motivations to misstate the balance?*

#### *Inherent Risk due to Misappropriation*

## State of Washington

*Is the account balance or transaction class susceptible to sizable misappropriation?*

*Inherent Risk due to Non-Compliance*

*Are there any laws, contracts or grant agreements affecting the balance? If so, would non-compliance lead to sizable misstatements?*

*Are compliance requirements complex, hard to understand, subject to judgment or otherwise difficult to comply with?*

*Are there any motivations or pressures to not comply?*

### **STEP 2: Control Risk (CR)**

Assess control risk by system and assertion. This assessment should be based on the results of the control understanding, confirmation, and (if setting control risk to LOW) testing. If applicable, auditors will evaluate any control deficiencies and determine whether those deficiencies, individually or in combination, are significant deficiencies or material weaknesses.

*Control risk is the risk that material misstatements would not be prevented or detected timely by the system of internal control. Control risk could be thought of as the "vulnerability" of an entity to misstatements. Control risk exists independently of the inherent risk (the level of vulnerability exists independent of the level of threat).*

*Control risk is MAX in both of the following situations: (1) controls aren't tested or (2) controls are problematic and cannot be relied upon. In order to set control risk to LOW, the auditor must test that controls operated effectively throughout the period.*

*A material weakness exists when the design or operation of controls results in a reasonable possibility a material misstatement will not be prevented or detected and corrected in a timely manner. A significant deficiency is less severe than a material weakness, yet important enough to merit the attention of the governing body. **All potential material weaknesses and significant deficiencies should be discussed with the AIC, since they must be reported as findings.***

### **STEP 3: Risk of Material Misstatement (RMM)**

Assess the risk of material misstatement for each relevant assertion for each significant line item. The risk of material misstatement (RMM) is a combination of the auditor's separate assessment of inherent and control risk.

*In practice, the RMM is the amount of substantive evidence that's needed, and the only way to reduce the amount of needed substantive evidence (equal to the inherent risk) is to test controls. As such, when control risk is MAX, the RMM must always equal the inherent risk (IR).*

*When controls are tested & can be relied upon (are determined to be effective) it is a matter of professional judgment how much the RMM should be set lower than inherent risk (1 or 2 steps).*

*Auditors should assess RMM by assertion, if different. For example, if RMM is assessed at MOD for the existence assertion, but LOW for the rights & obligations assertion, then document "MOD – existence and LOW – rights & obligations".*

# State of Washington

## **STEP 4: Design Substantive Testing**

Design a substantive testing strategy that addresses the relevant assertion (identified risk) in the portion of the line item that relates to that risk.

*Planning identifies where to audit (significant balances, classes of transactions & disclosures) what to audit for (relevant assertions), and how much to audit (RMM). The quantity and quality of evidence obtained by substantive tests needs to match the level of risk. The higher the risk of material misstatement, the greater evidence needed. "Greater evidence" could either be greater quantity of evidence, greater quality of evidence, or some combination of greater quality and quantity.*

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6210](#) – Planning Financial Statement Audits**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits Planning Guide](#)**

Record of Work Done:

## **(1) Inherent Risk (IR):**

Based on our understanding of the line item, we assessed inherent risk as follows for each relevant assertion and significant class of transactions:

Occurrence – **HIGH**

Valuation - **HIGH**

## **(2) Control Risk (CR):**

We assessed control risk as follows for each system and relevant assertion:

AFRS – Occurrence, Valuation

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

# State of Washington

Pay1 – Occurrence, Valuation

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

## **(3) Risk of Material Misstatement (RMM):**

We considered both inherent and control risk and assessed the risk of material misstatement as follows for each relevant assertion and significant class of transactions:

Occurrence – **HIGH**

Valuation – **HIGH**

## **(4) Testing Strategy:**

We designed our substantive testing strategy based on our assessment of the risk of material misstatement. We plan to perform the following tests:

### **Occurrence**

#### Purchased Insurance

We will test the entire population of 24 purchased insurance payments to vendors. To test each transaction, we will tie out the disbursement in AFRS to HCA's Pay1 system (Pay1 payment summary screens H.47 for PEBB and F.47 for SEBB), to ensure that the payments were valid and recorded in the proper period.

We will also compare the AFRS expenditure amounts for each of the Purchased Insurance monthly payments to the Carrier Payment spreadsheets to determine how HCA arrived at the AFRS amounts. If there are any adjustments made to the amounts in the Carrier Payment spreadsheets, we will request supporting documentation and explanations for adjustments made that are above the floor.

#### Self-Insurance

We will use detailed GL activity (Webi) and filter the data by subsubobject, GL 6505 accrued expenses and GL 6510 cash expenses to determine our population. We will use the sampling spreadsheet to determine our sample size. To test each transaction we will review HCA's summary of vendor invoice by plan and subsubobject, HCA's Voucher Distribution Form (A19) and the vendors invoice (I.e. Regence, Moda, and Delta Dental), subtotaled by plans offered for PEBB/SEBB, to ensure that the transactions are valid and recorded in the proper fiscal year.

We will also compare the AFRS expenditure amounts for each of the invoices we selected for testing to the weekly/monthly claims data reports that HCA used in order to arrive at the expenditure amounts. If there are any adjustments made to the claims data report figures in order to arrive at the expenditure amounts, we will request supporting documentation and explanations for adjustments that are above the floor.

## State of Washington

**Valuation** - See [Risk Assessment] for incurred but not paid (IBNP) testing strategy. Adjustments made to the IBNP liability were offset in claims expenses. No additional work planned for expense of IBNP adjustments. Note, HCA called the incurred but not paid (IBNP) liability the incurred but not recorded (IBNR) liability. IBNP and IBNR were used interchangeably.

We anticipate that these tests will provide sufficient appropriate audit evidence to address the assessed risk of material misstatement for relevant assertions in significant classes of transactions.

### F.3.PRG - Premiums and Claims

*Procedure Step:* Substantive Test

*Prepared By:* EZM, 10/1/2024

*Reviewed By:* CJG, 12/9/2024

Purpose/Conclusion.:

#### **Purpose:**

To determine whether reported expenses/expenditures represent real obligations incurred during the period.  
To determine whether expenses/expenditures were reported at properly valued or calculated amounts.

#### **Conclusion:**

We determined that reported expenses/expenditures represent real obligations incurred during the period.  
We determined that expenses/expenditures were reported at properly valued or calculated amounts.

Testing Strategy.:

#### **Occurrence Testing Strategy**

The following is a list of **considerations** for testing the occurrence assertion for expenses/expenditures. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

#### **Detail Roll-up**

Compare totals from general ledger to accounts payable, payroll or other subsidiary software modules.

## State of Washington

Review the government's reconciliation of general ledger to subsidiary systems.

*Detail roll-up testing is not sufficient audit evidence by itself since it only entails comparing different sets of the entity's own accounting records. However, it may be combined with other substantive tests to address identified risks. For example, if substantive testing is performed at the subledger level, it may be combined with a test that the subledger detail accurately rolls up to the general ledger or financial statements.*

### **Fictitious expenses**

Search for manual journal entries that debit (increase) expenditures. Consider testing if any risk indicators are noted.

Evaluate liabilities directly related to expenses for existence. See the existence steps for current and non-current liabilities for testing considerations.

*For example, if the entity reports a self-insurance liability, the auditor might evaluate whether the change in the liability (and associated expense) occurred. Similarly, if a new liability was reported, evaluate whether that liability (and associated expense) actually exists.*

If the entity reconciles recorded revenues and expenses to bank activity, then review monthly reconciliations and evaluate or test reconciling items.

If entity uses a warrant clearing account or payroll clearing account, review the entity's year-end reconciliation of recorded vendor payments and/or payroll payments with disbursements from the clearing account(s).

Test a sample of expenses/expenditures to determine whether the transaction was valid.

Perform analytical procedures on payroll expenses/expenditures. The analysis should include development of an expectation of what payroll should be in the current year due to changes in employees, COLAs, benefits, etc.

Test payroll to see if transactions are properly charged

### **Invalid, Unallowable or Fraudulent Expenses**

*See the testing strategy considerations in the Rights & Obligations step.*

### **Improper Expense Recognition**

Test selected or sampled expenditures recorded in the current period to verify the expense was recorded for the proper period.

*Transactions at the beginning and end of the period would generally be considered at highest risk of being improperly recorded in the current period. Auditors should consider scanning transactions recorded during these timeframes to identify high risk transactions.*

### **Incorrectly recording expenses that do not meet GAAP criteria**

## State of Washington

Review the entity's schedule cross-walking the financial statements to the general ledger and check that any transactions among consolidated funds are eliminated.

Check that transactions among governmental funds and transactions among proprietary funds are eliminated on the government-wide statements.

### **Interfund Expenses**

For internal service fund charges, see testing strategies for internal service funds in the Accountability folder. For other types of internal charges, see testing strategies for Internal Activities.

### Valuation Testing Strategy

The following is a list of **considerations** for testing the valuation assertion for expenses/expenditures. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests:

- Verify that payroll calculations are correct.

- If not already covered as part of control testing, verify that payroll software used correct rates.

- If not already covered as part of control testing, verify that accounts payable software used correct rates for calculating sales tax.

- Review calculation of any estimated expenses.

- Review related-party transactions to determine whether expense/expenditure transactions were correctly calculated.

### **Landfill Closure & Post-Closure Expenses**

*See the valuation testing strategy for non-current liabilities..*

**OPEB** - Auditors should use the OPEB Testing Strategy workpaper available in the Store for auditing OPEB expenses.

**Pollution Remediation** - Auditors should use the Pollution Liability Testing Strategy workpaper available in the Store for auditing pollution remediation expenses.

Guidance/Criteria:
--------------------

### **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

### **BARS [3.8.6](#) Use of Payroll and Claims Funds**

# State of Washington

Record of Work Done:

## **Substantive tests performed to meet the Occurrence assertion:**

### Testing Procedures:

We reviewed the testing strategy for occurrence. We tested the self-insurance and purchased insurance transactions for the occurrence assertion as follows:

### Purchased Insurance

For purchased insurance, we determined we would test all of the transactions in the population, as the population was small and the support was readily available. To test each transaction, we tied out the disbursement in AFRS to HCA's Pay1 system (Pay1 payment summary screens H.47 for PEBB and F.47 for SEBB) and reviewed the month of service to ensure that the payments were valid and recorded in the proper period. We tested the entire purchased insurance population for the following attributes:

Did the recorded expense occur within FYE June 30, 2024?

Did the recorded expense in AFRS tie to the Pay1 H.47 (PEBB) or F.47 (SEBB) screenshot?

We also compared the AFRS expenditure amounts for each of the invoices we selected for testing to the weekly/monthly claims data reports that HCA used in order to arrive at the expenditure amounts, and the figures tied without exception. We noted that there were some large adjustments (over \$110k, which is our floor) made to the invoice amounts - we requested support for these adjustments in order to confirm that the amounts were supported by adequate documentation. We reviewed the documentation we received, which were supplemental invoices from the third party administrators, and the amounts in the invoices tied to the adjustment amounts in the weekly/monthly claims data reports without exception.

We also compared the AFRS expenditure amounts for each of the Purchased Insurance monthly payments to the Carrier Payment spreadsheets to determine how HCA arrived at the AFRS amounts. We noted that there were two adjustments made to October and November 2023 monthly payments, totaling \$13.365 million and \$13.189 million, respectively. We requested support for these amounts and received a "SEBB 2022 Risk Adjustment" spreadsheet that supported these amounts. We noted that the amount was made up of 2022 SEBB risk adjustment transfers for Kaiser Foundation Health Plan of WA (KPWA), Kaiser Foundation Health Plan of WA Options (KPWAO), Kaiser Foundation Health Plan of the Northwest (KPNW), and Premera.

### Self-Insurance

For self-insurance, we used the sampling spreadsheet (7.5% tolerable misstatement, assurance set to high) to determine our sample size. While we had an initial sample size of 38, we decided to test a sample that aligned with a very high level of assurance, due to the fact that the Premiums & Claims balance significantly increased from the prior year (in FY23, it was \$3.8 billion, and in FY24, it's \$5 billion). To test each transaction we reviewed HCA's summary of vendor invoices by plan and subsubobject, HCA's Voucher Distribution Form (A19) and the vendor's invoice (I.e. Regence, Premera, Moda, and Delta Dental) to determine the month of service, and tied the invoice to the A-19, to ensure that the

## State of Washington

transactions are valid and recorded in the proper fiscal year. We tested each transaction for the following attributes:

(Occurrence) - Did the recorded expense occur within FYE June 30, 2024?

(Occurrence) - Did the recorded expense tie to the documentation from the vendor?

We also compared the AFRS expenditure amounts for each of the invoices we selected for testing to the weekly/monthly claims data reports that HCA used in order to arrive at the expenditure amounts, and the figures tied without exception. We noted that there were some large adjustments (over \$110k, which is our floor) made to the invoice amounts - we requested support for these adjustments in order to confirm that the amounts were supported by adequate documentation. We reviewed the documentation we received, which were supplemental invoices from the third party administrators, and the amounts in the invoices tied to the adjustment amounts in the weekly/monthly claims data reports without exception.

### Testing Results:

Purchased Insurance testing: [\[FS Sampling - Premiums and Claims\]](#).

We tested all of the transactions for the occurrence assertion and we did not note any exceptions.

Self-Insurance testing: [\[FS Sampling - Premiums and Claims\]](#).

We tested this sample for the occurrence assertion and we did not note any exceptions.

### **Substantive tests performed to meet the Valuation assertion:**

#### Testing Procedures:

The valuation risk is related to incurred but not paid (IBNP) adjustments. Our understanding of this area is found in the Claims and Judgments Payable line item found here [\[Understanding of Line Item\]](#). The liability is adjusting subobject NH, health insurance premium and claims expenses. See IBNR testing at [\[Substantive Test\]](#).

### **F.4.PRG - Due From Other Governments**

*Procedure Step:* Summary & Conclusion

*Prepared By:* MRF, 10/1/2024

*Reviewed By:* RKM, 11/24/2024

Purpose/Conclusion:
---------------------

# State of Washington

## **Purpose:**

To evaluate risk assessments and the sufficiency and appropriateness of evidence obtained based on results of substantive work.

## **Conclusion:**

We determined that **no** modifications were necessary to inherent risk, control risk, or the risk of material misstatement as assessed in planning.

We also determined that evidence obtained was sufficient and appropriate in response to the risk of material misstatement.

Testing Strategy:

Auditors are **required** to evaluate conclusions for substantive testing as follows:

*Auditors may wish to use the optional Lead Sheet available in the Store to summarize testing related to each balance and assertion.*

**1.** Determine whether the results of substantive testing indicate a need to modify the inherent risk assessment (IR), control risk assessment (CR), risk of material misstatement (RMM) or other aspects of planning (such as material balances or assertions). If so, document changes and consider the need for additional testing.

*If the results of substantive testing indicate a need to change control risk, auditors should also update the **Permanent File** by either correcting the documentation or by adding an update section describing changes to the top of the record of work done. For all changes to IR, CR, or RMM the **Material Balances** spreadsheet should be updated.*

*More significant changes to other aspects of planning (such as material balances or assertions) should be referenced in this step and documented in detail in the **Changes to FS Audit Plan** step.*

**2.** Evaluate whether the quality and quantity of evidence obtained is sufficient and appropriate in response to the risk of material misstatement. In making this determination, auditors should evaluate:

### **Information to be used as audit evidence:**

Does evidence relate to the population, period of time and risk (assertion and “what could go wrong” from the Material Balance Spreadsheet)? If there are any gaps or uncertainties in the logical connection between the evidence and conclusions, is there a documented consideration and explanation?

Are the sources of information sufficiently reliable and appropriate for the risk (whether internal to the government, external, or auditor developed)? If key information is not from a sufficiently reliable source (for example, inquiry), then is it corroborated by information that is?

## State of Washington

Are there any concerns about accuracy, completeness, authenticity, or bias in information? If so, did the auditor perform sufficient procedures to confirm reliability of that information?

Is information precise enough to catch if misstatements exceeded the tolerable level?

Is information detailed enough to conclude on whether or not there were misstatements?

Was there any information that appeared contradictory or inconsistent? If so, was there a documented response to the inconsistencies or doubts about the reliability of evidence?

### Results:

How much misstatement was identified by testing, and the likelihood and magnitude of further potential misstatement?

How did misstatements occur and how often might they occur again in the population?

Were misstatements caused by control deficiencies or circumvention of controls?

If control deficiencies, is there a need to re-evaluate our understanding of controls in the [Permanent File](#) folder or assessment of control risk?

If circumvention, the [Management Override of Controls](#) step should address or reference this area. Auditors should also consider whether a fraud risk has been identified.

Did tests identify a different level or type of risk than the planned audit response was designed to address?

If likely misstatements are identified, are further procedures necessary to improve the precision of our estimate?

*To support the overall evaluation of audit risk and provide a basis for concluding on the overall sufficiency and appropriateness of evidence in the [FS Summary & Report](#) step, auditors should conclude in each area whether the auditor continues to believe that the tests performed and quality and quantity of evidence obtained are commensurate with RMM for all relevant risks (the "what could go wrong", in the [Material Balances](#) spreadsheet).*

If the auditor determines that evidence is not sufficient or appropriate, additional substantive testing should be done. If sufficient, appropriate evidence is not available for audit, the AIC should discuss the effect on our audit report with the AAM and AM.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6310](#) – Determining the Nature, Timing and Extent of Substantive Testing**

**SAO Audit Policy [3210](#) – Audit Evidence**

# State of Washington

## Record of Work Done:

Based on test results, we re-evaluated risk assessments, procedures, evidence obtained and conclusions as follows:

### **(1) Do the results of substantive tests indicate a need to modify our risk assessment (IR, CR and RMM)?**

Risk of Material Misstatement was originally determined to be MAX. We determined we did not need to modify our risk assessment.

### **(2) Was the quality and quantity of evidence obtained sufficient and appropriate?**

The quality and quantity of evidence obtained was sufficient and appropriate.

## **F.4.PRG - Due From Other Governments**

*Procedure Step:* Understanding of Line Item

*Prepared By:* MRF, 5/22/2024

*Reviewed By:* RKM, 8/20/2024

## Purpose/Conclusion:

### **Purpose / Conclusion:**

To gain an understanding of the line item and confirm the scope of testing as documented in the Significant Account Matrix.

We will repeat a recommendation for HCA to improve resources (PAY1 reports, databases, etc.) to facilitate the tracking of invoices, payments, any related adjustments, and batched revenue transactions between PAY1 and AFRS [E: HCA Receivables Lack of Complete Reconciliation Pay1 to AFRS].

## Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

### **STEP 1: Prior Audit Exceptions**

Document any exceptions noted during the prior audit. Follow-up to determine how the agency has responded to or corrected the issue, unless this work is anticipated as part of the testing strategy.

# State of Washington

## **STEP 2: Analyze Composition and Changes of Line Item**

Include link to the line item leadsheet. This will be completed at the end of the audit. Leadsheet analysis should be documented in this spreadsheet.

Inquire with agency staff about the activities and transactions that make up the balance and any changes to those activities or transactions in relation to the prior year.

Determine relevant classes of transactions or account balances within the line item to analyze (such as agencies, funds, programs, departments, accounts, and/or objects), and use AFRS to create trends of those elements. This step should not include any specific dollar amounts associate with the line item.

Evaluate trends to identify:

- (1) What classes of transactions or account balances are primary to the identified risk. Auditors should specifically consider what elements are primary to the line item (comprising a large percentage of the line item), and which elements the identified risk would apply to, and which elements might be most susceptible to the identified risk (having a high risk of non-trivial misstatement for a relevant assertion, considering likelihood and impact of potential for misstatement).
- (2) What changes are primary to the identified risk, if applicable. Auditors should specifically consider whether the overall change to the line item from the prior year was significant, what elements were the primary drivers of overall change, whether any elements changed significantly from the prior year, and which changes (if any) might relate to the identified risk.
- (3) Any unusual or unexpected elements, amounts, or changes that may indicate a risk, whether the one identified in planning or a new one that may need to be considered for a change to the plan.

**Consider** other procedures to gain an understanding of the line item, such as review of key policy documents, review of program information or reports, inquiry of staff, budget information, or other analytical procedures.

## **STEP 3: Update Material Account Matrix**

Based on your understanding of the line item, update the Significant Account Matrix with final conclusions on the agencies covered, account description, significant accounting systems, and risk (what could go wrong and relevant assertions). The account description should reflect the significant transaction streams or account balances relevant to the risk.

*The description of agencies, significant accounting systems, and what could go wrong in the Significant Account Matrix constitute the overall scope of substantive testing.*

*A transaction stream is significant based on the potential for misstatement. This is often due in part to its size (ie: comprising a large percentage of the total line item), but is ultimately a judgment about the susceptibility to the identified risk (for example, when the risk is understatement a small or omitted account may hold the most potential for the largest misstatement).*

*Significant accounting system(s) are those that contain key controls over significant classes of transactions included in the line item. Control systems identified in this step must match the Significant Account Matrix and have a separate control understanding*

# State of Washington

*documented.*

*Talk with the AIC if you identify any changes to the Material Account Matrix.*

Guidance/Criteria:

Record of Work Done:

## **(1) Prior Audit Exceptions:**

During the FY23 audit we found that Pay1 receivable reports (B5519 and B5381) for PEBB and SEBB were not tied out to AFRS by ERB accountants at year end to ensure AFRS amounts were accurate and existed. HCA relied on automatic coding and posting performed by Pay1. HCA ERB relied on cash reconciliations to ensure all cash was accurately recorded in Pay1 and AFRS.

We followed up with Rita Homan, Deputy Accounting Section Manager, on 05/02/2024 regarding this issue. She explained HCA is still in process of implementing resource/report improvements. This includes improving the resources to facilitate the tracking of invoices, payments, any related adjustments, and batched revenue transactions between PAY1 and AFRS. HCA Accounting submitted a request to HCA's IT department for PAY1 receivables data to be loaded to a SQL database to facilitate a full reconciliation between PAY1 receivables and AFRS. It has not yet been completed. We will include this in a recommendation to HCA for FY24. See issue at [\[E: HCA Receivables Lack of Complete Reconciliation Pay1 to AFRS\]](#).

## **(2) Composition & Change Analysis:**

Line Item Leadsheet: [\[Line Item Lead Sheet\]](#).

Due from Other Governments was reported in the following funds:

Fund 721 - Public Employees' and Retirees Insurance Account - represents about 10% of the total due.

In FY21, MODA pharmaceutical rebates were also included in the Due from Other Governments balance, and made Fund 721 about 30% of the total.

Milliman actuarial services later determined these rebates should be recorded in the "Invoiced But Not Received (IBNR)" balance, which reduced the amount recorded in Fund 721 to about 10% of the total.

HCA expects this policy to continue in FY24 and we do not expect to test fund 721 in Due From Other Governments

Fund 493 - School Employees' Insurance Account - Represents about 90% of the total due from other governments balance.

Based on general HCA Employee and Retiree Benefits (ERB) division understanding, GL 1352 Due from Other Governments included activity from higher education state agencies, and external local governments or political subdivisions (cities, towns, counties, school districts, etc.). HCA managed PEBB and SEBB under the Employee and Retiree Benefits division. See [\[Health Insurance Activities Updated 2024\]](#) for general understanding of ERB operations.

## State of Washington

The Health Insurance opinion unit was new for fiscal year ended 06/30/2021. In prior years, OFM made adjustments to remove retiree activity from PEBB balances to fiduciary funds. Due to GASB 84, retirees were no longer presented in fiduciary activities and reported in a custodial fund (FKE).

### **(3) Updates to Significant Account Matrix:**

We determined no updates to the Significant Account Matrix were necessary.

### **F.4.PR.G - Due From Other Governments**

*Procedure Step:* Controls - Pay1  
*Prepared By:* MRF, 5/6/2024  
*Reviewed By:* RKM, 9/30/2024

Purpose/Conclusion.*
----------------------

#### **Purpose:**

To gain an understanding of internal controls.

#### **Conclusion:**

We gained an understanding of internal controls as documented in the record of work done. We noted the following weakness:

Pay1 receivable reports (B5519 and B5381) for PEBB and SEBB were not tied out to AFRS by ERB accountants at year end to ensure AFRS amounts were accurate and existed. HCA relied on automatic coding and posting performed by Pay1. HCA ERB relied on cash reconciliations to ensure all cash was accurately recorded in Pay1 and AFRS. See issue at [[E: HCA Receivables Lack of Complete Reconciliation Pay1 to AFRS](#)].

# State of Washington

Testing Strategy:

**The following procedures are required for all material systems:**

1. List the financial statement balance(s) and relevant assertion(s) addressed by the understanding.
2. Gain an understanding of the internal control process, identify how transactions are recorded in AFRS, identify key controls over relevant assertion(s), and note any control weaknesses.
  - In gaining an understanding of controls, consider the overall understanding of State-Level control elements as documented in the "State-Level Controls" step as they relate to this particular system.
  - Identify controls systems covering all relevant assertions for all significant classes of transactions.
  - Standards require the auditor to gain an understanding of the significant accounting system(s) that contain key controls over significant classes of transactions included in the line item.
  - Control systems identified in this step must match the Material Account Matrix and have a separate control understanding documented.
  - Talk with the ACFR Specialist or AIC if you identify different systems than the ones anticipated in the Material Account Matrix.

For each material system, auditors must document:

A brief outline of the transaction flow from beginning to end.

An expanded description of key controls.

Business processes relevant to financial reporting of the relevant assertion for the material balance. Processes should encompass automated and manual procedures by which transactions or events are identified or initiated, authorized as needed, recorded, processed and corrected as needed.

Original accounting records and how records are rolled-up to intermediary ledgers and transferred to the general ledger (AFRS) or financial statements.

Detailed descriptions of key controls. Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

The following is information to **consider** when identifying key controls and transaction flow.

"Key controls" refer to the few controls that together provide reasonable assurance that material misstatements will be prevented or detected and corrected. This is contrasted with ancillary or supporting controls, which – although helpful and recommended – would provide less than reasonable assurance by themselves.

## State of Washington

The focus of the write-up is on the key controls. Key controls should be specifically identified (as “key controls”) in the write-up. This can be done in whatever way the auditor prefers, so long as it is obvious. Details that the auditor should document regarding key controls may include:

- Who or what initiates the control
- When (or how often) is the control applied
- Who performs the control
- As needed, the experience, knowledge and attitude of the person applying the control
- Detailed description of the control process or activity. For example, if the control is a review: what exactly is reviewed, what is the reviewer looking at or for and what are the reviewer’s criteria?
- How the key control is documented or evidenced
- If not obvious from the description, how the control prevents or timely detects and corrects misstatements
- Any exceptions or alternative processing to the normal process
- What happens when misstatements or issues are identified by the control

The “transaction flow” refers to the process by which transactions are initiated, authorized, recorded, processed and reported (as applicable). Outlining the transaction flow gives context to key controls, especially how transactions become subject to controls in the first place. If a control inherently ensures that all applicable transactions are included (ex: bank reconciliation where the assertion is existence), the auditor may decide to just start the write-up with the initiation of the control procedure and go from there.

Elements of the transaction flow are defined informally as follows:

*Initiation:* How are transactions initiated?

*Authorization:* How are transactions and accounting record maintenance authorized?

*Recording:* How are transactions or balances identified and recorded in financial accounting systems?

*Processing:* How are the transactions or balances processed after they are recorded (if at all)? Processing may be manual or automated and may occur at a subsidiary system level or at the general ledger level.

*Reporting:* How are records translated into the financial statements? This part of the transaction flow extends the understanding to the actual financial statements that the audit is opining on. Since we already document an understanding of the financial reporting process in general, it is usually enough to simply reference this overall understanding. However, if there are important steps unique to the covered balances, it may be more appropriate to mention them here.

Although transaction flow is a good way to think about understanding and documenting a control system, auditors should not worry too much about documenting “each element, in order” because often elements may be combined, not noticeable, not applicable or occur in a different order.

Guidance/Criteria.*
---------------------

# State of Washington

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits](#) Planning Guide**

Record of Work Done.
----------------------

## **Material Balance(s) and Assertions**

Internal controls in Pay1 address the following balance(s):

Due From Other Governments

For the following assertions:

Existence - There is a risk that recorded receivables are more than source billings or records.

Valuation - There is a risk the receivables have not been properly calculated.

Classification - There is a risk amounts due from state entities have been reported as due from other governments.

## **Gain an Understanding of Internal Controls**

We met with HCA on 5/01/2024 to review controls over accounts receivable and the related allowance for doubtful accounts. We met with the following HCA staff:

Rita Homan, HCA Deputy Accounting Section Manager

Kari Summerour- External Audit Liaison

William Sogge- External Audit Liaison

See [[Health Insurance Activities Updated 2024](#)] for understanding of ERB operations and billing cycles. See [[Premiums and Assessments](#)] for revenue understanding.

## **Background Information**

Public Employee Benefits Board (PEBB) operations are governed by [RCW 41.05](#), [WAC 182-08](#), [WAC 182-12](#), and [WAC 182-16](#). [WAC 182-08-180](#) defined payments are due the first day of the month in which coverage was effective. PEBB subscriber payments are due with 45 days for the first month of COBRA coverage. Continuing payments are considered past due after 30 days. Participating employers and subscribers are given a 30

## State of Washington

day grace period for late payments. Subscribers are retroactively terminated after 60 days of non-payment. Before termination, the Assistant Accounting Section Manager noted HCA made efforts to describe the consequences of retroactive termination and allowed subscribers to establish a payment plan.

School Employee Benefits Board (SEBB) was voted to be PEBB-like by the board and governed under RCW 41.05, WAC 182-30, WAC 182-31, and WAC 182-32. WAC 182-30-040 defined specific payment rules. SEBB premiums are also due the first day of the month in which coverage was effective. SEBB subscriber payments are due with 45 days for the first month of COBRA coverage. Continuing payments are similar to PEBB rules in which payments were due within 30 days and retroactively terminated after 60 days of non-payment. SEBB subscribers are also eligible to establish payments plans if needed to prevent terminations of coverage.

### **Due From Other Governments - GL 1352**

#### **Pay1 Automatic Invoicing**

Pay1 maintains key information for all subscribers and dependents. Participating employers are responsible for accuracy of demographic information and elections maintained in Pay1. Based on elections entered or imported into Pay1 by the participating employer, Pay1 automatically calculates the amount due for each individual subscriber in an itemized monthly bill by SSN. To perform the calculation, Pay1 uses the rate tables that are updated every six months to calculate subscriber premiums. The subscriber premiums are added to the employer premiums to calculate the total amount owed to HCA by subscriber. The employer premiums are determined by the State Index Rate or for Political Sub-Divisions, a contracted rate. The State Index Rate is determined semi-annually by Legislature.

Pay1 then automatically posts calculated revenues and related accounts receivable for PEBB and SEBB based on current month subscriber elections (**Key Control #1 - Automated Interface - Existence/Valuation**). Nightly, PAY1 interfaces with AFRS to post transactions. Calculated invoice amounts are summarized in the HRISD-B5099-R01 report "Invoice Report by Agency". Each day's transactions posted to AFRS from the invoice reports are summarized in the HRISD-B5081-R01 report "Insurance to AFRS Transaction Generation Report". Amounts reported in AFRS tie back to both automated Pay1 reports.

After invoices were created, Pay1 suspended posting the revenues and related receivables until the first of the month for services. In the prior years, receivable reports included the suspended billings under the 0-30 days aging column on receivable reports. Therefore, the June report would include July which would be the suspended billings. For FY22 the report was modified to not include the suspended billings so they would not have to be backed out each month.

Transactions are easily identifiable by transaction codes. We received a OneNote document compiled by Rita Homan that showed the cycles for posting invoiced amounts, receipts, and refunds. Invoices are grouped based on the type of receivable. For example, self pay retiree invoices are posted using TC 12. For transactions posted in relation to the Due From Other Governments Balance (GL 1352), the following transaction codes were used:

52 - To post receivables from governments. Debits 1352 (Due From Other Governments), Credits 3205 (Accrued Revenue)

## State of Washington

92 - To post cash receipts from governments. Debits 7110 (Receipts In-Process), Credits 1352 (Due From Other Governments)

### Cash Receipts

HCA accepted payments from participating employers and subscribers via lock box for self-pay (retirees), COBRA subscribers, and school districts. State agencies and retirees who elected to have their PEBB premiums withheld from their DRS monthly distribution paid via direct transfer automatically executed with transfers from the treasury office.

HCA's lock box and bank accounts were held with US Bank (DES state contract). Every work day, cash lock box reports for PEBB and SEBB were remitted to HCA via secure file transfer. Reports indicated the employer number (agency number) or subscriber number (social security number). HCA imported the banking activity into Pay1 through an automated nightly batch process. Pay1 automatically coded payments to participating employer or subscriber accounts with full AFRS revenue source coding. Cash activity was also automatically sent to AFRS and reduces receivable balances. When Pay1 could not identify the account due to an issue with social security numbers or agency number, the payment was coded to the suspense account. When Pay1 could not identify the account due to a mismatched account type, the payment was coded to 107BSU. Mismatched payments typically occurred when subscribers changed type of accounts. For example, new retirees often remitted their first payment before their retiree account was complete in Pay1 (self-pay) or if a subscriber separated from their respective participating employer and started COBRA coverage.

Employee Retiree Benefits (ERB) division accountants review lockbox reports daily and match payments for completeness and accuracy. The ERB accountants monitor revenues and cash receipts to ensure bills prepared by Pay1 are accurate and match the amounts in AFRS. If the amount in AFRS does not match the amount collected in Pay1, an In-Process Report is automatically generated. This report provides details on any discrepancies between the amount in AFRS to the amount in Pay1. The ERB Accountants review this report daily and address any discrepancies **(Key Control #2 - Manual - Existence/Classification)**. The "Unbalanced In-process Reconciliation Report" report number DLY007 is ran by fiscal staff for transactions in process through the day before. The unbalanced report is reviewed to ensure amounts are posted to the correct fund in the correct amount. If any significant changes are identified, ERB staff track and research incorrectly posted amounts. The automatic bank lockbox reports and posting of revenue in PAY1 are reviewed and confirmed daily at a high level (in-process report has to match what was received by the lockbox that day vs. AFRS entries for each daily lockbox). Lockboxes for PEBB and SEBB employers are additionally reviewed monthly to ensure the correct employer was credited.

### Adjusting Entries - Prepayments/Credit Balances

At the end of the month, Pay1 automatically generated aging reports based on customer type. Pay1 generated the following reports:

- bh#grp.txt
- bh#ind.txt
- pebb#grp.txt
- pebb#ind.txt, PAY1 report HRISD-B5519-R01
- sebb#ind.txt, Pay1 report SEBB-B5519-R01

## State of Washington

excrpt.txt

Reports were reviewed for reasonableness by ERB Fiscal Analyst 4s and reformatted so ERB Fiscal Analyst 2s could manage individual accounts listed. Reports were also converted to Excel for retention purposes. ERB Fiscal Analysts 2 contacted every customer that had a balance greater than 30 days past due and advised them if no payment occurred, they would be terminated from PEBB or SEBB.

The Pay1 receivable reports (B5519 and B5381) for PEBB and SEBB were not tied out to AFRS by ERB accountants at year end to ensure AFRS amounts were accurate and existed. HCA relied on automatic coding and posting performed by Pay1. HCA ERB relied on cash reconciliations to ensure all cash was accurately recorded in Pay1 and AFRS. See issue at [\[E: HCA Receivables Lack of Complete Reconciliation Pay1 to AFRS\]](#).

Monthly, IT generated a printed receivable report from Pay1, HRISD-B5519-R01 and SEBB-B5519-R01. This report summarized all receivables for each customer. Rita Homan, Assistant Accounting Section Manager, reviewed the report manually at the end of every month to ensure the following:

- Significant past due amounts were being followed up on ERB Fiscal Analyst 2s and documented
- Review for errors and other automatic transactions that Pay1 may have posted to customer accounts

FA4s used the 'pebb#ind.txt' file to prepare backup for the unearned journal voucher (reversing JV). Receivable data (payments) was filtered to identify subscriber accounts with credits by revenue source code. The FA4 used the Excel workbook to prepare the journal voucher. The FA5s, ERB Accounting Manager, and Assistant Accounting Section Manager were allowed reviewers to post the adjustment. JVs were reviewed to ensure the revenue source codes used were complete and receivable balances were accurate and represented actual amounts from Pay1 **(Key Control #3 – Manual – Valuation/Classification)**.

The same PEBB procedures noted above were used for SEBB reports and the SEBB unearned revenue adjustment (reversing JV). SEBB had the same review controls as PEBB.

### **Adjusting Entries - Write-Offs and Allowance for Doubtful Accounts**

Receivable balances over 90 days were considered uncollectible and reported in allowance for doubtful accounts. Write-offs were also based off of the monthly report "Monthly Group Aging Report Summary" (Pay1 report HRISD-B5519-R01). The ERB Fiscal Analyst (FA) 4 converted the text file into Excel. The FA4 totaled the receivables over 90 days past due for self-pay customers and retirees. The FA4 compared the month end and beginning of the month balances to determine the appropriate adjustment needed. The FA4 prepared the monthly journal voucher. The FA5, Assistant Accounting Section Manager, or ERB Accounting Section Manager reviewed the journal vouchers and related workpapers to ensure the accuracy of the adjustment **(Key Control #4 - Manual - Valuation/Classification)**.

Rita explained write-offs can also be made if they are for tolerated amounts. Tolerated amounts are based on the type of payor and history with payments. Write-offs are made in the H.11 screen within Pay1, where all adjustments are made. Activity is documented within H.11 including who

## State of Washington

made the adjustment and comments to justify the write-off. At month end, Pay1 also generates a report HRISD-B5217-R01 and SEBB-B5217-R01 "Write-Off Report" that summarizes those write-offs to be included in the monthly adjusting JV. PEBB and SEBB did not sell off uncollectible receivables. When subscribers were terminated for non-payment, Pay1 recorded a write-off for the receivable and automatically posted the transaction in AFRS.

If participating employers or subscribers did not pay the full premium (including surcharges due), ERB fiscal analysts were allowed to write-off insignificant amounts (insignificant shortfalls). Insignificant amounts were defined in WAC 182-05-015 and considered amounts less than \$50 or 10% of the premium. Write-offs with comments were summarized and reviewed in the monthly adjusting journal entry for the allowance for doubtful accounts.

### **Classification of Receivables**

The Deputy Accounting Section Manager noted classification of receivables was based on the customer type and how customers paid. She also noted PEBB, the plan other state agencies were members of, did not use interagency due to and due from accounts. All participating employers in the PEBB and SEBB plans were governments. Retiree accounts, amounts were reported as Due from Other Governments because a significant amount of retirees had their premiums withheld from their respective monthly DRS pension distribution. As of June 30, 2021, retirees were not included in the health insurance opinion unit. Retiree activity was reported in a custodial fund (FKE).

### **How transactions are recorded in AFRS:**

Pay1 automatically posted invoices and applied cash receipts to customers' receivable accounts.

For monthly adjustments, ERB accountants use journal vouchers based on Pay1 reports to reclassify and adjust receivable balances.

### **Key controls are as follows:**

**Key Control #1 (Automated Interface - Existence/Valuation):** Pay1 automatically posts calculated revenues and related accounts receivable for PEBB and SEBB based on current month subscriber elections.

**Key Control #2 (Manual - Existence/Classification):** Daily, ERB accountants review payments automatically processed and not automatically processed, in Pay1, and reconcile payments to AFRS to ensure that revenues/receivables exist and are accurately classified for the Pay1 System.

**Key Control #3 (Manual - Valuation/Classification):** Monthly, ERB FA4s manually adjusted receivables related to PEBB/SEBB premiums by journal voucher. Adjusting entries were used to record prepayments and credit balances for groups based on Pay1 report HRISD-B5519-R01 and SEBB-B5519-R01. The entry is reviewed by the FA5, ERB Accounting Section Manager, or Deputy Accounting Section Manager to ensure accuracy and classification of adjustments.

**Key Control #4 (Manual - Valuation/Classification):** Monthly, ERB FA4s manually adjusted receivables related to PEBB/SEBB premiums by journal voucher. Adjusting entries were used to record allowance for doubtful accounts and write-offs based on Pay1 report HRISD-B5519-R01 and SEBB-B5519-R01. The entry is reviewed by the FA5, ERB Accounting Section Manager, or Deputy Accounting Section Manager to ensure accuracy and classification of adjustments.

# State of Washington

## Noted Weaknesses are as Follows:

PAY1/AFRS Reconciliation - Pay1 receivable reports (B5519 and B5381) for PEBB and SEBB were not tied out to AFRS by ERB accountants at year end to ensure AFRS amounts were accurate and existed. HCA relied on automatic coding and posting performed by Pay1. HCA ERB relied on cash reconciliations to ensure all cash was accurately recorded in Pay1 and AFRS. See issue at [\[E: HCA Receivables Lack of Complete Reconciliation Pay1 to AFRS\]](#).

## F.4.PRG - Due From Other Governments

*Procedure Step:* Key Control #1 (Automated)

*Prepared By:* MRF, 5/24/2024

*Reviewed By:* RKM, 6/5/2024

### Purpose/Conclusion:

#### **Purpose:**

To determine whether Pay1 automatically calculates and prepares monthly billings based on current month subscriber elections maintained in Pay1, and prepares billings based on approved employer and employee rates (**key control #1 for Pay1**) was in place and operating effectively and to consider related general IT controls in order to assess control risk.

#### **Conclusion:**

Based on our understanding and test results, we concluded that the automated control **was** in place and operating effectively.

Based on our understanding, related general IT controls **were** in place and adequately designed to ensure that the control operated consistently during the audit period. However, we did not test the operating effectiveness of general IT controls.

Our understanding and control risk assessment, which incorporates these conclusions, is documented at [\[Controls - Pay1\]](#).

### Testing Strategy:

The following procedures are **required** for all automated key controls for financial and single audits:

## **STEP 1: Understand Automated Key Control**

# State of Washington

Gain an understanding of the automated key control. The understanding can either be documented in the control system step or could be documented here in this step. Auditors should consider the following aspects of the automated control when gaining an understanding:

## Software Calculation:

Is there written documentation of the calculation, and/or the source rates and factors used in the calculation?

*We would expect written documentation that defines the calculation and is an official, approved source for the formulas, rates and factors. This may be an approved policy or could be system documentation.*

What formulas are used to make the calculation?

What values or factors are used to make the calculation? For example:

- Rate tables used by the calculation
- Profile fields (i.e., applicable transaction types)
- Programmed/set formulas and/or values
- Constraints (i.e., effective date, minimums/maximums, etc.)

How is the calculation triggered or initiated?

How is the calculation recorded in the accounting system (or used in an end result)?

## **STEP 2: Confirm and Test Automated Key Control**

Confirm and test the automated control. To test the automated control, consider the following procedures:

## Software Calculation:

Re-perform the calculation for selected transactions.

*Auditors would NOT normally use sampling for automated controls. Instead, auditors should judgmentally select one instance of each significant variation of the calculation. If the number of potential variations is large, auditors would judgmentally select based on risk factors (for example, the most common scenarios, or scenarios associated with identified risks, or scenarios that are not addressed by the entity's testing procedures).*

*In some cases, it may be possible for the auditor to reperform the calculation for the entire population.*

If any rate tables or values were updated during the period, view the current values (by observing the rate table or values in an admin menu or from a printed system report) and compare to approved sources.

*If no updates were made or there are only a few values, this risk could be addressed by re-performing the calculation. However, if source rate tables or values are large or complex, it may be more efficient to test these values directly than to recalculate a larger number of transactions.*

## State of Washington

Consider the use of analytical procedures such as trends or descriptive statistics on the population (like average, minimum and maximum values, or a graph of values across the population) and follow up on any unexpected values or trends. *Analytical procedures would normally also count as a substantive test.*

### **STEP 3: Understand General IT Controls**

Gain an understanding of the general IT controls that support the continued proper operation of the automated control. Identify key general IT controls and note any control weaknesses. Auditors should consider the following aspects of general IT controls when gaining an understanding:

#### **Software Calculation:**

Inquire if the entity has experienced any errors or irregularities with the calculation. Also how often changes are made to the calculation, and how many changes (if any) were made during the year.

How can the software calculation (formulas, rates/values, settings/configurations) be changed or customized?

*Software calculations will usually have one or more administrative menus that allow the government to modify rate tables or other calculation values, or to configure the calculation or apply settings.*

*In other cases, software calculation formulas and/or values may be hard-coded into the system and require programmers to make the changes. If the government has access to source code, then it needs internal procedures for program changes. If the program is controlled by vendors, we would expect program change procedures and expectations to be included in the contract.*

What are the procedures to authorize and make program changes or configuration/setting changes to the software calculation?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

*If utilizing a test environment, there should be controls to ensure that the live environment is updated and is consistent with the live production environment. As management is responsible for the accuracy of their automated controls (i.e., in the live environment), we would expect there to be a procedure to confirm each key automated control once it is in the live environment. This could be manually re-performing the calculation, reviewing reports against known expectations, etc.*

How are program changes or configuration/setting changes monitored or reviewed?

## State of Washington

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change programming, but they may be responsible for patch management, master table data, and/or configurations.*

### **STEP 4: Confirm Key General IT Controls**

Confirm your understanding of key general IT controls to determine whether they have been placed in operation (*whether the entity has actually implemented key controls*).

### **STEP 5: Test Key General IT Controls**

Document whether general IT controls will be tested. Option 1 would result in control risk at MAX for the automated control. Either option 2 or 3 is necessary in order to set control risk at LOW. If general IT controls are tested, consider the following procedures:

#### **Software Calculation:**

If program changes or setting/configuration changes are logged, review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the calculation may also provide this evidence if the re-performance tests address all states of the calculation during the period.

If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

### **STEP 6: Final Control Risk**

Evaluate the results and document a final control risk assessment in the control system step. Consider whether any deficiencies identified with either the automated control or related general IT controls represent material weaknesses or significant deficiencies.

# State of Washington

*Note: general IT control deficiencies do not necessarily mean the automated control is not properly functioning. General IT control deficiencies would normally be considered a significant deficiency or material weakness only if it caused an issue with the compliance requirement or assertion.*

## **Recommendation Review Requirement**

IT Security related information is considered category 3 data protected by Public Request Exemption RCW 42.56.420. Issues related to IT Security require the following special handling:

[Instructions](#) are located in Team IT Audit's System's Sharepoint page.

Details of IT Security related issues should NOT be included in any emails or helpdesks.

Exit, ML and Findings should be separately communicated in an IT Security Results Document.

Findings will be referenced, but not included in the audit report.

All IT security-related recommendations must be reviewed by [Team IT Audit](#).

Template language for common IT related recommendations can be found in [ARS Part 5 Chapter 8](#).

## **PUBLIC REQUEST EXEMPTION**

Some IT related information is protected by Public Request Exemption RCW 42.56.420 for cyber security purposes. The details documented in the record of work and support workpapers may qualify for this exemption. If so, auditors must include this statement in the record of work done and any related workpapers: **"This record contains information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited "**.

Guidance/Criteria:

Record of Work Done:

**This record may contain information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited.**

## **Due From Other Governments - Automated Interface - Existence/Valuation**

**Key Control 1 - (Existence/Valuation): Pay1 automatically posts calculated revenues and related accounts receivable for PEBB and SEBB based on current month subscriber elections.**

## **STEP 1: Understand Automated Key Control**

The understanding for this key control is documented above in the "Controls - Pay1" step.

## **STEP 2: Confirm and Test Automated Key Control:**

We reviewed and recalculated automated calculations done by Pay1 for premiums as part of the premiums and assessments understanding at

# State of Washington

[Key Control #1 (Automated)] for each of the following agency groups:

Regular PEBB state agency - DSHS

SEBB - School District

PEBB Political sub-division/group - Olympia Medical Center

Retiree, no specific employer

All Pay1 calculations were accurate based on employee/employer elections. *No issues noted.*

## **Noted Weaknesses are as follows:**

none.

## **STEP 3: Understand General IT Controls**

Documentation for this general IT control is documented above in the "Controls -Pay1" step.

## **STEP 4: Confirm Key General IT Controls**

We reviewed the general control for the automated Pay1 premiums updates as part of the premiums and assessments understanding at [Key Control #1 (Automated)].

We reviewed the rate table update for PEBB composite state shares from May 2024. *No issues noted.*

## **STEP 5: Test Key General IT Controls**

Not applicable - we are not planning to rely on automated controls and therefore do not need to test general controls; control risk will be assessed at MAX.

## **F.4.PR.G - Due From Other Governments**

*Procedure Step:* Key Control #2 (Manual)

*Prepared By:* MRF, 5/6/2024

*Reviewed By:* RKM, 6/5/2024

Purpose/Conclusion:

## **Purpose:**

## State of Washington

To confirm ERB accountants review payments automatically processed, and not automatically processed, in Pay1, and reconcile payments to AFRS daily, to ensure that revenues/receivables exist and are accurately classified for the Pay1 System (key control 2 for Pay1) in order to assess control risk.

### **Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

## State of Washington

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency.*

***All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.***

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*

## State of Washington

*D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

**Key Control #2 (Manual - Existence/Classification): Daily, ERB accountants review payments automatically processed and not automatically processed, in Pay1, and reconcile payments to AFRS to ensure that revenues/receivables exist and are accurately classified for the Pay1 System.**

The understanding for this system is documented above in the "Controls - Pay1" step.

### **1. Confirmation of Key Manual Control:**

We confirmed this control as part of Premiums and Assessments at [[Key Control #2 \(Manual\)](#)].

### **Noted Weaknesses are as follows:**

None.

### **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

# State of Washington

## F.4.PR.G - Due From Other Governments

*Procedure Step:* Key Control #4 (Manual)

*Prepared By:* MRF, 5/6/2024

*Reviewed By:* RKM, 6/25/2024

Purpose/Conclusion:

**Purpose:**

To confirm if ERB FA4s manually adjusted receivables related to PEBB/SEBB premiums for allowance/writeoffs by journal voucher on a monthly basis (key control 4 for Pay1) in order to assess control risk.

**Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the*

## State of Washington

*person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency.*

***All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.***

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

## State of Washington

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*

*D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

Guidance/Criteria.:

Record of Work Done.:

**Key Control 4 - (Valuation/Classification) Monthly, ERB FA4s manually adjusted receivables related to PEBB/SEBB premiums by journal voucher. Adjusting entries were used to record allowance for doubtful accounts and write-offs based on Pay1 report HRISD-B5519-R01 and SEBB-B5519-R01. The entry is reviewed by the FA5, ERB Accounting Section Manager, or Deputy Accounting Section Manager to ensure accuracy and classification of adjustments.**

The understanding for this system is documented above in the "Controls - Pay1" step.

### **1. Confirmation of Key Manual Control:**

We obtained the March 2024 month end receivable adjusting journal vouchers from Rita Homan, Deputy Accounting Section Manager, for PEBB and SEBB. We received a walkthrough of the process on 05/01/2024 with Rita Homan.

### **PEBB**

We obtained and reviewed the following JV:

PAJV6165 - To write off uncollectible accounts receivable to bad debt expense for March 2024 and book bad debt/uncollectible accounts receivable per aging report as of March 31, 2024, for PEBB

## State of Washington

The journal voucher was prepared on 04/04/2024 by Michael Williamson, Fiscal Analyst 4, and reviewed by Brooke Schofield, Fiscal Analyst 5 on 05/02/2024. The total amount posted was \$739,181 in a batch.

We reviewed the monthly group aging report summary HRISDB5519-R01 with run date 03/29/2024. We noted \$145,884 was in the 01-30 days column, \$274,771 was in the 31-60 days column, \$89,835 was in the 61-90 days column, \$67,975 was in the 91-120 days column, and \$60,128 was included in the "over 120" days column in the selfpay agencies group. The total aging balance per the report for self pay was \$638,593.

The balance recorded in AFRS was \$1,374,839 (excluding MODA) as of 02/29/2024 in GL 1312, Accounts Receivable. This was entered into the computational spreadsheet "pajv6165-file0002-PEBB Pay1 WO 032024" and verified by Michael Williamson.

To adjust the balance to match current aging report, a \$736,246 entry was made (\$1,374,839 less \$638,593). Entry ties to the reports noted above. **No issues noted.**

We reviewed the Write-Off Report for Month of March 2024, HRISDB5217-R01 with run date 04/01/2024. We noted the total write-off was \$869 based on accounts that were written off for various amounts. The report includes comments for why write-offs were made. The total write off amount was included in entry. Entry ties to Pay1 reports noted above. **No issues noted.**

The total of the JV was the allowance for doubtful accounts adjustment of \$736,246, the bad debt expense write off of \$869, and various corrections in the amount of \$2,065 for a total of \$739,181. **No issues noted.**

### SEBB

We obtained and reviewed the following JVs:

SAJV1482 - To book bad debt/uncollectible accounts receivable per aging report as of 03/31/2024. The journal voucher was processed 04/05/2024, prepared by Oanh Pham, Fiscal Analyst 4, and reviewed by Rita Homan, Deputy Accounting Manager. The total amount posted was \$86,931.

We reviewed the monthly group aging report summary SEBB-B5519-R01 with run date 03/29/2024. We noted \$16,321 in the 01-30 days column, \$79,033 in the 31-60 days column, \$61,802 in the 61-90 days column, \$59,696 included in the 91-120 days column, and \$45,648 in the "over 120" days column, for the selfpay agencies group. This is a total of \$262,500.

The balance recorded in AFRS was \$349,404 as of 2/29/2024 in GL 1312, Accounts Receivable, but the balance per the aging report was \$262,500. To adjust the balance to what is actually receivable per the aging report, a \$86,904 entry was made (\$349,404 less \$262,500). Entry ties to the reports noted above. **No issues noted.**

We reviewed the Write-Off Report for Month of March 2024, SEBB-B5217-R01 with run date 04/01/2024. We noted the total write-off was \$9 based on accounts that were written off for various amounts. The report includes comments for why write-offs were made. The total write off amount was included in entry. Entry ties to Pay1 reports noted above. **No issues noted.**

The JV batch entry was the \$86,904 adjusting entry for doubtful accounts, the \$9 bad debt expense write off, and an adjustment of \$18 to correct a pay1 coding error. The total on the JV was \$86,931. **No issues noted.**

### Noted Weaknesses are as follows:

None

# State of Washington

## **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

## **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

## **F.4.PR.G - Due From Other Governments**

*Procedure Step:* Risk Assessment

*Prepared By:* MRF, 6/26/2024

*Reviewed By:* CJG, 12/9/2024

Purpose/Conclusion:

### **Purpose / Conclusion:**

To assess inherent risk, control risk, and the risk of material misstatement in order to design an initial testing strategy for each assertion.

Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

### **STEP 1: Inherent Risk (IR)**

Assess inherent risk for each relevant assertion. This assessment is based on understanding of the entity and the nature of the account balance or class of transactions.

*Inherent risk is the susceptibility of an assertion to material misstatement. It is our assessment of "total threat", which includes both "natural risk" and identified risk indicators, without any regard to any potential control activities. As inherent risk is fully independent of control risk, any understanding of controls cannot be used to increase/decrease the assessment of inherent risk. Consider the following factors as your basis for this assessment:*

# State of Washington

## *General Considerations*

*Does the balance include transactions that are difficult to audit or involve complex accounting issues?*

*Were there significant misstatements identified in previous audits or prior-period adjustments in the account balance or transaction class? If so, analyzing the cause of prior period misstatements will help in analyzing inherent risk.*

*Are there any inherent risk factors at the entity or industry level, such as changes in regulation or accounting rules, unique transactions or accounting practices, use of information technology, etc that affect the balance?*

## *Inherent Risk due to Error*

*How large are the transactions making up the balance? If the balance has only a few large transactions, even a single error may mean a significant misstatement.*

*Have there been changes in the transactions making up the balance that may increase risk? For example, significantly different composition, nature or volume of transactions may inherently disrupt established controls.*

*Are financial events originated or identified by accounting personnel or non-accounting personnel? This consideration is mainly for the completeness assertion.*

*Does the process to account for transactions involve judgment or estimation, complex calculations, numerous steps or significant manual steps?*

*Do transactions have widely varying attributes that need to be manually identified? For example, grant loans that are accounted for in one of several ways depending on the terms of the agreement.*

## *Inherent Risk due to Fraudulent Reporting (intentional misstatements)*

*Are there substantial pressures or motivations to misstate the balance?*

## *Inherent Risk due to Misappropriation*

*Is the account balance or transaction class susceptible to sizable misappropriation?*

## *Inherent Risk due to Non-Compliance*

*Are there any laws, contracts or grant agreements affecting the balance? If so, would non-compliance lead to sizable misstatements?*

*Are compliance requirements complex, hard to understand, subject to judgment or otherwise difficult to comply with?*

*Are there any motivations or pressures to not comply?*

## **STEP 2: Control Risk (CR)**

Assess control risk by system and assertion. This assessment should be based on the results of the control understanding, confirmation, and (if setting control risk to LOW) testing. If applicable, auditors will evaluate any control deficiencies and determine whether those deficiencies, individually or in combination, are significant deficiencies or material weaknesses.

*Control risk is the risk that material misstatements would not be prevented or detected timely by the system of internal control. Control risk could be thought of as the "vulnerability" of an entity to misstatements. Control risk exists independently of the inherent risk (the level of vulnerability exists independent of the level of threat).*

## State of Washington

*Control risk is MAX in both of the following situations: (1) controls aren't tested or (2) controls are problematic and cannot be relied upon. In order to set control risk to LOW, the auditor must test that controls operated effectively throughout the period.*

*A material weakness exists when the design or operation of controls results in a reasonable possibility a material misstatement will not be prevented or detected and corrected in a timely manner. A significant deficiency is less severe than a material weakness, yet important enough to merit the attention of the governing body. **All potential material weaknesses and significant deficiencies should be discussed with the AIC, since they must be reported as findings.***

### **STEP 3: Risk of Material Misstatement (RMM)**

Assess the risk of material misstatement for each relevant assertion for each significant line item. The risk of material misstatement (RMM) is a combination of the auditor's separate assessment of inherent and control risk.

*In practice, the RMM is the amount of substantive evidence that's needed, and the only way to reduce the amount of needed substantive evidence (equal to the inherent risk) is to test controls. As such, when control risk is MAX, the RMM must always equal the inherent risk (IR).*

*When controls are tested & can be relied upon (are determined to be effective) it is a matter of professional judgment how much the RMM should be set lower than inherent risk (1 or 2 steps).*

*Auditors should assess RMM by assertion, if different. For example, if RMM is assessed at MOD for the existence assertion, but LOW for the rights & obligations assertion, then document "MOD – existence and LOW – rights & obligations".*

### **STEP 4: Design Substantive Testing**

Design a substantive testing strategy that addresses the relevant assertion (identified risk) in the portion of the line item that relates to that risk.

*Planning identifies where to audit (significant balances, classes of transactions & disclosures) what to audit for (relevant assertions), and how much to audit (RMM). The quantity and quality of evidence obtained by substantive tests needs to match the level of risk. The higher the risk of material misstatement, the greater evidence needed. "Greater evidence" could either be greater quantity of evidence, greater quality of evidence, or some combination of greater quality and quantity.*

Guidance/Criteria:
--------------------

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6210](#) – Planning Financial Statement Audits**

# State of Washington

## SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk

### [Financial Statement Audits](#) Planning Guide

Record of Work Done:

#### **(1) Inherent Risk (IR):**

Based on our understanding of the line item, we assessed inherent risk as follows for each relevant assertion and significant class of transactions:

Existence - **HIGH**

Valuation - **HIGH**

Classification - **HIGH**

#### **(2) Control Risk (CR):**

We assessed control risk as follows for each system and relevant assertion:

**Pay1 - MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

#### **(3) Risk of Material Misstatement (RMM):**

We considered both inherent and control risk and assessed the risk of material misstatement as follows for each relevant assertion and significant class of transactions:

Existence - HIGH

Valuation - HIGH

Classification - HIGH

#### **(4) Testing Strategy:**

We designed our substantive testing strategy based on our assessment of the risk of material misstatement. We plan to perform the following tests:

#### **Testing to meet Existence assertion:**

## State of Washington

Obtain June 2024 month-end receivable report (summary by customer type and detail by participating employer) for both PEBB and SEBB accounts. We will use the sampling spreadsheet to select accounts to ensure the receivable existed by reviewing subsequent payments. Obtain and review a year end receivable reconciliation between Pay1 and AFRS for PEBB/SEBB to ensure amounts reported for ACFR existed.

### **Testing to meet Valuation assertion:**

Obtain June 2024 month-end receivable report (summary by customer type and detail by participating employer) for both PEBB and SEBB accounts. We will use the sampling spreadsheet to select accounts to ensure the receivable is properly calculated based on automated calculations and any adjustments. Obtain and review a year end receivable reconciliation between Pay1 and AFRS for PEBB/SEBB to ensure amounts reported for ACFR are accurate.

### **Testing to meet Classification assertion:**

Obtain June 2024 month-end receivable report (summary by customer type and detail by participating employer) for both PEBB and SEBB accounts. We will use the sampling spreadsheet to select accounts to ensure the receivable is classified properly as *due from other governments*.

We anticipate that these tests will provide sufficient appropriate audit evidence to address the assessed risk of material misstatement for relevant assertions in significant classes of transactions.

### **F.4.PR.G - Due From Other Governments**

*Procedure Step:* Substantive Test

*Prepared By:* MRF, 10/1/2024

*Reviewed By:* CJG, 12/9/2024

Purpose/Conclusion.*
----------------------

### **Purpose:**

To determine whether reported receivables represent amounts relating to the period, were reported at properly calculated amounts and were properly classified.

### **Conclusion:**

## State of Washington

We determined receivables represent amounts relating to the period and were properly classified. We determined reported receivables were correctly calculated with the following exception:

Amounts tied to supporting documents, but some payments were incorrectly excluded from the total value of receivables as of June 30th due to timing with the July invoices. HCA agreed with the issue and conducted a review of all governments receivables to determine the true total misstatement of the Due From Other Governments receivable balance. The known misstatement of the balance is \$15,456,164.64 between both PEBB and SEBB. See issue here [[E: HCA\\_Misstatement of Due From Other Governments Receivables](#)].

We also noted the following:

PAY1 could not be fully reconciled to AFRS amounts. Due to system limitations, HCA could not track or identify variances between PAY1 and AFRS for both PEBB and SEBB. This resulted in AFRS reporting \$9,382,356 less than PAY1. See issue at [[E: HCA\\_Receivables Lack of Complete Reconciliation Pay1 to AFRS](#)].

See AOM here [[Aggregation of Misstatements \(GAAP\)](#)].

### Testing Strategy:

The following is a list of **considerations** for testing the existence assertion for other assets. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

### Receivables

- Confirm receivables with the obligated party.

- Confirm intergovernmental receivables with the other agency.

- Confirm trade receivables using negative or positive confirmations to customers. *NOTE: if trade receivables were not confirmed, auditors should document the reasons for not following the audit requirement (see policy/criteria tab).*

- Verify receivables to source billing documents, reimbursement requests or other documentation.

- If receivables are sent to an external collection agency or trigger an action that affects the obligated party (ie: water shut-off) within a reasonably short time period, trace or reconcile from the A/R Aging report to the collection agency's report or evidence of a confirming action.

- Verify receivables through subsequent receipt of funds (remittance documentation should evidence the period to which it applies).

- For the period following balance sheet date, scan the accounts receivable general ledger control account for material charge-off and unusual transactions, and investigate.

Perform analytical procedures to determine the reasonableness of receivable balances and follow-up on any unexpected results. For example, trend analysis of aged A/R, trend of beginning balance, billings, adjustments, payments and ending balance, inventory/volume usage

## State of Washington

reconciliation, etc.

The following is a list of **considerations** for testing the valuation assertion for other assets. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

Review the entity's calculation of the value of intangible assets.

Review the entity's calculation of write-off of inventory or other assets due to obsolescence or damage.

### **Calculation or Realizable Value of Receivables**

Re-calculate a sample or selection of billings. If billings are calculated by software, the auditor could test and substantiate the automated control and also consider any risks associated with manual inputs used by software.

Evaluate the entity's calculation of the allowance amount for reasonableness. This evaluation should include comparing the entity's estimate to the entity's actual historical experience of collecting or writing-off receivables.

Trace the amount of bad debt approved by the governing body (per minutes) to reductions of receivables and bad debt expense to verify it was properly accounted for. *Note: approvals may be slightly more, as customers may pay after the bad debt has been approved but before it is written off.*

The following is a list of **considerations** for testing the classification assertion for other assets. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

### **Classification as Current or Non-Current**

If any amounts are noted through testing that will not be collected within one year, ensure they are reported as a non-current account receivable (must use classified format per GASB 34 paragraph 97). For example, a patient balance of \$100,000 and the patient has a repayment agreement to make \$50 per month payments or established a history of small payments that would allow the District to reasonably determine that the amount will not be collected within one year.

### **Classification between Opinion Units**

Search for manual journal entries that transfer other assets from one opinion unit to another without recording an operating statement transaction (debit and credit to capital assets and fund balance for each opinion unit, respectively). Consider testing if any risk indicators are noted.

Evaluate whether receivables or other assets appear reasonable in relation to the activities of the fund. Follow-up on any unexpected results.

Guidance/Criteria:
--------------------

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6350](#) – External Confirmations**

# State of Washington

## **Purpose:**

To determine whether other assets were reported at properly valued or calculated amounts.

## **Current & Non-Current (Government-wide and Proprietary Statements)**

GASB 34 paragraph 31 defines "current" and "non-current" classification of assets:

"Governments are encouraged to present assets and liabilities in order of their relative liquidity. An asset's liquidity should be determined by how readily it is expected to be converted to cash and whether restrictions limit the government's ability to use the resources. A liability's liquidity is based on its maturity, or when cash is expected to be used to liquidate it. The liquidity of an asset or liability may be determined by assessing the average liquidity of the class of assets or liabilities to which it belongs, even though individual balances may be significantly more or less liquid than others in the same class and some items may have both current and long-term elements ..."

Record of Work Done:

## **Sampling Methodology:**

We obtained PAY1 PEBB (HRISDB5381-R01) and SEBB (SEBBB5381-R01) receivable reports from HCA for June 30, 2024. We converted receivable reports from txt files to Excel using text to columns. We used the sampling spreadsheet in accordance with SAO sampling policy 3240 to determine our sample size for amounts due from other governments for both SEBB and PEBB.

## **SEBB (School Employees) [SEBB Due From Other Governments FS Sampling]:**

We randomly selected transactions using the small population method per the sampling spreadsheet. We determined the random sample seemed a reasonable representation of our population.

## **PEBB (Political Sub-div) [PEBB Due From Other Governments FS Sampling]:**

We initially randomly selected transactions per the sampling spreadsheet, but noted the average dollar amount of the testing population was significantly smaller than the average of the total population. We met with Jordan Prince, Sampling Specialist, on 8/19/2024 to discuss the best methodology to sample. We determined the following:

- We are unable to perform stratification of selections because the data set is too small and "bottom heavy" (a few very large items).

- Per the sampling spreadsheet, we should select 14 transactions. We would have to select the top 14 transactions to get 90% coverage, which is not an accurate representation of our population.

- Selections with a total dollar amount under \$1,000 should not be included in our sample selection population. The total of these items is less than 0.025% of the total population and any issues would be insignificant.

- We would judgmentally select amounts over \$400k and include them in the individually significant items (ISI), for a total of five ISIs.

- We would randomly select transactions through the remaining population, excluding the small amounts and the judgementally selected ISIs.

# State of Washington

## **Substantive tests performed to meet the Existence / Occurrence assertion:**

We obtained the June 2024 month-end receivable report (summary by customer type and detail by participating employer) for both PEBB and SEBB accounts. We selected accounts using approved sampling methodology to ensure the receivable existed by reviewing subsequent payments.

We reviewed invoices for June 30, 2024 (invoiced in May) for all selected employers and any subsequent payments for the invoices (warrants, deposit slips, ACH support, images from US Bank lockbox data) to ensure the receivable existed at year end. We tied actual invoice amounts to the B5381 report and INV-PMT, an invoice payment history provided by HCA. See testing performed in the "PEBB Population Testing" and "SEBB Population Testing" tabs. *No issues noted.*

We obtained and reviewed the year end receivable reconciliation between Pay1 and AFRS for PEBB/SEBB to ensure amounts reported for ACFR existed.

We obtained a reconciliation performed by Rita Homan, HCA Deputy Accounting Section Manager, for both PEBB and SEBB to AFRS. See tabs "PEBB Reconciliation" and "SEBB Reconciliation" in each of the testing spreadsheets. HCA used the month end receivable report (B5381) reduced by the following to tie amounts to AFRS:

- employer prepayments

- employee receivable report amounts not included in B5381 (from report B5519) and prepayments

- US Bank Lockbox receipts recorded in AFRS (not in B5381)

HCA identified the following variances that could not be determined due to lack of supporting reports from PAY1:

- PEBB - \$2,039,922 more reported in PAY1 reports

- SEBB - \$7,342,434 more reported by PAY1 reports

See issue related to HCA's PAY1 reconciliations at [[E: HCA\\_Receivables Lack of Complete Reconciliation Pay1 to AFRS](#)]. The variance is above the floor, we will carry this issue to the aggregation of misstatements [[Aggregation of Misstatements \(GAAP\)](#)].

## **Substantive tests performed to meet the Valuation assertion:**

We used the selected sample of accounts and tested to ensure the receivable is properly calculated based on automated calculations and any adjustments.

We recalculated the amount due (receivable) as of June 30, 2024. We recalculated by taking the amount of the invoices for June 30, 2024 (invoiced in May) and adding any remaining balance forward from previous periods (report HRISDB5079-R01), less any payment(s) received by the government for coverage provided before June 30th, 2024. We compared the recalculated amount to PAY1 and INV-PMT. See tabs "PEBB Reconciliation" and "SEBB Reconciliation" in each of the testing spreadsheets.

We identified variances in both PEBB and SEBB testing for the valuation of the receivables. We noted the variances matched the June payment amounts exactly and followed up with Rita Homan of HCA. We determined the error was due to the following:

- PAY1 report 5381 (group aging summary report) excludes payments made after invoicing runs for the following month. Payments are recorded in PAY1 for the subsequent coverage month, but are recorded accurately in AFRS as payment for the current month.

## State of Washington

The 5381 report excludes payments posted after the invoicing cycle for each program (different invoice cycles), causing an overstatement of the receivable balance at the end of each month.

Using the sampling spreadsheet, we estimated the total error was between \$300k and \$44M based on if the issue is found in small or large payments.

Rita Homan performed follow up work and reviewed all Other Government's receivable balances that had payments after July invoicing. HCA determined the true misstatement of the balance was \$15,456,164.64 between both PEBB and SEBB. Rita Homan provided the billing reports as excel sheets detailing the calculated balance of the receivable and screenshots of the Pay1 report 5381 aging reports to show that the June payments were incorrectly excluded from the total receivables. We reviewed the supporting material provided by Rita Homan and agreed with the calculations, and since the error was found in a mix of primarily smaller payments with a few large payments, we determined the amount of \$15.5M is reasonable. See issue here [[E: HCA Misstatement of Due From Other Governments Receivables](#)]. The variance is above the floor, we will carry this issue to the aggregation of misstatements [[Aggregation of Misstatements \(GAAP\)](#)].

### **Substantive tests performed to meet the Classification assertion:**

We obtained the June 2024 month-end receivable report (summary by customer type and detail by participating employer) for both PEBB and SEBB accounts. We reviewed the government types for the PEBB population and noted they were all listed as political subdivisions or education, we noted no state agencies.

For the randomly selected samples, we reviewed invoices for June 30, 2024 (invoiced in May) for all selected employers and any subsequent payments for the invoices (warrants, deposit slips, ACH support, images from US Bank lockbox data) to ensure the receivable was classified properly as due from other governments. We ensured invoices were processed for actual governments (non-federal) and were for the correct period (expected to be collected within one year). All invoices were for the coverage period of 6/30/2024 for actual governments. See testing performed in the "PEBB Population Testing" tab. ***No issues noted.***

### **F.5.PRG - Receivables**

*Procedure Step:* Summary & Conclusion

*Prepared By:* MRF, 9/30/2024

*Reviewed By:* RKM, 11/24/2024

Purpose/Conclusion:

### **Purpose:**

# State of Washington

To evaluate risk assessments and the sufficiency and appropriateness of evidence obtained based on results of substantive work.

## **Conclusion:**

We determined that **no** modifications were necessary to inherent risk, control risk, or the risk of material misstatement as assessed in planning.

We also determined that evidence obtained was sufficient and appropriate in response to the risk of material misstatement.

Testing Strategy:

Auditors are **required** to evaluate conclusions for substantive testing as follows:

*Auditors may wish to use the optional Lead Sheet available in the Store to summarize testing related to each balance and assertion.*

**1.** Determine whether the results of substantive testing indicate a need to modify the inherent risk assessment (IR), control risk assessment (CR), risk of material misstatement (RMM) or other aspects of planning (such as material balances or assertions). If so, document changes and consider the need for additional testing.

*If the results of substantive testing indicate a need to change control risk, auditors should also update the **Permanent File** by either correcting the documentation or by adding an update section describing changes to the top of the record of work done. For all changes to IR, CR, or RMM the **Material Balances** spreadsheet should be updated.*

*More significant changes to other aspects of planning (such as material balances or assertions) should be referenced in this step and documented in detail in the **Changes to FS Audit Plan** step.*

**2.** Evaluate whether the quality and quantity of evidence obtained is sufficient and appropriate in response to the risk of material misstatement. In making this determination, auditors should evaluate:

## **Information to be used as audit evidence:**

Does evidence relate to the population, period of time and risk (assertion and “what could go wrong” from the Material Balance Spreadsheet)? If there are any gaps or uncertainties in the logical connection between the evidence and conclusions, is there a documented consideration and explanation?

Are the sources of information sufficiently reliable and appropriate for the risk (whether internal to the government, external, or auditor developed)? If key information is not from a sufficiently reliable source (for example, inquiry), then is it corroborated by information that is?

Are there any concerns about accuracy, completeness, authenticity, or bias in information? If so, did the auditor perform sufficient procedures to confirm reliability of that information?

## State of Washington

Is information precise enough to catch if misstatements exceeded the tolerable level?  
Is information detailed enough to conclude on whether or not there were misstatements?  
Was there any information that appeared contradictory or inconsistent? If so, was there a documented response to the inconsistencies or doubts about the reliability of evidence?

### Results:

How much misstatement was identified by testing, and the likelihood and magnitude of further potential misstatement?  
How did misstatements occur and how often might they occur again in the population?  
Were misstatements caused by control deficiencies or circumvention of controls?  
If control deficiencies, is there a need to re-evaluate our understanding of controls in the [Permanent File](#) folder or assessment of control risk?  
If circumvention, the [Management Override of Controls](#) step should address or reference this area. Auditors should also consider whether a fraud risk has been identified.  
Did tests identify a different level or type of risk than the planned audit response was designed to address?  
If likely misstatements are identified, are further procedures necessary to improve the precision of our estimate?

*To support the overall evaluation of audit risk and provide a basis for concluding on the overall sufficiency and appropriateness of evidence in the [FS Summary & Report](#) step, auditors should conclude in each area whether the auditor continues to believe that the tests performed and quality and quantity of evidence obtained are commensurate with RMM for all relevant risks (the "what could go wrong", in the [Material Balances](#) spreadsheet).*

If the auditor determines that evidence is not sufficient or appropriate, additional substantive testing should be done. If sufficient, appropriate evidence is not available for audit, the AIC should discuss the effect on our audit report with the AAM and AM.

Guidance/Criteria.:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6310](#) – Determining the Nature, Timing and Extent of Substantive Testing**

**SAO Audit Policy [3210](#) – Audit Evidence**

Record of Work Done.:

Based on test results, we re-evaluated risk assessments, procedures, evidence obtained and conclusions as follows:

# State of Washington

## **(1) Do the results of substantive tests indicate a need to modify our risk assessment (IR, CR and RMM)?**

The results of substantive tests do not indicate a need to modify our risk assessment.

## **(2) Was the quality and quantity of evidence obtained sufficient and appropriate?**

The quality and quantity of evidence obtained was sufficient and appropriate.

### **F.5.PRG - Receivables**

*Procedure Step:* Understanding of Line Item

*Prepared By:* MRF, 5/22/2024

*Reviewed By:* RKM, 6/5/2024

Purpose/Conclusion:

#### **Purpose / Conclusion:**

To gain an understanding of the line item and confirm the scope of testing as documented in the Significant Account Matrix.

Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

#### **STEP 1: Prior Audit Exceptions**

Document any exceptions noted during the prior audit. Follow-up to determine how the agency has responded to or corrected the issue, unless this work is anticipated as part of the testing strategy.

#### **STEP 2: Analyze Composition and Changes of Line Item**

Include link to the line item leadsheet. This will be completed at the end of the audit. Leadsheet analysis should be documented in this spreadsheet.

## State of Washington

Inquire with agency staff about the activities and transactions that make up the balance and any changes to those activities or transactions in relation to the prior year.

Determine relevant classes of transactions or account balances within the line item to analyze (such as agencies, funds, programs, departments, accounts, and/or objects), and use AFRS to create trends of those elements. This step should not include any specific dollar amounts associate with the line item.

Evaluate trends to identify:

- (1) What classes of transactions or account balances are primary to the identified risk. Auditors should specifically consider what elements are primary to the line item (comprising a large percentage of the line item), and which elements the identified risk would apply to, and which elements might be most susceptible to the identified risk (having a high risk of non-trivial misstatement for a relevant assertion, considering likelihood and impact of potential for misstatement).
- (2) What changes are primary to the identified risk, if applicable. Auditors should specifically consider whether the overall change to the line item from the prior year was significant, what elements were the primary drivers of overall change, whether any elements changed significantly from the prior year, and which changes (if any) might relate to the identified risk.
- (3) Any unusual or unexpected elements, amounts, or changes that may indicate a risk, whether the one identified in planning or a new one that may need to be considered for a change to the plan.

**Consider** other procedures to gain an understanding of the line item, such as review of key policy documents, review of program information or reports, inquiry of staff, budget information, or other analytical procedures.

### **STEP 3: Update Significant Account Matrix**

Based on your understanding of the line item, update the Significant Account Matrix with final conclusions on the agencies covered, account description, significant accounting systems, and risk (what could go wrong and relevant assertions). The account description should reflect the significant transaction streams or account balances relevant to the risk.

*The description of agencies, significant accounting systems, and what could go wrong in the Significant Account Matrix constitute the overall scope of substantive testing.*

*A transaction stream is significant based on the potential for misstatement. This is often due in part to its size (ie: comprising a large percentage of the total line item), but is ultimately a judgment about the susceptibility to the identified risk (for example, when the risk is understatement a small or omitted account may hold the most potential for the largest misstatement).*

*Significant accounting system(s) are those that contain key controls over significant classes of transactions included in the line item. Control systems identified in this step must match the Significant Account Matrix and have a separate control understanding documented.*

*Talk with the AIC if you identify any changes to the Significant Account Matrix.*

Guidance/Criteria.7

# State of Washington

Record of Work Done:

## **(1) Prior Audit Exceptions:**

During FY23 we found that HCA has no documented process in place to review the accuracy of claims data provided to Milliman and relies on Milliman's procedures alone to determine the receivables balance.

We inquired with Sara Whitley, ERB Finance Manager, about this prior audit issue on April 26, 2024, and she informed us that there's sections of HIPPA that restrict the "plan sponsor" (HCA) from reviewing claims data passed directly from "group health plans" (third party administrators [TPA]). Specifically, these sections are [45 CFR 164.504, sections f\(2\) and \(3\)](#). Sara stated that the Authority contracts with Milliman to check for reasonableness of the raw claims data, that the Authority depends on TPAs to provide accurate claims data to Milliman, and as a compensating control, HCA compares claims reports from TPAs and compares the amounts in those reports to prior period amounts to ensure that trends are aligning with the Authority's expectations (see our control understanding and the confirmation work we did for key control #1 for more details on this last item). Considering that HCA is not allowed to review the claims data in detail, per HIPPA, and considering HCA's compensating control of reviewing TPA reports to ensure the claims amounts align with HCA's expectations, we've determined that it's reasonable for HCA to not review key claims data in detail. **No issues noted.**

## **(2) Composition & Change Analysis:**

Line Item Leadsheet: [\[Line Item Lead Sheet\]](#).

Receivables at year end consist of two categories: Normal operational receivables and year end adjustments/specialty amounts.

Normal operational receivables, include insurance premiums billed but not paid, to two main groups.

1. Active Employees - State and Local
2. COBRA/Self Pay - State and Local- Per inquiry with HCA, Fund 721 receivables consist of receivables that stem from premiums billed to PEBB self-pay retirees/COBRA.

Local government receivables (GL 1352) are reported in the "due from other governments" line item and do not need their work replicated here. State government receivables (GL 1354) is a very small balance and is not expected to be material to any of the line items. *As such, normal operational receivables will not be covered in the receivables balance testing.*

Year end Adjustments/specialty amounts include two categories:

1. MODA pharmaceutical rebates - **Fund 721** - Public Employees' and Retirees Insurance Account

In the prior year, rebate receivables from MODA Health for pharmaceutical were also reported as a receivable in Fund 721. HCA's contracted actuary, Milliman, provided a memo in February 2023 that changed the reporting for MODA rebate receivables and they are now reported

## State of Washington

in IBNR update quarterly. *We do not expect MODA rebate receivables to affect the receivables balance and will not be included in our control understanding or substantive testing.*

### 2. SEBB risk rate adjustments - **Fund 493** - School Employees' Insurance Account

Per inquiry with HCA, Fund 493 receivables consist of a SEBB Risk adjustment Transfer and receivables that stem from premiums billed to SEBB self-pay retirees/COBRA. HCA expects the majority of the receivables balance to be a result of the SEBB risk rate adjustment transfer.

### **(3) Updates to Significant Account Matrix:**

We made no changes to the Significant Account Matrix.

### **F.5.PRG - Receivables**

*Procedure Step:* Controls - Milliman Calculation

*Prepared By:* MRF, 5/22/2024

*Reviewed By:* RKM, 6/5/2024

Purpose/Conclusion:

#### **Purpose:**

To gain an understanding of internal controls.

#### **Conclusion:**

We gained an understanding of internal controls as documented in the record of work done.

Testing Strategy:

#### **The following procedures are required for all material systems:**

1. List the financial statement balance(s) and relevant assertion(s) addressed by the understanding.
2. Gain an understanding of the internal control process, identify how transactions are recorded in AFRS, identify key controls over relevant

## State of Washington

assertion(s), and note any control weaknesses.

In gaining an understanding of controls, consider the overall understanding of State-Level control elements as documented in the "State-Level Controls" step as they relate to this particular system.

Identify controls systems covering all relevant assertions for all significant classes of transactions.

Standards require the auditor to gain an understanding of the significant accounting system(s) that contain key controls over significant classes of transactions included in the line item.

Control systems identified in this step must match the Material Account Matrix and have a separate control understanding documented.

Talk with the ACFR Specialist or AIC if you identify different systems than the ones anticipated in the Material Account Matrix.

For each material system, auditors must document:

A brief outline of the transaction flow from beginning to end.

An expanded description of key controls.

Business processes relevant to financial reporting of the relevant assertion for the material balance. Processes should encompass automated and manual procedures by which transactions or events are identified or initiated, authorized as needed, recorded, processed and corrected as needed.

Original accounting records and how records are rolled-up to intermediary ledgers and transferred to the general ledger (AFRS) or financial statements.

Detailed descriptions of key controls. Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

The following is information to **consider** when identifying key controls and transaction flow.

"Key controls" refer to the few controls that together provide reasonable assurance that material misstatements will be prevented or detected and corrected. This is contrasted with ancillary or supporting controls, which – although helpful and recommended – would provide less than reasonable assurance by themselves.

The focus of the write-up is on the key controls. Key controls should be specifically identified (as "key controls") in the write-up. This can be done in whatever way the auditor prefers, so long as it is obvious. Details that the auditor should document regarding key controls may include:

Who or what initiates the control

When (or how often) is the control applied

Who performs the control

As needed, the experience, knowledge and attitude of the person applying the control

## State of Washington

Detailed description of the control process or activity. For example, if the control is a review: what exactly is reviewed, what is the reviewer looking at or for and what are the reviewer's criteria?

How the key control is documented or evidenced

If not obvious from the description, how the control prevents or timely detects and corrects misstatements

Any exceptions or alternative processing to the normal process

What happens when misstatements or issues are identified by the control

The "transaction flow" refers to the process by which transactions are initiated, authorized, recorded, processed and reported (as applicable). Outlining the transaction flow gives context to key controls, especially how transactions become subject to controls in the first place. If a control inherently ensures that all applicable transactions are included (ex: bank reconciliation where the assertion is existence), the auditor may decide to just start the write-up with the initiation of the control procedure and go from there.

Elements of the transaction flow are defined informally as follows:

*Initiation:* How are transactions initiated?

*Authorization:* How are transactions and accounting record maintenance authorized?

*Recording:* How are transactions or balances identified and recorded in financial accounting systems?

*Processing:* How are the transactions or balances processed after they are recorded (if at all)? Processing may be manual or automated and may occur at a subsidiary system level or at the general ledger level.

*Reporting:* How are records translated into the financial statements? This part of the transaction flow extends the understanding to the actual financial statements that the audit is opining on. Since we already document an understanding of the financial reporting process in general, it is usually enough to simply reference this overall understanding. However, if there are important steps unique to the covered balances, it may be more appropriate to mention them here.

Although transaction flow is a good way to think about understanding and documenting a control system, auditors should not worry too much about documenting "each element, in order" because often elements may be combined, not noticeable, not applicable or occur in a different order.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

# State of Washington

## Financial Statement Audits Planning Guide

Record of Work Done:

### **Material Balance(s) and Assertions**

Internal controls in the Milliman Calculation address the following balance(s):

#### **Receivables**

For the following assertions:

**Valuation** - There is a risk that: risk adjustments, supporting receivables from managed care plans, may not be supported by amounts determined by actuaries; HCA used actuaries that were not creditable or lacked experience (educational and professional) to determine estimate; assumptions based on unaudited attestations made by HCA were not accurate (i.e. information relied on by Milliman did not reflect actual operations or benefits provided); and claim history information provided to Milliman was not complete (i.e. multiple sources of claims).

### **Gain an Understanding of Internal Controls**

We met with HCA staff on 05/02/2024 to review controls over accounts receivable for GL 1312. We met with the following staff:

Rita Homan, HCA Assistant Accounting Section Manager  
Kari Summerour, HCA Liaison  
William Sogge, HCA Liaison  
Sara Whitley, ERB (Employee Benefits Board both PEBB and SEBB) Finance Unit Manager  
Lisa Kolle, ERB Accounting Manager (Started in March 2024)  
Samantha Zimmerman, Internal Controls Officer (Started in Feb 2024)

### **Background**

We noted receivables in GL 1312 were recorded in the following funds:

Fund 721 - Public Employees' and Retirees Insurance Account  
Fund 493 - School Employees' Insurance Account

Receivables included in these funds were a result of Public Employees Benefit Board (PEBB) and School Employees Benefits Board (SEBB) insurance premiums billed and not yet paid. These billings are recorded 2 different ways depending on the party being billed:

Active employees - This includes state agency, higher education, and K12 active employees. The employer is billed as part of the invoicing cycle and pays HCA. Since the accounts receivable are due from state/local governments, these amounts are reported in GL 1352, due from other governments. See our understanding of due from other governments at [[Understanding of Line Item](#)].

## State of Washington

COBRA (Consolidated Omnibus Budget Reconciliation Act) continuing coverage/retirees self-pay - This includes amounts invoiced but not paid from retirees and COBRA participants. These receivables are included GL 1312, accounts receivables, and are the individuals responsibility to pay. These historically represent a small portion of the total receivables balance. We do not expect the COBRA receivables to make up a significant portion of the Receivables balance.

Receivables include significant adjustments in fund 493 to record the SEBB risk rate adjustment. Based on our understanding of the line item at [\[Understanding of Line Item\]](#), we noted a majority of the Receivables balance is expected to be the SEBB risk rate adjustment. In the prior year, the SEBB risk rate adjustment made up 70% of the balance. Without the adjustment related to MODA rebate receivables, the SEBB risk adjustment is expected to represent a larger portion of the receivables balance. As such, we determined focusing our understanding and substantive testing on SEBB risk rate adjustment alone will provide sufficient coverage of the Receivables balance.

### **SEBB Risk Rate Adjustment Transfer**

Rita explained the SEBB risk rate adjustment is done at year end to adjust for the difference from the expected rate used in the plan calculations to the actual rate at year end. Since SEBB is relatively new, she expects this rate adjustment will continue being made for the next few fiscal years. As the plan goes on, Rita expects the differences to be less between expectations and actual. This process is similar to how PEBB was treated when it was first implemented. HCA contracts with Milliman to calculate the final risk adjustment transfer payments for each carrier that is participating in the School Employees Benefits Board (SEBB) health insurance program. The participating carriers in the SEBB program included Uniform Medical Plans (UMP), managed care organizations (MCOs) of Kaiser Permanente of Washington (KPWA), Kaiser Permanente of Washington Options (KPWAO), Kaiser Permanente Northwest (KPNW), and Premera. Milliman does this risk adjustment once a year in August to ensure all activity as of June 30 is included.

### **SEBB Claims Data**

Milliman works with the Employee Retiree Benefits (ERB) Finance division as the main contact within HCA. Per Sara Whitley, ERB Finance Unit Manager, Milliman's calculation for the SEBB risk adjustment transfer uses claims incurred between 1/1/23 and 12/31/23 and paid between 1/1/23 and 3/31/24. Milliman receives raw claims data directly from Regence (UMP) and the fully insured carriers (Kaiser Permanente/Premera) which includes all medical claims data, pharmacy claims data, and membership diagnosis codes for the time period. HCA establishes contracts with each of the insured carriers and requirements related to when and what data is to be provided for the Risk adjustment transfer, as detailed in the contract under the Risk Adjustment Exhibit. The terms related to risk adjustment are standardized for all contracts to ensure processes and data submitted to Milliman is uniform for their processing. On a quarterly basis, ERB will meet with the contracted carriers and discuss general plan management topics. As part of the meetings, the carriers present reports that compare what carriers are submitting to Milliman in relation to raw claims and what the carriers have on record for those amounts.

Once the data is received by Milliman, the data is processed through the Milliman Advanced Risk Adjustment (MARA) software to refresh risk scores used in the calculation of the risk adjustment transfer. Milliman has their own separate analytical procedures to ensure claims data received is accurate, complete, and reasonable. Using historical data available to them, Milliman confirms the following:

## State of Washington

Distribution of claim counts by month for each carrier is relatively reasonable based on expectations. This review looks for possible over or under reporting within a single month for any of the carriers. The expectation is that the number of claims in a month is proportional to the workdays within the month.

Paid runout is consistent with historical data. This review looks for possible changes in processing patterns that may lead to inconsistent reporting speeds within the data. The expectation is that the processing of runout is consistent with historical observations and that there is neither a buildup or expansion of backlog that may influence the reported data.

Diagnosis code positions are populated as they would expect. The expectation of diagnosis code positions is based on historical data where consistency of reporting is evaluated based on the count of diagnosis code positions included within the data.

The number of invalid members or orphaned claims (i.e. claims that cannot be matched with an enrollment record) are limited and in line with historical expectations. The data used in the process of risk adjustment requires that HCA reports the member as eligible for funding, and that the carrier reports diagnosis codes that are matched with the enrollment record. Milliman determines a reasonable match rate based on their experience with other risk adjustment data sets.

Since raw claims data is heavily protected under HIPPA compliance rules, HCA has limited access to data from third party administrators (Regence) and fully insured carriers. HCA relies on Milliman's analysis and review of the raw claims data to ensure information is accurate and complete. HCA's ERB unit also utilizes comparison tools to perform high level reviews of Milliman's raw feed and the information reported in their memos/other deliverables, including the risk adjustment memo. Although HCA cannot perform a review of raw claims data, they have the following processes to ensure reasonableness of data provided to Milliman:

On a quarterly and annual basis, HCA meets with the carriers to discuss general plan management topics and utilization. The reports supplied during these quarterly meetings are created by the carriers and allow a point of comparison between what the carriers are submitting to Milliman with respect to raw claims, and what the carriers have on record for these amounts.

Each year during rate development HCA uses the completed "Bid Rate Forms" to verify information supplied to Milliman is generally aligned with carrier inputs of information (to include claims by category of service, trends, actuarial memorandums, etc.).

### **Adjustment Calculation**

The Milliman memo details the amount due from/owed to each carrier. All underlying assumptions, analysis of claims data, and methodology are documented within Milliman's memo related to the Risk Adjustment Transfer. Upon receipt of the Milliman calculation, the ERB Finance team performs a review of the calculation for reasonableness and will follow up on significant changes with Milliman. As the contact within HCA, ERB also meets weekly with Milliman during the preparation of the risk adjustment calculation to ensure the calculations appear reasonable with previous year interim analysis. HCA relies on actuary work performed by Milliman for the calculation of the SEBB Risk Rate Adjustment to ensure SEBB receivables are accurately valued for the ACFR (**Key Controls #1 - Valuation**).

### **Year End Adjusting Entry**

HCA uses their excel workbook SEBB Risk Adjustment Transfer to track payments receivable and reconcile that information to the Milliman memo. The workbook show receivables outstanding as of year end. The JV at year end for the SEBB Risk Adjustment Transfer is prepared by an FA and

## State of Washington

reviewed by Rita Homan, Accounting Section Manager, to ensure the entry is accurate and supported by Milliman's calculations (**Key Control #1 - Valuation**).

### How Transactions are Recorded in AFRS:

SEBB Risk Rate Adjustment Transfer - ERB Accountants prepare a journal voucher to record receivables identified by Milliman at year end.

### Key Controls are as follows:

Key Control #1 (Valuation) - HCA relies on actuary work performed by Milliman for the calculation of the SEBB Risk Rate Adjustment to ensure SEBB receivables are accurately valued for the ACFR. At year end, a Fiscal Analyst from the accounting section prepares the SEBB Risk Adjustment Transfer JV and the Accounting Section Manager reviews the entry to ensure the amount is accurate and supported by Milliman's Calculations.

### Noted Weaknesses are as Follows:

None.

### F.5.PR.G - Receivables

*Procedure Step:* Key Control #1 (Manual)

*Prepared By:* EZM, 9/23/2024

*Reviewed By:* RKM, 9/26/2024

Purpose/Conclusion:

#### **Purpose:**

To confirm Fiscal Analyst prepares the SEBB Risk Adjustment Transfer based on actuarial calculations performed by Milliman (Key Control 1 for AFRS) in order to assess control risk.

#### **Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess**

## State of Washington

**control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency.*

***All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be***

## State of Washington

*reported as findings.*

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

# State of Washington

## SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk

Record of Work Done:

**Key Control 1- Valuation:** HCA relies on actuary work performed by Milliman for the calculation of the SEBB Risk Rate Adjustment to ensure SEBB receivables are accurately valued for the ACFR. At year end, a Fiscal Analyst from the accounting section prepares the SEBB Risk Adjustment Transfer JV and the Accounting Section Manager reviews the entry to ensure the amount is accurate and supported by Milliman's Calculations.

The understanding for this system is documented above in the "Controls - Milliman Calculation" step.  
We recieved the Milliman memo on September 20, 2024.

### **1. Confirmation of Key Manual Control:**

We received JV SAJV1600 from Rita Homan, Accounting Section Manager. We noted it was prepared by Katherine Plaquet, Fiscal Analyst 5, on 8/27/2024 and reviewed/approved by Rita Homan, Accounting Section Manager, on 8/27/2024. We noted the total amount to the risk adjustment accruals was \$94,981,952. The entry was broken down into the following: Table 1 2023 Final Risk Adjustment Transfer Overview- Paid through March 2024 Processing Period.

Kaiser Foundation Health Plan of WA (KPWA): -\$50,294,274  
Kaiser Foundation Health Plan of WA Options (KPWAO): \$28,640,705  
Kaiser Foundation Health Plan of the Northwest (KPNW): -\$9,868,009  
Premera: -\$6,178,964

We reviewed the HCA prepared workbook "Accounting\_SEBB 2023 Net Transfer Payment Tables" and all amounts from the entry tied without exception. The workbook was calculated based on actuarial calculations from Milliman and the entry ties to Milliman calculations without exception. See the Milliman memo dated August 30, 2024 at [[Final 2023 SEBB Risk Transfer Report](#)]. To determine if we can rely on the work of Milliman, we performed the rely on specialist step at [[Rely on Work of Specialist](#)].

### **Noted Weaknesses are as follows:**

None.

### **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be

# State of Washington

effective to reduce detection risk to an acceptable level.

### **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

### **F.5.PR.G - Receivables**

*Procedure Step:* Key Control #1 (Manual)

*Prepared By:* EZM, 9/23/2024

*Reviewed By:* RKM, 9/26/2024

Purpose/Conclusion:

#### **Purpose:**

To confirm Fiscal Analyst prepares the SEBB Risk Adjustment Transfer based on actuarial calculations performed by Milliman (Key Control 1 for AFRS) in order to assess control risk.

#### **Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals*

## State of Washington

*ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency.*

***All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.***

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

## State of Washington

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

**Key Control 1- Valuation:** HCA relies on actuary work performed by Milliman for the calculation of the SEBB Risk Rate Adjustment to ensure SEBB receivables are accurately valued for the ACFR. At year end, a Fiscal Analyst from the accounting section prepares the SEBB Risk Adjustment Transfer JV and the Accounting Section Manager reviews the entry to ensure the amount is accurate and supported by Milliman's Calculations.

# State of Washington

The understanding for this system is documented above in the "Controls - Milliman Calculation" step.  
We recieved the Milliman memo on September 20, 2024.

## **1. Confirmation of Key Manual Control:**

We received JV SAJV1600 from Rita Homan, Accounting Section Manager. We noted it was prepared by Katherine Plaquet, Fiscal Analyst 5, on 8/27/2024 and reviewed/approved by Rita Homan, Accounting Section Manager, on 8/27/2024. We noted the total amount to the risk adjustment accruals was \$94,981,952. The entry was broken down into the following: Table 1 2023 Final Risk Adjustment Transfer Overview- Paid through March 2024 Processing Period.

Kaiser Foundation Health Plan of WA (KPWA): -\$50,294,274

Kaiser Foundation Health Plan of WA Options (KPWAO): \$28,640,705

Kaiser Foundation Health Plan of the Northwest (KPNW): -\$9,868,009

Premiera: -\$6,178,964

We reviewed the HCA prepared workbook "Accounting\_SEBB 2023 Net Transfer Payment Tables" and all amounts from the entry tied without exception. The workbook was calculated based on actuarial calculations from Milliman and the entry ties to Milliman calculations without exception. See the Milliman memo dated August 30, 2024 at [[Final 2023 SEBB Risk Transfer Report](#)]. To determine if we can rely on the work of Milliman, we performed the rely on specialist step at [[Rely on Work of Specialist](#)].

## **Noted Weaknesses are as follows:**

None.

## **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

## **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

## **F.5.PR.G - Receivables**

*Procedure Step:* Risk Assessment

*Prepared By:* MRF, 6/18/2024

# State of Washington

*Reviewed By:* RKM, 7/5/2024

Purpose/Conclusion:

**Purpose / Conclusion:**

To assess inherent risk, control risk, and the risk of material misstatement in order to design an initial testing strategy for each assertion.

Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

**STEP 1: Inherent Risk (IR)**

Assess inherent risk for each relevant assertion. This assessment is based on understanding of the entity and the nature of the account balance or class of transactions.

*Inherent risk is the susceptibility of an assertion to material misstatement. It is our assessment of "total threat", which includes both "natural risk" and identified risk indicators, without any regard to any potential control activities. As inherent risk is fully independent of control risk, any understanding of controls cannot be used to increase/decrease the assessment of inherent risk. Consider the following factors as your basis for this assessment:*

*General Considerations*

*Does the balance include transactions that are difficult to audit or involve complex accounting issues?*

*Were there significant misstatements identified in previous audits or prior-period adjustments in the account balance or transaction class? If so, analyzing the cause of prior period misstatements will help in analyzing inherent risk.*

*Are there any inherent risk factors at the entity or industry level, such as changes in regulation or accounting rules, unique transactions or accounting practices, use of information technology, etc that affect the balance?*

*Inherent Risk due to Error*

*How large are the transactions making up the balance? If the balance has only a few large transactions, even a single error may mean a significant misstatement.*

*Have there been changes in the transactions making up the balance that may increase risk? For example, significantly different composition, nature or volume of transactions may inherently disrupt established controls.*

*Are financial events originated or identified by accounting personnel or non-accounting personnel? This consideration is mainly for the completeness assertion.*

*Does the process to account for transactions involve judgment or estimation, complex calculations, numerous steps or significant manual steps?*

## State of Washington

*Do transactions have widely varying attributes that need to be manually identified? For example, grant loans that are accounted for in one of several ways depending on the terms of the agreement.*

*Inherent Risk due to Fraudulent Reporting (intentional misstatements)*

*Are there substantial pressures or motivations to misstate the balance?*

*Inherent Risk due to Misappropriation*

*Is the account balance or transaction class susceptible to sizable misappropriation?*

*Inherent Risk due to Non-Compliance*

*Are there any laws, contracts or grant agreements affecting the balance? If so, would non-compliance lead to sizable misstatements?*

*Are compliance requirements complex, hard to understand, subject to judgment or otherwise difficult to comply with?*

*Are there any motivations or pressures to not comply?*

### **STEP 2: Control Risk (CR)**

Assess control risk by system and assertion. This assessment should be based on the results of the control understanding, confirmation, and (if setting control risk to LOW) testing. If applicable, auditors will evaluate any control deficiencies and determine whether those deficiencies, individually or in combination, are significant deficiencies or material weaknesses.

*Control risk is the risk that material misstatements would not be prevented or detected timely by the system of internal control. Control risk could be thought of as the "vulnerability" of an entity to misstatements. Control risk exists independently of the inherent risk (the level of vulnerability exists independent of the level of threat).*

*Control risk is MAX in both of the following situations: (1) controls aren't tested or (2) controls are problematic and cannot be relied upon. In order to set control risk to LOW, the auditor must test that controls operated effectively throughout the period.*

*A material weakness exists when the design or operation of controls results in a reasonable possibility a material misstatement will not be prevented or detected and corrected in a timely manner. A significant deficiency is less severe than a material weakness, yet important enough to merit the attention of the governing body. **All potential material weaknesses and significant deficiencies should be discussed with the AIC, since they must be reported as findings.***

### **STEP 3: Risk of Material Misstatement (RMM)**

Assess the risk of material misstatement for each relevant assertion for each significant line item. The risk of material misstatement (RMM) is a combination of the auditor's separate assessment of inherent and control risk.

*In practice, the RMM is the amount of substantive evidence that's needed, and the only way to reduce the amount of needed substantive evidence (equal to the inherent risk) is to test controls. As such, when control risk is MAX, the RMM must always equal the inherent risk (IR).*

## State of Washington

*When controls are tested & can be relied upon (are determined to be effective) it is a matter of professional judgment how much the RMM should be set lower than inherent risk (1 or 2 steps).*

*Auditors should assess RMM by assertion, if different. For example, if RMM is assessed at MOD for the existence assertion, but LOW for the rights & obligations assertion, then document "MOD – existence and LOW – rights & obligations".*

### **STEP 4: Design Substantive Testing**

Design a substantive testing strategy that addresses the relevant assertion (identified risk) in the portion of the line item that relates to that risk.

*Planning identifies where to audit (significant balances, classes of transactions & disclosures) what to audit for (relevant assertions), and how much to audit (RMM). The quantity and quality of evidence obtained by substantive tests needs to match the level of risk. The higher the risk of material misstatement, the greater evidence needed. "Greater evidence" could either be greater quantity of evidence, greater quality of evidence, or some combination of greater quality and quantity.*

Guidance/Criteria.:

Record of Work Done.:

#### **(1) Inherent Risk (IR):**

Based on our understanding of the line item, we assessed inherent risk as follows for each relevant assertion and significant class of transactions:

Valuation – **HIGH**

#### **(2) Control Risk (CR):**

We assessed control risk as follows for each system and relevant assertion:

**AFRS – MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

#### **(3) Risk of Material Misstatement (RMM):**

We considered both inherent and control risk and assessed the risk of material misstatement as follows for each relevant assertion and significant class of transactions:

Valuation – HIGH

# State of Washington

## **(4) Testing Strategy:**

We designed our substantive testing strategy based on our assessment of the risk of material misstatement. We plan to perform the following tests:

Obtain June 2023 Risk Adjustment Transfer Memo (for FY 24) from Milliman and tie to HCAs workbook and entry to ensure amounts reported to AFRS are supported by actuarial calculation.

Perform rely on work of others - specialist step (obtained from TeamStore) for Milliman to determine the actuary is creditable and experienced to perform the calculation of SEBB Risk Adjustment for receivables.

We anticipate that these tests will provide sufficient appropriate audit evidence to address the assessed risk of material misstatement for relevant assertions in significant classes of transactions.

## **F.5.PRG - Receivables**

*Procedure Step:* Substantive Test

*Prepared By:* EZM, 9/20/2024

*Reviewed By:* RKM, 10/2/2024

Purpose/Conclusion.:

### **Purpose:**

To determine whether receivables were reported at properly calculated amounts.

### **Conclusion:**

We determined receivables were reported at properly calculated amounts.

Testing Strategy.:

Guidance/Criteria.:

## State of Washington

Record of Work Done:

### **Substantive tests performed to meet the Valuation assertion:**

#### Testing Procedures:

We obtained the June 2023 Risk Adjustment Transfer Memo (for FY24) from Milliman and tied to HCAs workbook and entry to ensure amounts reported to AFRS are supported by actuarial calculation.

We performed the rely on work of others - specialist step (obtained from teamstore) for Milliman to determine the actuary is creditable and experienced to perform the calculation of SEBB Risk Adjustment for receivables.

#### Testing Results:

The SEBB fund 493 covers 99.2% of the total receivables balance based on our breakdown in the lead sheet [[Line Item Lead Sheet](#)]. We noted that the SEBB Risk Adjustment Transfer alone makes up 99.3% of the SEBB fund 493 Receivables balance. See [[SEBB Risk Adjustment Transfer Testing](#)]. We considered this review to provide sufficient coverage of the total receivables balance reported in the health insurance fund. ***No issues noted.***

We obtained the Milliman Memo for the June 2023 Risk Adjustment Transfer [[Final 2023 SEBB Risk Transfer Report](#)] from Sara Whitley, Employee Retiree Benefits Finance Unit Manager. We obtained HCA's year end journal entry, SAJV1600, from Rita Homan, HCA Assistant Accounting Section Manager. We tied amounts directly from HCA's year end entry for each carrier to Milliman's calculation without exception. All reported receivable amounts from carriers were supported by Milliman calculation. See review at [[SEBB Risk Adjustment Transfer Testing](#)]. ***No issues noted.***

We performed a review of specialist work by Milliman to ensure we could rely on their work as part of substantive testing. Based on our review of the specialist's competence, capability, objectivity, and our understanding/evaluation of specialist's work and conclusions, we determined we can rely on Milliman's work. See [[Rely on Work of Specialist](#)]. ***No issues noted.***

### **F.6.PRG - Accounts Payable**

*Procedure Step:* Summary & Conclusion

*Prepared By:* EZM, 10/9/2024

*Reviewed By:* RKM, 11/21/2024

Purpose/Conclusion:

# State of Washington

## **Purpose:**

To evaluate risk assessments and the sufficiency and appropriateness of evidence obtained based on results of substantive work.

## **Conclusion:**

We determined that **no** modifications were necessary to inherent risk, control risk, or the risk of material misstatement as assessed in planning.

We also determined that evidence obtained was sufficient and appropriate in response to the risk of material misstatement.

Testing Strategy:

Auditors are **required** to evaluate conclusions for substantive testing as follows:

*Auditors may wish to use the optional Lead Sheet available in the Store to summarize testing related to each balance and assertion.*

**1.** Determine whether the results of substantive testing indicate a need to modify the inherent risk assessment (IR), control risk assessment (CR), risk of material misstatement (RMM) or other aspects of planning (such as material balances or assertions). If so, document changes and consider the need for additional testing.

*If the results of substantive testing indicate a need to change control risk, auditors should also update the **Permanent File** by either correcting the documentation or by adding an update section describing changes to the top of the record of work done. For all changes to IR, CR, or RMM the **Material Balances** spreadsheet should be updated.*

*More significant changes to other aspects of planning (such as material balances or assertions) should be referenced in this step and documented in detail in the **Changes to FS Audit Plan** step.*

**2.** Evaluate whether the quality and quantity of evidence obtained is sufficient and appropriate in response to the risk of material misstatement. In making this determination, auditors should evaluate:

### **Information to be used as audit evidence:**

Does evidence relate to the population, period of time and risk (assertion and “what could go wrong” from the Material Balance Spreadsheet)? If there are any gaps or uncertainties in the logical connection between the evidence and conclusions, is there a documented consideration and explanation?

Are the sources of information sufficiently reliable and appropriate for the risk (whether internal to the government, external, or auditor developed)? If key information is not from a sufficiently reliable source (for example, inquiry), then is it corroborated by information that is?

## State of Washington

Are there any concerns about accuracy, completeness, authenticity, or bias in information? If so, did the auditor perform sufficient procedures to confirm reliability of that information?

Is information precise enough to catch if misstatements exceeded the tolerable level?

Is information detailed enough to conclude on whether or not there were misstatements?

Was there any information that appeared contradictory or inconsistent? If so, was there a documented response to the inconsistencies or doubts about the reliability of evidence?

### Results:

How much misstatement was identified by testing, and the likelihood and magnitude of further potential misstatement?

How did misstatements occur and how often might they occur again in the population?

Were misstatements caused by control deficiencies or circumvention of controls?

If control deficiencies, is there a need to re-evaluate our understanding of controls in the [Permanent File](#) folder or assessment of control risk?

If circumvention, the [Management Override of Controls](#) step should address or reference this area. Auditors should also consider whether a fraud risk has been identified.

Did tests identify a different level or type of risk than the planned audit response was designed to address?

If likely misstatements are identified, are further procedures necessary to improve the precision of our estimate?

*To support the overall evaluation of audit risk and provide a basis for concluding on the overall sufficiency and appropriateness of evidence in the [FS Summary & Report](#) step, auditors should conclude in each area whether the auditor continues to believe that the tests performed and quality and quantity of evidence obtained are commensurate with RMM for all relevant risks (the "what could go wrong", in the [Material Balances](#) spreadsheet).*

If the auditor determines that evidence is not sufficient or appropriate, additional substantive testing should be done. If sufficient, appropriate evidence is not available for audit, the AIC should discuss the effect on our audit report with the AAM and AM.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6310](#) – Determining the Nature, Timing and Extent of Substantive Testing**

**SAO Audit Policy [3210](#) – Audit Evidence**

# State of Washington

## Record of Work Done:

Based on test results, we re-evaluated risk assessments, procedures, evidence obtained and conclusions as follows:

**(1) Do the results of substantive tests indicate a need to modify our risk assessment (IR, CR and RMM)?**

No, the results of substantive tests do not indicate a need to modify our risk assessment.

**(2) Was the quality and quantity of evidence obtained sufficient and appropriate?**

Yes, the quality and quantity of evidence obtained was sufficient and appropriate.

## F.6.PRG - Accounts Payable

*Procedure Step:* Understanding of Line Item

*Prepared By:* EZM, 6/5/2024

*Reviewed By:* RKM, 6/7/2024

## Purpose/Conclusion:

**Purpose / Conclusion:**

To gain an understanding of the line item and confirm the scope of testing as documented in the Significant Account Matrix.

## Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

**STEP 1: Prior Audit Exceptions**

Document any exceptions noted during the prior audit. Follow-up to determine how the agency has responded to or corrected the issue, unless this work is anticipated as part of the testing strategy.

**STEP 2: Analyze Composition and Changes of Line Item**

## State of Washington

Include link to the line item leadsheet. This will be completed at the end of the audit. Leadsheet analysis should be documented in this spreadsheet.

Inquire with agency staff about the activities and transactions that make up the balance and any changes to those activities or transactions in relation to the prior year.

Determine relevant classes of transactions or account balances within the line item to analyze (such as agencies, funds, programs, departments, accounts, and/or objects), and use AFRS to create trends of those elements. This step should not include any specific dollar amounts associate with the line item.

Evaluate trends to identify:

- (1) What classes of transactions or account balances are primary to the identified risk. Auditors should specifically consider what elements are primary to the line item (comprising a large percentage of the line item), and which elements the identified risk would apply to, and which elements might be most susceptible to the identified risk (having a high risk of non-trivial misstatement for a relevant assertion, considering likelihood and impact of potential for misstatement).
- (2) What changes are primary to the identified risk, if applicable. Auditors should specifically consider whether the overall change to the line item from the prior year was significant, what elements were the primary drivers of overall change, whether any elements changed significantly from the prior year, and which changes (if any) might relate to the identified risk.
- (3) Any unusual or unexpected elements, amounts, or changes that may indicate a risk, whether the one identified in planning or a new one that may need to be considered for a change to the plan.

**Consider** other procedures to gain an understanding of the line item, such as review of key policy documents, review of program information or reports, inquiry of staff, budget information, or other analytical procedures.

### **STEP 3: Update Significant Account Matrix**

Based on your understanding of the line item, update the Significant Account Matrix with final conclusions on the agencies covered, account description, significant accounting systems, and risk (what could go wrong and relevant assertions). The account description should reflect the significant transaction streams or account balances relevant to the risk.

*The description of agencies, significant accounting systems, and what could go wrong in the Significant Account Matrix constitute the overall scope of substantive testing.*

*A transaction stream is significant based on the potential for misstatement. This is often due in part to its size (ie: comprising a large percentage of the total line item), but is ultimately a judgment about the susceptibility to the identified risk (for example, when the risk is understatement a small or omitted account may hold the most potential for the largest misstatement).*

*Significant accounting system(s) are those that contain key controls over significant classes of transactions included in the line item. Control systems identified in this step must match the Significant Account Matrix and have a separate control understanding documented.*

*Talk with the AIC if you identify any changes to the Significant Account Matrix.*

# State of Washington

Guidance/Criteria:

Record of Work Done:

**(1) Prior Audit Exceptions:**

None.

**(2) Composition & Change Analysis:**

Line Item Leadsheet: [\[Line Item Lead Sheet\]](#).

This line item is the total of all GL 5111 balances in the PEBB and SEBB program funds, including administrative funds for the programs. Activity in this line item is for June or prior services (related to the Premiums and Claims line item) that will be paid after fiscal year end (typically in July or August).

*ACFR Database*

We performed an analysis to review the composition of this ACFR line item. See [\[Line Item Lead Sheet\]](#) for details.

We analyzed the payable amounts in the line item lead sheet and identified funds 493 (SEBB) and 721 (PEBB) as the significant funds for this line item. We also noted that the FY23 fund percentage compositions were in line with FY22 with the exception of funds 493 and 721 which each had changes of approximately 22%. Fund 493 decreased from the prior year by 22.36% and fund 721 increased by 22.24%.

We noted that this balance has doubled from FY22. Per Rita Homan, Deputy Accounting Section Manager, this is due to the timing of payments and the cut-off period. There were payments to Regence and Delta Dental that would normally be paid prior to the cut-off that had to be accrued.

**(3) Updates to Significant Account Matrix:**

None.

**F.6.PRG - Accounts Payable**

*Procedure Step:* Controls - AFRS

*Prepared By:* EZM, 4/30/2024

# State of Washington

*Reviewed By:* RKM, 9/11/2024

Purpose/Conclusion:

**Purpose:**

To gain an understanding of internal controls.

**Conclusion:**

We gained an understanding of internal controls as documented in the record of work done.

Testing Strategy:

**The following procedures are required for all material systems:**

1. List the financial statement balance(s) and relevant assertion(s) addressed by the understanding.
2. Gain an understanding of the internal control process, identify how transactions are recorded in AFRS, identify key controls over relevant assertion(s), and note any control weaknesses.
  - In gaining an understanding of controls, consider the overall understanding of State-Level control elements as documented in the "State-Level Controls" step as they relate to this particular system.
  - Identify controls systems covering all relevant assertions for all significant classes of transactions.
  - Standards require the auditor to gain an understanding of the significant accounting system(s) that contain key controls over significant classes of transactions included in the line item.
  - Control systems identified in this step must match the Material Account Matrix and have a separate control understanding documented.
  - Talk with the ACFR Specialist or AIC if you identify different systems than the ones anticipated in the Material Account Matrix.

For each material system, auditors must document:

A brief outline of the transaction flow from beginning to end.

An expanded description of key controls.

Business processes relevant to financial reporting of the relevant assertion for the material balance. Processes should encompass automated and manual procedures by which transactions or events are identified or initiated, authorized as needed, recorded, processed and corrected as needed.

Original accounting records and how records are rolled-up to intermediary ledgers and transferred to the general ledger (AFRS) or financial statements.

## State of Washington

Detailed descriptions of key controls. Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

The following is information to **consider** when identifying key controls and transaction flow.

“Key controls” refer to the few controls that together provide reasonable assurance that material misstatements will be prevented or detected and corrected. This is contrasted with ancillary or supporting controls, which – although helpful and recommended – would provide less than reasonable assurance by themselves.

The focus of the write-up is on the key controls. Key controls should be specifically identified (as “key controls”) in the write-up. This can be done in whatever way the auditor prefers, so long as it is obvious. Details that the auditor should document regarding key controls may include:

- Who or what initiates the control
- When (or how often) is the control applied
- Who performs the control
- As needed, the experience, knowledge and attitude of the person applying the control
- Detailed description of the control process or activity. For example, if the control is a review: what exactly is reviewed, what is the reviewer looking at or for and what are the reviewer’s criteria?
- How the key control is documented or evidenced
- If not obvious from the description, how the control prevents or timely detects and corrects misstatements
- Any exceptions or alternative processing to the normal process
- What happens when misstatements or issues are identified by the control

The “transaction flow” refers to the process by which transactions are initiated, authorized, recorded, processed and reported (as applicable). Outlining the transaction flow gives context to key controls, especially how transactions become subject to controls in the first place. If a control inherently ensures that all applicable transactions are included (ex: bank reconciliation where the assertion is existence), the auditor may decide to just start the write-up with the initiation of the control procedure and go from there.

Elements of the transaction flow are defined informally as follows:

*Initiation:* How are transactions initiated?

*Authorization:* How are transactions and accounting record maintenance authorized?

*Recording:* How are transactions or balances identified and recorded in financial accounting systems?

# State of Washington

*Processing:* How are the transactions or balances processed after they are recorded (if at all)? Processing may be manual or automated and may occur at a subsidiary system level or at the general ledger level.

*Reporting:* How are records translated into the financial statements? This part of the transaction flow extends the understanding to the actual financial statements that the audit is opining on. Since we already document an understanding of the financial reporting process in general, it is usually enough to simply reference this overall understanding. However, if there are important steps unique to the covered balances, it may be more appropriate to mention them here.

Although transaction flow is a good way to think about understanding and documenting a control system, auditors should not worry too much about documenting “each element, in order” because often elements may be combined, not noticeable, not applicable or occur in a different order.

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits](#) Planning Guide**

Record of Work Done:

## **Material Balance(s) and Assertions**

Internal controls in AFRS address the following balance(s):

Accounts Payable

For the following assertions:

Valuation - There is a risk that PEBB/SEBB premiums & claims services accrued to accounts payable are not adequately supported by invoices or weekly claims requests. There is a risk that these accruals are not properly valued (e.g. the amount accrued does not correspond with the invoiced amount).

## **Gain an Understanding of Internal Controls**

We met with Rita Homan, Deputy Accounting Section Manager, and Lisa Kolle, PEB Accounting Manager, on April 18, 2024, to gain an

## State of Washington

understanding of the controls over Accounts Payable.

Every month, HCA receives invoices from third party administrators (TPA) including MODA, Regence, and Delta Dental) which are sent to a shared accounts payable inbox directly by the TPAs. A Fiscal Analyst 3 or 4 will review the invoices and run a report from the claims SQL database for the specific date range of the invoice. If the claims data report and invoice amounts do not tie for a particular TPA, the Fiscal Analyst will contact the internal HCA account manager of that TPA and will work with them to reconcile the difference. When the claims detail and invoice tie, the Fiscal Analyst reaches out to the internal HCA account manager to get their approval to pay and once they offer their approval, the Fiscal Analyst prepares the A19 and the SQL claims report to support the payment accrual. The Fiscal Analyst enters the transaction into AFRS and uploads documentation (A19, SQL claims report, invoice) into WebAX (HCA's digital documentation system) for review. Katherine Plaquet, Fiscal Analyst 5, reviews and releases the transaction in AFRS. The Fiscal Analyst 5 reviews the transaction to ensure they are supported by appropriate documentation and that coding and amounts are accurate.

At the end of every month, a Fiscal Analyst 4 performs GL 5111 reconciliation for many of the funds associated with this GL. Reconciliations are performed on funds 418, 439, 492, 493, 494, and 721 as these are the funds with the most activity. The dental admin funds (438 and 475) only have one payment each month and are not reconciled with an official reconciliation document. The Fiscal Analyst performs the reconciliation using an "Outstanding Balance Detail" report to ensure that the vendors being paid are expected, transactions are properly clearing the GL, and transactions are coded and valued correctly. Once complete, they will email the reconciliation to Katherine Plaquet, Fiscal Analyst 5, for secondary review to ensure the accounts payable balance is valued correctly (**Key Control #1 - Valuation**).

### **How Transactions are Recorded in AFRS:**

The Fiscal Analyst enters the transaction into AFRS and uploads data into WebAX. A Fiscal Analyst 5 reviews and releases the transactions into AFRS.

### **Key Controls are as Follows:**

**Key Control #1 - (Valuation - Manual)** - At the end of every month, a Fiscal Analyst performs the GL 5111 reconciliations using an "Outstanding Balance Detail" report to ensure that the vendors being paid are expected, transactions are properly clearing the GL, and transactions are coded and valued correctly. Once complete, the Fiscal Analyst will email the reconciliation to a Fiscal Analyst 5 for secondary review to ensure the accounts payable balance is valued correctly.

### **Noted Weaknesses are as Follows:**

None.

### **F.6.PR.G - Accounts Payable**

# State of Washington

*Procedure Step:* Key Control #1 (Manual)  
*Prepared By:* EZM, 5/15/2024  
*Reviewed By:* RKM, 7/5/2024

## Purpose/Conclusion:

### **Purpose:**

To confirm that at the end of every month, a Fiscal Analyst performs the GL 5111 reconciliations using an "Outstanding Balance Detail" report to ensure that the vendors being paid are expected, transactions are properly clearing the GL, and transactions are coded and valued correctly, and that a Fiscal Analyst 5 then performs a secondary review of this reconciliation (**Key Control #1 for AFRS**) in order to assess control risk.

### **Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls. However, we noted the following insignificant control deficiency:

HCA staff did not prepare or review the November 2023 GL 5111 reconciliations in a timely manner. Per our control understanding, Fiscal Analysts are supposed to perform these reconciliations at the end of every month, but the PEBB GL 5111 November 2023 reconciliation wasn't performed until the end of January 2024, and the SEBB GL5111 November 2023 reconciliation wasn't performed until March 2024. When we inquired with Rita Homan, Deputy Accounting Section Manager, about this, she informed us that HCA tries to perform these reconciliations on a monthly basis, but they weren't able to during this fiscal year due to being short staffed. **See issue: [V: HCA Accounts Payable Reconciliations Were Not Performed Timely]**

## Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has*

## State of Washington

*been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*
