*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency.*

***All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.***

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional*

## State of Washington

*testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

**Key Control 1 (Valuation):** At the end of every month, a Fiscal Analyst performs the GL 5111 reconciliations using an "Outstanding Balance Detail" report to ensure that the vendors being paid are expected, transactions are properly clearing the GL, and transactions are coded and valued correctly. Once complete, the Fiscal Analyst will email the reconciliation to a Fiscal Analyst 5 for secondary review to ensure the accounts

# State of Washington

payable balance is valued correctly.

The understanding for this system is documented above in the "Controls - AFRS" step.

## **1. Confirmation of Key Manual Control:**

Rita Homan, Deputy Accounting Section Manager, provided the fund 493 (SEBB) and fund 721 (PEBB) fiscal month 05 (November 2023) reconciliations.

**PEBB** - We reviewed the FM05 GL 5111 reconciliation for fund 721 and noted that the reconciliation was created by Michael Williamson, Fiscal Analyst, on 1/31/2024 and was reviewed and approved by Katherine Plaquet, Fiscal Analyst 5, on 1/31/2024. We also reviewed the "Download by Vendor" tab in the excel spreadsheet, which serves as the the "Outstanding Balance Detail" report, which detailed the amount owed to each vendor, the transaction code used, and the total amount payable for fund 493 as of 11/30/2023. We noted that the following transaction codes were used to account for GL 5111:

- 198 - Refund Recorded as Revenue (TREA)
- 210 - Record Account/Voucher Payable - No Encumbrance (TREA)
- 390 - Pay Revenue Account/Voucher Payable - No Encumbrance (TREA)
- 397 - Pay Account/Voucher Payable (TREA)
- 398 - Pay Expenditure Account/Voucher Payable (TREA)
- 736 - Record Account/Voucher Payable - No Encumbrance
- 955 - Request Warrant
- 956 - N/ALL\_PAY\_ACCRUED\_CONTRACTS\_PAYABLE

We inspected the [Transaction Code Table spreadsheet from OFM's website](#) and we noted that each of these transaction codes feed into GL 5111, and as such, we've determined that these accounts payable transactions were properly recorded. The final balance of (\$30,817,968.09.18) on the reconciliation ties to the November 2023 fund 721 GL break down tab and the outstanding balance detail tab without exception.

**SEBB** - We reviewed the FM05 GL 5111 reconciliation for fund 493 and noted that the reconciliation was created by Oanh Pham, Fiscal Analyst, on 3/19/2024 and was reviewed and approved by Katherine Plaquet, Fiscal Analyst 5, on 3/19/2024. We also reviewed the "Download by Vendor" tab in the excel spreadsheet, which serves as the the "Outstanding Balance Detail" report, which detailed the amount owed to each vendor, the transaction code used, and the total amount payable for fund 493 as of 11/30/2023. We noted that the following transaction codes were used to account for GL 5111:

- 198 - Refund Recorded as Revenue (TREA)
- 210 - Record Account/Voucher Payable - No Encumbrance (TREA)
- 390 - Pay Revenue Account/Voucher Payable - No Encumbrance (TREA)
- 397 - Pay Account/Voucher Payable (TREA)

# State of Washington

398 - Pay Expenditure Account/Voucher Payable (TREA)  
736 - Record Account/Voucher Payable - No Encumbrance  
955 - Request Warrant  
956 - N/ALL\_PAY\_ACCRUED\_CONTRACTS\_PAYABLE

We inspected the [Transaction Code Table spreadsheet from OFM's website](#) and we noted that each of these transaction codes feed into GL 5111, and as such, we've determined that these accounts payable transactions were properly recorded. The final balance of (\$12,600,986.91) on the reconciliation ties to the November 2023 fund 493 GL break down tab and the outstanding balance detail tab with no exceptions.

## **Noted Weaknesses are as follows:**

HCA staff did not prepare or review the November 2023 GL 5111 reconciliations in a timely manner. Per our control understanding, Fiscal Analysts are supposed to perform these reconciliations at the end of every month, but the PEBB GL 5111 November 2023 reconciliation wasn't performed until the end of January 2024, and the SEBB GL 5111 November 2023 reconciliation wasn't performed until March 2024. When we inquired with Rita Homan, Deputy Accounting Section Manager, about this, she informed us that HCA tries to perform these reconciliations on a monthly basis, but they weren't able to during this fiscal year due to being short staffed. **See issue linked in conclusion above.**

## **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

## **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

## **F.6.PR.G - Accounts Payable**

*Procedure Step:* Risk Assessment  
*Prepared By:* EZM, 5/17/2024  
*Reviewed By:* RKM, 9/11/2024

# State of Washington

Purpose/Conclusion:

**Purpose / Conclusion:**

To assess inherent risk, control risk, and the risk of material misstatement in order to design an initial testing strategy for each assertion.

Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

**STEP 1: Inherent Risk (IR)**

Assess inherent risk for each relevant assertion. This assessment is based on understanding of the entity and the nature of the account balance or class of transactions.

*Inherent risk is the susceptibility of an assertion to material misstatement. It is our assessment of "total threat", which includes both "natural risk" and identified risk indicators, without any regard to any potential control activities. As inherent risk is fully independent of control risk, any understanding of controls cannot be used to increase/decrease the assessment of inherent risk. Consider the following factors as your basis for this assessment:*

*General Considerations*

*Does the balance include transactions that are difficult to audit or involve complex accounting issues?*

*Were there significant misstatements identified in previous audits or prior-period adjustments in the account balance or transaction class? If so, analyzing the cause of prior period misstatements will help in analyzing inherent risk.*

*Are there any inherent risk factors at the entity or industry level, such as changes in regulation or accounting rules, unique transactions or accounting practices, use of information technology, etc that affect the balance?*

*Inherent Risk due to Error*

*How large are the transactions making up the balance? If the balance has only a few large transactions, even a single error may mean a significant misstatement.*

*Have there been changes in the transactions making up the balance that may increase risk? For example, significantly different composition, nature or volume of transactions may inherently disrupt established controls.*

*Are financial events originated or identified by accounting personnel or non-accounting personnel? This consideration is mainly for the completeness assertion.*

*Does the process to account for transactions involve judgment or estimation, complex calculations, numerous steps or significant manual steps?*

*Do transactions have widely varying attributes that need to be manually identified? For example, grant loans that are accounted for in one of several ways depending on the terms of the agreement.*

*Inherent Risk due to Fraudulent Reporting (intentional misstatements)*

## State of Washington

*Are there substantial pressures or motivations to misstate the balance?*

*Inherent Risk due to Misappropriation*

*Is the account balance or transaction class susceptible to sizable misappropriation?*

*Inherent Risk due to Non-Compliance*

*Are there any laws, contracts or grant agreements affecting the balance? If so, would non-compliance lead to sizable misstatements?*

*Are compliance requirements complex, hard to understand, subject to judgment or otherwise difficult to comply with?*

*Are there any motivations or pressures to not comply?*

### **STEP 2: Control Risk (CR)**

Assess control risk by system and assertion. This assessment should be based on the results of the control understanding, confirmation, and (if setting control risk to LOW) testing. If applicable, auditors will evaluate any control deficiencies and determine whether those deficiencies, individually or in combination, are significant deficiencies or material weaknesses.

*Control risk is the risk that material misstatements would not be prevented or detected timely by the system of internal control. Control risk could be thought of as the "vulnerability" of an entity to misstatements. Control risk exists independently of the inherent risk (the level of vulnerability exists independent of the level of threat).*

*Control risk is MAX in both of the following situations: (1) controls aren't tested or (2) controls are problematic and cannot be relied upon. In order to set control risk to LOW, the auditor must test that controls operated effectively throughout the period.*

*A material weakness exists when the design or operation of controls results in a reasonable possibility a material misstatement will not be prevented or detected and corrected in a timely manner. A significant deficiency is less severe than a material weakness, yet important enough to merit the attention of the governing body. **All potential material weaknesses and significant deficiencies should be discussed with the AIC, since they must be reported as findings.***

### **STEP 3: Risk of Material Misstatement (RMM)**

Assess the risk of material misstatement for each relevant assertion for each significant line item. The risk of material misstatement (RMM) is a combination of the auditor's separate assessment of inherent and control risk.

*In practice, the RMM is the amount of substantive evidence that's needed, and the only way to reduce the amount of needed substantive evidence (equal to the inherent risk) is to test controls. As such, when control risk is MAX, the RMM must always equal the inherent risk (IR).*

*When controls are tested & can be relied upon (are determined to be effective) it is a matter of professional judgment how much the RMM should be set lower than inherent risk (1 or 2 steps).*

## State of Washington

*Auditors should assess RMM by assertion, if different. For example, if RMM is assessed at MOD for the existence assertion, but LOW for the rights & obligations assertion, then document "MOD – existence and LOW – rights & obligations".*

### **STEP 4: Design Substantive Testing**

Design a substantive testing strategy that addresses the relevant assertion (identified risk) in the portion of the line item that relates to that risk.

*Planning identifies where to audit (significant balances, classes of transactions & disclosures) what to audit for (relevant assertions), and how much to audit (RMM). The quantity and quality of evidence obtained by substantive tests needs to match the level of risk. The higher the risk of material misstatement, the greater evidence needed. "Greater evidence" could either be greater quantity of evidence, greater quality of evidence, or some combination of greater quality and quantity.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6210](#) – Planning Financial Statement Audits**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits Planning Guide](#)**

Record of Work Done:

### **(1) Inherent Risk (IR):**

Based on our understanding of the line item, we assessed inherent risk as follows for each relevant assertion and significant class of transactions:

Valuation – **HIGH**

### **(2) Control Risk (CR):**

We assessed control risk as follows for each system and relevant assertion:

AFRS – Valuation

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

## State of Washington

### **(3) Risk of Material Misstatement (RMM):**

We considered both inherent and control risk and assessed the risk of material misstatement as follows for each relevant assertion and significant class of transactions:

Valuation – **High**

### **(4) Testing Strategy:**

We designed our substantive testing strategy based on our assessment of the risk of material misstatement. We plan to perform the following tests:

**Valuation** - We will use the sampling spreadsheet to determine our sample size. We will test year-end accruals to ensure that the valuation of the accrual is properly supported (invoice amount).

We anticipate that these tests will provide sufficient appropriate audit evidence to address the assessed risk of material misstatement for relevant assertions in significant classes of transactions.

### **F.6.PR.G - Accounts Payable**

*Procedure Step:* Risk Assessment

*Prepared By:* EZM, 5/17/2024

*Reviewed By:* RKM, 9/11/2024

Purpose/Conclusion:

#### **Purpose / Conclusion:**

To assess inherent risk, control risk, and the risk of material misstatement in order to design an initial testing strategy for each assertion.

Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

#### **STEP 1: Inherent Risk (IR)**

## State of Washington

Assess inherent risk for each relevant assertion. This assessment is based on understanding of the entity and the nature of the account balance or class of transactions.

*Inherent risk is the susceptibility of an assertion to material misstatement. It is our assessment of "total threat", which includes both "natural risk" and identified risk indicators, without any regard to any potential control activities. We considered both inherent and control risk and assessed the risk of material misstatement as follows for each relevant assertion and significant class of transactions:

Valuation – **High**

### **(4) Testing Strategy:**

We designed our substantive testing strategy based on our assessment of the risk of material misstatement. We plan to perform the following tests:

# State of Washington

**Valuation** - We will use the sampling spreadsheet to determine our sample size. We will test year-end accruals to ensure that the valuation of the accrual is properly supported (invoice amount).

We anticipate that these tests will provide sufficient appropriate audit evidence to address the assessed risk of material misstatement for relevant assertions in significant classes of transactions.

## G.1.PRG - Due From Other Governments

*Procedure Step:* Summary & Conclusion

*Prepared By:* EJB, 10/4/2024

*Reviewed By:* CJG, 11/20/2024

Purpose/Conclusion:

### **Purpose:**

To evaluate risk assessments and the sufficiency and appropriateness of evidence obtained based on results of substantive work.

### **Conclusion:**

We determined that **one** modification was deemed necessary to the risk of material misstatement as assessed in planning. See the audit issue detailed in the substantive testing ROWD [[Substantive Test](#)]. See audit issue here [[V: ECY\\_Application of Loan Payments](#)].

We also determined that evidence obtained was sufficient and appropriate in response to the risk of material misstatement.

Testing Strategy:

Auditors are **required** to evaluate conclusions for substantive testing as follows:

*Auditors may wish to use the optional Lead Sheet available in the Store to summarize testing related to each balance and assertion.*

**1.** Determine whether the results of substantive testing indicate a need to modify the inherent risk assessment (IR), control risk assessment (CR), risk of material misstatement (RMM) or other aspects of planning (such as material balances or assertions). If so, document changes and consider the need for additional testing.

## State of Washington

*If the results of substantive testing indicate a need to change control risk, auditors should also update the [Permanent File](#) by either correcting the documentation or by adding an update section describing changes to the top of the record of work done. For all changes to IR, CR, or RMM the [Material Balances](#) spreadsheet should be updated.*

*More significant changes to other aspects of planning (such as material balances or assertions) should be referenced in this step and documented in detail in the [Changes to FS Audit Plan](#) step.*

2. Evaluate whether the quality and quantity of evidence obtained is sufficient and appropriate in response to the risk of material misstatement. In making this determination, auditors should evaluate:

### Information to be used as audit evidence:

- Does evidence relate to the population, period of time and risk (assertion and “what could go wrong” from the Material Balance Spreadsheet)? If there are any gaps or uncertainties in the logical connection between the evidence and conclusions, is there a documented consideration and explanation?
- Are the sources of information sufficiently reliable and appropriate for the risk (whether internal to the government, external, or auditor developed)? If key information is not from a sufficiently reliable source (for example, inquiry), then is it corroborated by information that is?
- Are there any concerns about accuracy, completeness, authenticity, or bias in information? If so, did the auditor perform sufficient procedures to confirm reliability of that information?
- Is information precise enough to catch if misstatements exceeded the tolerable level?
- Is information detailed enough to conclude on whether or not there were misstatements?
- Was there any information that appeared contradictory or inconsistent? If so, was there a documented response to the inconsistencies or doubts about the reliability of evidence?

### Results:

- How much misstatement was identified by testing, and the likelihood and magnitude of further potential misstatement?
- How did misstatements occur and how often might they occur again in the population?
- Were misstatements caused by control deficiencies or circumvention of controls?
  - If control deficiencies, is there a need to re-evaluate our understanding of controls in the [Permanent File](#) folder or assessment of control risk?
  - If circumvention, the [Management Override of Controls](#) step should address or reference this area. Auditors should also consider whether a fraud risk has been identified.
  - Did tests identify a different level or type of risk than the planned audit response was designed to address?
  - If likely misstatements are identified, are further procedures necessary to improve the precision of our estimate?

## State of Washington

*To support the overall evaluation of audit risk and provide a basis for concluding on the overall sufficiency and appropriateness of evidence in the **FS Summary & Report** step, auditors should conclude in each area whether the auditor continues to believe that the tests performed and quality and quantity of evidence obtained are commensurate with RMM for all relevant risks (the "what could go wrong", in the **Material Balances** spreadsheet).*

If the auditor determines that evidence is not sufficient or appropriate, additional substantive testing should be done. If sufficient, appropriate evidence is not available for audit, the AIC should discuss the effect on our audit report with the AAM and AM.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6310](#) – Determining the Nature, Timing and Extent of Substantive Testing**

**SAO Audit Policy [3210](#) – Audit Evidence**

Record of Work Done:

Based on test results, we re-evaluated risk assessments, procedures, evidence obtained and conclusions as follows:

### **(1) Do the results of substantive tests indicate a need to modify our risk assessment (IR, CR and RMM)?**

The results of the substantive tests indicated a need to modify our risk assessment. We initially assessed the RMM as low given that there were no prior year valuation issues, and that the automated process for eHub has not been an issue in prior years. The current year issue referenced above resulted in the need to raise the RMM from low to mod, which resulted in the sample size being raised from 21 to 29. The additional samples met all tests without error.

### **(2) Was the quality and quantity of evidence obtained sufficient and appropriate?**

The quality and quantity of evidence obtained was sufficient and appropriate.

### **G.1.PRG - Due From Other Governments**

*Procedure Step:* Understanding of Line Item

# State of Washington

*Prepared By:* EJB, 7/9/2024

*Reviewed By:* CJG, 11/20/2024

Purpose/Conclusion:

**Purpose / Conclusion:**

To gain an understanding of the line item and confirm the scope of testing as documented in the Significant Account Matrix.

Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

**STEP 1: Prior Audit Exceptions**

Document any exceptions noted during the prior audit. Follow-up to determine how the agency has responded to or corrected the issue, unless this work is anticipated as part of the testing strategy.

**STEP 2: Analyze Composition and Changes of Line Item**

Include link to the line item leadsheet. This will be completed at the end of the audit. Leadsheet analysis should be documented in this spreadsheet.

Inquire with agency staff about the activities and transactions that make up the balance and any changes to those activities or transactions in relation to the prior year.

Determine relevant classes of transactions or account balances within the line item to analyze (such as agencies, funds, programs, departments, accounts, and/or objects), and use AFRS to create trends of those elements. This step should not include any specific dollar amounts associate with the line item.

Evaluate trends to identify:

- (1) What classes of transactions or account balances are primary to the identified risk. Auditors should specifically consider what elements are primary to the line item (comprising a large percentage of the line item), and which elements the identified risk would apply to, and which elements might be most susceptible to the identified risk (having a high risk of non-trivial misstatement for a relevant assertion, considering likelihood and impact of potential for misstatement).
- (2) What changes are primary to the identified risk, if applicable. Auditors should specifically consider whether the overall change to the line item from the prior year was significant, what elements were the primary drivers of overall change, whether any elements changed

## State of Washington

significantly from the prior year, and which changes (if any) might relate to the identified risk.

(3) Any unusual or unexpected elements, amounts, or changes that may indicate a risk, whether the one identified in planning or a new one that may need to be considered for a change to the plan.

**Consider** other procedures to gain an understanding of the line item, such as review of key policy documents, review of program information or reports, inquiry of staff, budget information, or other analytical procedures.

### STEP 3: Update Significant Account Matrix

Based on your understanding of the line item, update the Significant Account Matrix with final conclusions on the agencies covered, account description, significant accounting systems, and risk (what could go wrong and relevant assertions). The account description should reflect the significant transaction streams or account balances relevant to the risk.

*The description of agencies, significant accounting systems, and what could go wrong in the Significant Account Matrix constitute the overall scope of substantive testing.*

*A transaction stream is significant based on the potential for misstatement. This is often due in part to its size (ie: comprising a large percentage of the total line item), but is ultimately a judgment about the susceptibility to the identified risk (for example, when the risk is understatement a small or omitted account may hold the most potential for the largest misstatement).*

*Significant accounting system(s) are those that contain key controls over significant classes of transactions included in the line item. Control systems identified in this step must match the Significant Account Matrix and have a separate control understanding documented.*

*Talk with the AIC if you identify any changes to the Significant Account Matrix.*

Guidance/Criteria.:

Record of Work Done.:

#### **(1) Prior Audit Exceptions:**

One prior audit exception has been noted in the Department of Ecology - Clean Water State Revolving Fund financial statements surrounding classification issues between short term and long term receivable. However, this will not be an issue for the ACFR as the statement of financial position is not classified.

#### **(2) Composition & Change Analysis:**

Line Item Leadsheet: [\[Line Item Lead Sheet\]](#).

#### **Background**

The Clean Water State Revolving Fund (CWSRF), using funding provided by the Environmental Protection Agency (EPA), provides loans to eligible recipients for water infrastructure projects. The funding is made available to local government entities for projects such as updating or

# State of Washington

constructing treatment centers, creating national estuary programs, improving energy efficiency, and reusing/recycling of waste water/storm water among other eligible uses.

The loans receivable balance represents the principal receivable for water infrastructure loans in the upcoming fiscal year plus any accrued interest. Loans receivable is not reduced by an allowance for doubtful accounts. Loan recipients have never defaulted on loans in the history of the program. Loan recipients are incentivized to make timely payments and close their loan so they will be granted low interest or forgivable loans in the future. We determined that it is reasonable for the CWSRF to not maintain an allowance for doubtful accounts.

Accrued interest is recorded from the time of the last payment received in the current fiscal year, to the current fiscal year end.

### **(3) Updates to Significant Account Matrix:**

We noted no updates to the Significant Account Matrix.

### **G.1.PRG - Due From Other Governments**

*Procedure Step:* Controls - eHub  
*Prepared By:* EJB, 7/18/2024  
*Reviewed By:* CJG, 11/20/2024

Purpose/Conclusion.:

#### **Purpose:**

To gain an understanding of internal controls.

#### **Conclusion:**

We gained an understanding of internal controls as documented in the record of work done.

Testing Strategy.:

#### **The following procedures are required for all material systems:**

1. List the financial statement balance(s) and relevant assertion(s) addressed by the understanding.

## State of Washington

2. Gain an understanding of the internal control process, identify how transactions are recorded in AFRS, identify key controls over relevant assertion(s), and note any control weaknesses.

In gaining an understanding of controls, consider the overall understanding of State-Level control elements as documented in the "State-Level Controls" step as they relate to this particular system.

Identify controls systems covering all relevant assertions for all significant classes of transactions.

Standards require the auditor to gain an understanding of the significant accounting system(s) that contain key controls over significant classes of transactions included in the line item.

Control systems identified in this step must match the Material Account Matrix and have a separate control understanding documented.

Talk with the ACFR Specialist or AIC if you identify different systems than the ones anticipated in the Material Account Matrix.

For each material system, auditors must document:

A brief outline of the transaction flow from beginning to end.

An expanded description of key controls.

Business processes relevant to financial reporting of the relevant assertion for the material balance. Processes should encompass automated and manual procedures by which transactions or events are identified or initiated, authorized as needed, recorded, processed and corrected as needed.

Original accounting records and how records are rolled-up to intermediary ledgers and transferred to the general ledger (AFRS) or financial statements.

Detailed descriptions of key controls. Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

The following is information to **consider** when identifying key controls and transaction flow.

"Key controls" refer to the few controls that together provide reasonable assurance that material misstatements will be prevented or detected and corrected. This is contrasted with ancillary or supporting controls, which – although helpful and recommended – would provide less than reasonable assurance by themselves.

The focus of the write-up is on the key controls. Key controls should be specifically identified (as "key controls") in the write-up. This can be done in whatever way the auditor prefers, so long as it is obvious. Details that the auditor should document regarding key controls may include:

Who or what initiates the control

When (or how often) is the control applied

## State of Washington

Who performs the control

As needed, the experience, knowledge and attitude of the person applying the control

Detailed description of the control process or activity. For example, if the control is a review: what exactly is reviewed, what is the reviewer looking at or for and what are the reviewer's criteria?

How the key control is documented or evidenced

If not obvious from the description, how the control prevents or timely detects and corrects misstatements

Any exceptions or alternative processing to the normal process

What happens when misstatements or issues are identified by the control

The "transaction flow" refers to the process by which transactions are initiated, authorized, recorded, processed and reported (as applicable). Outlining the transaction flow gives context to key controls, especially how transactions become subject to controls in the first place. If a control inherently ensures that all applicable transactions are included (ex: bank reconciliation where the assertion is existence), the auditor may decide to just start the write-up with the initiation of the control procedure and go from there.

Elements of the transaction flow are defined informally as follows:

*Initiation:* How are transactions initiated?

*Authorization:* How are transactions and accounting record maintenance authorized?

*Recording:* How are transactions or balances identified and recorded in financial accounting systems?

*Processing:* How are the transactions or balances processed after they are recorded (if at all)? Processing may be manual or automated and may occur at a subsidiary system level or at the general ledger level.

*Reporting:* How are records translated into the financial statements? This part of the transaction flow extends the understanding to the actual financial statements that the audit is opining on. Since we already document an understanding of the financial reporting process in general, it is usually enough to simply reference this overall understanding. However, if there are important steps unique to the covered balances, it may be more appropriate to mention them here.

Although transaction flow is a good way to think about understanding and documenting a control system, auditors should not worry too much about documenting "each element, in order" because often elements may be combined, not noticeable, not applicable or occur in a different order.

Guidance/Criteria:
--------------------

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

# State of Washington

## SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk

### [Financial Statement Audits](#) Planning Guide

Record of Work Done:

#### **Significant Balance(s) and Assertions**

Internal controls in eHub address the following balance(s):

Due From Other Governments

For the following assertion:

Valuation - There is a risk that loans receivable could be miscalculated due to errors in the application of payments or errors in amortization.

#### **1. Gain an Understanding of Internal Controls**

We met with Carla Clarey, Revenues Manager, and Beth Swanson, Senior Financial Advisor, on June 3, 2024 to gain an understanding of controls over loans receivable (controls are consistent with prior year, and there were no changes to the process in FY24).

#### **Loan Creation/Fund Disbursement**

Carla explained that the loan process begins with the agreement between the Department of Ecology and the loan recipient. Agreements are structured using a loan agreement template within Ecology's Administration of Grants and Loans system (EAGL). The language remains similar between agreements but key information such as interest rates, loan lifetime, loan amounts are added to the template agreement. The agreement goes through a system of reviews to ensure accuracy of loan details and sent to the loan recipient for signature.

The loan amount from the signed agreement will be encumbered to allocate funds towards that loan. The loan interest rate and number of years is input from the signed agreement. Per Carla, all information input into the Ecology Helping Unify Business software system (eHub) undergoes a second review by a supervisor. Generally, a Fiscal Analyst 2 will enter information (loan interest rate, loan amount, length of loan from loan agreement) into eHub, a Fiscal Analyst 4 or Clara will review eHub entries for accuracy based on loan agreement details. The actual loan receivable balance is only increased as they get payment request progress reports (PRPRs) to create payments and disburse the funds.

Deferred interest also accrues on a monthly basis from the first payment until the loan is finalized. When the project is completed, the loan amortization schedule is created based on the final loan amount and loan terms. After the amortization schedules have been finalized, they are sent to loan recipients with their final loan agreement, final contract, and the client signs the contract.

## State of Washington

The amortization schedules provide expected values for upcoming principal payments so long as the loan recipient sticks to the repayment plan. If the recipient falls behind (rare) or pays portions or all of the loan off early (common), the remaining principal will not tie to the original amortization schedule. Early payments remove principal owed from the end of the loan (last payment) and does not influence the amount of interest in earlier scheduled repayments. eHub will track and adjust actual/expected payment amounts within the Loan Customer Payments Screen if there were changes to the original payment schedule as a result of early repayment. The loans receivable balance (expected payments) are calculated and created by eHub based on loan agreement information and actual loan transactions **(Key Control 1 - Valuation - Automated Software Calculation)**

### **How Transactions are Recorded in AFRS:**

#### Reclassification

eHub creates a JV that automatically pulls the amounts and puts them into account coding to transfer funds from 1652 (long-term) to 1352 (short-term) for the portion of the loan excepted to be paid in the next fiscal year based on the amortization schedules. eHub creates JVs based on manual entries of key loan information from the system and should match loan agreement details. The coding is prepared in the JV by eHub, staff only need to add the current document number to make the account transfer. Staff performs a manual review of the JVs. There are also smaller adjustments made when a loan goes into repayment throughout the year as loans close out and their amortization schedule is finalized.

At year end, reclassification is done annually based on the amortization schedules. Finance staff attempt to reconcile known adjustments from the amortization schedules through a GL 1352-1652 adjustment worksheet. Due to limitations of eHub system reports, and issues that occurred during system conversion, finance staff has not been able to fully reconcile or determine differences of short term/long term amounts receivable between AFRS and eHub. When the legacy system was converted to eHub, long term balances loaded incorrectly as short term. Per Beth, entries within eHub also may not be accurately recorded as short term/long term due to issues with transaction codes not being recognized by the eHub system. Without any reliable system reports, eHub remains unreconciled to reported balances. This will not be an issue for the ACFR audit as there is not a classified statement of financial position.

Beth performs a reconciliation between eHub's AR subsidiary ledger and AFRS using a Webi query of AFRS GL 1352 and 1652 data to ensure amounts were properly valued **(Key Control 2 - Valuation)**. She uses the 1352-1652 worksheet that uses webi query data and loan status information from eHub to make adjustments. She reviews the 1352-1652 worksheet to identify accounts:

- that have paid their loans off during the year
- signed their agreement late
- have a deferred payment period over the next fiscal year
- amendments to loans
- other changes to loan payment amounts.

Beth will make the appropriate adjustment based on the above and document final amounts to be reported in AFRS.

#### Accrued Interest

## State of Washington

Carla explained that at year-end they run a report from eHub that pulls all accrued interest on loans from their last payment in the fiscal year through June 30. eHub calculates accrued interest by the last payment date recorded in the system for each loan through June 30th and calculates accrued interest due in mid August. This amount is recorded in AFRS via JV to add to the loan receivable balance for this interest earned (**Key Control 3 - Valuation**). A Fiscal Analyst 2 will create the JV, a separate fiscal staff member will review the JV to ensure amounts are reasonable before it is sent to AFRS. The reviewer will typically review the last payment date/accrued interest and compare for reasonableness based on historical interest payments. The year end report also calculates the anticipated payments for the next fiscal year.

### Key Controls are as Follows:

**Key Control 1 (Valuation) - Automated Software Calculation - eHub calculates the loans receivable balance based on the final loan amount, loan terms and actual loan payments tracked by the system.**

**Key Control 2 (Valuation) - Beth Swanson, Senior Financial Advisor, performs a reconciliation between eHub's AR subsidiary ledger and AFRS using a Webi query of AFRS GL 1352 and 1652 data to ensure amounts were properly valued.**

**Key Control 3 (Valuation) - Beth Swanson, Senior Financial Advisor, records deferred interest in AFRS via JV to add to the loan receivable balance for interest earned.**

### Noted Weaknesses are as Follows:

No weaknesses have been noted.

### G.1.PRG - Due From Other Governments

*Procedure Step:* Key Control 1 (Automated)

*Prepared By:* EJB, 8/13/2024

*Reviewed By:* CJG, 11/20/2024

Purpose/Conclusion.*
----------------------

#### **Purpose:**

To determine whether **Key Control 1 (Valuation) - AUTOMATED SOFTWARE CALCULATION - eHub calculates the loans receivable balance based on the final loan amount, loan terms and actual loan payments tracked by the system** - was in place and operating effectively and to consider related general IT controls in order to assess control risk.

#### **Conclusion:**

Based on our understanding and test results, we concluded that the automated control **was** in place and operating effectively.

# State of Washington

Based on our understanding, related general IT controls **were** in place and adequately designed to ensure that the control operated consistently during the audit period. However, we did not test the operating effectiveness of general IT controls.

Our understanding and control risk assessment, which incorporates these conclusions, is documented at [\[Controls - eHub\]](#).

Testing Strategy:

The following procedures are **required** for all automated key controls for financial and single audits:

## **STEP 1: Understand Automated Key Control**

Gain an understanding of the automated key control. The understanding can either be documented in the control system step or could be documented here in this step. Auditors should consider the following aspects of the automated control when gaining an understanding:

### **Software Calculation:**

Is there written documentation of the calculation, and/or the source rates and factors used in the calculation?

*We would expect written documentation that defines the calculation and is an official, approved source for the formulas, rates and factors. This may be an approved policy or could be system documentation.*

What formulas are used to make the calculation?

What values or factors are used to make the calculation? For example:

- Rate tables used by the calculation
- Profile fields (i.e., applicable transaction types)
- Programmed/set formulas and/or values
- Constraints (i.e., effective date, minimums/maximums, etc.)

How is the calculation triggered or initiated?

How is the calculation recorded in the accounting system (or used in an end result)?

### **Automated Interfaces:**

Is data transferred in real time (immediately) or in a batch? If batched, how often does the interface occur (daily, monthly, quarterly, etc.)?

What triggers the data transfer?

*Transfers could be manually initiated, could be hardcoded into either the sending or receiving system's programming, could be controlled by administrative menus (for integrated software modules), or could be run as automated jobs with third party software or programming.*

## State of Washington

Could the interface process fail? If so, how would the entity recognize that the process failed?

*This may not be a relevant risk for integrated software, but may be the case for custom interfaces designed outside the software which may be subject to various points of failure.*

Will the interface process reject transactions or batches with errors? If so, who monitors rejections and follows up on rejected transactions to ensure correction (either in the sending or receiving systems) and how are corrections tracked and monitored?

*For example, information that could trigger a rejection or isolated transaction and batch can include: invalid data, duplicate data, or missing factors. If errors are possible, we would expect the isolated data is reviewed, tracked and corrected in a timely manner.*

Are any reconciliations done to provide assurance that data transfer was complete and accurate?

*We would expect the local government to perform a reconciliation between source and destination systems to ensure the interfaced data is complete and accurate. This may be a manual reconciliation or spot-check, a system or dashboard report, or automated edit check. Depending on how often errors (if any) are expected, the reconciliation could be done each time the interface occurs, or on a monitoring basis, like annually.*

### Edit Checks:

Inquire if the entity has a written policy or documentation describing the approval process and protocols for reviewers?

What is the approval process in the application?

What transactions, data, tasks, or documents are approved?

Who are the preparers? How do preparers submit for approval?

Who are the authorized approvers? Are there backup approvers?

What documents or information are required to make approval judgment?

What is the next step once a transaction/data/ task/document is approved or denied?

Is there any exception situations where approval can be by-passed or waived?

Can the approver make changes to information during the approval stage? If so, is the preparer notified of the changes?

Can anyone make changes to the approved information after the approval stage? If so, are changes captured in an audit trail and is the audit trail (log) regularly reviewed and monitored to detect any unauthorized changes?

Does the application prevent users from approving their own work (self-approval)?

*Some applications have a feature preventing self-approval. If an application does not have a feature preventing self-approval, we would expect manual controls in place to ensure the segregation of duties between preparer and approver, if relevant to the risk.*

## State of Washington

Does the application have high-level users that can also approve?

*High-Level Users (aka Users with elevated privileges, system or application "Administrators", "Super Users", etc.) typically have full access to change system settings and may have extensive function rights of software applications. Depending on entity's size and complexity, different high-level users may be responsible for the network vs. application level. High-level users represent a heightened risk for overriding segregation of duties and normal control processes.*

*We would expect entities to have compensating monitoring controls if personnel are responsible for both application settings and transaction processing controls.*

### Computer Generated Reports:

What information or exceptions is the report designed to identify (what is the purpose of the report)?

How is the report used and by whom?

For exception reports, who reviews the report and how do they follow up on exceptions?

*Auditors should consider whether the exception report reviewer has appropriate authority and information to effectively follow-up on report results. For fraud-related risks, also consider whether the review position is appropriately segregated from positions that can initiate transactions. For exception reports that regularly identify many transactions needing multi-step follow-up, the manual review and follow-up may be identified as a separate key control rather than documented and evaluated as an aspect of the automated exception report control.*

What are the report parameters or criteria? Does the report have any calculated fields? If so, what are the calculations?

*The ideal method of documenting an understanding of a computer generated report is to get a screenshot or printout of the report parameters. If using a report writer, this may be printed with the report, or may be accessed from a design view or intermediary screen. For custom or complex reports, this may be the SQL code.*

*For exception reports, auditors should pay special attention to the definition of an exception embodied in the report parameters.*

*NOTE: observation of the report parameters will also count as a confirmation of the report and could also be used to test the report.*

### Electronic Approvals:

Inquire if the entity has a written policy or documentation describing the approval process and protocols for reviewers?

What is the approval process in the application?

## State of Washington

What transactions, data, tasks, or documents are approved?  
Who are the preparers? How do preparers submit for approval?  
Who are the authorized approvers? Are there backup approvers?  
What documents or information are required to make approval judgment?  
What is the next step once a transaction/data/ task/document is approved or denied?  
Is there any exception situations where approval can be by-passed or waived?

Can the approver make changes to information during the approval stage? If so, is the preparer notified of the changes?

Can anyone make changes to the approved information after the approval stage? If so, are changes captured in an audit trail and is the audit trail (log) regularly reviewed and monitored to detect any unauthorized changes?

Does the application prevent users from approving their own work (self-approval)?

*Some applications have a feature preventing self-approval. If an application does not have a feature preventing self-approval, we would expect manual controls in place to ensure the segregation of duties between preparer and approver, if relevant to the risk.*

Does the application have high-level users that can also approve?

*High-Level Users (aka Users with elevated privileges, system or application "Administrators", "Super Users", etc.) typically have full access to change system settings and may have extensive function rights of software applications. Depending on entity's size and complexity, different high-level users may be responsible for the network vs. application level. High-level users represent a heightened risk for overriding segregation of duties and normal control processes.*

*We would expect entities to have compensating monitoring controls if personnel are responsible for both application settings and transaction processing controls.*

### **STEP 2: Confirm and Test Automated Key Control**

Confirm and test the automated control. To test the automated control, consider the following procedures:

#### **Software Calculation:**

Re-perform the calculation for selected transactions.

*Auditors would NOT normally use sampling for automated controls. Instead, auditors should judgmentally select one instance of each significant variation of the calculation. If the number of potential variations is large, auditors would judgmentally select based on risk factors (for example, the most common scenarios, or scenarios associated with identified risks, or scenarios that are not addressed by the entity's testing procedures).*

*In some cases, it may be possible for the auditor to reperform the calculation for the entire population.*

## State of Washington

If any rate tables or values were updated during the period, view the current values (by observing the rate table or values in an admin menu or from a printed system report) and compare to approved sources.

*If no updates were made or there are only a few values, this risk could be addressed by re-performing the calculation. However, if source rate tables or values are large or complex, it may be more efficient to test these values directly than to recalculate a larger number of transactions.*

Consider the use of analytical procedures such as trends or descriptive statistics on the population (like average, minimum and maximum values, or a graph of values across the population) and follow up on any unexpected values or trends. *Analytical procedures would normally also count as a substantive test.*

### Automated Interfaces:

Re-perform a reconciliation, comparison or analytical procedure between both systems to determine whether data interfaced completely and accurately. Alternatively, review the entity's reconciliation or comparison if they perform one.

*For example, auditors could perform count totals and summarize the data to determine whether the same number of transactions reside in both systems, or the total amount from the sending system was posted to the receiving system. Whether this takes the form of a comparison (numbers expected to match exactly), reconciliation (when reconciling items are expected) or analytical procedure (if numerous adjustments or reconciling items are expected) will depend on the nature of the interface and client documentation.*

*Note: these procedures would also provide substantive evidence.*

Observe documentation, such as interface logs or email notifications, to determine whether interfaces complete per expected interval (daily, monthly, quarterly, etc.).

*We would expect the data transfer to be consistent based on the programmed schedule. If data is expected to be transferred on a weekly basis, we would expect to see some form of documentation showing the weekly transfer.*

Observe evidence that batch jobs are monitored such as tracking spreadsheets or emails.

When interfaces did not occur as expected, determine whether procedures were followed to resubmit job or that there was a logical reason no data was received/sent for the interval (for example, it was a holiday so there was no interface for that day).

### Edit Checks:

Re-perform the edit check for selected transactions.

*Auditors would NOT normally use sampling for automated controls. Instead, auditors should judgmentally select one instance of each*

## State of Washington

*significant variation of the check. If the number of potential variations is large, auditors would judgmentally select based on risk factors (for example, the most common scenarios, or scenarios associated with identified risks, or scenarios that are not addressed by the entity's testing procedures).*

*In some cases, it may be possible for the auditor to reperform the edit check for the entire population.*

Consider the use of analytical procedures such as trends or descriptive statistics on the population (like average, minimum and maximum values, or a graph of values across the population) and follow up on any unexpected values or trends. Analytical procedures would normally also count as a substantive test.

### Computer Generated Reports:

For exception reports, inquire with the person assigned to review the report how frequently exceptions are noted by the report. Trace identified exceptions to documentation of correction or resolution.

Re-perform the report by either (a) generating it yourself in the entity's system (if the auditor has direct access to the system), (b) recreating the report using CAATS, or (c) by observing the report be generated in your presence. If observing, note any user-entered values or parameters and determine whether entered parameters were appropriate. Compare re-performed report to the one being tested.

### Electronic Approvals:

Observe a transaction to see the approval process and verify any key aspects of the process or limits.

If transaction data or reports include approval information, use CAATS to confirm that all transactions met authorization rules.

### **STEP 3: Understand General IT Controls**

Gain an understanding of the general IT controls that support the continued proper operation of the automated control. Identify key general IT controls and note any control weaknesses. Auditors should consider the following aspects of general IT controls when gaining an understanding:

#### Software Calculation:

Inquire if the entity has experienced any errors or irregularities with the calculation. Also how often changes are made to the calculation, and how many changes (if any) were made during the year.

How can the software calculation (formulas, rates/values, settings/configurations) be changed or customized?

*Software calculations will usually have one or more administrative menus that allow the government to modify rate tables or other calculation values, or to configure the calculation or apply settings.*

*In other cases, software calculation formulas and/or values may be hard-coded into the system and require programmers to make the changes. If the government has access to source code, then it needs internal procedures for program changes. If the program is*

## State of Washington

*controlled by vendors, we would expect program change procedures and expectations to be included in the contract.*

What are the procedures to authorize and make program changes or configuration/setting changes to the software calculation?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

*If utilizing a test environment, there should be controls to ensure that the live environment is updated and is consistent with the live production environment. As management is responsible for the accuracy of their automated controls (i.e., in the live environment), we would expect there to be a procedure to confirm each key automated control once it is in the live environment. This could be manually re-performing the calculation, reviewing reports against known expectations, etc.*

How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change programming, but they may be responsible for patch management, master table data, and/or configurations.*

### Automated Interfaces:

Inquire if the entity has experienced any errors or irregularities with the interface. Also how often changes are made to the interface, and how many changes (if any) were made during the year.

What are the procedures to authorize and make changes to the interface?

*Except for the most simple situations, we would normally expect update procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

## State of Washington

What are the procedures to test that program changes are properly working?

*If the data transfer is already going to be checked or reconciled, then there may be less need for specific test procedures on program changes since any errors will be identified right away.*

How are program changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

*If the program is controlled by a third-party, we would expect a process between the government and vendor that allows the government to make requests and receive communication at the completion of the request.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to vendor developed/supported coding that controls how the system processes the interfaced data, but they may be responsible for working the interface error queues and reconciling the interfaced data.*

### Edit Checks:

Inquire if the entity has experienced any errors or irregularities with the edit checks. Also how often changes are made to the checks, and how many changes (if any) were made during the year.

How can the edit check be changed or customized?

*Edit checks may be hard-coded into the system and require programmers to make the changes. If the government has access to source code, then it needs internal procedures for program changes. If the program is controlled by vendors, we would expect program change procedures and expectations to be included in the contract.*

*In other cases, edit checks may be established or configured through one or more administrative menus.*

What are the procedures to authorize and make program changes or configuration/setting changes?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change*

## State of Washington

*management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

*If utilizing a test environment, there should be controls to ensure that the live environment is updated and is consistent with the live production environment. As management is responsible for the accuracy of their automated controls (i.e., in the live environment), we would expect there to be a procedure to confirm each key automated control once it is in the live environment. This could be manually re-performing the edit check, reviewing reports against known expectations, etc.*

How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change programming, but they may be responsible for patch management, master table data, and/or configurations.*

### Computer Generated Reports:

Inquire if the entity has experienced any errors or irregularities with the report. Also how often changes are made to the report, and how many changes (if any) were made during the year.

How is the report triggered or initiated?

*For reports that are automatically triggered, the auditor would normally not identify job scheduling or monitoring as a general control since we would expect failure of the report to generate*

Is the report hardcoded into the program, or is it a custom or ad hoc report? Also, what manual inputs (if any) are required to run the report?

*What parameters, criteria (date ranges, fund number, departments) or instructions are entered by the user to generate the exception report. The more options entity personnel have to customize or modify the report, the higher the risk of human error and inaccurate or incomplete reports. Pre-programmed reports provide less flexibility than ad-hoc reports; however, if program change controls are in*

## State of Washington

*place, they are more consistent.*

If the report is hardcoded into the system, how are program changes made?

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change vendor developed reports, but they may be responsible for triggering, setting certain parameters, and/or following up on exception report results.*

NOTE: if the auditor cannot identify sufficiently effective general IT controls, the automated control will need to be tested using the same methods as a manual control (ie: sampling throughout the period). For example, if the report is manually generated and highly dependent on a number of manual inputs each time, or if the report does not have formal change controls, such as an ad hoc report or excel-based report. In such cases, the automated report is controlled by limited access and the judgment of the report writer – that is, while the report is an automated component, there is also an integrated manual component to the control.

### Electronic Approvals:

How are users assigned preparer and approver roles? Are user accounts periodically checked for needed changes? See the [User Access](#) step in the Accountability folder for more control considerations.

If configurations or settings relevant to the approval process are controlled by an admin menu, who has access to this menu?

If the entity has access to source coding for approval controls, what are the procedures to authorize and make program changes?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

## State of Washington

*For example, local governments may not have access to vendor developed/supported coding that controls how the electronic approval works, but they may be responsible for approval configurations or settings and/or user account management.*

### **STEP 4: Confirm Key General IT Controls**

Confirm your understanding of key general IT controls to determine whether they have been placed in operation (*whether the entity has actually implemented key controls*).

### **STEP 5: Test Key General IT Controls**

Document whether general IT controls will be tested. Option 1 would result in control risk at MAX for the automated control. Either option 2 or 3 is necessary in order to set control risk at LOW. If general IT controls are tested, consider the following procedures:

#### **Software Calculation:**

If program changes or setting/configuration changes are logged, review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the calculation may also provide this evidence if the re-performance tests address all states of the calculation during the period.

If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

#### **Automated Interfaces:**

Review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, reconciling or comparing the data transfer (or reviewing the entity's reconciliation or comparison) may also provide this evidence if tests address all states of the interface during the period.

## State of Washington

Inspect job processing error logs/reports. Observe evidence that errors in processing were isolated and resolved. For example, select a sample of rejected transactions and observe evidence to determine whether errors were appropriately corrected and the corrections were timely.

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

### Edit Checks:

If program changes or setting/configuration changes are logged, review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the edit check may also provide this evidence if the re-performance tests address all states of the edit check during the period.

If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

### Computer Generated Reports:

If the report is subject to program change controls (either due to being hardcoded or by being automatically triggered), review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

If the report is subject to program change controls, review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the report may also provide this evidence if the re-performance tests address all states of the report during the period.

If the report relies on manual inputs and report copies saved show the parameters entered, the auditor can check a selection or sample of reports to confirm that the report was run correctly.

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

### Electronic Approvals:

## State of Washington

Review user access report to verify that current users are appropriate. Also consider review of user access change logs (if available) to evaluate user account management throughout the period. See the User Access step in the Accountability folder for more testing considerations.

If approvals are governed by significant settings/configurations, and such changes are logged, review the change log to verify the population of changes for the year.

*Verification that no configuration changes were made, along with the auditor's evaluation that no such changes are expected, would normally be sufficient evidence to conclude that no further testing is necessary.*

If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.

If the entity has access to source code, review the change log to verify the population of changes for the year. Then review programming change documentation or the entity's test documentation for selected or sampled changes.

*Verification that no program changes were made, along with the auditor's evaluation that no such changes are expected, would normally be sufficient evidence to conclude that no further testing is necessary.*

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the SOC Report Reliance worksheet in the Store.

### **STEP 6: Final Control Risk**

Evaluate the results and document a final control risk assessment in the control system step. Consider whether any deficiencies identified with either the automated control or related general IT controls represent material weaknesses or significant deficiencies.

*Note: general IT control deficiencies do not necessarily mean the automated control is not properly functioning. General IT control deficiencies would normally be considered a significant deficiency or material weakness only if it caused an issue with the compliance requirement or assertion.*

### **Recommendation Review Requirement**

IT Security related information is considered category 3 data protected by Public Request Exemption RCW 42.56.420. Issues related to IT Security require the following special handling:

[Instructions](#) are located in Team IT Audit's System's Sharepoint page.

Details of IT Security related issues should NOT be included in any emails or helpdesks.

Exit, ML and Findings should be separately communicated in an IT Security Results Document.

Findings will be referenced, but not included in the audit report.

All IT security-related recommendations must be reviewed by [Team IT Audit](#).

# State of Washington

Template language for common IT related recommendations can be found in [ARS Part 5 Chapter 8](#).

## **PUBLIC REQUEST EXEMPTION**

Some IT related information is protected by Public Request Exemption RCW 42.56.420 for cyber security purposes. The details documented in the record of work and support workpapers may qualify for this exemption. If so, auditors must include this statement in the record of work done and any related workpapers: "**This record contains information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited**".

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

## **Information Technology Planning Guide**

Auditors may contact [Team IT Audit](#) with any testing strategy or control assessment questions or to request assistance from an IT Specialist.

**Software Calculation:** A **software calculation control** exists when the value of a transaction is determined by a software application. This process can be a key control when the entity relies on the system to generate calculations correctly to determine the amount of transactions (i.e., summarizing/account code allocation to post to general ledger, calculate student, utility, other charges, etc.).

**Automated Interfaces:** An interface is a process that moves information from one computer application to another. The interface can occur internally between systems maintained by a single agency, or between systems maintained by different agencies or private companies. The interface can also occur between modules within the same computer application.

The data transferred might be a file consisting of one or more records processed at a later time (batch), or it can be a real-time update. Risk associated with interfaces increases as the number of transactions or the number of other services and systems supported by the interfaced data increases.

Poor design or inadequate oversight can affect the transfer of transaction data among the systems. Interface controls are automated and/or manual processes designed to ensure transmission and processing of information is complete and accurate.

## **Manual vs. Automated Interfaces**

## State of Washington

A “manual interface” is the transfer of data from one system or module to another system or module, initiated and controlled by a user. An example of a manual interface is when customer accounts are downloaded from a utility billing system to be used to perform meter readings. When complete, the file with meter readings may be uploaded and posted to the customer accounts.

An “automated interface” is the transfer of data from one system or module to another system or module that happens automatically based on a schedule, or other predefined criteria. A common example of an automated interface is the payroll module of a system. Typically, a payroll batch is created in the payroll module. Once approved, the batch is automatically sent by the system to the general ledger or other applicable modules, such as accounts payable.

Entities should have reconciliation controls between their various applications regardless of the method used for interfacing.

*Auditors should have determined whether system interfaces are automated as part of the Key Software Applications workpaper. **If not**, ask the following question to determine whether the system interface is manual or automated.*

*Is the data transferred from one system/module to another system/module by a user using an uploading and posting technique? For example, data is pulled from one system into a text file or other format, that is then uploaded into a different system or module by posting or in an upload feature of the module. If the answer to this question is yes, the interface would be considered “manual” since it is initiated and controlled by manually rather than through an automated process.*

**Edit Checks:** An **edit check** is a programmed routine designed to check input data or processing results for accuracy, compliance, or reasonableness. Types of edit checks include:

Range Checks: ensure that numeric values fall within specified ranges, minimums and/or maximums. For example, ensuring that a capital asset can only be entered as a positive amount, or a purchase order can only be submitted without secondary approval for less than a certain threshold.

Consistency Checks: verify that related data fields are consistent with each other. For example, ensuring that a patient’s age matches their date of birth.

Format Checks: validate data formats (for example, dates as MM/DD/YYYY or phone numbers as ###-###-####).

Logical Checks: assess logical relationships between data fields. For instance, verifying that total debits equals total credits in a journal entry.

Duplicate Checks: identify duplicate records or entries. For example, preventing the same invoice from being entered twice.

Cross-Field Checks: compare data across different fields. For instance, ensuring that the start date of a project is before the end date.

Required Field Checks: ensure that mandatory fields are filled out. For instance, making sure that a patient’s name and date of birth are provided.

Referential Integrity Checks: validate relationships between data tables. For example, confirming that a vendor number exists in the vendor master file as an active entity.

Outlier Checks: detect extreme or unexpected values. For instance, flagging water meter reading values that are extreme outliers for the customer type or account history.

# State of Washington

Pattern Checks: look for specific patterns in data. For example, verifying that email addresses follow a valid format.

Edit checks may result in automatic rejection of a transaction, inability to proceed with a transaction, trigger for additional processing or review, or may simply result in a warning message to the user.

Edit checks may be identified as a key control when they are sufficiently relevant (ie: addressing the risk), precise (ie: able to catch all errors, rather than just being only reasonableness or limit check), and sufficiently strong (ie: prevent invalid transactions, rather than just generating a warning messages). Auditors may identify an individual edit or a group of edit checks together as a key control.

**Computer Generated Reports:** A **computer-generated report** is a report that is created by a computer program. The computer program, also referred to as a report generator or tool, takes data from a data source, such as a database, and displays it in a specified format. The process to generate a report often includes performing calculations on the data, such as summarizing, classifying, etc., before displaying, or can display the calculations on the report.

There are two types of computer-generated reports, pre-programmed and ad-hoc or customized reports.

Pre-programmed or canned reports are pre-defined reports where criteria and specifications are hard coded in the system. A canned report may allow limited parameters, (month/year, for example), but in general the information that will be displayed is pre-determined.

Ad-hoc or customized reports allow the user to drill down and customize what information is displayed on the report based on some allowed criteria, such as account codes, dollar amounts minimum, etc).

In contrast, a **manual report** is one that is created outside the system using data exports or is created ad hoc by a user. An example of a manual report is one that is created by copying data from a data source and pasting the data in an Excel spreadsheet or Word document or Powerpoint presentation where it is then processed further. With manual reports, each time a report is created, the data could be incorrect due to user error, such as not copying all relevant data, or processing errors. Therefore, these types of reports should be understood and tested similar to manual controls.

**Electronic Approvals:** Electronic approvals, electronic signatures and digital signatures are technically different, although often these terms are used interchangeably by entities.

Auditors should have determined whether the electronic approval is an automated control as part of the overall understanding of controls. For automated control purposes, an electronic approval is a software system functionality that:

Permits a user to approve transaction(s) within the software system

The system automatically documents, or logs, the data approved by the user and any subsequent manipulation

The acceptance or rejection of the transaction by the approver will trigger an additional software system process, such as posting of a transaction.

## State of Washington

E-mail, scanned-in pictures of signatures, or font-changed signatures, etc. may be part of a control activity but are generally not considered an automated control and are not covered by this testing strategy.

### Electronic Signature vs Digital Signature

An “**electronic signature**” can look like a handwritten signature that has been scanned and then pasted into an electronic document. The reliability of this type of approval is variable. Recommend gaining an understanding of the process used to store and affix the signature to the document and then discuss the process with Team IT Audit before placing reliance on this control.

A “**digital signature**” is a legal signature with a formal certification process that documents who approved the document and ensures the document is not modified after certification. Reliability of this process is very high but has significant technical features. Recommend brainstorm with Team IT Audit before placing reliance on this control.

### **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

**Statements on Auditing Standards [AU-C 315](#) Understanding the Entity and Its Environment and Assessing the Risks of Material Misstatement** - paragraphs .A106-.A109 describe general and application controls and how they relate to audit risks

**Statements on Auditing Standards [AU-C 330](#) Performaing Audit Procedures in Response to Assessed Risks and Evaluating the Audit Evidence Obtained** - paragraphs .10b and .A33-.A34 describe requirements and guidance for testing indirect controls in conjunction with tests of controls, that is, testing key general controls in conjunction with a test of a key automated control

Record of Work Done.:
-----------------------

### **Due from Other Governments - Valuation**

**Key Control #1 - Automated Software Calculation - eHub calculates the loans receivable balance based on the final loan amount, loan terms and actual loan payments tracked by the system.**

The understanding for this system is documented above in the "Controls - [[Controls - eHub](#)]" step.

### **STEP 1: Understand Automated Key Control**

The loan amount from the signed agreement will be encumbered to allocate funds towards that loan. The loan interest rate and number of years is input from the signed agreement. Per Carla Clarey, Revenues Manager, all information input into the Ecology Helping Unify Business software system (eHub) undergoes a second review by a supervisor. Generally, a Fiscal Analyst 2 will enter information (loan interest rate, loan amount, length of loan from loan agreement) into eHub, a Fiscal Analyst 4 or Clara will review eHub entries for accuracy based on loan agreement details.

## State of Washington

The actual loan receivable balance is only increased as they get payment request progress reports (PRPRs) to create payments and disburse the funds.

Deferred interest also accrues on a monthly basis from the first payment until the loan is finalized. When the project is completed, the loan amortization schedule is created based on the final loan amount and loan terms. After the amortization schedules have been finalized, they are sent to loan recipients with their final loan agreement, final contract, and the client signs the contract.

The amortization schedules provide expected values for upcoming principal payments so long as the loan recipient sticks to the repayment plan. If the recipient falls behind (rare) or pays portions or all of the loan off early (common), the remaining principal will not tie to the original amortization schedule. Early payments remove principal owed from the end of the loan (last payment) and does not influence the amount of interest in earlier scheduled repayments. eHub will track and adjust actual/expected payment amounts within the Loan Customer Payments Screen if there were changes to the original payment schedule as a result of early repayment. The loans receivable balance (expected payments) are calculated and created by eHub based on loan agreement information and actual loan transactions.

### **STEP 2: Confirm and Test Automated Key Control:**

In order to confirm the control, we looked in eHub at Loan ID EL190167 and performed a recalculation of the beginning and ending balance the loan should be at (beginning balance at 7/1/2023 and ending balance at 6/30/2024) and verified that the loan balance at year end was calculated correctly and ties to what is reported. The beginning balance was \$23,967,096.12 (recalculated and tied), the disbursed principal payments were \$1,279,935 (recalculated and tied), the deferred interest payments were \$672,403 (recalculated and tied), and the total payment of \$1,952,338 (recalculated and tied), and the total receivable amount is \$22,014,758.12 at year end (recalculated and tied to year end balance as reported in eHub taken from the amortization schedule). The amortization schedule appears to be properly calculating the year end loan balance as designed. We noted no errors in recalculation or confirmation of the above control.

### **STEP 3: Understand General IT Controls**

The general IT control for due from other governments surrounds loan amortization schedule creation and electronic approval. We met with Beth Swanson, Senior Financial Advisor, and Carla Clarey on 6/13/2024 via MS Teams to discuss and update our understanding of the general IT controls.

**Per Carla, changes can only be made to automated controls by the third part vendor (Azure in this case) and not by anyone at ECY. ECY has no access to edit Azure. In order to request changes be made, Fiscal Analyst 4's may submit a ticket to eHub and then eHub makes the appropriate requested changes in a sandbox (isolated) environment provided by a third party called Azure (General IT Control).** The loan amortization schedule creation is then tested by Carla in this controlled sandbox environment. If Carla deems the change solves the issue submitted on the ticket, she sends approval to eHub to put the change into production.

Carla noted that changes are rarely made to the software. This has only happened twice since 2020 and they were for minor changes to the amortization schedule start date issues. In 2020, some loans that were being created did not reflect the start date input by the loan preparer. Since the ticket was submitted in eHub and the change was tested and approved, this has not been an issue.

## State of Washington

After a loan has been edited or changed in eHub, changes and approvals are done in via email. The loan administrator is the one that approves any changes made - typically Kerry Lines or Lisa Freuderick. There is currently no set policy on how often loan approvals are verified - Carla noted loan amortization schedule approvals are randomly spot checked and each spot check in the current year has shown that loan changes are approved.

### **STEP 4: Confirm Key General IT Controls**

In order to confirm that **changes are made to eHub's calculational inputs only by Azure and no one at ECY**, we examined the spreadsheet that was used in the sandbox testing through Azure. We noted the change on 7/18/2023 that was made was to verify that when an unscheduled payment entered into eHub, the amortization schedule adjusts accordingly. We examined the email showing the requested change (between Amber Aaron, Managed Service Team Lead at HSO - the third party organization that provided the sandbox testing in Azure, and Emily Haeger, (eHub Fiscal Business Analyst), examined the spreadsheet used to show the recalculation produced by eHub (tested in Azure), and noted an email between Emily Hargar, Janis Henry, Financial Systems Business Unit Manager at ECY, and Carla Clarey, Revenue Receivables Manager at ECY confirming the changes made and noted her approval saying she tested the information and noted it looks correct. We noted no errors in confirmation of this control.

### **G.1.PRG - Due From Other Governments**

*Procedure Step:* Key Control 2 (Manual)

*Prepared By:* EJB, 10/2/2024

*Reviewed By:* CJG, 11/20/2024

Purpose/Conclusion:

#### **Purpose:**

To confirm - **Key Control 2 (Valuation) - The Senior Financial Advisor performs a reconciliation between eHub's AR subsidiary ledger and AFRS using a Webi query of AFRS GL 1352 and 1652 data to ensure amounts were properly valued.** - in order to assess control risk.

#### **Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls. In testing, however, we noted one instance where the reconciliation process does not appear to be operating as it was designed. See below for more information, and see the audit issue here [[V](#)]:

# State of Washington

ECY Application of Loan Payments].

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important*

## State of Washington

*enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency.*

***All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.***

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

Guidance/Criteria.7

### **ADDITIONAL BACKGROUND**

# State of Washington

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

**Key Control 2 (Valuation) - Beth Swanson, Senior Financial Advisor, performs a reconciliation between eHub's AR subsidiary ledger and AFRS using a Webi query of AFRS GL 1352 and 1652 data to ensure amounts were properly valued.**

The understanding for this system is documented above in the "Controls - eHub [[Controls - eHub](#)]" step.

## **1. Confirmation of Key Manual Control:**

To ensure amounts are accurately valued, Beth and Carla use the webi query of loans receivable data (1352 and 1652) and identify accounts with activity recorded after year end, amended loans, or deferred payments and make correcting entries and adjustments to loans receivable based on the webi query report and note the changes in the 1352-1652 excel spreadsheet. This includes removing loans that have agreements signed after year end that were included in the financial statement balance and correcting loans with incorrectly posted payments.

We reviewed the reconciliation of eHub's subsidiary ledger as compared to AFRS Webi Query noting the total balance in eHub ties to what is recorded in AFRS for GL accounts 1352 and 1652. On the population spreadsheet used to pick the sample, we noted that the total balance of the loans receivable (due from other governments) ties to what is recorded in AFRS. This population spreadsheet is derived from eHub's AR subsidiary ledger, which was also reviewed and ties to the spreadsheet. ***No issues noted.***

**During substantive testing, we noted the following weakness:** When Beth was preparing the reconciliation, she noted that she mistakenly applied all November payments for each loan to one loan that was part of our testing sample. However, the payments were applied to their respective loans in eHub. We deem this an issue as the reconciliation process is not operating as designed. See issue above in conclusion.

## **Noted Weaknesses are as follows:**

None

## **2. Preliminary Control Risk Assessment**

## State of Washington

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

#### **G.1.PRG - Due From Other Governments**

*Procedure Step:* Key Control 3 (Manual)

*Prepared By:* EJB, 10/2/2024

*Reviewed By:* CJG, 11/20/2024

Purpose/Conclusion:

#### **Purpose:**

To confirm - **Key Control 3 (Valuation) - The Senior Financial Advisor records deferred interest in AFRS via JV to add to the loan receivable balance for interest earned** - in order to assess control risk.

#### **Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

# State of Washington

## receivable balance for interest earned.

The understanding for this system is documented above in the "Controls - [[Controls - eHub](#)]" step.

### **1. Confirmation of Key Manual Control:**

We received the JVs to accrue interest for loans - JV# 46104581 & 46104581-01 on 9/25/2024, confirming that deferred interest was calculated and entered into AFRS and confirmed the interest was added to the loan receivable balance at year end. The JV was traced to support provided for the population used to select the sample. Deferred interest was accrued and added into the total loan receivable balance as of 6/30/2024 as the population support ties to the state balance in AFRS. Interest calculated for Loan ID# EL150024 was \$364.68. This amount was traced to the population document (a list of all loans at 6/30/2024 that ties to AFRS) and we noted no errors. ***No issues noted.***

### **Noted Weaknesses are as follows:**

None

### **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

## **G.1.PRG - Due From Other Governments**

*Procedure Step:* Risk Assessment

*Prepared By:* EJB, 8/13/2024

*Reviewed By:* CJG, 11/20/2024

Purpose/Conclusion.*
----------------------

### **Purpose / Conclusion:**

To assess inherent risk, control risk, and the risk of material misstatement in order to design an initial testing strategy for each assertion.

# State of Washington

## Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

### **STEP 1: Inherent Risk (IR)**

Assess inherent risk for each relevant assertion. This assessment is based on understanding of the entity and the nature of the account balance or class of transactions.

*Inherent risk is the susceptibility of an assertion to material misstatement. It is our assessment of "total threat", which includes both "natural risk" and identified risk indicators, without any regard to any potential control activities. As inherent risk is fully independent of control risk, any understanding of controls cannot be used to increase/decrease the assessment of inherent risk. Consider the following factors as your basis for this assessment:*

#### *General Considerations*

*Does the balance include transactions that are difficult to audit or involve complex accounting issues?*

*Were there significant misstatements identified in previous audits or prior-period adjustments in the account balance or transaction class? If so, analyzing the cause of prior period misstatements will help in analyzing inherent risk.*

*Are there any inherent risk factors at the entity or industry level, such as changes in regulation or accounting rules, unique transactions or accounting practices, use of information technology, etc that affect the balance?*

#### *Inherent Risk due to Error*

*How large are the transactions making up the balance? If the balance has only a few large transactions, even a single error may mean a significant misstatement.*

*Have there been changes in the transactions making up the balance that may increase risk? For example, significantly different composition, nature or volume of transactions may inherently disrupt established controls.*

*Are financial events originated or identified by accounting personnel or non-accounting personnel? This consideration is mainly for the completeness assertion.*

*Does the process to account for transactions involve judgment or estimation, complex calculations, numerous steps or significant manual steps?*

*Do transactions have widely varying attributes that need to be manually identified? For example, grant loans that are accounted for in one of several ways depending on the terms of the agreement.*

#### *Inherent Risk due to Fraudulent Reporting (intentional misstatements)*

*Are there substantial pressures or motivations to misstate the balance?*

#### *Inherent Risk due to Misappropriation*

*Is the account balance or transaction class susceptible to sizable misappropriation?*

#### *Inherent Risk due to Non-Compliance*

## State of Washington

*Are there any laws, contracts or grant agreements affecting the balance? If so, would non-compliance lead to sizable misstatements?  
Are compliance requirements complex, hard to understand, subject to judgment or otherwise difficult to comply with?  
Are there any motivations or pressures to not comply?*

### **STEP 2: Control Risk (CR)**

Assess control risk by system and assertion. This assessment should be based on the results of the control understanding, confirmation, and (if setting control risk to LOW) testing. If applicable, auditors will evaluate any control deficiencies and determine whether those deficiencies, individually or in combination, are significant deficiencies or material weaknesses.

*Control risk is the risk that material misstatements would not be prevented or detected timely by the system of internal control. Control risk could be thought of as the "vulnerability" of an entity to misstatements. Control risk exists independently of the inherent risk (the level of vulnerability exists independent of the level of threat).*

*Control risk is MAX in both of the following situations: (1) controls aren't tested or (2) controls are problematic and cannot be relied upon. In order to set control risk to LOW, the auditor must test that controls operated effectively throughout the period.*

*A material weakness exists when the design or operation of controls results in a reasonable possibility a material misstatement will not be prevented or detected and corrected in a timely manner. A significant deficiency is less severe than a material weakness, yet important enough to merit the attention of the governing body. **All potential material weaknesses and significant deficiencies should be discussed with the AIC, since they must be reported as findings.***

### **STEP 3: Risk of Material Misstatement (RMM)**

Assess the risk of material misstatement for each relevant assertion for each significant line item. The risk of material misstatement (RMM) is a combination of the auditor's separate assessment of inherent and control risk.

*In practice, the RMM is the amount of substantive evidence that's needed, and the only way to reduce the amount of needed substantive evidence (equal to the inherent risk) is to test controls. As such, when control risk is MAX, the RMM must always equal the inherent risk (IR).*

*When controls are tested & can be relied upon (are determined to be effective) it is a matter of professional judgment how much the RMM should be set lower than inherent risk (1 or 2 steps).*

*Auditors should assess RMM by assertion, if different. For example, if RMM is assessed at MOD for the existence assertion, but LOW for the rights & obligations assertion, then document "MOD – existence and LOW – rights & obligations".*

### **STEP 4: Design Substantive Testing**

## State of Washington

Design a substantive testing strategy that addresses the relevant assertion (identified risk) in the portion of the line item that relates to that risk.

*Planning identifies where to audit (significant balances, classes of transactions & disclosures) what to audit for (relevant assertions), and how much to audit (RMM). The quantity and quality of evidence obtained by substantive tests needs to match the level of risk. The higher the risk of material misstatement, the greater evidence needed. "Greater evidence" could either be greater quantity of evidence, greater quality of evidence, or some combination of greater quality and quantity.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6210](#) – Planning Financial Statement Audits**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits Planning Guide](#)**

Record of Work Done:

### **(1) Inherent Risk (IR):**

Based on our understanding of the line item, we assessed inherent risk as follows for each relevant assertion and significant class of transactions:

Valuation - Moderate

### **(2) Control Risk (CR):**

We assessed control risk as follows for each system and relevant assertion:

eHub - Valuation

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **(3) Risk of Material Misstatement (RMM):**

We considered both inherent and control risk and assessed the risk of material misstatement as follows for each relevant assertion and significant

# State of Washington

class of transactions:

Valuation – Moderate

## **(4) Testing Strategy:**

We designed our substantive testing strategy based on our assessment of the risk of material misstatement. We plan to perform the following tests:

We plan to use the Ecology Helping Unify Business software system (eHub) to perform testing of the loans receivable balance. We will search for the selected loan ID number on the Loan Management > Loans > All loans screen to determine if recorded loans receivable amounts were accurately valued. Then we will use the loan transactions screen and the amortization schedule to recalculate loans receivable based on actual payments.

Verify that eHub receivables have reconciled to AFRS.

We anticipate that these tests will provide sufficient appropriate audit evidence to address the assessed risk of material misstatement for relevant assertions in significant classes of transactions.

## **G.1.PRГ - Due From Other Governments**

*Procedure Step:* Substantive Test

*Prepared By:* EJB, 10/22/2024

*Reviewed By:* CJG, 11/20/2024

Purpose/Conclusion.\*

### **Purpose:**

To determine whether receivables were reported at properly valued or calculated amounts (Valuation).

### **Conclusion:**

We determined receivables were properly valued, however the reconciliation process does not appear to be operating as it was designed. See below for more information, and see the audit issue here [[V: ECY Application of Loan Payments](#)].

Testing Strategy.\*

# State of Washington

**Add the testing strategy for each relevant assertion from the TeamStore.**

Guidance/Criteria:

**Add the Guidance/Criteria for each relevant assertion from the TeamStore. You may also include other resources that you used for testing.**

Record of Work Done:

**Substantive tests performed to meet the Valuation assertion:**

We used the Ecology Helping Unify Business software system (eHub) to perform testing of the loans receivable balance. We searched for the selected loan ID number on the Loan Management > Loans > All loans screen to determine if recorded loans receivable amounts were accurately valued. Then, we used the loan transactions screen and the amortization schedule to recalculate loans receivable based on actual payments.

On the summary tab of the testing workpaper referenced below, we verified that the eHub receivables reconciled to AFRS without error.

See testing here [[EL190167 Loan Transactions Summary](#)].

**Substantive tests performed to meet the Valuation assertion:**

All testing was performed using eHub to confirm loans were calculated correctly.

we searched for the loan ID# on the Loan Management > Loans > All loans screen to determine if recorded loans receivable amounts were accurately valued.

We used the same loan transactions screens and the amortization schedule to recalculate loans receivable based on actual payments made.

During the testing performed on the worksheet, we determined that one of the loans was not calculated correctly on the PBC 1352-1652 report (the reconciliation to AFRS). Per discussion with Beth, this loan is one of three loans to a specific entity. On the 1352-1652 report, there were payments in November on all three loans. When Beth was preparing the reconciliation, she noted that she mistakenly applied all November payments for each loan to the one loan we selected. However, the payments were applied to their respective loans in eHub. Based on this information, we noted that the process of preparing the reconciliation is a bigger risk than we had initially assessed. We raised the risk of material misstatement to moderate and increased the sample size from 21 to 29. The additional samples met testing expectations without error. We noted that the issue will *not* be projected out as the entire loan balance would not have been understated. However, we still deem this an issue as the reconciliation process is not operating as designed. See issue above in conclusion.

**G.2.PRg - Other Taxes**

# State of Washington

*Procedure Step:* Summary & Conclusion

*Prepared By:* BFW, 11/21/2024

*Reviewed By:* RKM, 11/21/2024

Purpose/Conclusion.

**Purpose:**

To evaluate risk assessments and the sufficiency and appropriateness of evidence obtained based on results of substantive work.

**Conclusion:**

We determined that **no** modifications were necessary to inherent risk, control risk, or the risk of material misstatement as assessed in planning.

We also determined that evidence obtained was sufficient and appropriate in response to the risk of material misstatement.

Testing Strategy.

Auditors are **required** to evaluate conclusions for substantive testing as follows:

*Auditors may wish to use the optional Lead Sheet available in the Store to summarize testing related to each balance and assertion.*

**1.** Determine whether the results of substantive testing indicate a need to modify the inherent risk assessment (IR), control risk assessment (CR), risk of material misstatement (RMM) or other aspects of planning (such as material balances or assertions). If so, document changes and consider the need for additional testing.

*If the results of substantive testing indicate a need to change control risk, auditors should also update the **Permanent File** by either correcting the documentation or by adding an update section describing changes to the top of the record of work done. For all changes to IR, CR, or RMM the **Material Balances** spreadsheet should be updated.*

*More significant changes to other aspects of planning (such as material balances or assertions) should be referenced in this step and documented in detail in the **Changes to FS Audit Plan** step.*

**2.** Evaluate whether the quality and quantity of evidence obtained is sufficient and appropriate in response to the risk of material misstatement. In making this determination, auditors should evaluate:

# State of Washington

## Information to be used as audit evidence:

- Does evidence relate to the population, period of time and risk (assertion and “what could go wrong” from the Material Balance Spreadsheet)? If there are any gaps or uncertainties in the logical connection between the evidence and conclusions, is there a documented consideration and explanation?
- Are the sources of information sufficiently reliable and appropriate for the risk (whether internal to the government, external, or auditor developed)? If key information is not from a sufficiently reliable source (for example, inquiry), then is it corroborated by information that is?
- Are there any concerns about accuracy, completeness, authenticity, or bias in information? If so, did the auditor perform sufficient procedures to confirm reliability of that information?
- Is information precise enough to catch if misstatements exceeded the tolerable level?
- Is information detailed enough to conclude on whether or not there were misstatements?
- Was there any information that appeared contradictory or inconsistent? If so, was there a documented response to the inconsistencies or doubts about the reliability of evidence?

## Results:

- How much misstatement was identified by testing, and the likelihood and magnitude of further potential misstatement?
- How did misstatements occur and how often might they occur again in the population?
- Were misstatements caused by control deficiencies or circumvention of controls?
  - If control deficiencies, is there a need to re-evaluate our understanding of controls in the [Permanent File](#) folder or assessment of control risk?
  - If circumvention, the [Management Override of Controls](#) step should address or reference this area. Auditors should also consider whether a fraud risk has been identified.
- Did tests identify a different level or type of risk than the planned audit response was designed to address?
- If likely misstatements are identified, are further procedures necessary to improve the precision of our estimate?

*To support the overall evaluation of audit risk and provide a basis for concluding on the overall sufficiency and appropriateness of evidence in the [FS Summary & Report](#) step, auditors should conclude in each area whether the auditor continues to believe that the tests performed and quality and quantity of evidence obtained are commensurate with RMM for all relevant risks (the “what could go wrong”, in the [Material Balances](#) spreadsheet).*

If the auditor determines that evidence is not sufficient or appropriate, additional substantive testing should be done. If sufficient, appropriate evidence is not available for audit, the AIC should discuss the effect on our audit report with the AAM and AM.

Guidance/Criteria.:

## **ADDITIONAL BACKGROUND**

# State of Washington

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6310](#) – Determining the Nature, Timing and Extent of Substantive Testing**

**SAO Audit Policy [3210](#) – Audit Evidence**

Record of Work Done.:

Based on test results, we re-evaluated risk assessments, procedures, evidence obtained and conclusions as follows:

**(1) Do the results of substantive tests indicate a need to modify our risk assessment (IR, CR and RMM)?**

The results of substantive tests do not indicate a need to modify our risk assessment.

**(2) Was the quality and quantity of evidence obtained sufficient and appropriate?**

The quality and quantity of evidence obtained was sufficient and appropriate.

## G.2.PRG - Other Taxes

*Procedure Step:* Understanding of Line Item

*Prepared By:* BFW, 6/4/2024

*Reviewed By:* RKM, 6/10/2024

Purpose/Conclusion.:

### **Purpose / Conclusion:**

To gain an understanding of the line item and confirm the scope of testing as documented in the Significant Account Matrix.

Testing Strategy.:

Auditors are **required** to perform the following procedures for each line item:

### **STEP 1: Prior Audit Exceptions**

# State of Washington

Document any exceptions noted during the prior audit. Follow-up to determine how the agency has responded to or corrected the issue, unless this work is anticipated as part of the testing strategy.

## **STEP 2: Analyze Composition and Changes of Line Item**

Include link to the line item leadsheet. This will be completed at the end of the audit. Leadsheet analysis should be documented in this spreadsheet.

Inquire with agency staff about the activities and transactions that make up the balance and any changes to those activities or transactions in relation to the prior year.

Determine relevant classes of transactions or account balances within the line item to analyze (such as agencies, funds, programs, departments, accounts, and/or objects), and use AFRS to create trends of those elements. This step should not include any specific dollar amounts associate with the line item.

Evaluate trends to identify:

- (1) What classes of transactions or account balances are primary to the identified risk. Auditors should specifically consider what elements are primary to the line item (comprising a large percentage of the line item), and which elements the identified risk would apply to, and which elements might be most susceptible to the identified risk (having a high risk of non-trivial misstatement for a relevant assertion, considering likelihood and impact of potential for misstatement).
- (2) What changes are primary to the identified risk, if applicable. Auditors should specifically consider whether the overall change to the line item from the prior year was significant, what elements were the primary drivers of overall change, whether any elements changed significantly from the prior year, and which changes (if any) might relate to the identified risk.
- (3) Any unusual or unexpected elements, amounts, or changes that may indicate a risk, whether the one identified in planning or a new one that may need to be considered for a change to the plan.

**Consider** other procedures to gain an understanding of the line item, such as review of key policy documents, review of program information or reports, inquiry of staff, budget information, or other analytical procedures.

## **STEP 3: Update Significant Account Matrix**

Based on your understanding of the line item, update the Significant Account Matrix with final conclusions on the agencies covered, account description, significant accounting systems, and risk (what could go wrong and relevant assertions). The account description should reflect the significant transaction streams or account balances relevant to the risk.

*The description of agencies, significant accounting systems, and what could go wrong in the Significant Account Matrix constitute the overall scope of substantive testing.*

*A transaction stream is significant based on the potential for misstatement. This is often due in part to its size (ie: comprising a large percentage of the total line item), but is ultimately a judgment about the susceptibility to the identified risk (for example, when the risk is*

## State of Washington

*understatement a small or omitted account may hold the most potential for the largest misstatement).*  
*Significant accounting system(s) are those that contain key controls over significant classes of transactions included in the line item. Control systems identified in this step must match the Significant Account Matrix and have a separate control understanding documented.*  
*Talk with the AIC if you identify any changes to the Significant Account Matrix.*

Guidance/Criteria.:

Record of Work Done.:

### **(1) Prior Audit Exceptions:**

There were no prior audit exceptions for this line item.

### **(2) Composition & Change Analysis:**

Line Item Leadsheet: [[Line Item Lead Sheet](#)].

Other Taxes is made up of the following taxes:

Source 112 - Hazardous Substance Tax (99.98%)

Source 160 - Commercial Fishing - Privilege Tax (0.02%)

Hazardous Substance Tax makes up the majority of the balance, therefore we will focus our control understanding and testing on this source.

Hazardous substance tax is a tax on the first possession of hazardous substances in Washington. The tax applies to petroleum products, certain pesticides, and certain chemicals. Hazardous Substance Tax revenues are determined using the Automated Tax and Licensing Administration System (ATLAS), based on tax returns submitted in the system. ATLAS automatically calculates the Hazardous Substance Tax due based on information provided on the tax return. DOR Tax Examiners verify the documents provided by tax payers to support the amount of taxes due. Tax payments automatically update in the system, which sends the information to AFRS in a nightly batch process. The batch information is reviewed and reconciled by staff in the Business & Financial Services (B&FS) division. Hazardous Substance Tax revenue is accrued in AFRS in the same manner as other taxes receivable are recorded in ATLAS.

### **(3) Updates to Significant Account Matrix:**

We identified no changes that need to be made to the Significant Account Matrix.

## **G.2.PRГ - Other Taxes**

# State of Washington

*Procedure Step:* Controls - ATLAS  
*Prepared By:* BFW, 6/11/2024  
*Reviewed By:* RKM, 10/17/2024

Purpose/Conclusion:

**Purpose:**

To gain an understanding of internal controls.

**Conclusion:**

We gained an understanding of internal controls as documented in the record of work done.

Testing Strategy:

**The following procedures are required for all material systems:**

1. List the financial statement balance(s) and relevant assertion(s) addressed by the understanding.
2. Gain an understanding of the internal control process, identify how transactions are recorded in AFRS, identify key controls over relevant assertion(s), and note any control weaknesses.
  - In gaining an understanding of controls, consider the overall understanding of State-Level control elements as documented in the "State-Level Controls" step as they relate to this particular system.
  - Identify controls systems covering all relevant assertions for all significant classes of transactions.
  - Standards require the auditor to gain an understanding of the significant accounting system(s) that contain key controls over significant classes of transactions included in the line item.
  - Control systems identified in this step must match the Material Account Matrix and have a separate control understanding documented.
  - Talk with the ACFR Specialist or AIC if you identify different systems than the ones anticipated in the Material Account Matrix.

For each material system, auditors must document:

- A brief outline of the transaction flow from beginning to end.
- An expanded description of key controls.

## State of Washington

Business processes relevant to financial reporting of the relevant assertion for the material balance. Processes should encompass automated and manual procedures by which transactions or events are identified or initiated, authorized as needed, recorded, processed and corrected as needed.

Original accounting records and how records are rolled-up to intermediary ledgers and transferred to the general ledger (AFRS) or financial statements.

Detailed descriptions of key controls. Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

The following is information to **consider** when identifying key controls and transaction flow.

“Key controls” refer to the few controls that together provide reasonable assurance that material misstatements will be prevented or detected and corrected. This is contrasted with ancillary or supporting controls, which – although helpful and recommended – would provide less than reasonable assurance by themselves.

The focus of the write-up is on the key controls. Key controls should be specifically identified (as “key controls”) in the write-up. This can be done in whatever way the auditor prefers, so long as it is obvious. Details that the auditor should document regarding key controls may include:

- Who or what initiates the control

- When (or how often) is the control applied

- Who performs the control

- As needed, the experience, knowledge and attitude of the person applying the control

- Detailed description of the control process or activity. For example, if the control is a review: what exactly is reviewed, what is the reviewer looking at or for and what are the reviewer’s criteria?

- How the key control is documented or evidenced

- If not obvious from the description, how the control prevents or timely detects and corrects misstatements

- Any exceptions or alternative processing to the normal process

- What happens when misstatements or issues are identified by the control

The “transaction flow” refers to the process by which transactions are initiated, authorized, recorded, processed and reported (as applicable). Outlining the transaction flow gives context to key controls, especially how transactions become subject to controls in the first place. If a control inherently ensures that all applicable transactions are included (ex: bank reconciliation where the assertion is existence), the auditor may decide to just start the write-up with the initiation of the control procedure and go from there.

# State of Washington

Elements of the transaction flow are defined informally as follows:

*Initiation:* How are transactions initiated?

*Authorization:* How are transactions and accounting record maintenance authorized?

*Recording:* How are transactions or balances identified and recorded in financial accounting systems?

*Processing:* How are the transactions or balances processed after they are recorded (if at all)? Processing may be manual or automated and may occur at a subsidiary system level or at the general ledger level.

*Reporting:* How are records translated into the financial statements? This part of the transaction flow extends the understanding to the actual financial statements that the audit is opining on. Since we already document an understanding of the financial reporting process in general, it is usually enough to simply reference this overall understanding. However, if there are important steps unique to the covered balances, it may be more appropriate to mention them here.

Although transaction flow is a good way to think about understanding and documenting a control system, auditors should not worry too much about documenting "each element, in order" because often elements may be combined, not noticeable, not applicable or occur in a different order.

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits](#) Planning Guide**

Record of Work Done:

Internal controls in the Automated Tax and Licensing Administration System (ATLAS) address the following balance(s):

Other Taxes - Hazardous Substance Tax

For the following assertions:

**Occurrence** - There is a risk that recorded revenue is more than source records.

**Valuation** - There is a risk that tax revenues are not recorded at properly valued amounts.

# State of Washington

## **Gain an Understanding of Internal Controls**

We met with Brittany Padilla, Tax Administration Manager - Hazardous Substance, and Liz Black, Program Coordinator, via Teams on April 22, 2024 to gain an understanding of controls.

## **Tax Returns**

The majority of tax returns are received electronically and filed through the online taxpayer system, My DOR, which is part of the State's Secure Access Washington (SAW) application created by the Washington Technology Solutions (WaTech). Returns filed in My DOR are sent directly into ATLAS, which is coded to automatically calculate taxes due based on the information entered by the taxpayer on the return. Taxpayers are typically filing either monthly or quarterly on a combined excise tax return. All businesses conducting in Washington state dealing with the substances outlined in [RCW 82.21](#), petroleum products, certain pesticides, and certain chemicals are subject to hazardous substance tax.

When a taxpayer logs into their My DOR account and selects to file a return, ATLAS automatically calculates taxes due from pre-programmed rates based on return information entered by the taxpayer (**Key Control #1- Automated- Valuation**). When the taxpayer submits the return, taxes due and the payment amount are recorded in the transactions tab of ATLAS. Additionally, information such as the date filed, the date paid, and any changes or adjustments made to the return or the taxpayer's account will also be recorded in the transactions tab of ATLAS. My DOR and ATLAS only allow a return to be filed once and ATLAS will create a work item for duplicate return received if the taxpayer attempts to submit a paper return for the same return period received. Logic checks are run when the return is processed. If there is an error, the return is flagged and sent to a work queue for an Examiner to review. Returns flagged for review do not get recorded to the appropriate revenue source until errors are resolved and released from the queue.

For July 1, 2023 - June 30, 2024 the published rates are \$1.40 per barrel. [WAC 458-20-252](#) explains that under chapter 82.21, a hazardous substance tax is imposed upon the wholesale value of certain substances and products, with specific credits and exemptions provided. Exemptions and deductions claimed for this tax are tracked on a spreadsheet that lists lifelong taxpayers that have taken them. An Excise Tax Examiner (ETE) 3 will review the spreadsheet and reconcile quarterly to ensure taxpayers who are claiming the exemptions or deductions have claimed them previously or verify qualifications for taxpayers who are claiming for the first time (**Key Control #2 - Manual - Occurrence**).

There are two deductions possible: Agricultural Crop Protection Products Exemption RCW 82.21.040 (5), and Other Deductions RCW 82.21.040 (1-4). Taxpayers may be able to take an exemption from the Hazardous Substance Tax if they have possession of agricultural crop protection products that are warehoused, but not used or sold, in Washington. (Engrossed Substitute Senate Bill (ESSB) 6057 Part XIX; Chapter 6, Laws of 2015). This exemption was effective 9/1/2015. Reporting is reviewed quarterly, and each taxpayer is contacted by the ETE3 assigned to the program. An Annual Tax Performance Report (ATPR) is required for this exemption. Anyone reporting the Agricultural Crop Protection deduction is required to submit an annual tax performance report (ATPR). Taxpayers have to file the ATPR timely, and if they do not file this timely then they are billed back for the exemption / deduction that they took. The ETE reviews everything in its entirety. If the spreadsheet reconciliation has not been performed at the time of the ATPR due date, then the ATPR holistic account review would identify any deductions taken that are

## State of Washington

unallowable. In FY23, the total amount of exemptions taken roughly \$19.3 million, or 7% of the balance for Hazardous Substance Tax. This is expected to be similar in FY24.

### **How Transactions are Recorded in AFRS:**

#### **Gross Receipts Accrual Entry**

For monthly filers, excise tax returns for June activity are due July 25th and for quarterly filers, tax returns for the 4th fiscal quarter (April, May, and June) are due July 31st. In August, the ATLAS "gross receipts" report, which is programmed to pull all gross receipts for the period July 1 - August 15, is downloaded to Excel and compared to the gross receipts from the prior five years to check that the values seem reasonable. Revenue Accounting will prepare a JV to enter into AFRS to show the June returns received after June 30<sup>th</sup> as a receivable and accrued revenue for the FYE.

We met with Jerry Tilson, Revenue Accounting Manager, on April 10, 2024 to discuss the gross receipts accrual entry. Jerry explained that towards the end of August, he runs the "gross receipts" report from ATLAS for receipts received between July 1 - August 15 for the tax filing period of June 30 and exports the data to Excel. Once the data is exported into Excel, he sorts by fund and revenue source. The data is then automatically pulled into the "taxpayer assessed taxes (tat) worksheet" tab where the gross receipts are summarized by tax type. Jerry then reviews the report for any errors or major changes and compares the amounts to the prior 5 years for reasonableness. Any significant changes are noted and documented at the bottom of the taxpayer assessed taxes report. After reviewing the report, Jerry verifies that the total gross receipts amount on the "taxpayer assessed taxes report" tab matches the total on the "combined gross receipts adj" tab to ensure that the data from the gross receipts report was pulled in correctly. The JV is then created by pulling the data from the "taxpayer assessed taxes report" tab and input into AFRS by a Revenue Accounting Fiscal Analyst and reviewed and released by Jerry. Additionally, Binh Vu, Accounting Manager, reviews all fiscal-year end JVs. A fiscal analyst reviews the AFRS daily transaction report the next business day to ensure that the accruals were recorded in AFRS accurately and occurred in the correct period.

#### **Cash Journal Entries**

When payments are received via ACH/debit, ACH/credit, wire transfer, and cash/check from field offices, ATLAS automatically generates an A8 cash journal (CJ) to record the cash receipts. For payments received by credit card, lockbox and via mail/FedEx/UPS, a manual CJ is created in ATLAS by Treasury Management in Business & Financial Services (B&FS). Treasury Management staff batch the documents and prepare the deposits assuring they both balance. Once they are entered, the Batch Control System (BCS) compares the total of the individual batches to what was deposited for the day. The A8s are sent to the State Treasurer's Office (OST) for deposit entry into the Treasury Management System and verification that all funds have been received. If the payment amount received by the OST does not match DOR's A8, they will contact DOR and inform them of the out of balance condition. Treasury Management will follow up on the difference by totaling and comparing the documents and payments. The Batch Sheet which contains the batch amount totals, document count, batch date, and batch number is placed on top, and the batch is forwarded to Taxpayer Account Administration (TAA). Treasury Management then reconciles the ATLAS cash journal report totals to the total deposit recorded in the OST's concentration account to ensure they match.

## State of Washington

DOR's Revenue Accounting section in B&FS verifies the CJ batches are error free and releases for processing in AFRS at the end of each day. ATLAS initially records the deposit in Fund 01P (Suspense Account) and then distributes from suspense to the proper revenue source codes once the returns and payments are applied to the taxpayers' accounts. If the payment is identified as Excise Tax but not applied to a tax return, the fund is transferred to the general fund Revenue Act revenue source (01-99 – Tax Revenue Suspense). If tax payments are not applied to the taxpayer's account due to mismatched returns or errors that need to be resolved, the funds will remain in the suspense account until issues are resolved by Tax Examiners. Once the payment has been applied to the taxpayer's account, ATLAS will automatically create a journal voucher to move the funds to the appropriate revenue sources. Batches are created and transmitted to AFRS in the evening. Revenue Accounting reviews the batch the following day and releases them in AFRS.

### **Reconciliation Process**

ATLAS receives a daily reconciliation file from AFRS and performs an automatic reconciliation between the data recorded in AFRS and ATLAS to ensure revenues recorded are accurate and complete (**Key Control #3 -Automated- Valuation/Occurrence**). OFM sends an AFRS download into a SFT folder daily that is picked up by ATLAS. ATLAS then automatically performs a reconciliation between the journal voucher batches in ATLAS from the prior day to the revenues recorded in AFRS. Once the reconciliation is complete, ATLAS will update the batch with the reconciliation date under the "reconciled" column. There have been a few issues where the AFRS file was not received and some batches did not go through the automatic reconciliation. Revenue Accounting reviews each batch in ATLAS for a "reconciliation date" to ensure the reconciliation took place. If the AFRS file is not received, Revenue Accounting will contact OFM for the file. However, if the request is made 10 days or more after the date the batches were processed in AFRS, the AFRS data is no longer available for transmission. If the batch does not go through the automatic reconciliation, Revenue Accounting will perform a manual reconciliation.

### **Key Controls are as Follows:**

**Key Control #1 - (Automated) - Valuation** - When a taxpayer logs into their My DOR account and selects to file a return, ATLAS automatically calculates taxes due from pre-programmed rates based on return information entered by the taxpayer.

**Key Control #2 - (Manual) - Occurrence** - Exemptions and deductions claimed for this tax are tracked on a spreadsheet that lists lifelong taxpayers that have taken them. An Excise Tax Examiner 3 will review the spreadsheet and reconcile quarterly to ensure taxpayers who are claiming the exemptions or deductions have claimed them previously or verify qualifications for taxpayers who are claiming for the first time.

**Key Control #3 - (Automated) - Valuation/Occurrence** - ATLAS receives a daily reconciliation file from AFRS and performs an automatic reconciliation between the data recorded in AFRS and ATLAS to ensure revenues recorded are accurate and complete.

### **Noted Weaknesses are as Follows:**

None.

# State of Washington

## G.2.PR.G - Other Taxes

*Procedure Step:* Key Control #1 (Automated)

*Prepared By:* BFW, 10/16/2024

*Reviewed By:* RKM, 10/17/2024

### Purpose/Conclusion:

#### **Purpose:**

To determine whether when a taxpayer logs into their My DOR account and selects to file a return, ATLAS automatically calculates taxes due from pre-programmed rates based on return information entered by the taxpayer (**key control 1 for ATLAS**) was in place and operating effectively and to consider related general IT controls in order to assess control risk.

#### **Conclusion:**

Based on our understanding and test results, we concluded that the automated control **was** in place and operating effectively.

Based on our understanding, related general IT controls **were** in place and adequately designed to ensure that the control operated consistently during the audit period. However, we did not test the operating effectiveness of general IT controls.

Our understanding and control risk assessment, which incorporates these conclusions, is documented at [[Risk Assessment](#)].

### Testing Strategy:

The following procedures are **required** for all automated key controls for financial and single audits:

#### **STEP 1: Understand Automated Key Control**

Gain an understanding of the automated key control. The understanding can either be documented in the control system step or could be documented here in this step. Auditors should consider the following aspects of the automated control when gaining an understanding:

#### **Software Calculation:**

Is there written documentation of the calculation, and/or the source rates and factors used in the calculation?

*We would expect written documentation that defines the calculation and is an official, approved source for the formulas, rates and factors. This may be an approved policy or could be system documentation.*

## State of Washington

What formulas are used to make the calculation?

What values or factors are used to make the calculation? For example:

- Rate tables used by the calculation

- Profile fields (i.e., applicable transaction types)

- Programmed/set formulas and/or values

- Constraints (i.e., effective date, minimums/maximums, etc.)

How is the calculation triggered or initiated?

How is the calculation recorded in the accounting system (or used in an end result)?

### Automated Interfaces:

Is data transferred in real time (immediately) or in a batch? If batched, how often does the interface occur (daily, monthly, quarterly, etc.)?

What triggers the data transfer?

*Transfers could be manually initiated, could be hardcoded into either the sending or receiving system's programming, could be controlled by administrative menus (for integrated software modules), or could be run as automated jobs with third party software or programming.*

Could the interface process fail? If so, how would the entity recognize that the process failed?

*This may not be a relevant risk for integrated software, but may be the case for custom interfaces designed outside the software which may be subject to various points of failure.*

Will the interface process reject transactions or batches with errors? If so, who monitors rejections and follows up on rejected transactions to ensure correction (either in the sending or receiving systems) and how are corrections tracked and monitored?

*For example, information that could trigger a rejection or isolated transaction and batch can include: invalid data, duplicate data, or missing factors. If errors are possible, we would expect the isolated data is reviewed, tracked and corrected in a timely manner.*

Are any reconciliations done to provide assurance that data transfer was complete and accurate?

*We would expect the local government to perform a reconciliation between source and destination systems to ensure the interfaced data is complete and accurate. This may be a manual reconciliation or spot-check, a system or dashboard report, or automated edit check. Depending on how often errors (if any) are expected, the reconciliation could be done each time the interface occurs, or on a monitoring basis, like annually.*

# State of Washington

## Edit Checks:

Inquire if the entity has a written policy or documentation describing the approval process and protocols for reviewers?

What is the approval process in the application?

What transactions, data, tasks, or documents are approved?

Who are the preparers? How do preparers submit for approval?

Who are the authorized approvers? Are there backup approvers?

What documents or information are required to make approval judgment?

What is the next step once a transaction/data/ task/document is approved or denied?

Is there any exception situations where approval can be by-passed or waived?

Can the approver make changes to information during the approval stage? If so, is the preparer notified of the changes?

Can anyone make changes to the approved information after the approval stage? If so, are changes captured in an audit trail and is the audit trail (log) regularly reviewed and monitored to detect any unauthorized changes?

Does the application prevent users from approving their own work (self-approval)?

*Some applications have a feature preventing self-approval. If an application does not have a feature preventing self-approval, we would expect manual controls in place to ensure the segregation of duties between preparer and approver, if relevant to the risk.*

Does the application have high-level users that can also approve?

*High-Level Users (aka Users with elevated privileges, system or application "Administrators", "Super Users", etc.) typically have full access to change system settings and may have extensive function rights of software applications. Depending on entity's size and complexity, different high-level users may be responsible for the network vs. application level. High-level users represent a heightened risk for overriding segregation of duties and normal control processes.*

*We would expect entities to have compensating monitoring controls if personnel are responsible for both application settings and transaction processing controls.*

## Computer Generated Reports:

What information or exceptions is the report designed to identify (what is the purpose of the report)?

How is the report used and by whom?

For exception reports, who reviews the report and how do they follow up on exceptions?

*Auditors should consider whether the exception report reviewer has appropriate authority and information to effectively follow-up on report results. For fraud-related risks, also consider whether the review position is appropriately segregated from positions that can initiate transactions. For exception reports that regularly identify many transactions needing multi-step follow-up, the manual review and*

## State of Washington

*follow-up may be identified as a separate key control rather than documented and evaluated as an aspect of the automated exception report control.*

What are the report parameters or criteria? Does the report have any calculated fields? If so, what are the calculations?

*The ideal method of documenting an understanding of a computer generated report is to get a screenshot or printout of the report parameters. If using a report writer, this may be printed with the report, or may be accessed from a design view or intermediary screen. For custom or complex reports, this may be the SQL code.*

*For exception reports, auditors should pay special attention to the definition of an exception embodied in the report parameters.*

*NOTE: observation of the report parameters will also count as a confirmation of the report and could also be used to test the report.*

### Electronic Approvals:

Inquire if the entity has a written policy or documentation describing the approval process and protocols for reviewers?

What is the approval process in the application?

What transactions, data, tasks, or documents are approved?

Who are the preparers? How do preparers submit for approval?

Who are the authorized approvers? Are there backup approvers?

What documents or information are required to make approval judgment?

What is the next step once a transaction/data/ task/document is approved or denied?

Is there any exception situations where approval can be by-passed or waived?

Can the approver make changes to information during the approval stage? If so, is the preparer notified of the changes?

Can anyone make changes to the approved information after the approval stage? If so, are changes captured in an audit trail and is the audit trail (log) regularly reviewed and monitored to detect any unauthorized changes?

Does the application prevent users from approving their own work (self-approval)?

*Some applications have a feature preventing self-approval. If an application does not have a feature preventing self-approval, we would expect manual controls in place to ensure the segregation of duties between preparer and approver, if relevant to the risk.*

Does the application have high-level users that can also approve?

*High-Level Users (aka Users with elevated privileges, system or application "Administrators", "Super Users", etc.) typically have full access to change system settings and may have extensive function rights of software applications. Depending on entity's size and complexity, different high-level users may be responsible for the network vs. application level. High-level users represent a heightened risk for*

# State of Washington

*overriding segregation of duties and normal control processes.*

*We would expect entities to have compensating monitoring controls if personnel are responsible for both application settings and transaction processing controls.*

## **STEP 2: Confirm and Test Automated Key Control**

Confirm and test the automated control. To test the automated control, consider the following procedures:

### **Software Calculation:**

Re-perform the calculation for selected transactions.

*Auditors would NOT normally use sampling for automated controls. Instead, auditors should judgmentally select one instance of each significant variation of the calculation. If the number of potential variations is large, auditors would judgmentally select based on risk factors (for example, the most common scenarios, or scenarios associated with identified risks, or scenarios that are not addressed by the entity's testing procedures).*

*In some cases, it may be possible for the auditor to reperform the calculation for the entire population.*

If any rate tables or values were updated during the period, view the current values (by observing the rate table or values in an admin menu or from a printed system report) and compare to approved sources.

*If no updates were made or there are only a few values, this risk could be addressed by re-performing the calculation. However, if source rate tables or values are large or complex, it may be more efficient to test these values directly than to recalculate a larger number of transactions.*

Consider the use of analytical procedures such as trends or descriptive statistics on the population (like average, minimum and maximum values, or a graph of values across the population) and follow up on any unexpected values or trends. *Analytical procedures would normally also count as a substantive test.*

### **Automated Interfaces:**

Re-perform a reconciliation, comparison or analytical procedure between both systems to determine whether data interfaced completely and accurately. Alternatively, review the entity's reconciliation or comparison if they perform one.

*For example, auditors could perform count totals and summarize the data to determine whether the same number of transactions reside in both systems, or the total amount from the sending system was posted to the receiving system. Whether this takes the form of a comparison (numbers expected to match exactly), reconciliation (when reconciling items are expected) or analytical procedure (if numerous adjustments or reconciling items are expected) will depend on the nature of the interface and client documentation.*

# State of Washington

*Note: these procedures would also provide substantive evidence.*

Observe documentation, such as interface logs or email notifications, to determine whether interfaces complete per expected interval (daily, monthly, quarterly, etc.).

*We would expect the data transfer to be consistent based on the programmed schedule. If data is expected to be transferred on a weekly basis, we would expect to see some form of documentation showing the weekly transfer.*

Observe evidence that batch jobs are monitored such as tracking spreadsheets or emails.

When interfaces did not occur as expected, determine whether procedures were followed to resubmit job or that there was a logical reason no data was received/sent for the interval (for example, it was a holiday so there was no interface for that day).

## Edit Checks:

Re-perform the edit check for selected transactions.

*Auditors would NOT normally use sampling for automated controls. Instead, auditors should judgmentally select one instance of each significant variation of the check. If the number of potential variations is large, auditors would judgmentally select based on risk factors (for example, the most common scenarios, or scenarios associated with identified risks, or scenarios that are not addressed by the entity's testing procedures).*

*In some cases, it may be possible for the auditor to reperform the edit check for the entire population.*

Consider the use of analytical procedures such as trends or descriptive statistics on the population (like average, minimum and maximum values, or a graph of values across the population) and follow up on any unexpected values or trends. Analytical procedures would normally also count as a substantive test.

## Computer Generated Reports:

For exception reports, inquire with the person assigned to review the report how frequently exceptions are noted by the report. Trace identified exceptions to documentation of correction or resolution.

Re-perform the report by either (a) generating it yourself in the entity's system (if the auditor has direct access to the system), (b) recreating the report using CAATS, or (c) by observing the report be generated in your presence. If observing, note any user-entered values or parameters and determine whether entered parameters were appropriate. Compare re-performed report to the one being tested.

## Electronic Approvals:

Observe a transaction to see the approval process and verify any key aspects of the process or limits.

## State of Washington

If transaction data or reports include approval information, use CAATS to confirm that all transactions met authorization rules.

### **STEP 3: Understand General IT Controls**

Gain an understanding of the general IT controls that support the continued proper operation of the automated control. Identify key general IT controls and note any control weaknesses. Auditors should consider the following aspects of general IT controls when gaining an understanding:

#### **Software Calculation:**

Inquire if the entity has experienced any errors or irregularities with the calculation. Also how often changes are made to the calculation, and how many changes (if any) were made during the year.

How can the software calculation (formulas, rates/values, settings/configurations) be changed or customized?

*Software calculations will usually have one or more administrative menus that allow the government to modify rate tables or other calculation values, or to configure the calculation or apply settings.*

*In other cases, software calculation formulas and/or values may be hard-coded into the system and require programmers to make the changes. If the government has access to source code, then it needs internal procedures for program changes. If the program is controlled by vendors, we would expect program change procedures and expectations to be included in the contract.*

What are the procedures to authorize and make program changes or configuration/setting changes to the software calculation?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

*If utilizing a test environment, there should be controls to ensure that the live environment is updated and is consistent with the live production environment. As management is responsible for the accuracy of their automated controls (i.e., in the live environment), we would expect there to be a procedure to confirm each key automated control once it is in the live environment. This could be manually re-performing the calculation, reviewing reports against known expectations, etc.*

How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or*

## State of Washington

*per-change basis.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change programming, but they may be responsible for patch management, master table data, and/or configurations.*

### Automated Interfaces:

Inquire if the entity has experienced any errors or irregularities with the interface. Also how often changes are made to the interface, and how many changes (if any) were made during the year.

What are the procedures to authorize and make changes to the interface?

*Except for the most simple situations, we would normally expect update procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

*If the data transfer is already going to be checked or reconciled, then there may be less need for specific test procedures on program changes since any errors will be identified right away.*

How are program changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

*If the program is controlled by a third-party, we would expect a process between the government and vendor that allows the government to make requests and receive communication at the completion of the request.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to vendor developed/supported coding that controls how the system processes the*

## State of Washington

*interfaced data, but they may be responsible for working the interface error queues and reconciling the interfaced data.*

### Edit Checks:

Inquire if the entity has experienced any errors or irregularities with the edit checks. Also how often changes are made to the checks, and how many changes (if any) were made during the year.

How can the edit check be changed or customized?

*Edit checks may be hard-coded into the system and require programmers to make the changes. If the government has access to source code, then it needs internal procedures for program changes. If the program is controlled by vendors, we would expect program change procedures and expectations to be included in the contract.*

*In other cases, edit checks may be established or configured through one or more administrative menus.*

What are the procedures to authorize and make program changes or configuration/setting changes?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

*If utilizing a test environment, there should be controls to ensure that the live environment is updated and is consistent with the live production environment. As management is responsible for the accuracy of their automated controls (i.e., in the live environment), we would expect there to be a procedure to confirm each key automated control once it is in the live environment. This could be manually re-performing the edit check, reviewing reports against known expectations, etc.*

How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

## State of Washington

*For example, local governments may not have access to change programming, but they may be responsible for patch management, master table data, and/or configurations.*

### Computer Generated Reports:

Inquire if the entity has experienced any errors or irregularities with the report. Also how often changes are made to the report, and how many changes (if any) were made during the year.

How is the report triggered or initiated?

*For reports that are automatically triggered, the auditor would normally not identify job scheduling or monitoring as a general control since we would expect failure of the report to generate*

Is the report hardcoded into the program, or is it a custom or ad hoc report? Also, what manual inputs (if any) are required to run the report?

*What parameters, criteria (date ranges, fund number, departments) or instructions are entered by the user to generate the exception report. The more options entity personnel have to customize or modify the report, the higher the risk of human error and inaccurate or incomplete reports. Pre-programmed reports provide less flexibility than ad-hoc reports; however, if program change controls are in place, they are more consistent.*

If the report is hardcoded into the system, how are program changes made?

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change vendor developed reports, but they may be responsible for triggering, setting certain parameters, and/or following up on exception report results.*

NOTE: if the auditor cannot identify sufficiently effective general IT controls, the automated control will need to be tested using the same methods as a manual control (ie: sampling throughout the period). For example, if the report is manually generated and highly dependent on a number of manual inputs each time, or if the report does not have formal change controls, such as an ad hoc report or excel-based report. In such cases, the automated report is controlled by limited access and the judgment of the report writer – that is, while the report is an automated component, there is also an integrated manual component to the control.

### Electronic Approvals:

How are users assigned preparer and approver roles? Are user accounts periodically checked for needed changes? See the [User Access](#) step in the Accountability folder for more control considerations.

If configurations or settings relevant to the approval process are controlled by an admin menu, who has access to this menu?

## State of Washington

If the entity has access to source coding for approval controls, what are the procedures to authorize and make program changes?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?  
How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to vendor developed/supported coding that controls how the electronic approval works, but they may be responsible for approval configurations or settings and/or user account management.*

### **STEP 4: Confirm Key General IT Controls**

Confirm your understanding of key general IT controls to determine whether they have been placed in operation (*whether the entity has actually implemented key controls*).

### **STEP 5: Test Key General IT Controls**

Document whether general IT controls will be tested. Option 1 would result in control risk at MAX for the automated control. Either option 2 or 3 is necessary in order to set control risk at LOW. If general IT controls are tested, consider the following procedures:

#### **Software Calculation:**

If program changes or setting/configuration changes are logged, review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the calculation may also provide this evidence if the re-performance tests address all states of the calculation during the period.

## State of Washington

If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) worksheet in the Store.

### Automated Interfaces:

Review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, reconciling or comparing the data transfer (or reviewing the entity's reconciliation or comparison) may also provide this evidence if tests address all states of the interface during the period.

Inspect job processing error logs/reports. Observe evidence that errors in processing were isolated and resolved. For example, select a sample of rejected transactions and observe evidence to determine whether errors were appropriately corrected and the corrections were timely.

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) worksheet in the Store.

### Edit Checks:

If program changes or setting/configuration changes are logged, review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the edit check may also provide this evidence if the re-performance tests address all states of the edit check during the period.

If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) worksheet in the Store.

### Computer Generated Reports:

## State of Washington

If the report is subject to program change controls (either due to being hardcoded or by being automatically triggered), review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

If the report is subject to program change controls, review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the report may also provide this evidence if the re-performance tests address all states of the report during the period.

If the report relies on manual inputs and report copies saved show the parameters entered, the auditor can check a selection or sample of reports to confirm that the report was run correctly.

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

### Electronic Approvals:

Review user access report to verify that current users are appropriate. Also consider review of user access change logs (if available) to evaluate user account management throughout the period. See the User Access step in the Accountability folder for more testing considerations.

If approvals are governed by significant settings/configurations, and such changes are logged, review the change log to verify the population of changes for the year.

*Verification that no configuration changes were made, along with the auditor's evaluation that no such changes are expected, would normally be sufficient evidence to conclude that no further testing is necessary.*

If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.

If the entity has access to source code, review the change log to verify the population of changes for the year. Then review programming change documentation or the entity's test documentation for selected or sampled changes.

*Verification that no program changes were made, along with the auditor's evaluation that no such changes are expected, would normally be sufficient evidence to conclude that no further testing is necessary.*

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the SOC Report Reliance workpaper in the Store.

# State of Washington

## **STEP 6: Final Control Risk**

Evaluate the results and document a final control risk assessment in the control system step. Consider whether any deficiencies identified with either the automated control or related general IT controls represent material weaknesses or significant deficiencies.

*Note: general IT control deficiencies do not necessarily mean the automated control is not properly functioning. General IT control deficiencies would normally be considered a significant deficiency or material weakness only if it caused an issue with the compliance requirement or assertion.*

## **Recommendation Review Requirement**

IT Security related information is considered category 3 data protected by Public Request Exemption RCW 42.56.420. Issues related to IT Security require the following special handling:

[Instructions](#) are located in Team IT Audit's System's Sharepoint page.

Details of IT Security related issues should NOT be included in any emails or helpdesks.

Exit, ML and Findings should be separately communicated in an IT Security Results Document.

Findings will be referenced, but not included in the audit report.

All IT security-related recommendations must be reviewed by [Team IT Audit](#).

Template language for common IT related recommendations can be found in [ARS Part 5 Chapter 8](#).

## **PUBLIC REQUEST EXEMPTION**

Some IT related information is protected by Public Request Exemption RCW 42.56.420 for cyber security purposes. The details documented in the record of work and support workpapers may qualify for this exemption. If so, auditors must include this statement in the record of work done and any related workpapers: **"This record contains information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited "**.

Guidance/Criteria:
--------------------

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Information Technology](#) Planning Guide**

Auditors may contact [Team IT Audit](#) with any testing strategy or control assessment questions or to request assistance from an IT Specialist.

**Software Calculation:** A **software calculation control** exists when the value of a transaction is determined by a software application. This

## State of Washington

process can be a key control when the entity relies on the system to generate calculations correctly to determine the amount of transactions (i.e., summarizing/account code allocation to post to general ledger, calculate student, utility, other charges, etc.).

**Automated Interfaces:** An interface is a process that moves information from one computer application to another. The interface can occur internally between systems maintained by a single agency, or between systems maintained by different agencies or private companies. The interface can also occur between modules within the same computer application.

The data transferred might be a file consisting of one or more records processed at a later time (batch), or it can be a real-time update. Risk associated with interfaces increases as the number of transactions or the number of other services and systems supported by the interfaced data increases.

Poor design or inadequate oversight can affect the transfer of transaction data among the systems. Interface controls are automated and/or manual processes designed to ensure transmission and processing of information is complete and accurate.

### Manual vs. Automated Interfaces

A "manual interface" is the transfer of data from one system or module to another system or module, initiated and controlled by a user. An example of a manual interface is when customer accounts are downloaded from a utility billing system to be used to perform meter readings. When complete, the file with meter readings may be uploaded and posted to the customer accounts.

An "automated interface" is the transfer of data from one system or module to another system or module that happens automatically based on a schedule, or other predefined criteria. A common example of an automated interface is the payroll module of a system. Typically, a payroll batch is created in the payroll module. Once approved, the batch is automatically sent by the system to the general ledger or other applicable modules, such as accounts payable.

Entities should have reconciliation controls between their various applications regardless of the method used for interfacing.

*Auditors should have determined whether system interfaces are automated as part of the Key Software Applications workpaper. **If not**, ask the following question to determine whether the system interface is manual or automated.*

*Is the data transferred from one system/module to another system/module by a user using an uploading and posting technique? For example, data is pulled from one system into a text file or other format, that is then uploaded into a different system or module by posting or in an upload feature of the module. If the answer to this question is yes, the interface would be considered "manual" since it is initiated and controlled by manually rather than through an automated process.*

**Edit Checks:** An **edit check** is a programmed routine designed to check input data or processing results for accuracy, compliance, or reasonableness. Types of edit checks include:

## State of Washington

Range Checks: ensure that numeric values fall within specified ranges, minimums and/or maximums. For example, ensuring that a capital asset can only be entered as a positive amount, or a purchase order can only be submitted without secondary approval for less than a certain threshold.

Consistency Checks: verify that related data fields are consistent with each other. For example, ensuring that a patient's age matches their date of birth.

Format Checks: validate data formats (for example, dates as MM/DD/YYYY or phone numbers as ###-###-####).

Logical Checks: assess logical relationships between data fields. For instance, verifying that total debits equals total credits in a journal entry.

Duplicate Checks: identify duplicate records or entries. For example, preventing the same invoice from being entered twice.

Cross-Field Checks: compare data across different fields. For instance, ensuring that the start date of a project is before the end date.

Required Field Checks: ensure that mandatory fields are filled out. For instance, making sure that a patient's name and date of birth are provided.

Referential Integrity Checks: validate relationships between data tables. For example, confirming that a vendor number exists in the vendor master file as an active entity.

Outlier Checks: detect extreme or unexpected values. For instance, flagging water meter reading values that are extreme outliers for the customer type or account history.

Pattern Checks: look for specific patterns in data. For example, verifying that email addresses follow a valid format.

Edit checks may result in automatic rejection of a transaction, inability to proceed with a transaction, trigger for additional processing or review, or may simply result in a warning message to the user.

Edit checks may be identified as a key control when they are sufficiently relevant (ie: addressing the risk), precise (ie: able to catch all errors, rather than just being only reasonableness or limit check), and sufficiently strong (ie: prevent invalid transactions, rather than just generating a warning messages). Auditors may identify an individual edit or a group of edit checks together as a key control.

**Computer Generated Reports:** A **computer-generated report** is a report that is created by a computer program. The computer program, also referred to as a report generator or tool, takes data from a data source, such as a database, and displays it in a specified format. The process to generate a report often includes performing calculations on the data, such as summarizing, classifying, etc., before displaying, or can display the calculations on the report.

There are two types of computer-generated reports, pre-programmed and ad-hoc or customized reports.

Pre-programmed or canned reports are pre-defined reports where criteria and specifications are hard coded in the system. A canned report may allow limited parameters, (month/year, for example), but in general the information that will be displayed is pre-determined.

Ad-hoc or customized reports allow the user to drill down and customize what information is displayed on the report based on some allowed criteria, such as account codes, dollar amounts minimum, etc).

## State of Washington

In contrast, a **manual report** is one that is created outside the system using data exports or is created ad hoc by a user. An example of a manual report is one that is created by copying data from a data source and pasting the data in an Excel spreadsheet or Word document or Powerpoint presentation where it is then processed further. With manual reports, each time a report is created, the data could be incorrect due to user error, such as not copying all relevant data, or processing errors. Therefore, these types of reports should be understood and tested similar to manual controls.

**Electronic Approvals:** Electronic approvals, electronic signatures and digital signatures are technically different, although often these terms are used interchangeably by entities.

Auditors should have determined whether the electronic approval is an automated control as part of the overall understanding of controls. For automated control purposes, an electronic approval is a software system functionality that:

- Permits a user to approve transaction(s) within the software system

- The system automatically documents, or logs, the data approved by the user and any subsequent manipulation

- The acceptance or rejection of the transaction by the approver will trigger an additional software system process, such as posting of a transaction.

E-mail, scanned-in pictures of signatures, or font-changed signatures, etc. may be part of a control activity but are generally not considered an automated control and are not covered by this testing strategy.

### Electronic Signature vs Digital Signature

An "**electronic signature**" can look like a handwritten signature that has been scanned and then pasted into an electronic document. The reliability of this type of approval is variable. Recommend gaining an understanding of the process used to store and affix the signature to the document and then discuss the process with Team IT Audit before placing reliance on this control.

A "**digital signature**" is a legal signature with a formal certification process that documents who approved the document and ensures the document is not modified after certification. Reliability of this process is very high but has significant technical features. Recommend brainstorm with Team IT Audit before placing reliance on this control.

### **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

**Statements on Auditing Standards [AU-C 315](#) Understanding the Entity and Its Environment and Assessing the Risks of Material Misstatement** - paragraphs .A106-.A109 describe general and application controls and how they relate to audit risks

**Statements on Auditing Standards [AU-C 330](#) Performing Audit Procedures in Response to Assessed Risks and Evaluating the**

# State of Washington

**Audit Evidence Obtained** - paragraphs .10b and .A33-.A34 describe requirements and guidance for testing indirect controls in conjunction with tests of controls, that is, testing key general controls in conjunction with a test of a key automated control

Record of Work Done:

**Key Control #4 - (Automated) - Valuation** - When a taxpayer logs into their My DOR account and selects to file a return, ATLAS automatically calculates taxes due from pre-programmed rates based on return information entered by the taxpayer.

## **STEP 1: Understand Automated Key Control**

The understanding for this system is documented above in the "Controls - ATLAS" step.

## **STEP 2: Confirm and Test Automated Key Control:**

To confirm the automated control, we re-performed the tax calculations for a sample of tax returns at [\[HST Testing\]](#). See "IT Control Testing - Valuation" tab.

## **STEP 3: Understand General IT Controls**

We gained an understanding of general controls in the Tax Collections for Other Governments section, as the processes are identical regardless of the type of tax being calculated, see here: [\[Key Control 2 \(Automated\)\]](#).

## **STEP 4: Confirm Key General IT Controls**

We confirmed general IT controls in the Tax Collections for Other Governments section, as the processes are identical regardless of the type of tax being calculated, see here: [\[Key Control 2 \(Automated\)\]](#).

## **STEP 5: Test Key General IT Controls**

Not applicable - we are not planning to rely on automated controls and therefore do not need to test general controls; control risk will be assessed at MAX.

## **G.2.PRG - Other Taxes**

*Procedure Step:* Key Control #2 (Manual)

*Prepared By:* BFW, 6/24/2024

*Reviewed By:* RKM, 10/15/2024

## State of Washington

Purpose/Conclusion.\*

**Purpose:**

To confirm quarterly review of deductions and exemptions for the hazardous substance tax **(Key Control 2 for ATLAS)** in order to assess control risk.

**Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy.\*

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

## State of Washington

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency.*

***All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.***

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. *Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. *Controls are not related to a "significant risk" identified in the audit plan.*
- C. *Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all*

## State of Washington

*control testing.*

*D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

**Key Control #2 - (Manual) - Occurrence** - Exemptions and deductions claimed for this tax are tracked on a spreadsheet that lists lifelong taxpayers that have taken them. An Excise Tax Examiner 3 will review the spreadsheet and reconcile quarterly to ensure taxpayers who are claiming the exemptions or deductions have claimed them previously or verify qualifications for taxpayers who are claiming for the first time.

The understanding for this system is documented above in the "Controls - ATLAS" step.

### **1. Confirmation of Key Manual Control:**

We obtained the spreadsheet reconciliation for Q1 of FY24. We noted one tab of the document was for crop protection deduction. There were 4 taxpayers listed, three of which had three months worth of filing periods noted and one had two months worth of filing periods, all listed as verified with the dates they were initially verified as qualifying for this deduction. The reviewer was noted as "HH - 3/24". We noted a second tab for Other Deductions that contained 4 taxpayers, one for three months, two for two months and one for a single month. We noted three of the four taxpayers were verified and date of verification was noted for each. One was noted as not verified, "Request for information - No description given." The reviewer for all but one of these was noted as "HH - 3/24" and the reviewer for the last one was noted as "BP - 4/24". ***No issues noted.***

### **Noted Weaknesses are as follows:**

None.

# State of Washington

## **2. Preliminary Control Risk Assessment**

Based on our understanding and anticipated audit strategy, we assessed preliminary control risk as follows:

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

## **3. Control Risk at LOW - Test of Key Manual Control:**

Not applicable - we are not planning to rely on controls and therefore do not need to test controls; control risk will be assessed at maximum.

## **G.2.PRG - Other Taxes**

*Procedure Step:* Key Control #3 (Automated)

*Prepared By:* BFW, 6/20/2024

*Reviewed By:* RKM, 10/17/2024

Purpose/Conclusion:

### **Purpose:**

To determine whether daily reconciliation between ATLAS and AFRS (**key control 3 for ATLAS**) was in place and operating effectively and to consider related general IT controls in order to assess control risk.

### **Conclusion:**

Based on our understanding and test results, we concluded that the automated control **was** in place and operating effectively.

Based on our understanding, related general IT controls **were** in place and adequately designed to ensure that the control operated consistently during the audit period. However, we did not test the operating effectiveness of general IT controls.

Our understanding and control risk assessment, which incorporates these conclusions, is documented at [Risk Assessment].

Testing Strategy:

The following procedures are **required** for all automated key controls for financial and single audits:

# State of Washington

## **STEP 1: Understand Automated Key Control**

Gain an understanding of the automated key control. The understanding can either be documented in the control system step or could be documented here in this step. Auditors should consider the following aspects of the automated control when gaining an understanding:

### **Software Calculation:**

Is there written documentation of the calculation, and/or the source rates and factors used in the calculation?

*We would expect written documentation that defines the calculation and is an official, approved source for the formulas, rates and factors. This may be an approved policy or could be system documentation.*

What formulas are used to make the calculation?

What values or factors are used to make the calculation? For example:

- Rate tables used by the calculation
- Profile fields (i.e., applicable transaction types)
- Programmed/set formulas and/or values
- Constraints (i.e., effective date, minimums/maximums, etc.)

How is the calculation triggered or initiated?

How is the calculation recorded in the accounting system (or used in an end result)?

### **Automated Interfaces:**

Is data transferred in real time (immediately) or in a batch? If batched, how often does the interface occur (daily, monthly, quarterly, etc.)?

What triggers the data transfer?

*Transfers could be manually initiated, could be hardcoded into either the sending or receiving system's programming, could be controlled by administrative menus (for integrated software modules), or could be run as automated jobs with third party software or programming.*

Could the interface process fail? If so, how would the entity recognize that the process failed?

*This may not be a relevant risk for integrated software, but may be the case for custom interfaces designed outside the software which may be subject to various points of failure.*

Will the interface process reject transactions or batches with errors? If so, who monitors rejections and follows up on rejected transactions to ensure correction (either in the sending or receiving systems) and how are corrections tracked and monitored?

## State of Washington

*For example, information that could trigger a rejection or isolated transaction and batch can include: invalid data, duplicate data, or missing factors. If errors are possible, we would expect the isolated data is reviewed, tracked and corrected in a timely manner.*

Are any reconciliations done to provide assurance that data transfer was complete and accurate?

*We would expect the local government to perform a reconciliation between source and destination systems to ensure the interfaced data is complete and accurate. This may be a manual reconciliation or spot-check, a system or dashboard report, or automated edit check. Depending on how often errors (if any) are expected, the reconciliation could be done each time the interface occurs, or on a monitoring basis, like annually.*

### Edit Checks:

Inquire if the entity has a written policy or documentation describing the approval process and protocols for reviewers?

What is the approval process in the application?

What transactions, data, tasks, or documents are approved?

Who are the preparers? How do preparers submit for approval?

Who are the authorized approvers? Are there backup approvers?

What documents or information are required to make approval judgment?

What is the next step once a transaction/data/ task/document is approved or denied?

Is there any exception situations where approval can be by-passed or waived?

Can the approver make changes to information during the approval stage? If so, is the preparer notified of the changes?

Can anyone make changes to the approved information after the approval stage? If so, are changes captured in an audit trail and is the audit trail (log) regularly reviewed and monitored to detect any unauthorized changes?

Does the application prevent users from approving their own work (self-approval)?

*Some applications have a feature preventing self-approval. If an application does not have a feature preventing self-approval, we would expect manual controls in place to ensure the segregation of duties between preparer and approver, if relevant to the risk.*

Does the application have high-level users that can also approve?

*High-Level Users (aka Users with elevated privileges, system or application "Administrators", "Super Users", etc.) typically have full access to change system settings and may have extensive function rights of software applications. Depending on entity's size and complexity, different high-level users may be responsible for the network vs. application level. High-level users represent a heightened risk for overriding segregation of duties and normal control processes.*

*We would expect entities to have compensating monitoring controls if personnel are responsible for both application settings and*

# State of Washington

*transaction processing controls.*

## Computer Generated Reports:

What information or exceptions is the report designed to identify (what is the purpose of the report)?

How is the report used and by whom?

For exception reports, who reviews the report and how do they follow up on exceptions?

*Auditors should consider whether the exception report reviewer has appropriate authority and information to effectively follow-up on report results. For fraud-related risks, also consider whether the review position is appropriately segregated from positions that can initiate transactions. For exception reports that regularly identify many transactions needing multi-step follow-up, the manual review and follow-up may be identified as a separate key control rather than documented and evaluated as an aspect of the automated exception report control.*

What are the report parameters or criteria? Does the report have any calculated fields? If so, what are the calculations?

*The ideal method of documenting an understanding of a computer generated report is to get a screenshot or printout of the report parameters. If using a report writer, this may be printed with the report, or may be accessed from a design view or intermediary screen. For custom or complex reports, this may be the SQL code.*

*For exception reports, auditors should pay special attention to the definition of an exception embodied in the report parameters.*

*NOTE: observation of the report parameters will also count as a confirmation of the report and could also be used to test the report.*

## Electronic Approvals:

Inquire if the entity has a written policy or documentation describing the approval process and protocols for reviewers?

What is the approval process in the application?

What transactions, data, tasks, or documents are approved?

Who are the preparers? How do preparers submit for approval?

Who are the authorized approvers? Are there backup approvers?

What documents or information are required to make approval judgment?

What is the next step once a transaction/data/ task/document is approved or denied?

Is there any exception situations where approval can be by-passed or waived?

Can the approver make changes to information during the approval stage? If so, is the preparer notified of the changes?

Can anyone make changes to the approved information after the approval stage? If so, are changes captured in an audit trail and is the audit trail (log) regularly reviewed and monitored to detect any unauthorized changes?

## State of Washington

Does the application prevent users from approving their own work (self-approval)?

*Some applications have a feature preventing self-approval. If an application does not have a feature preventing self-approval, we would expect manual controls in place to ensure the segregation of duties between preparer and approver, if relevant to the risk.*

Does the application have high-level users that can also approve?

*High-Level Users (aka Users with elevated privileges, system or application "Administrators", "Super Users", etc.) typically have full access to change system settings and may have extensive function rights of software applications. Depending on entity's size and complexity, different high-level users may be responsible for the network vs. application level. High-level users represent a heightened risk for overriding segregation of duties and normal control processes.*

*We would expect entities to have compensating monitoring controls if personnel are responsible for both application settings and transaction processing controls.*

### **STEP 2: Confirm and Test Automated Key Control**

Confirm and test the automated control. To test the automated control, consider the following procedures:

#### **Software Calculation:**

Re-perform the calculation for selected transactions.

*Auditors would NOT normally use sampling for automated controls. Instead, auditors should judgmentally select one instance of each significant variation of the calculation. If the number of potential variations is large, auditors would judgmentally select based on risk factors (for example, the most common scenarios, or scenarios associated with identified risks, or scenarios that are not addressed by the entity's testing procedures).*

*In some cases, it may be possible for the auditor to reperform the calculation for the entire population.*

If any rate tables or values were updated during the period, view the current values (by observing the rate table or values in an admin menu or from a printed system report) and compare to approved sources.

*If no updates were made or there are only a few values, this risk could be addressed by re-performing the calculation. However, if source rate tables or values are large or complex, it may be more efficient to test these values directly than to recalculate a larger number of transactions.*

Consider the use of analytical procedures such as trends or descriptive statistics on the population (like average, minimum and maximum values, or a graph of values across the population) and follow up on any unexpected values or trends. *Analytical procedures would normally also count as a substantive test.*

# State of Washington

## Automated Interfaces:

Re-perform a reconciliation, comparison or analytical procedure between both systems to determine whether data interfaced completely and accurately. Alternatively, review the entity's reconciliation or comparison if they perform one.

*For example, auditors could perform count totals and summarize the data to determine whether the same number of transactions reside in both systems, or the total amount from the sending system was posted to the receiving system. Whether this takes the form of a comparison (numbers expected to match exactly), reconciliation (when reconciling items are expected) or analytical procedure (if numerous adjustments or reconciling items are expected) will depend on the nature of the interface and client documentation.*

*Note: these procedures would also provide substantive evidence.*

Observe documentation, such as interface logs or email notifications, to determine whether interfaces complete per expected interval (daily, monthly, quarterly, etc.).

*We would expect the data transfer to be consistent based on the programmed schedule. If data is expected to be transferred on a weekly basis, we would expect to see some form of documentation showing the weekly transfer.*

Observe evidence that batch jobs are monitored such as tracking spreadsheets or emails.

When interfaces did not occur as expected, determine whether procedures were followed to resubmit job or that there was a logical reason no data was received/sent for the interval (for example, it was a holiday so there was no interface for that day).

## Edit Checks:

Re-perform the edit check for selected transactions.

*Auditors would NOT normally use sampling for automated controls. Instead, auditors should judgmentally select one instance of each significant variation of the check. If the number of potential variations is large, auditors would judgmentally select based on risk factors (for example, the most common scenarios, or scenarios associated with identified risks, or scenarios that are not addressed by the entity's testing procedures).*

*In some cases, it may be possible for the auditor to reperform the edit check for the entire population.*

Consider the use of analytical procedures such as trends or descriptive statistics on the population (like average, minimum and maximum values, or a graph of values across the population) and follow up on any unexpected values or trends. Analytical procedures would normally also count as a substantive test.

# State of Washington

## Computer Generated Reports:

For exception reports, inquire with the person assigned to review the report how frequently exceptions are noted by the report. Trace identified exceptions to documentation of correction or resolution.

Re-perform the report by either (a) generating it yourself in the entity's system (if the auditor has direct access to the system), (b) recreating the report using CAATS, or (c) by observing the report be generated in your presence. If observing, note any user-entered values or parameters and determine whether entered parameters were appropriate. Compare re-performed report to the one being tested.

## Electronic Approvals:

Observe a transaction to see the approval process and verify any key aspects of the process or limits.

If transaction data or reports include approval information, use CAATS to confirm that all transactions met authorization rules.

## **STEP 3: Understand General IT Controls**

Gain an understanding of the general IT controls that support the continued proper operation of the automated control. Identify key general IT controls and note any control weaknesses. Auditors should consider the following aspects of general IT controls when gaining an understanding:

## Software Calculation:

Inquire if the entity has experienced any errors or irregularities with the calculation. Also how often changes are made to the calculation, and how many changes (if any) were made during the year.

How can the software calculation (formulas, rates/values, settings/configurations) be changed or customized?

*Software calculations will usually have one or more administrative menus that allow the government to modify rate tables or other calculation values, or to configure the calculation or apply settings.*

*In other cases, software calculation formulas and/or values may be hard-coded into the system and require programmers to make the changes. If the government has access to source code, then it needs internal procedures for program changes. If the program is controlled by vendors, we would expect program change procedures and expectations to be included in the contract.*

What are the procedures to authorize and make program changes or configuration/setting changes to the software calculation?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

## State of Washington

*If utilizing a test environment, there should be controls to ensure that the live environment is updated and is consistent with the live production environment. As management is responsible for the accuracy of their automated controls (i.e., in the live environment), we would expect there to be a procedure to confirm each key automated control once it is in the live environment. This could be manually re-performing the calculation, reviewing reports against known expectations, etc.*

How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change programming, but they may be responsible for patch management, master table data, and/or configurations.*

### Automated Interfaces:

Inquire if the entity has experienced any errors or irregularities with the interface. Also how often changes are made to the interface, and how many changes (if any) were made during the year.

What are the procedures to authorize and make changes to the interface?

*Except for the most simple situations, we would normally expect update procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

*If the data transfer is already going to be checked or reconciled, then there may be less need for specific test procedures on program changes since any errors will be identified right away.*

How are program changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables*

## State of Washington

*or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

*If the program is controlled by a third-party, we would expect a process between the government and vendor that allows the government to make requests and receive communication at the completion of the request.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to vendor developed/supported coding that controls how the system processes the interfaced data, but they may be responsible for working the interface error queues and reconciling the interfaced data.*

### Edit Checks:

Inquire if the entity has experienced any errors or irregularities with the edit checks. Also how often changes are made to the checks, and how many changes (if any) were made during the year.

How can the edit check be changed or customized?

*Edit checks may be hard-coded into the system and require programmers to make the changes. If the government has access to source code, then it needs internal procedures for program changes. If the program is controlled by vendors, we would expect program change procedures and expectations to be included in the contract.*

*In other cases, edit checks may be established or configured through one or more administrative menus.*

What are the procedures to authorize and make program changes or configuration/setting changes?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

*If utilizing a test environment, there should be controls to ensure that the live environment is updated and is consistent with the live production environment. As management is responsible for the accuracy of their automated controls (i.e., in the live environment), we would expect there to be a procedure to confirm each key automated control once it is in the live environment. This could be manually re-performing the edit check, reviewing reports against known expectations, etc.*

## State of Washington

How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change programming, but they may be responsible for patch management, master table data, and/or configurations.*

### Computer Generated Reports:

Inquire if the entity has experienced any errors or irregularities with the report. Also how often changes are made to the report, and how many changes (if any) were made during the year.

How is the report triggered or initiated?

*For reports that are automatically triggered, the auditor would normally not identify job scheduling or monitoring as a general control since we would expect failure of the report to generate*

Is the report hardcoded into the program, or is it a custom or ad hoc report? Also, what manual inputs (if any) are required to run the report?

*What parameters, criteria (date ranges, fund number, departments) or instructions are entered by the user to generate the exception report. The more options entity personnel have to customize or modify the report, the higher the risk of human error and inaccurate or incomplete reports. Pre-programmed reports provide less flexibility than ad-hoc reports; however, if program change controls are in place, they are more consistent.*

If the report is hardcoded into the system, how are program changes made?

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change vendor developed reports, but they may be responsible for triggering, setting certain parameters, and/or following up on exception report results.*

## State of Washington

NOTE: if the auditor cannot identify sufficiently effective general IT controls, the automated control will need to be tested using the same methods as a manual control (ie: sampling throughout the period). For example, if the report is manually generated and highly dependent on a number of manual inputs each time, or if the report does not have formal change controls, such as an ad hoc report or excel-based report. In such cases, the automated report is controlled by limited access and the judgment of the report writer – that is, while the report is an automated component, there is also an integrated manual component to the control.

### Electronic Approvals:

How are users assigned preparer and approver roles? Are user accounts periodically checked for needed changes? See the [User Access](#) step in the Accountability folder for more control considerations.

If configurations or settings relevant to the approval process are controlled by an admin menu, who has access to this menu?

If the entity has access to source coding for approval controls, what are the procedures to authorize and make program changes?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to vendor developed/supported coding that controls how the electronic approval works, but they may be responsible for approval configurations or settings and/or user account management.*

### **STEP 4: Confirm Key General IT Controls**

Confirm your understanding of key general IT controls to determine whether they have been placed in operation (*whether the entity has actually implemented key controls*).

### **STEP 5: Test Key General IT Controls**

Document whether general IT controls will be tested. Option 1 would result in control risk at MAX for the automated control. Either option 2 or 3

## State of Washington

is necessary in order to set control risk at LOW. If general IT controls are tested, consider the following procedures:

### Software Calculation:

If program changes or setting/configuration changes are logged, review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the calculation may also provide this evidence if the re-performance tests address all states of the calculation during the period.

If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

### Automated Interfaces:

Review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, reconciling or comparing the data transfer (or reviewing the entity's reconciliation or comparison) may also provide this evidence if tests address all states of the interface during the period.

Inspect job processing error logs/reports. Observe evidence that errors in processing were isolated and resolved. For example, select a sample of rejected transactions and observe evidence to determine whether errors were appropriately corrected and the corrections were timely.

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

### Edit Checks:

If program changes or setting/configuration changes are logged, review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

## State of Washington

- Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the edit check may also provide this evidence if the re-performance tests address all states of the edit check during the period.
- If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.
- If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

### Computer Generated Reports:

- If the report is subject to program change controls (either due to being hardcoded or by being automatically triggered), review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

- If the report is subject to program change controls, review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the report may also provide this evidence if the re-performance tests address all states of the report during the period.
- If the report relies on manual inputs and report copies saved show the parameters entered, the auditor can check a selection or sample of reports to confirm that the report was run correctly.
- If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

### Electronic Approvals:

- Review user access report to verify that current users are appropriate. Also consider review of user access change logs (if available) to evaluate user account management throughout the period. See the User Access step in the Accountability folder for more testing considerations.
- If approvals are governed by significant settings/configurations, and such changes are logged, review the change log to verify the population of changes for the year.

*Verification that no configuration changes were made, along with the auditor's evaluation that no such changes are expected, would normally be sufficient evidence to conclude that no further testing is necessary.*

- If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.

## State of Washington

If the entity has access to source code, review the change log to verify the population of changes for the year. Then review programming change documentation or the entity's test documentation for selected or sampled changes.

*Verification that no program changes were made, along with the auditor's evaluation that no such changes are expected, would normally be sufficient evidence to conclude that no further testing is necessary.*

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the SOC Report Reliance workpaper in the Store.

### **STEP 6: Final Control Risk**

Evaluate the results and document a final control risk assessment in the control system step. Consider whether any deficiencies identified with either the automated control or related general IT controls represent material weaknesses or significant deficiencies.

*Note: general IT control deficiencies do not necessarily mean the automated control is not properly functioning. General IT control deficiencies would normally be considered a significant deficiency or material weakness only if it caused an issue with the compliance requirement or assertion.*

### **Recommendation Review Requirement**

IT Security related information is considered category 3 data protected by Public Request Exemption RCW 42.56.420. Issues related to IT Security require the following special handling:

[Instructions](#) are located in Team IT Audit's System's Sharepoint page.

Details of IT Security related issues should NOT be included in any emails or helpdesks.

Exit, ML and Findings should be separately communicated in an IT Security Results Document.

Findings will be referenced, but not included in the audit report.

All IT security-related recommendations must be reviewed by [Team IT Audit](#).

Template language for common IT related recommendations can be found in [ARS Part 5 Chapter 8](#).

### **PUBLIC REQUEST EXEMPTION**

Some IT related information is protected by Public Request Exemption RCW 42.56.420 for cyber security purposes. The details documented in the record of work and support workpapers may qualify for this exemption. If so, auditors must include this statement in the record of work done and any related workpapers: **"This record contains information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited "**.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

# State of Washington

## SAO Audit Policy [2310](#) - Reporting Identified Audit Issues

## SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk

### [Information Technology](#) Planning Guide

Auditors may contact [Team IT Audit](#) with any testing strategy or control assessment questions or to request assistance from an IT Specialist.

**Software Calculation:** A **software calculation control** exists when the value of a transaction is determined by a software application. This process can be a key control when the entity relies on the system to generate calculations correctly to determine the amount of transactions (i.e., summarizing/account code allocation to post to general ledger, calculate student, utility, other charges, etc.).

**Automated Interfaces:** An interface is a process that moves information from one computer application to another. The interface can occur internally between systems maintained by a single agency, or between systems maintained by different agencies or private companies. The interface can also occur between modules within the same computer application.

The data transferred might be a file consisting of one or more records processed at a later time (batch), or it can be a real-time update. Risk associated with interfaces increases as the number of transactions or the number of other services and systems supported by the interfaced data increases.

Poor design or inadequate oversight can affect the transfer of transaction data among the systems. Interface controls are automated and/or manual processes designed to ensure transmission and processing of information is complete and accurate.

#### Manual vs. Automated Interfaces

A “manual interface” is the transfer of data from one system or module to another system or module, initiated and controlled by a user. An example of a manual interface is when customer accounts are downloaded from a utility billing system to be used to perform meter readings. When complete, the file with meter readings may be uploaded and posted to the customer accounts.

An “automated interface” is the transfer of data from one system or module to another system or module that happens automatically based on a schedule, or other predefined criteria. A common example of an automated interface is the payroll module of a system. Typically, a payroll batch is created in the payroll module. Once approved, the batch is automatically sent by the system to the general ledger or other applicable modules, such as accounts payable.

Entities should have reconciliation controls between their various applications regardless of the method used for interfacing.

*Auditors should have determined whether system interfaces are automated as part of the Key Software Applications workpaper. **If not**, ask the*

# State of Washington

*following question to determine whether the system interface is manual or automated.*

*Is the data transferred from one system/module to another system/module by a user using an uploading and posting technique? For example, data is pulled from one system into a text file or other format, that is then uploaded into a different system or module by posting or in an upload feature of the module. If the answer to this question is yes, the interface would be considered "manual" since it is initiated and controlled by manually rather than through an automated process.*

**Edit Checks:** An **edit check** is a programmed routine designed to check input data or processing results for accuracy, compliance, or reasonableness. Types of edit checks include:

Range Checks: ensure that numeric values fall within specified ranges, minimums and/or maximums. For example, ensuring that a capital asset can only be entered as a positive amount, or a purchase order can only be submitted without secondary approval for less than a certain threshold.

Consistency Checks: verify that related data fields are consistent with each other. For example, ensuring that a patient's age matches their date of birth.

Format Checks: validate data formats (for example, dates as MM/DD/YYYY or phone numbers as ###-###-####).

Logical Checks: assess logical relationships between data fields. For instance, verifying that total debits equals total credits in a journal entry.

Duplicate Checks: identify duplicate records or entries. For example, preventing the same invoice from being entered twice.

Cross-Field Checks: compare data across different fields. For instance, ensuring that the start date of a project is before the end date.

Required Field Checks: ensure that mandatory fields are filled out. For instance, making sure that a patient's name and date of birth are provided.

Referential Integrity Checks: validate relationships between data tables. For example, confirming that a vendor number exists in the vendor master file as an active entity.

Outlier Checks: detect extreme or unexpected values. For instance, flagging water meter reading values that are extreme outliers for the customer type or account history.

Pattern Checks: look for specific patterns in data. For example, verifying that email addresses follow a valid format.

Edit checks may result in automatic rejection of a transaction, inability to proceed with a transaction, trigger for additional processing or review, or may simply result in a warning message to the user.

Edit checks may be identified as a key control when they are sufficiently relevant (ie: addressing the risk), precise (ie: able to catch all errors, rather than just being only reasonableness or limit check), and sufficiently strong (ie: prevent invalid transactions, rather than just generating a warning messages). Auditors may identify an individual edit or a group of edit checks together as a key control.

**Computer Generated Reports:** A **computer-generated report** is a report that is created by a computer program. The computer program, also referred to as a report generator or tool, takes data from a data source, such as a database, and displays it in a specified format. The process

## State of Washington

to generate a report often includes performing calculations on the data, such as summarizing, classifying, etc., before displaying, or can display the calculations on the report.

There are two types of computer-generated reports, pre-programmed and ad-hoc or customized reports.

Pre-programmed or canned reports are pre-defined reports where criteria and specifications are hard coded in the system. A canned report may allow limited parameters, (month/year, for example), but in general the information that will be displayed is pre-determined.

Ad-hoc or customized reports allow the user to drill down and customize what information is displayed on the report based on some allowed criteria, such as account codes, dollar amounts minimum, etc).

In contrast, a **manual report** is one that is created outside the system using data exports or is created ad hoc by a user. An example of a manual report is one that is created by copying data from a data source and pasting the data in an Excel spreadsheet or Word document or Powerpoint presentation where it is then processed further. With manual reports, each time a report is created, the data could be incorrect due to user error, such as not copying all relevant data, or processing errors. Therefore, these types of reports should be understood and tested similar to manual controls.

**Electronic Approvals:** Electronic approvals, electronic signatures and digital signatures are technically different, although often these terms are used interchangeably by entities.

Auditors should have determined whether the electronic approval is an automated control as part of the overall understanding of controls. For automated control purposes, an electronic approval is a software system functionality that:

Permits a user to approve transaction(s) within the software system

The system automatically documents, or logs, the data approved by the user and any subsequent manipulation

The acceptance or rejection of the transaction by the approver will trigger an additional software system process, such as posting of a transaction.

E-mail, scanned-in pictures of signatures, or font-changed signatures, etc. may be part of a control activity but are generally not considered an automated control and are not covered by this testing strategy.

### Electronic Signature vs Digital Signature

An “**electronic signature**” can look like a handwritten signature that has been scanned and then pasted into an electronic document. The reliability of this type of approval is variable. Recommend gaining an understanding of the process used to store and affix the signature to the document and then discuss the process with Team IT Audit before placing reliance on this control.

A “**digital signature**” is a legal signature with a formal certification process that documents who approved the document and ensures the document is not modified after certification. Reliability of this process is very high but has significant technical features. Recommend brainstorm

# State of Washington

with Team IT Audit before placing reliance on this control.

## **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

**Statements on Auditing Standards [AU-C 315](#) Understanding the Entity and Its Environment and Assessing the Risks of Material Misstatement** - paragraphs .A106-.A109 describe general and application controls and how they relate to audit risks

**Statements on Auditing Standards [AU-C 330](#) Performaing Audit Procedures in Response to Assessed Risks and Evaluating the Audit Evidence Obtained** - paragraphs .10b and .A33-.A34 describe requirements and guidance for testing indirect controls in conjunction with tests of controls, that is, testing key general controls in conjunction with a test of a key automated control

Record of Work Done.

**Key Control #3 - (Automated) - Valuation/Occurrence** - ATLAS receives a daily reconciliation file from AFRS and performs an automatic reconciliation between the data recorded in AFRS and ATLAS to ensure revenues recorded are accurate and complete.

### **STEP 1: Understand Automated Key Control**

The understanding for this system is documented above in the "Controls - ATLAS" step.

### **STEP 2: Confirm and Test Automated Key Control:**

We met with Ayano Faasumalie, Revenue and Finance Reporting Coordinator, on April 16, 2024 via teams, to walkthrough the daily reconciliation between ATLAS and AFRS. We reviewed a taxpayer account as part of our control 2 confirmation in Retail Sales and Use & B&O that was posted to ATLAS in JV #140E1015 with a batch total of \$312,543,343.99. We reviewed the JV within ATLAS and noted the reconciled column showed JV #140E1015 was reconciled by ATLAS to AFRS 3/28/2024. We then tied out this JV's total to the batch log, created by Revenue Accounting using AFRS data, without exception. *No issues noted.*

### **STEP 3: Understand General IT Controls**

We gained an understanding of general controls over the interface process as part of Taxes Receivable (Net of Allowance) key control 2, which can be seen here: [[Key Control #2 \(Automated\)](#)].

### **STEP 4: Confirm Key General IT Controls**

We confirmed general IT controls as part of Taxes Receivable (Net of Allowance) key control 2, which can be seen here: [[Key Control #2 \(Automated\)](#)].

### **STEP 5: Test Key General IT Controls**

Not applicable - we are not planning to rely on automated controls and therefore do not need to test general controls; control risk will be assessed

# State of Washington

at MAX.

## G.2.PRG - Other Taxes

*Procedure Step:* Risk Assessment  
*Prepared By:* BFW, 6/20/2024  
*Reviewed By:* RKM, 10/17/2024

Purpose/Conclusion:

### **Purpose / Conclusion:**

To assess inherent risk, control risk, and the risk of material misstatement in order to design an initial testing strategy for each assertion.

Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

### **STEP 1: Inherent Risk (IR)**

Assess inherent risk for each relevant assertion. This assessment is based on understanding of the entity and the nature of the account balance or class of transactions.

*Inherent risk is the susceptibility of an assertion to material misstatement. It is our assessment of "total threat", which includes both "natural risk" and identified risk indicators, without any regard to any potential control activities. As inherent risk is fully independent of control risk, any understanding of controls cannot be used to increase/decrease the assessment of inherent risk. Consider the following factors as your basis for this assessment:*

#### *General Considerations*

*Does the balance include transactions that are difficult to audit or involve complex accounting issues?*

*Were there significant misstatements identified in previous audits or prior-period adjustments in the account balance or transaction class? If so, analyzing the cause of prior period misstatements will help in analyzing inherent risk.*

*Are there any inherent risk factors at the entity or industry level, such as changes in regulation or accounting rules, unique transactions or accounting practices, use of information technology, etc that affect the balance?*

*Inherent Risk due to Error*

## State of Washington

*How large are the transactions making up the balance? If the balance has only a few large transactions, even a single error may mean a significant misstatement.*

*Have there been changes in the transactions making up the balance that may increase risk? For example, significantly different composition, nature or volume of transactions may inherently disrupt established controls.*

*Are financial events originated or identified by accounting personnel or non-accounting personnel? This consideration is mainly for the completeness assertion.*

*Does the process to account for transactions involve judgment or estimation, complex calculations, numerous steps or significant manual steps?*

*Do transactions have widely varying attributes that need to be manually identified? For example, grant loans that are accounted for in one of several ways depending on the terms of the agreement.*

*Inherent Risk due to Fraudulent Reporting (intentional misstatements)*

*Are there substantial pressures or motivations to misstate the balance?*

*Inherent Risk due to Misappropriation*

*Is the account balance or transaction class susceptible to sizable misappropriation?*

*Inherent Risk due to Non-Compliance*

*Are there any laws, contracts or grant agreements affecting the balance? If so, would non-compliance lead to sizable misstatements?*

*Are compliance requirements complex, hard to understand, subject to judgment or otherwise difficult to comply with?*

*Are there any motivations or pressures to not comply?*

### **STEP 2: Control Risk (CR)**

Assess control risk by system and assertion. This assessment should be based on the results of the control understanding, confirmation, and (if setting control risk to LOW) testing. If applicable, auditors will evaluate any control deficiencies and determine whether those deficiencies, individually or in combination, are significant deficiencies or material weaknesses.

*Control risk is the risk that material misstatements would not be prevented or detected timely by the system of internal control. Control risk could be thought of as the "vulnerability" of an entity to misstatements. Control risk exists independently of the inherent risk (the level of vulnerability exists independent of the level of threat).*

*Control risk is MAX in both of the following situations: (1) controls aren't tested or (2) controls are problematic and cannot be relied upon. In order to set control risk to LOW, the auditor must test that controls operated effectively throughout the period.*

*A material weakness exists when the design or operation of controls results in a reasonable possibility a material misstatement will not be prevented or detected and corrected in a timely manner. A significant deficiency is less severe than a material weakness, yet important enough to merit the attention of the governing body. **All potential material weaknesses and significant deficiencies should be discussed with the AIC, since they must be reported as findings.***

# State of Washington

## **STEP 3: Risk of Material Misstatement (RMM)**

Assess the risk of material misstatement for each relevant assertion for each significant line item. The risk of material misstatement (RMM) is a combination of the auditor's separate assessment of inherent and control risk.

*In practice, the RMM is the amount of substantive evidence that's needed, and the only way to reduce the amount of needed substantive evidence (equal to the inherent risk) is to test controls. As such, when control risk is MAX, the RMM must always equal the inherent risk (IR).*

*When controls are tested & can be relied upon (are determined to be effective) it is a matter of professional judgment how much the RMM should be set lower than inherent risk (1 or 2 steps).*

*Auditors should assess RMM by assertion, if different. For example, if RMM is assessed at MOD for the existence assertion, but LOW for the rights & obligations assertion, then document "MOD – existence and LOW – rights & obligations".*

## **STEP 4: Design Substantive Testing**

Design a substantive testing strategy that addresses the relevant assertion (identified risk) in the portion of the line item that relates to that risk.

*Planning identifies where to audit (significant balances, classes of transactions & disclosures) what to audit for (relevant assertions), and how much to audit (RMM). The quantity and quality of evidence obtained by substantive tests needs to match the level of risk. The higher the risk of material misstatement, the greater evidence needed. "Greater evidence" could either be greater quantity of evidence, greater quality of evidence, or some combination of greater quality and quantity.*

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6210](#) – Planning Financial Statement Audits**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits Planning Guide](#)**

Record of Work Done:

## **(1) Inherent Risk (IR):**

## State of Washington

Based on our understanding of the line item, we assessed inherent risk as follows for each relevant assertion and significant class of transactions:

**Occurrence - Moderate**

**Valuation - Moderate**

**(2) Control Risk (CR):**

We assessed control risk as follows for each system and relevant assertion:

**Automated Tax and Licensing Administration System (ATLAS) - MAX - Occurrence, Valuation**

We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

**(3) Risk of Material Misstatement (RMM):**

We considered both inherent and control risk and assessed the risk of material misstatement as follows for each relevant assertion and significant class of transactions:

**Occurrence - Moderate**

**Valuation - Moderate**

**(4) Testing Strategy:**

We designed our substantive testing strategy based on our assessment of the risk of material misstatement.

**Occurrence** - We will select a sample of registered taxpayers, review ATLAS for a filed return, and tie return to AFRS to ensure revenue occurred in the current year and is complete.

**Valuation** - We will recalculate taxes paid for the same sample noted above of registered taxpayers to ensure taxes are recorded at proper values

We anticipate that these tests will provide sufficient appropriate audit evidence to address the assessed risk of material misstatement for relevant assertions in significant classes of transactions.

**G.2.PRГ - Other Taxes**

*Procedure Step:* Substantive Test

*Prepared By:* BFW, 10/15/2024

# State of Washington

*Reviewed By:* RKM, 10/17/2024

Purpose/Conclusion:

**Purpose:**

To determine whether reported revenues represent actual amounts relating to the period.  
To determine whether revenues were reported at properly valued or calculated amounts.

**Conclusion:**

We determined reported revenues represent actual amounts relating to the period and revenues were reported at properly valued or calculated amounts. *No issues noted.*

Testing Strategy:

The following is a list of **considerations** for testing the occurrence assertion for revenues. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

Confirm intergovernmental revenues with the other government or grantor or by reviewing appropriate correspondence.

*Note: intergovernmental revenues received from the State Treasurer should be addressed as part of the State Treasurer Distributions baseline test.*

If revenue is receipted into a specific clearing account, or if third-party lockbox or receipting services are used, compare recorded revenue to a sum of monthly totals from bank, lockbox or service organization reports.

Trace selected or sampled revenues from the GL to supporting billings or subsequent receipts.

Develop sufficiently precise expectations for a substantive analytical to compare to reported revenue amounts.

Search for manual journal entries that credit (increase) revenues. Consider testing if any risk indicators are noted.

**Cut-Off / Revenue Recognition**

Test transactions recorded in the current period to verify the revenue occurred during the period.

*Transactions recorded at the beginning and end of the current period would generally be considered at highest risk of being improperly recorded in the current period. Consider scanning and selecting transactions if high risk transactions can be identified by description or date fields.*

# State of Washington

If revenue is billed at a constant rate, calculate an expectation based on the average monthly billing or re-calculate the year-end accrual journal entry and compare to the reported receivable.

Evaluate revenue recognition against GAAP criteria for selected transactions or revenue streams.

## **Interfund Revenues**

For internal service fund charges, see testing strategies for internal service funds in the Accountability folder. For other types of internal charges, see testing strategies for Internal Activities.

## **Detail Roll-up**

Compare year-end totals from general ledger to subsidiary software modules for selected revenues.

Review the government's reconciliation of general ledger to subsidiary ledgers.

*Detail roll-up testing is not sufficient audit evidence by itself since it only entails comparing different sets of the entity's own accounting records. However, it may be combined with other substantive tests to address identified risks. For example, if substantive testing is performed at the subledger level, it may be combined with a test that the subledger detail accurately rolls up to the general ledger or financial statements.*

The following is a list of **considerations** for testing the completeness assertion for revenues. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

Identify expected revenue streams based on understanding of fund activities and scan to see if revenue is reported for all such streams.

Follow up on any unexpectedly missing streams.

Identify new revenues (ex: new grants or programs) and follow up to verify that expected revenues have been reported.

Confirm intergovernmental revenues with the other government or grantor or by reviewing appropriate correspondence.

*Note: intergovernmental revenues received from the State Treasurer should be addressed as part of the State Treasurer Distributions baseline test.*

If revenue is receipted into a specific clearing account, or if third-party lockbox or receipting services are used, compare recorded revenue to a sum of monthly totals from bank, lockbox or service organization reports.

Trace selected or sampled revenues from source documents to accounting records.

*Source documents may consist of billing, fine, or fee records. Or it may consist of service records that imply a billing, such as license or permit issuance.*

Perform a multi-year trend of revenues and follow up on unexpected decreases.

Search for manual journal entries that debit (decrease) revenues. Consider testing if any risk indicators are noted.

# State of Washington

## Cut-Off

Test transactions recorded in the next period to determine whether the revenue should have been recorded in the current period.

*Transactions recorded at the beginning of the next period would generally be considered at highest risk of being improperly shifted to that future period. Consider scanning and selecting transactions if high risk transactions can be identified by description or date fields. If the population is large, consider stratifying to either scan and select or test 100% of all large value transactions combined with a lower assurance sample for small dollar transactions.*

## Detail Roll-up

Compare year-end totals from general ledger to subsidiary software modules for selected revenues.

Review the government's reconciliation of general ledger to subsidiary ledgers.

*Detail roll-up testing is not sufficient audit evidence by itself since it only entails comparing different sets of the entity's own accounting records. However, it may be combined with other substantive tests to address identified risks. For example, if substantive testing is performed at the subledger level, it may be combined with a test that the subledger detail accurately rolls up to the general ledger or financial statements.*

The following is a list of **considerations** for testing the valuation assertion for revenues. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

## Calculation

Recalculate billed revenues on a check (one of each variation), CAATS or sample basis.

For large populations of standard billings, perform CAATS tests to identify unexpected or outlier transactions for further review.

Review related-party transactions to determine whether revenue transactions were correctly calculated.

## Realizable Value

Re-calculate a sample or selection of billings. If billings are calculated by software, the auditor could test and substantiate the automated control and also consider any risks associated with manual inputs used by software.

Evaluate the entity's calculation of the allowance amount for reasonableness. This evaluation should include comparing the entity's estimate to the entity's actual historical experience of collecting or writing-off receivables.

Trace the amount of bad debt approved by the governing body (per minutes) to reductions of receivables and bad debt expense to verify it was properly accounted for. *Note: approvals may be slightly more, as customers may pay after the bad debt has been approved but before it is written off.*

## Estimation / Recognition

Review calculation and support for assumptions of any estimated revenues.

# State of Washington

Accounting research to verify that revenues were reported in conformity with revenue recognition policies reported in the financial statement notes.

Guidance/Criteria:

## **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

**BARS 3.6.13 Utility Tax (*applies only to cities*)** - should be accounted for as a revenue in the general fund (3164000) and expenditure in the utility fund (53P0040), if the utility passes the tax on to its customers then the additional charges should be recognized as revenue (343P000) directly in the utility fund not in the general fund

## **BARS 3.6.11 Suspense Funds**

Record of Work Done:

### **Population**

To ensure testing provided a sufficient amount of coverage of the Hazardous Substance Tax balance, we obtained our population and broke out the taxes by fund and sources to ensure amounts we tested represented the whole balance. We obtained a query from ATLAS from Ayano Faasualie, Revenue & Financial Reporting Coordinator, that included all payments made by taxpayers that included hazardous substance tax. We tied the totals directly to the monthly revenue activity (MRA) spreadsheet prepared by Revenue Accounting at DOR and provided by Jerry Tilson, Revenue Accounting Supervisor. We used the MRA spreadsheet to break out each tax type by fund and source and tied amounts to the ACFR line item lead sheet [[Line Item Lead Sheet](#)]. See our reconciliation as part of testing at [[HST Testing](#)], in tab 'Testing Summary.' Amounts tied without exception. We considered the population complete and provided coverage over the whole ACFR balance. ***No issues noted.***

Using the revenue query ran from ATLAS noted above, we haphazardly selected a sample of 30 transactions (payments made to a taxpayer account for a single filing period) and used the same sample to ensure amounts reported in AFRS occurred in the current year and accurately valued. See more details for each assertion below.

### **Substantive tests performed to meet the Occurrence assertion:**

To ensure reported revenues represent actual amounts relating to the period, we performed the following substantive tests:

- FY24 return was filed for taxpayer
- Ensured tax revenue was recorded to batch processed in ATLAS for the correct period
- Ensured batch total processed in ATLAS ties to batch total recorded in AFRS

For each selection, we reviewed screen shots of the revenue tab within the taxpayer's account and history sub tab to identify the tax return for

## State of Washington

the correct filing period, provided by Ayano Fassuamalie, Revenue & Financial Reporting Coordinator. Within ATLAS, there was a hyper link for the ATLAS receivable accumulation that the transaction was included in and could be followed from there and we were provided screen shots of this. We traced each taxpayer account to the ATLAS accumulation and matched the batch total in ATLAS to the year end entry to AFRS using additional screen shots of these items. Based on the tax type, we ensured the revenue was included in the correct balance. ***No issues noted.*** See testing performed at [\[HST Testing\]](#).

### **Substantive tests performed to meet the Valuation assertion:**

To determine whether tax revenues were reported at properly valued or calculated amounts, we performed the following substantive tests:

Recalculated retail sales, use, and B&O taxes for the selected taxpayer

During review of controls, we noted ATLAS automatically applies tax rates for hazardous substance taxes and automatically calculates taxes due. To test the IT control, we re-performed calculations for a sample of 30 taxpayers as documented at [\[HST Testing\]](#) in the "IT Control Testing - Valuation." We noted that all taxes recalculated tied to the taxes owed and paid in ATLAS and determined that revenues were reported at properly valued and calculated amounts. ***No issues noted.***

### **G.3.PRG - Licenses, Permits and Fees**

*Procedure Step:* Summary & Conclusion

*Prepared By:* EJB, 9/9/2024

*Reviewed By:* CJG, 11/20/2024

Purpose/Conclusion.:

#### **Purpose:**

To evaluate risk assessments and the sufficiency and appropriateness of evidence obtained based on results of substantive work.

#### **Conclusion:**

We determined that no modifications were necessary to inherent risk, control risk, or the risk of material misstatement as assessed in planning.

We also determined that evidence obtained was sufficient and appropriate in response to the risk of material misstatement.

Testing Strategy.:

# State of Washington

Auditors are **required** to evaluate conclusions for substantive testing as follows:

*Auditors may wish to use the optional Lead Sheet available in the Store to summarize testing related to each balance and assertion.*

**1.** Determine whether the results of substantive testing indicate a need to modify the inherent risk assessment (IR), control risk assessment (CR), risk of material misstatement (RMM) or other aspects of planning (such as material balances or assertions). If so, document changes and consider the need for additional testing.

*If the results of substantive testing indicate a need to change control risk, auditors should also update the **Permanent File** by either correcting the documentation or by adding an update section describing changes to the top of the record of work done. For all changes to IR, CR, or RMM the **Material Balances** spreadsheet should be updated.*

*More significant changes to other aspects of planning (such as material balances or assertions) should be referenced in this step and documented in detail in the **Changes to FS Audit Plan** step.*

**2.** Evaluate whether the quality and quantity of evidence obtained is sufficient and appropriate in response to the risk of material misstatement. In making this determination, auditors should evaluate:

Information to be used as audit evidence:

- Does evidence relate to the population, period of time and risk (assertion and “what could go wrong” from the Material Balance Spreadsheet)? If there are any gaps or uncertainties in the logical connection between the evidence and conclusions, is there a documented consideration and explanation?
- Are the sources of information sufficiently reliable and appropriate for the risk (whether internal to the government, external, or auditor developed)? If key information is not from a sufficiently reliable source (for example, inquiry), then is it corroborated by information that is?
- Are there any concerns about accuracy, completeness, authenticity, or bias in information? If so, did the auditor perform sufficient procedures to confirm reliability of that information?
- Is information precise enough to catch if misstatements exceeded the tolerable level?
- Is information detailed enough to conclude on whether or not there were misstatements?
- Was there any information that appeared contradictory or inconsistent? If so, was there a documented response to the inconsistencies or doubts about the reliability of evidence?

Results:

- How much misstatement was identified by testing, and the likelihood and magnitude of further potential misstatement?
- How did misstatements occur and how often might they occur again in the population?

## State of Washington

Were misstatements caused by control deficiencies or circumvention of controls?

If control deficiencies, is there a need to re-evaluate our understanding of controls in the [Permanent File](#) folder or assessment of control risk?

If circumvention, the [Management Override of Controls](#) step should address or reference this area. Auditors should also consider whether a fraud risk has been identified.

Did tests identify a different level or type of risk than the planned audit response was designed to address?

If likely misstatements are identified, are further procedures necessary to improve the precision of our estimate?

*To support the overall evaluation of audit risk and provide a basis for concluding on the overall sufficiency and appropriateness of evidence in the [FS Summary & Report](#) step, auditors should conclude in each area whether the auditor continues to believe that the tests performed and quality and quantity of evidence obtained are commensurate with RMM for all relevant risks (the "what could go wrong", in the [Material Balances](#) spreadsheet).*

If the auditor determines that evidence is not sufficient or appropriate, additional substantive testing should be done. If sufficient, appropriate evidence is not available for audit, the AIC should discuss the effect on our audit report with the AAM and AM.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6310](#) – Determining the Nature, Timing and Extent of Substantive Testing**

**SAO Audit Policy [3210](#) – Audit Evidence**

Record of Work Done:

Based on test results, we re-evaluated risk assessments, procedures, evidence obtained and conclusions as follows:

#### **(1) Do the results of substantive tests indicate a need to modify our risk assessment (IR, CR and RMM)?**

The results of substantive tests do not indicate a need to modify our risk assessment.

#### **(2) Was the quality and quantity of evidence obtained sufficient and appropriate?**

The quality and quantity of evidence obtained was sufficient and appropriate.

# State of Washington

## G.3.PRГ - Licenses, Permits and Fees

*Procedure Step:* Understanding of Line Item

*Prepared By:* EJB, 7/16/2024

*Reviewed By:* RKM, 12/17/2024

Purpose/Conclusion:

### **Purpose / Conclusion:**

To gain an understanding of the line item and confirm the scope of testing as documented in the Significant Account Matrix.

Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

### **STEP 1: Prior Audit Exceptions**

Document any exceptions noted during the prior audit. Follow-up to determine how the agency has responded to or corrected the issue, unless this work is anticipated as part of the testing strategy.

### **STEP 2: Analyze Composition and Changes of Line Item**

Include link to the line item leadsheet. This will be completed at the end of the audit. Leadsheet analysis should be documented in this spreadsheet.

Inquire with agency staff about the activities and transactions that make up the balance and any changes to those activities or transactions in relation to the prior year.

Determine relevant classes of transactions or account balances within the line item to analyze (such as agencies, funds, programs, departments, accounts, and/or objects), and use AFRS to create trends of those elements. This step should not include any specific dollar amounts associate with the line item.

Evaluate trends to identify:

(1) What classes of transactions or account balances are primary to the identified risk. Auditors should specifically consider what elements are primary to the line item (comprising a large percentage of the line item), and which elements the identified risk would apply to, and

## State of Washington

which elements might be most susceptible to the identified risk (having a high risk of non-trivial misstatement for a relevant assertion, considering likelihood and impact of potential for misstatement).

(2) What changes are primary to the identified risk, if applicable. Auditors should specifically consider whether the overall change to the line item from the prior year was significant, what elements were the primary drivers of overall change, whether any elements changed significantly from the prior year, and which changes (if any) might relate to the identified risk.

(3) Any unusual or unexpected elements, amounts, or changes that may indicate a risk, whether the one identified in planning or a new one that may need to be considered for a change to the plan.

**Consider** other procedures to gain an understanding of the line item, such as review of key policy documents, review of program information or reports, inquiry of staff, budget information, or other analytical procedures.

### STEP 3: Update Significant Account Matrix

Based on your understanding of the line item, update the Significant Account Matrix with final conclusions on the agencies covered, account description, significant accounting systems, and risk (what could go wrong and relevant assertions). The account description should reflect the significant transaction streams or account balances relevant to the risk.

*The description of agencies, significant accounting systems, and what could go wrong in the Significant Account Matrix constitute the overall scope of substantive testing.*

*A transaction stream is significant based on the potential for misstatement. This is often due in part to its size (ie: comprising a large percentage of the total line item), but is ultimately a judgment about the susceptibility to the identified risk (for example, when the risk is understatement a small or omitted account may hold the most potential for the largest misstatement).*

*Significant accounting system(s) are those that contain key controls over significant classes of transactions included in the line item. Control systems identified in this step must match the Significant Account Matrix and have a separate control understanding documented.*

*Talk with the AIC if you identify any changes to the Significant Account Matrix.*

Guidance/Criteria.:

Record of Work Done.:

#### **(1) Prior Audit Exceptions:**

In the prior year ACFR, there was a classification issue. The Dept. of Ecology (ECY) included the revenue from the CCA (Climate Commitment Act) Auction in Misc. Revenue. We noted that this should be grouped with license, permits and fees.

We emailed Kennesy Cavanah (statewide accountant) at OFM. She noted that this has been corrected in the current year, and confirmed the sort code has been changed to CD - Licenses, Permits, and Fees.

# State of Washington

## **(2) Composition & Change Analysis:**

Line Item Lead sheet: [\[Line Item Lead Sheet\]](#).

The CCA Auction revenue was introduced in FY23. It is reported as a "License Permit and Fee" and is treated as an exchange transaction. This is because ECY is selling the right to participate and trade the allowance in the open market and not right to use the allowances. When auction participants wish to sell allowances, they would then transfer them back to ECY to be included in the next auction. The proceeds from the sale are transferred to the appropriate auction participant. Based on our understanding of sale of allowances as an exchange transaction, we consider that revenue is earned when allowances are sold. The allowance do not meet the definition of assets or liabilities based on a technical inquiry with GASB. Per GASB Concept Statement number 4, "Assets are resources with present service capacity that the government presently controls." This revenue represents the sales of "allowances" to various entities that produce emissions. The allowances provide these entities the ability to produce emissions, with allowances sold decreasing year over year in an attempt to reduce emission production in Washington.

Cap-and-Invest Auctions are held four times per year, once per quarter. The participants register through a software called Compliance Instrument Tracking System Service (CITSS) which is where they bid on allowances and trade the allowances as desired by approved participants. At each auction, a set number of allowances (announced prior to the auction) go up for auction. These auctions are sealed-bid auctions, meaning that participants submit a bid that is not seen by anyone except the Climate Commitment Act Implementation Group (CCA IG) that distributes the allowances. Participants can submit a single bid for all desired allowances or a series of bids for various groups of allowances. Bids are sorted, highest to lowest, and allowances are allocated to each bid in that order. Once all allowances listed for auction have been assigned to a bid, the lowest \$ bid that won an allowance is the price that *all* participants pay. Participants that did not win an allowance will have to bargain for them on the CITSS Market, where winning participants may choose to sell their allowances (not dissimilar to a stock market).

There can be additional auctions throughout the year that are triggered when one of the quarterly auctions' settlement price is higher than a pre-determined number. These auctions are called Allowance Price Containment Reserve Auctions (APCR). There were two APCR Auctions in the current year as the settlement price for the June 2023 Auction (\$56.01) was in excess of the 2023 pre-determined settlement price trigger (\$48.30 for FY23), and the settlement price for the August 2023 Auction (\$63.03) was in excess of the 2024 pre-determined settlement price trigger (\$51.90 for FY24).

No-cost allowances are allowances issued to "clean" energy utilities. These utilities may "consign" these allowances to be sold in auction. This means that the utility company transfers the no-cost allowances back to the Dept. of Ecology to sell at auction on behalf of the utility company. These funds should never be recorded as revenue for the Dept. of Ecology. We would expect to see a list of these allowances sold and would expect to see them separate from revenue.

The GL account is 3210 and the fund codes are 26A & 26B. The majority of this line item is the aforementioned CCA Auction revenue. The remainder of this line item is insignificant to the Wildlife and Natural Resources Opinion Unit.

# State of Washington

## **Line item Summary:**

CCA Auction revenue is the only material revenue recorded in this account.

## **(3) Updates to Significant Account Matrix:**

There are no changes to the significant account matrix from what we have learned above.

## **G.3.PR.G - Licenses, Permits and Fees**

*Procedure Step:* Controls - Auction Platform

*Prepared By:* EJB, 7/18/2024

*Reviewed By:* RKM, 12/17/2024

Purpose/Conclusion:

### **Purpose:**

To gain an understanding of internal controls.

### **Conclusion:**

We gained an understanding of internal controls as documented in the record of work done.

Testing Strategy:

### **The following procedures are required for all material systems:**

1. List the financial statement balance(s) and relevant assertion(s) addressed by the understanding.
2. Gain an understanding of the internal control process, identify how transactions are recorded in AFRS, identify key controls over relevant assertion(s), and note any control weaknesses.
  - In gaining an understanding of controls, consider the overall understanding of State-Level control elements as documented in the "State-Level Controls" step as they relate to this particular system.
  - Identify controls systems covering all relevant assertions for all significant classes of transactions.
  - Standards require the auditor to gain an understanding of the significant accounting system(s) that contain key controls over significant classes of transactions included in the line item.

## State of Washington

Control systems identified in this step must match the Material Account Matrix and have a separate control understanding documented. Talk with the ACFR Specialist or AIC if you identify different systems than the ones anticipated in the Material Account Matrix.

For each material system, auditors must document:

- A brief outline of the transaction flow from beginning to end.

- An expanded description of key controls.

- Business processes relevant to financial reporting of the relevant assertion for the material balance. Processes should encompass automated and manual procedures by which transactions or events are identified or initiated, authorized as needed, recorded, processed and corrected as needed.

- Original accounting records and how records are rolled-up to intermediary ledgers and transferred to the general ledger (AFRS) or financial statements.

- Detailed descriptions of key controls. Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

The following is information to **consider** when identifying key controls and transaction flow.

“Key controls” refer to the few controls that together provide reasonable assurance that material misstatements will be prevented or detected and corrected. This is contrasted with ancillary or supporting controls, which – although helpful and recommended – would provide less than reasonable assurance by themselves.

The focus of the write-up is on the key controls. Key controls should be specifically identified (as “key controls”) in the write-up. This can be done in whatever way the auditor prefers, so long as it is obvious. Details that the auditor should document regarding key controls may include:

- Who or what initiates the control

- When (or how often) is the control applied

- Who performs the control

- As needed, the experience, knowledge and attitude of the person applying the control

- Detailed description of the control process or activity. For example, if the control is a review: what exactly is reviewed, what is the reviewer looking at or for and what are the reviewer’s criteria?

- How the key control is documented or evidenced

- If not obvious from the description, how the control prevents or timely detects and corrects misstatements

- Any exceptions or alternative processing to the normal process

- What happens when misstatements or issues are identified by the control

## State of Washington

The “transaction flow” refers to the process by which transactions are initiated, authorized, recorded, processed and reported (as applicable). Outlining the transaction flow gives context to key controls, especially how transactions become subject to controls in the first place. If a control inherently ensures that all applicable transactions are included (ex: bank reconciliation where the assertion is existence), the auditor may decide to just start the write-up with the initiation of the control procedure and go from there.

Elements of the transaction flow are defined informally as follows:

*Initiation:* How are transactions initiated?

*Authorization:* How are transactions and accounting record maintenance authorized?

*Recording:* How are transactions or balances identified and recorded in financial accounting systems?

*Processing:* How are the transactions or balances processed after they are recorded (if at all)? Processing may be manual or automated and may occur at a subsidiary system level or at the general ledger level.

*Reporting:* How are records translated into the financial statements? This part of the transaction flow extends the understanding to the actual financial statements that the audit is opining on. Since we already document an understanding of the financial reporting process in general, it is usually enough to simply reference this overall understanding. However, if there are important steps unique to the covered balances, it may be more appropriate to mention them here.

Although transaction flow is a good way to think about understanding and documenting a control system, auditors should not worry too much about documenting “each element, in order” because often elements may be combined, not noticeable, not applicable or occur in a different order.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits](#) Planning Guide**

Record of Work Done:

Internal controls in the Auction Platform address the following balance(s):

# State of Washington

License, Permits and Fees

For the following assertions:

Valuation - There is a risk Ecology has not calculated auction revenue proceeds correctly for this new program.

Completeness - The final auction for the fiscal year will likely require the posting of a receivable and there is a risk this revenue will not be reported in the correct fiscal year.

## **Gain an Understanding of Internal Controls**

We set up a MS Teams call with Beth Swanson, Senior Financial Advisor, Derek Nixon, Cap-and-Invest Section Manager, and Carla Clarey, Revenues Manager, at the Department of Ecology on June 3, 2024. We went over internal controls and internal processes in place regarding the Climate Commitment Act (CCA) Auction Revenue. We also noted that the software used by ECY for recording revenue transactions and year end receivables is eHub. eHub has been used by ECY for many years, and Beth and Carla are both familiar with how to use this software. Below is the process of deposit distribution, along with internal controls included:

## **Climate Commitment Act Auction Process:**

Deutsche Bank (DB) serves as the Financial Services Administrator (FSA) for the Cap-and-Invest Program's allowance auctions. After the auction has been scheduled, the ECY will release the amount of allowances to be sold at the auction (decided through legislation). Auctions are sealed bid auctions and the participants submit their bids through the auction platform software controlled and ran by the Western Climate Initiative (WCI). When bids are received, the auction platform sorts bids by highest to lowest, assigning allowances top to bottom until all allowances have been assigned. Below is the time line for the entire process, along with hypothetical dates to provide an illustration:

Auction Occurs - 2/28.

CCA IG determines settlement price and transmits to DB - 3/7 (5 business days).

CCA IG publishes Auction Summary Results Report on web site - 3/7 (5 business days).

DB obtains payments from winning bidders and collects funds by this date - 3/15 (11 business days).

DB notifies CCA IG when/whether payments are received and processed from qualified bidders by this date - 3/15 (11 business days).

CCA IG provides Fiscal Office amounts for each account 3/27 (27 calendar days).

DB transfers state-owned proceeds to US Bank and US Bank notifies OST - 3/28 (28 calendar days) - the remainder of the below steps all occur on 3/28, or 28 calendar days later).

OST creates ACH Accounts Receivable Report and the Wire Accounts receivable Report.

Fiscal Office downloads reports and records payment information.

Fiscal transfers A-8 cash journal to OST.

OST deposits revenue as instructed by ECY.

CCA IG publishes Washington Auction Public Proceeds Report on web site.

## State of Washington

Compliance Instrument Tracking System Service (CITSS) calculates who is eligible to participate in the auction based on inputs established by WCI and legislation. The Auction Platform (WCI) sets purchase limits, holding limits, and bid guarantees based on the structure of the upcoming auction. This information is released when the auction is announced. The holding limits are based on emission needs and the bid guarantees are based on a combination of holding limits and the participant's desired allowance purchases. The floor price for the auction is set by the ECY. When an auction participant bids, the only time a bid is rejected is if the bid is below the floor price. Each bid has a unique ID so that the Auction Platform, ECY, and the market participant can easily identify each transaction made. WCI hosts the auction platform and is contracted to provide third party analytics for these auctions which end up being the driving force for the revenue amounts recorded. Bidders are notified if they are qualified two days before the auction takes place. They have 12 days before auction to submit the bid guarantee. Qualified bidders are available online to the public at all times via a public records report. All submitted bids for all entities are reported in the bids report. ECY monitors the bid reports in real time during auctions. This helps catch and possible issues. The lowest bid that won an allowance now becomes the price that each participant pays for their respective awarded allowances. The CCA IG is an internal group created by the ECY. This team is made up of Derek Nixon, Cap-and-Invest Section Manager (leader of the CCA IG), Mike Johnson, Cap and Invest Auction Lead, Scott Hancock, Senior Market Monitor, and a few other people on the ECY CCA team. The CCA IG was formed to assist with the establishment of processes surrounding the CCA revenue. This team helps calculate and verify amounts are correct and are ready to be recorded as revenue. Upon completion of the auction, WCI sends the bid information to ECY. The auction platform (ran by WCI) calculates all bid and results reports that drive the calculation of funds to be received from DB and then recorded by the ECY (**Key Control #1 - Valuation - Automated**) CCA IG. Scott Hancock (Senior Market Monitor) developed a source code that he runs (via RStudio) to confirm the bid holding limits, the qualified bidders report, the bid guarantees, and the bid assignments (for bids that won an allowance and bids that did not win an allowance). Scott uses this source code to recalculate and verify that all information produced by the auction platform is accurate and calculates correctly. The information is then transmitted to DB.

The CCA IG publishes the Auction Summary Report on Ecology's Auctions and Trading web page here: [Climate Commitment Act Notices and Reports](#). The report will be similar in format and content to the California Air Resource Board's (CARB) [Summary Results Report \(ca.gov\)](#).

### **Collection and Transfer of Auction Funds:**

DB obtains payment from winning bidders, reconciles accounts, and collects funds. Bidders must submit cash, bond, or letter of credit at least 12 days in advance of the auction day and DB holds these funds (the bid guarantee) in escrow. Auction winners are notified via a financial statement and a financial settlement report. These reports are sent to each winner as an "invoice" that details the amount of allowances won, the amount paid per allowance, and the total cost and amount that will be transferred to DB. For each winning bidder, funds are taken from that bid guarantee and the remaining balance, if any, is returned to the bidder 26 days after auction.

DB notifies the CCA IG when/whether payments are received and processed from qualified bidders. The CCA IG then determines which funds are from consigned no cost allowances and which funds are from sold allowances that may be recorded as revenue. This process is simple as the amount of consigned allowances in each auction is determined before the auction occurs. The revenue from

## State of Washington

these allowances are simply the bid settlement price times the amount of consigned allowances. Consigned allowances are allocated annually to each eligible electrical distribution utility or natural gas supplier (consigning entity). A consigning entity consigns these allowances to be sold in the quarterly auctions over the course of the year. For 2023, allowances will be transferred mid-year after the CCA IG has finalized allocation calculations. This won't occur until the second, third or fourth auction. All proceeds from the auction of consigned allowances will be used for the benefit of ratepayers, which, for investor-owned utilities, will be determined by the Utilities and Transportation Commission (UTC). The auction platform (WCI) automatically designates these allowances as consigned when the consigning entity enters an auction. The department of Ecology does not have control over the funds received from these allowances sold at auction. UTC retains oversight and jurisdiction for the use of these revenues, which are not deposited into state accounts, and are instead wired directly to the consigning entities from DB. The CCA IG recalculates and confirms the amount to be paid from DB is accurate and complete (step #2).

The day prior to the deposit, authorized Ecology Fiscal Office staff receive deposit amounts for each account from CCA IG staff, calculated in the step above. CCA IG will also include the Office of the State Treasurer (OST) so that they are notified of the expected amount, date, and time, that the wire transfer will be received. Carla contacts DB weeks before the expected transfer to ensure bank information maintained by DB is accurate and unchanged. Lars Andreassen, Agency Budget Director, also notifies Carla of the proper accounts to post deposit amounts. He monitors statutory requirements set by [RCW 70A.65](#) and appropriation amounts to ensure that amounts are recorded in the proper fund (26A, 26B, and 26C).

DB transfers state-owned auction proceeds to U.S. Bank for deposit after the completion and verification of each auction. As part of the financial settlement process, which begins when the auction results are published, seven days after the auction and continues another seven days (14 days post auction), DB will transfer funds from their accounts to the Washington Settlement Account and, when applicable in the future, to consigning entities. The "Financial Settlement Report" is a spreadsheet export that details all price and quantity information, including totals, and is generated 14 days after the auction by Mike Johnson, Cap-and-Invest Auctions Lead. This report is what the ECY uses to record revenue related to auctions.

### **How Transactions are Recorded in AFRS:**

Upon notification from U.S. Bank of the deposit, OST creates the ACH Accounts Receivable Report and the Wire Accounts Receivable Report. The CCA IG compares the financial settlement report to the AR report from OST to ensure the amounts to be received are correct. These fund totals from the financial settlement report are sent to Carla after the funds have been transmitted to OST. These funds are compared to what OST has recorded. Ecology's Fiscal Office downloads these reports from the OST TM\$ system and records the payment information, including dollar amounts and funds, on the A-8 Cash Journal, as long as they match the financial settlement report. The FA2 cashier prepares the A-8 entry in eHUB, and then it is submitted. An FA4 lead or Carla reviews the journal for accuracy and submits it to AFRS. The person who submitted to AFRS will review in AFRS and release it. At the same time the A-8 is submitted into AFRS, a file is created for OST in the integration from eHUB to AFRS and OST. ECY verifies in TM\$ that the A-8 file was received in TM\$ (**Key Control #2 - Valuation/Completeness**). The preparer will then print the journal entry header, line information, supporting TM\$ report, and CCA IG emails to be physically filed.

## State of Washington

The A-8 cash journal is transferred to and received by OST electronically the same day and they record their journal to deposit revenue as instructed by Ecology. Deposits into each applicable account must occur within 24 hours of when the auction proceeds are transferred from DB to U.S. Bank.

CCA IG publishes the Washington Auction Public Proceeds Report on Ecology's Auctions and Trading web page here: [Climate Commitment Act Notices and Reports](#) The report will be similar in format and content to CARB's [Auction Proceeds Summary](#).

### **Key Controls are as Follows:**

**Key Control 1 - Automated - (Valuation)** - The auction platform (ran by WCI) calculates all bid reports and results reports that drive the calculation of funds to be received from DB and then recorded by the ECY.

**Key Control 2 (Completeness)** - Ecology's Fiscal Office downloads the ACH/Wire Receivable reports from the OST TM\$ system (can take up to five days after the auction takes place) and records the payment information, including dollar amounts and funds, on the A-8 Cash Journal, as long as they match the financial statement settlement report (sent from the Auction Platform to DB and to ECY). The FA2 cashier prepares the A-8 entry in eHUB, and then it is submitted for review. An FA4 lead or Carla Clarey, Revenues Manager, confirms the amount is correct via email correspondence with DB and US Bank before submitting it to AFRS.

### **Noted Weaknesses are as Follows:**

None.

### **G.3.PRG - Licenses, Permits and Fees**

*Procedure Step:* Key Control #1 (Automated)

*Prepared By:* EJB, 8/12/2024

*Reviewed By:* CJG, 11/20/2024

Purpose/Conclusion.*
----------------------

### **Purpose:**

To determine whether **Key Control 1 - Automated Software Calculation - (Valuation)** was in place and operating effectively and to consider related general IT controls in order to assess control risk.

### **Conclusion:**

Based on our understanding and test results, we concluded that the automated control **was** in place and operating effectively.

Based on our understanding, related general IT controls **were** in place and adequately designed to ensure that the control operated consistently

# State of Washington

during the audit period. However, we did not test the operating effectiveness of general IT controls.

Our understanding and control risk assessment, which incorporates these conclusions, is documented at [\[Controls - Auction Platform\]](#).

Testing Strategy:

The following procedures are **required** for all automated key controls for financial and single audits:

## **STEP 1: Understand Automated Key Control**

Gain an understanding of the automated key control. The understanding can either be documented in the control system step or could be documented here in this step. Auditors should consider the following aspects of the automated control when gaining an understanding:

### **Software Calculation:**

Is there written documentation of the calculation, and/or the source rates and factors used in the calculation?

*We would expect written documentation that defines the calculation and is an official, approved source for the formulas, rates and factors. This may be an approved policy or could be system documentation.*

What formulas are used to make the calculation?

What values or factors are used to make the calculation? For example:

- Rate tables used by the calculation
- Profile fields (i.e., applicable transaction types)
- Programmed/set formulas and/or values
- Constraints (i.e., effective date, minimums/maximums, etc.)

How is the calculation triggered or initiated?

How is the calculation recorded in the accounting system (or used in an end result)?

### **Automated Interfaces:**

Is data transferred in real time (immediately) or in a batch? If batched, how often does the interface occur (daily, monthly, quarterly, etc.)?

What triggers the data transfer?

*Transfers could be manually initiated, could be hardcoded into either the sending or receiving system's programming, could be controlled by administrative menus (for integrated software modules), or could be run as automated jobs with third party software or programming.*

Could the interface process fail? If so, how would the entity recognize that the process failed?

## State of Washington

*This may not be a relevant risk for integrated software, but may be the case for custom interfaces designed outside the software which may be subject to various points of failure.*

Will the interface process reject transactions or batches with errors? If so, who monitors rejections and follows up on rejected transactions to ensure correction (either in the sending or receiving systems) and how are corrections tracked and monitored?

*For example, information that could trigger a rejection or isolated transaction and batch can include: invalid data, duplicate data, or missing factors. If errors are possible, we would expect the isolated data is reviewed, tracked and corrected in a timely manner.*

Are any reconciliations done to provide assurance that data transfer was complete and accurate?

*We would expect the local government to perform a reconciliation between source and destination systems to ensure the interfaced data is complete and accurate. This may be a manual reconciliation or spot-check, a system or dashboard report, or automated edit check. Depending on how often errors (if any) are expected, the reconciliation could be done each time the interface occurs, or on a monitoring basis, like annually.*

### Edit Checks:

Inquire if the entity has a written policy or documentation describing the approval process and protocols for reviewers?

What is the approval process in the application?

What transactions, data, tasks, or documents are approved?

Who are the preparers? How do preparers submit for approval?

Who are the authorized approvers? Are there backup approvers?

What documents or information are required to make approval judgment?

What is the next step once a transaction/data/ task/document is approved or denied?

Is there any exception situations where approval can be by-passed or waived?

Can the approver make changes to information during the approval stage? If so, is the preparer notified of the changes?

Can anyone make changes to the approved information after the approval stage? If so, are changes captured in an audit trail and is the audit trail (log) regularly reviewed and monitored to detect any unauthorized changes?

Does the application prevent users from approving their own work (self-approval)?

*Some applications have a feature preventing self-approval. If an application does not have a feature preventing self-approval, we would expect manual controls in place to ensure the segregation of duties between preparer and approver, if relevant to the risk.*

Does the application have high-level users that can also approve?

## State of Washington

*High-Level Users (aka Users with elevated privileges, system or application "Administrators", "Super Users", etc.) typically have full access to change system settings and may have extensive function rights of software applications. Depending on entity's size and complexity, different high-level users may be responsible for the network vs. application level. High-level users represent a heightened risk for overriding segregation of duties and normal control processes.*

*We would expect entities to have compensating monitoring controls if personnel are responsible for both application settings and transaction processing controls.*

### Computer Generated Reports:

What information or exceptions is the report designed to identify (what is the purpose of the report)?

How is the report used and by whom?

For exception reports, who reviews the report and how do they follow up on exceptions?

*Auditors should consider whether the exception report reviewer has appropriate authority and information to effectively follow-up on report results. For fraud-related risks, also consider whether the review position is appropriately segregated from positions that can initiate transactions. For exception reports that regularly identify many transactions needing multi-step follow-up, the manual review and follow-up may be identified as a separate key control rather than documented and evaluated as an aspect of the automated exception report control.*

What are the report parameters or criteria? Does the report have any calculated fields? If so, what are the calculations?

*The ideal method of documenting an understanding of a computer generated report is to get a screenshot or printout of the report parameters. If using a report writer, this may be printed with the report, or may be accessed from a design view or intermediary screen. For custom or complex reports, this may be the SQL code.*

*For exception reports, auditors should pay special attention to the definition of an exception embodied in the report parameters.*

*NOTE: observation of the report parameters will also count as a confirmation of the report and could also be used to test the report.*

### Electronic Approvals:

Inquire if the entity has a written policy or documentation describing the approval process and protocols for reviewers?

What is the approval process in the application?

What transactions, data, tasks, or documents are approved?

Who are the preparers? How do preparers submit for approval?

## State of Washington

Who are the authorized approvers? Are there backup approvers?

What documents or information are required to make approval judgment?

What is the next step once a transaction/data/ task/document is approved or denied?

Is there any exception situations where approval can be by-passed or waived?

Can the approver make changes to information during the approval stage? If so, is the preparer notified of the changes?

Can anyone make changes to the approved information after the approval stage? If so, are changes captured in an audit trail and is the audit trail (log) regularly reviewed and monitored to detect any unauthorized changes?

Does the application prevent users from approving their own work (self-approval)?

*Some applications have a feature preventing self-approval. If an application does not have a feature preventing self-approval, we would expect manual controls in place to ensure the segregation of duties between preparer and approver, if relevant to the risk.*

Does the application have high-level users that can also approve?

*High-Level Users (aka Users with elevated privileges, system or application "Administrators", "Super Users", etc.) typically have full access to change system settings and may have extensive function rights of software applications. Depending on entity's size and complexity, different high-level users may be responsible for the network vs. application level. High-level users represent a heightened risk for overriding segregation of duties and normal control processes.*

*We would expect entities to have compensating monitoring controls if personnel are responsible for both application settings and transaction processing controls.*

### **STEP 2: Confirm and Test Automated Key Control**

Confirm and test the automated control. To test the automated control, consider the following procedures:

#### **Software Calculation:**

Re-perform the calculation for selected transactions.

*Auditors would NOT normally use sampling for automated controls. Instead, auditors should judgmentally select one instance of each significant variation of the calculation. If the number of potential variations is large, auditors would judgmentally select based on risk factors (for example, the most common scenarios, or scenarios associated with identified risks, or scenarios that are not addressed by the entity's testing procedures).*

*In some cases, it may be possible for the auditor to reperform the calculation for the entire population.*

If any rate tables or values were updated during the period, view the current values (by observing the rate table or values in an admin menu or from a printed system report) and compare to approved sources.

## State of Washington

*If no updates were made or there are only a few values, this risk could be addressed by re-performing the calculation. However, if source rate tables or values are large or complex, it may be more efficient to test these values directly than to recalculate a larger number of transactions.*

Consider the use of analytical procedures such as trends or descriptive statistics on the population (like average, minimum and maximum values, or a graph of values across the population) and follow up on any unexpected values or trends. *Analytical procedures would normally also count as a substantive test.*

### Automated Interfaces:

Re-perform a reconciliation, comparison or analytical procedure between both systems to determine whether data interfaced completely and accurately. Alternatively, review the entity's reconciliation or comparison if they perform one.

*For example, auditors could perform count totals and summarize the data to determine whether the same number of transactions reside in both systems, or the total amount from the sending system was posted to the receiving system. Whether this takes the form of a comparison (numbers expected to match exactly), reconciliation (when reconciling items are expected) or analytical procedure (if numerous adjustments or reconciling items are expected) will depend on the nature of the interface and client documentation.*

*Note: these procedures would also provide substantive evidence.*

Observe documentation, such as interface logs or email notifications, to determine whether interfaces complete per expected interval (daily, monthly, quarterly, etc.).

*We would expect the data transfer to be consistent based on the programmed schedule. If data is expected to be transferred on a weekly basis, we would expect to see some form of documentation showing the weekly transfer.*

Observe evidence that batch jobs are monitored such as tracking spreadsheets or emails.

When interfaces did not occur as expected, determine whether procedures were followed to resubmit job or that there was a logical reason no data was received/sent for the interval (for example, it was a holiday so there was no interface for that day).

### Edit Checks:

Re-perform the edit check for selected transactions.

*Auditors would NOT normally use sampling for automated controls. Instead, auditors should judgmentally select one instance of each significant variation of the check. If the number of potential variations is large, auditors would judgmentally select based on risk factors (for example, the most common scenarios, or scenarios associated with identified risks, or scenarios that are not addressed by the entity's*

# State of Washington

*testing procedures).*

*In some cases, it may be possible for the auditor to reperform the edit check for the entire population.*

Consider the use of analytical procedures such as trends or descriptive statistics on the population (like average, minimum and maximum values, or a graph of values across the population) and follow up on any unexpected values or trends. Analytical procedures would normally also count as a substantive test.

## **Computer Generated Reports:**

For exception reports, inquire with the person assigned to review the report how frequently exceptions are noted by the report. Trace identified exceptions to documentation of correction or resolution.

Re-perform the report by either (a) generating it yourself in the entity's system (if the auditor has direct access to the system), (b) recreating the report using CAATS, or (c) by observing the report be generated in your presence. If observing, note any user-entered values or parameters and determine whether entered parameters were appropriate. Compare re-performed report to the one being tested.

## **Electronic Approvals:**

Observe a transaction to see the approval process and verify any key aspects of the process or limits.

If transaction data or reports include approval information, use CAATS to confirm that all transactions met authorization rules.

## **STEP 3: Understand General IT Controls**

Gain an understanding of the general IT controls that support the continued proper operation of the automated control. Identify key general IT controls and note any control weaknesses. Auditors should consider the following aspects of general IT controls when gaining an understanding:

### **Software Calculation:**

Inquire if the entity has experienced any errors or irregularities with the calculation. Also how often changes are made to the calculation, and how many changes (if any) were made during the year.

How can the software calculation (formulas, rates/values, settings/configurations) be changed or customized?

*Software calculations will usually have one or more administrative menus that allow the government to modify rate tables or other calculation values, or to configure the calculation or apply settings.*

*In other cases, software calculation formulas and/or values may be hard-coded into the system and require programmers to make the changes. If the government has access to source code, then it needs internal procedures for program changes. If the program is controlled by vendors, we would expect program change procedures and expectations to be included in the contract.*

## State of Washington

What are the procedures to authorize and make program changes or configuration/setting changes to the software calculation?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

*If utilizing a test environment, there should be controls to ensure that the live environment is updated and is consistent with the live production environment. As management is responsible for the accuracy of their automated controls (i.e., in the live environment), we would expect there to be a procedure to confirm each key automated control once it is in the live environment. This could be manually re-performing the calculation, reviewing reports against known expectations, etc.*

How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change programming, but they may be responsible for patch management, master table data, and/or configurations.*

### Automated Interfaces:

Inquire if the entity has experienced any errors or irregularities with the interface. Also how often changes are made to the interface, and how many changes (if any) were made during the year.

What are the procedures to authorize and make changes to the interface?

*Except for the most simple situations, we would normally expect update procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

## State of Washington

*If the data transfer is already going to be checked or reconciled, then there may be less need for specific test procedures on program changes since any errors will be identified right away.*

How are program changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

*If the program is controlled by a third-party, we would expect a process between the government and vendor that allows the government to make requests and receive communication at the completion of the request.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to vendor developed/supported coding that controls how the system processes the interfaced data, but they may be responsible for working the interface error queues and reconciling the interfaced data.*

### Edit Checks:

Inquire if the entity has experienced any errors or irregularities with the edit checks. Also how often changes are made to the checks, and how many changes (if any) were made during the year.

How can the edit check be changed or customized?

*Edit checks may be hard-coded into the system and require programmers to make the changes. If the government has access to source code, then it needs internal procedures for program changes. If the program is controlled by vendors, we would expect program change procedures and expectations to be included in the contract.*

*In other cases, edit checks may be established or configured through one or more administrative menus.*

What are the procedures to authorize and make program changes or configuration/setting changes?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

## State of Washington

What are the procedures to test that program changes are properly working?

*If utilizing a test environment, there should be controls to ensure that the live environment is updated and is consistent with the live production environment. As management is responsible for the accuracy of their automated controls (i.e., in the live environment), we would expect there to be a procedure to confirm each key automated control once it is in the live environment. This could be manually re-performing the edit check, reviewing reports against known expectations, etc.*

How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change programming, but they may be responsible for patch management, master table data, and/or configurations.*

### Computer Generated Reports:

Inquire if the entity has experienced any errors or irregularities with the report. Also how often changes are made to the report, and how many changes (if any) were made during the year.

How is the report triggered or initiated?

*For reports that are automatically triggered, the auditor would normally not identify job scheduling or monitoring as a general control since we would expect failure of the report to generate*

Is the report hardcoded into the program, or is it a custom or ad hoc report? Also, what manual inputs (if any) are required to run the report?

*What parameters, criteria (date ranges, fund number, departments) or instructions are entered by the user to generate the exception report. The more options entity personnel have to customize or modify the report, the higher the risk of human error and inaccurate or incomplete reports. Pre-programmed reports provide less flexibility than ad-hoc reports; however, if program change controls are in place, they are more consistent.*

## State of Washington

If the report is hardcoded into the system, how are program changes made?

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change vendor developed reports, but they may be responsible for triggering, setting certain parameters, and/or following up on exception report results.*

NOTE: if the auditor cannot identify sufficiently effective general IT controls, the automated control will need to be tested using the same methods as a manual control (ie: sampling throughout the period). For example, if the report is manually generated and highly dependent on a number of manual inputs each time, or if the report does not have formal change controls, such as an ad hoc report or excel-based report. In such cases, the automated report is controlled by limited access and the judgment of the report writer – that is, while the report is an automated component, there is also an integrated manual component to the control.

### Electronic Approvals:

How are users assigned preparer and approver roles? Are user accounts periodically checked for needed changes? See the [User Access](#) step in the Accountability folder for more control considerations.

If configurations or settings relevant to the approval process are controlled by an admin menu, who has access to this menu?

If the entity has access to source coding for approval controls, what are the procedures to authorize and make program changes?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to vendor developed/supported coding that controls how the electronic approval works, but they may be responsible for approval configurations or settings and/or user account management.*

# State of Washington

## **STEP 4: Confirm Key General IT Controls**

Confirm your understanding of key general IT controls to determine whether they have been placed in operation (*whether the entity has actually implemented key controls*).

## **STEP 5: Test Key General IT Controls**

Document whether general IT controls will be tested. Option 1 would result in control risk at MAX for the automated control. Either option 2 or 3 is necessary in order to set control risk at LOW. If general IT controls are tested, consider the following procedures:

### **Software Calculation:**

If program changes or setting/configuration changes are logged, review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the calculation may also provide this evidence if the re-performance tests address all states of the calculation during the period.

If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the **SOC Report Reliance** workpaper in the Store.

### **Automated Interfaces:**

Review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, reconciling or comparing the data transfer (or reviewing the entity's reconciliation or comparison) may also provide this evidence if tests address all states of the interface during the period.

Inspect job processing error logs/reports. Observe evidence that errors in processing were isolated and resolved. For example, select a sample of rejected transactions and observe evidence to determine whether errors were appropriately corrected and the corrections were timely.

## State of Washington

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

### Edit Checks:

If program changes or setting/configuration changes are logged, review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the edit check may also provide this evidence if the re-performance tests address all states of the edit check during the period.

If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

### Computer Generated Reports:

If the report is subject to program change controls (either due to being hardcoded or by being automatically triggered), review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

If the report is subject to program change controls, review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the report may also provide this evidence if the re-performance tests address all states of the report during the period.

If the report relies on manual inputs and report copies saved show the parameters entered, the auditor can check a selection or sample of reports to confirm that the report was run correctly.

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

### Electronic Approvals:

Review user access report to verify that current users are appropriate. Also consider review of user access change logs (if available) to evaluate user account management throughout the period. See the User Access step in the Accountability folder for more testing considerations.

## State of Washington

If approvals are governed by significant settings/configurations, and such changes are logged, review the change log to verify the population of changes for the year.

*Verification that no configuration changes were made, along with the auditor's evaluation that no such changes are expected, would normally be sufficient evidence to conclude that no further testing is necessary.*

If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.

If the entity has access to source code, review the change log to verify the population of changes for the year. Then review programming change documentation or the entity's test documentation for selected or sampled changes.

*Verification that no program changes were made, along with the auditor's evaluation that no such changes are expected, would normally be sufficient evidence to conclude that no further testing is necessary.*

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the SOC Report Reliance worksheet in the Store.

### **STEP 6: Final Control Risk**

Evaluate the results and document a final control risk assessment in the control system step. Consider whether any deficiencies identified with either the automated control or related general IT controls represent material weaknesses or significant deficiencies.

*Note: general IT control deficiencies do not necessarily mean the automated control is not properly functioning. General IT control deficiencies would normally be considered a significant deficiency or material weakness only if it caused an issue with the compliance requirement or assertion.*

### **Recommendation Review Requirement**

IT Security related information is considered category 3 data protected by Public Request Exemption RCW 42.56.420. Issues related to IT Security require the following special handling:

[Instructions](#) are located in Team IT Audit's System's Sharepoint page.

Details of IT Security related issues should NOT be included in any emails or helpdesks.

Exit, ML and Findings should be separately communicated in an IT Security Results Document.

Findings will be referenced, but not included in the audit report.

All IT security-related recommendations must be reviewed by [Team IT Audit](#).

Template language for common IT related recommendations can be found in [ARS Part 5 Chapter 8](#).

### **PUBLIC REQUEST EXEMPTION**

Some IT related information is protected by Public Request Exemption RCW 42.56.420 for cyber security purposes. The details documented

# State of Washington

in the record of work and support workpapers may qualify for this exemption. If so, auditors must include this statement in the record of work done and any related workpapers: **"This record contains information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited "**.

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

## **Information Technology Planning Guide**

Auditors may contact [Team IT Audit](#) with any testing strategy or control assessment questions or to request assistance from an IT Specialist.

**Software Calculation:** A **software calculation control** exists when the value of a transaction is determined by a software application. This process can be a key control when the entity relies on the system to generate calculations correctly to determine the amount of transactions (i.e., summarizing/account code allocation to post to general ledger, calculate student, utility, other charges, etc.).

**Automated Interfaces:** An interface is a process that moves information from one computer application to another. The interface can occur internally between systems maintained by a single agency, or between systems maintained by different agencies or private companies. The interface can also occur between modules within the same computer application.

The data transferred might be a file consisting of one or more records processed at a later time (batch), or it can be a real-time update. Risk associated with interfaces increases as the number of transactions or the number of other services and systems supported by the interfaced data increases.

Poor design or inadequate oversight can affect the transfer of transaction data among the systems. Interface controls are automated and/or manual processes designed to ensure transmission and processing of information is complete and accurate.

## **Manual vs. Automated Interfaces**

A "manual interface" is the transfer of data from one system or module to another system or module, initiated and controlled by a user. An example of a manual interface is when customer accounts are downloaded from a utility billing system to be used to perform meter readings. When complete, the file with meter readings may be uploaded and posted to the customer accounts.

## State of Washington

An “automated interface” is the transfer of data from one system or module to another system or module that happens automatically based on a schedule, or other predefined criteria. A common example of an automated interface is the payroll module of a system. Typically, a payroll batch is created in the payroll module. Once approved, the batch is automatically sent by the system to the general ledger or other applicable modules, such as accounts payable.

Entities should have reconciliation controls between their various applications regardless of the method used for interfacing.

*Auditors should have determined whether system interfaces are automated as part of the Key Software Applications workpaper. **If not**, ask the following question to determine whether the system interface is manual or automated.*

*Is the data transferred from one system/module to another system/module by a user using an uploading and posting technique? For example, data is pulled from one system into a text file or other format, that is then uploaded into a different system or module by posting or in an upload feature of the module. If the answer to this question is yes, the interface would be considered “manual” since it is initiated and controlled by manually rather than through an automated process.*

**Edit Checks:** An **edit check** is a programmed routine designed to check input data or processing results for accuracy, compliance, or reasonableness. Types of edit checks include:

Range Checks: ensure that numeric values fall within specified ranges, minimums and/or maximums. For example, ensuring that a capital asset can only be entered as a positive amount, or a purchase order can only be submitted without secondary approval for less than a certain threshold.

Consistency Checks: verify that related data fields are consistent with each other. For example, ensuring that a patient’s age matches their date of birth.

Format Checks: validate data formats (for example, dates as MM/DD/YYYY or phone numbers as ###-###-####).

Logical Checks: assess logical relationships between data fields. For instance, verifying that total debits equals total credits in a journal entry.

Duplicate Checks: identify duplicate records or entries. For example, preventing the same invoice from being entered twice.

Cross-Field Checks: compare data across different fields. For instance, ensuring that the start date of a project is before the end date.

Required Field Checks: ensure that mandatory fields are filled out. For instance, making sure that a patient’s name and date of birth are provided.

Referential Integrity Checks: validate relationships between data tables. For example, confirming that a vendor number exists in the vendor master file as an active entity.

Outlier Checks: detect extreme or unexpected values. For instance, flagging water meter reading values that are extreme outliers for the customer type or account history.

Pattern Checks: look for specific patterns in data. For example, verifying that email addresses follow a valid format.

Edit checks may result in automatic rejection of a transaction, inability to proceed with a transaction, trigger for additional processing or review, or

## State of Washington

may simply result in a warning message to the user.

Edit checks may be identified as a key control when they are sufficiently relevant (ie: addressing the risk), precise (ie: able to catch all errors, rather than just being only reasonableness or limit check), and sufficiently strong (ie: prevent invalid transactions, rather than just generating a warning messages). Auditors may identify an individual edit or a group of edit checks together as a key control.

**Computer Generated Reports:** A **computer-generated report** is a report that is created by a computer program. The computer program, also referred to as a report generator or tool, takes data from a data source, such as a database, and displays it in a specified format. The process to generate a report often includes performing calculations on the data, such as summarizing, classifying, etc., before displaying, or can display the calculations on the report.

There are two types of computer-generated reports, pre-programmed and ad-hoc or customized reports.

- Pre-programmed or canned reports are pre-defined reports where criteria and specifications are hard coded in the system. A canned report may allow limited parameters, (month/year, for example), but in general the information that will be displayed is pre-determined.

- Ad-hoc or customized reports allow the user to drill down and customize what information is displayed on the report based on some allowed criteria, such as account codes, dollar amounts minimum, etc).

In contrast, a **manual report** is one that is created outside the system using data exports or is created ad hoc by a user. An example of a manual report is one that is created by copying data from a data source and pasting the data in an Excel spreadsheet or Word document or Powerpoint presentation where it is then processed further. With manual reports, each time a report is created, the data could be incorrect due to user error, such as not copying all relevant data, or processing errors. Therefore, these types of reports should be understood and tested similar to manual controls.

**Electronic Approvals:** Electronic approvals, electronic signatures and digital signatures are technically different, although often these terms are used interchangeably by entities.

Auditors should have determined whether the electronic approval is an automated control as part of the overall understanding of controls. For automated control purposes, an electronic approval is a software system functionality that:

- Permits a user to approve transaction(s) within the software system

- The system automatically documents, or logs, the data approved by the user and any subsequent manipulation

- The acceptance or rejection of the transaction by the approver will trigger an additional software system process, such as posting of a transaction.

E-mail, scanned-in pictures of signatures, or font-changed signatures, etc. may be part of a control activity but are generally not considered an automated control and are not covered by this testing strategy.

# State of Washington

## Electronic Signature vs Digital Signature

An “**electronic signature**” can look like a handwritten signature that has been scanned and then pasted into an electronic document. The reliability of this type of approval is variable. Recommend gaining an understanding of the process used to store and affix the signature to the document and then discuss the process with Team IT Audit before placing reliance on this control.

A “**digital signature**” is a legal signature with a formal certification process that documents who approved the document and ensures the document is not modified after certification. Reliability of this process is very high but has significant technical features. Recommend brainstorm with Team IT Audit before placing reliance on this control.

## **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

**Statements on Auditing Standards [AU-C 315](#) Understanding the Entity and Its Environment and Assessing the Risks of Material Misstatement** - paragraphs .A106-.A109 describe general and application controls and how they relate to audit risks

**Statements on Auditing Standards [AU-C 330](#) Performaing Audit Procedures in Response to Assessed Risks and Evaluating the Audit Evidence Obtained** - paragraphs .10b and .A33-.A34 describe requirements and guidance for testing indirect controls in conjunction with tests of controls, that is, testing key general controls in conjunction with a test of a key automated control

Record of Work Done.
----------------------

## **License, Permits & Fees CCA Auction Revenue - Valuation**

**Key Control 1 - Automated - (Valuation)** - The auction platform (ran by WCI) calculates all bid reports and results reports that drive the calculation of funds to be received from DB and then recorded by the ECY.

The understanding for this system is documented above in the "Controls - Auction Platform" step.

## **STEP 1: Understand Automated Key Control**

As detailed in the contract with WCI, ECY uses auction result reports produced by WCI's Auction Platform to record revenue related to each auction.

The Auction Platform calculates all bid reports based on the system's algorithm. See below for a detailed listing of the key reports derived form the Auction Platform:

Current Qualified Bidders Data - This report details the bidders and bidder types that qualify to enter each auction.

## State of Washington

Current Gather Bids - This report showed all bids made by entities participating in the auction.

(Current)Valid Price Points - This report showed which bids were qualified based on allowable allowances, bid guarantees, and holding limits.

Current Qualified Bids - This report showed additional information from the above report, and details out all bid edits made by the entity during the auction.

Current Demand Curve - This report showed all valid bids by entity that were won.

Current Distribution - This report showed all allotted allowances to bidders that were awarded allowances.

Final Results - This report shows the final results of the auction, including the settlement price, allowances won by each entity, and all funds expected to be received by each entity based on allowances won.

There are quarterly auctions in each fiscal year that use this Auction Platform and these reports are generated for each auction. These reports calculate the revenue amount to be recorded by the ECY. After the auctions are over, Ecology's Fiscal Office downloads ACH/Wire Receivable reports from the OST TM\$ system and records the payment information, including dollar amounts and funds, on the A-8 Cash Journal, as long as they match the financial settlement report. The FA2 cashier prepares the A-8 entry in eHUB, and then it is submitted. An FA4 lead or Carla reviews the journal for accuracy and submits it to AFRS (see [\[Key Control #2 \(Manual\)\]](#) for information on reporting these amounts).

Data is transferred immediately after the auction process has been completed, and ECY promptly recalculates all data provided in reports from the Auction Platform. Per discussion with ECY staff (as noted in the [\[Controls - Auction Platform\]](#) section), the process has yet to fail and WCI's algorithm has proven to work appropriately in each auction thus far (two auctions in 2023 and four in 2024). If there was a failure in the process, this would be caught by the code run by Scott Hancock, Senior Market Monitor (see the detail of the code run noted in the walkthrough in Step 2 below). The system will reject invalid bids before they can be made, and each qualified bidder will receive an error notification in real time.

### **STEP 2: Confirm and Test Automated Key Control:**

On July 15, 2024, we went to the ECY to perform a walkthrough of the CCA Auction Revenue process, and witnessed first hand the automated reports that come from the Auction Platform.

We reviewed all bids made in the auction and noted the settlement price was appropriately calculated (\$29.92/allowance). This was the amount reported in the public proceeds report available on the CCA's web site. We traced the lowest bid that won an allowance through each report, noting appropriate calculations had been made, along with the bid guarantees that were properly calculated in each report the auction platform produces. The total revenue to be recorded was \$157,379,200 which tied to the total released to the public on the Public Proceeds Report. See step 1 for all reports examined.

Scott Hancock (Senior Market Monitor) developed a source code that he runs (via RStudio) to confirm the bid holding limits, the qualified bidders report, the bid guarantees, the bid assignments (for bids that won an allowance and bids that did not win an allowance). Scott uses this source code to recalculate and verify that all information produced by the auction platform is accurate and calculates correctly. We witnessed Scott run

## State of Washington

this report the 2024 Q2 auction (June, 2024) and found no errors. We noted that the total number of allowances for sale, the total allowances won, and the bid price that all participants pay tied to the auction software data without error. This operates as a confirmation of the automated control.

Based on the above walkthrough, we noted that the controls in place appear to be operating as designed.

### **STEP 3: Understand General IT Controls**

Per discussion with the ECY team, there has not ever been errors or irregularities in the auction platform calculations.

Per discussion with Mike Johnson, Cap-and-Invest Auction Lead, ECY's CCA IG meets with WCI partner jurisdictions 2-3 times per week in regular meetings to discuss the maintenance, performance, and recommended updates & changes to the Auction Platform. These changes might include how different elements of the web page look, how Auction Platform Reports are executed, and the language, wording, and layout of each page.

**ECY has a structured policy in place for any edits or changes to be made to the algorithm. If ECY wants to make algorithm changes to edit the Auction reports, they reach out to the WCI to make these changes (General IT Control).** WCI makes the requested changes, and sends approval to ECY to test the changes via a mock auction. If the change is what ECY desires, they approve the change to be implemented for the next auction. WCI then implements these changes into the auction platform that is live for the next auction. ECY cannot make changes without confirmation emails with staff at WCI. Derek Nixon & Mike Johnson (Katie Murphy when Mike is out of office) are the only employees qualified to approve changes for WCI's review. Further changes are allowed to be made, but the same process must be repeated and tested by the entire ECY team. If any errors were caught in the algorithm (none thus far), the ECY would promptly reach out to the WCI to inquire as to what has occurred.

Mike mentioned that the auction platform has seen changes and updates released in the following times:

April, June, & September 2022.

February, April, July, and December 2023.

March 2024.

ECY is currently on their fifth version of the auction platform, and there have been 18 total changes that were fixed, tested, and approved for the current version of the auction platform. These tickets consist of updates or improvements related to password functionality (for bidders logging in to the platform), how digits are displayed in text boxes on the bidding page (size, alignment, and number of digits viewable at one time), how to "make public" instructional documents that are uploaded to the platform (FAQ and resources), specific changes to the French translation of an error message pop-up, and several tickets that were meant to confirm that the Nova Scotia jurisdiction has off-boarded appropriately and that Nova Scotia users no longer have access to data on the auction platform.

### **STEP 4: Confirm Key General IT Controls**

In order to confirm that **ECY has a structured policy in place for any edits or changes to be made to the algorithm**, we reached out to Derek and Mike and requested evidence of email communication about a recent change made to the Auction Platform algorithm. Mike responded

## State of Washington

with screen grabs from emails sent to Geeta Chaudhary, DevOps Engineer at WCI, on 7/25/2023 requesting changes to be made, and then the final implementation confirmation on 12/13/2023 for Platform Version 2.3 changes that were made in the software (Geeta confirmed), and that Mike had approved the changes after testing them in a controlled testing environment. This will suffice as a confirmation of the controls in place to make changes to the Auction Platform.

### **STEP 5: Test Key General IT Controls**

Not applicable - we are not planning to rely on automated controls and therefore do not need to test general controls; control risk will be assessed at MAX.

### **G.3.PRG - Licenses, Permits and Fees**

*Procedure Step:* Key Control #2 (Manual)

*Prepared By:* EJB, 7/19/2024

*Reviewed By:* RKM, 12/17/2024

Purpose/Conclusion:

#### **Purpose:**

To confirm **Key Control 2 (Completeness)**: Ecology's Fiscal Office downloads the ACH/Wire Receivable reports from the OST TM\$ system and records the payment information, including dollar amounts and funds, on the A-8 Cash Journal, as long as they match the financial statement settlement report. The FA2 cashier prepares the A-8 entry in eHUB, and then it is submitted for review. An FA4 lead or Carla Clarey, Revenues Manager, confirms the amount is correct via email correspondence with DB and US Bank before submitting it to AFRS in order to assess control risk.

#### **Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

## State of Washington

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency.*

***All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.***

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

## State of Washington

*If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

# State of Washington

Record of Work Done:

**Key Control 2 (Completeness)** - Ecology's Fiscal Office downloads the ACH/Wire Receivable reports from the OST TM\$ system (can take up to five days after the auction takes place) and records the payment information, including dollar amounts and funds, on the A-8 Cash Journal, as long as they match the financial statement settlement report (sent from the Auction Platform to DB and to ECY). The FA2 cashier prepares the A-8 entry in eHUB, and then it is submitted for review. An FA4 lead or Carla Clarey, Revenues Manager, confirms the amount is correct via email correspondence with DB and US Bank before submitting it to AFRS.

The understanding for this system is documented above in the [\[Controls - Auction Platform\]](#) step.

## **1. Confirmation of Key Manual Control:**

We observed the revenue recognition entry by examining all preparation documents provided to us by Carla Clarey, Revenue Receivables Manager, from the April auction (Document number 461X1860, JV#CJ-000259619, processed 4/2/2024). We reviewed the AFRS cash receipts journal summary detailing the total amount from auction, the cash receipts journal summary, the cash journal deposit detail, the cash journal receipt by remitter, the cash flow desk wire master file, confirmation email between Carla and Katie Murphy, Cap-and-Invest Market Planner, detailing the revenue to be recorded as a result from the April auction by reviewing the financial settlement report, and the confirmation email between ECY's cashing department and DB showing the wire transfer has been released. We determined the control is in place.

## **Noted Weaknesses are as follows:**

None.

## **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

## **G.3.PR.G - Licenses, Permits and Fees**

*Procedure Step:* Risk Assessment

*Prepared By:* EJB, 9/9/2024

*Reviewed By:* CJG, 11/20/2024

# State of Washington

Purpose/Conclusion:

**Purpose / Conclusion:**

To assess inherent risk, control risk, and the risk of material misstatement in order to design an initial testing strategy for each assertion.

Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

**STEP 1: Inherent Risk (IR)**

Assess inherent risk for each relevant assertion. This assessment is based on understanding of the entity and the nature of the account balance or class of transactions.

*Inherent risk is the susceptibility of an assertion to material misstatement. It is our assessment of "total threat", which includes both "natural risk" and identified risk indicators, without any regard to any potential control activities. As inherent risk is fully independent of control risk, any understanding of controls cannot be used to increase/decrease the assessment of inherent risk. Consider the following factors as your basis for this assessment:*

*General Considerations*

*Does the balance include transactions that are difficult to audit or involve complex accounting issues?*

*Were there significant misstatements identified in previous audits or prior-period adjustments in the account balance or transaction class? If so, analyzing the cause of prior period misstatements will help in analyzing inherent risk.*

*Are there any inherent risk factors at the entity or industry level, such as changes in regulation or accounting rules, unique transactions or accounting practices, use of information technology, etc that affect the balance?*

*Inherent Risk due to Error*

*How large are the transactions making up the balance? If the balance has only a few large transactions, even a single error may mean a significant misstatement.*

*Have there been changes in the transactions making up the balance that may increase risk? For example, significantly different composition, nature or volume of transactions may inherently disrupt established controls.*

*Are financial events originated or identified by accounting personnel or non-accounting personnel? This consideration is mainly for the completeness assertion.*

*Does the process to account for transactions involve judgment or estimation, complex calculations, numerous steps or significant manual steps?*

*Do transactions have widely varying attributes that need to be manually identified? For example, grant loans that are accounted for in one of several ways depending on the terms of the agreement.*

*Inherent Risk due to Fraudulent Reporting (intentional misstatements)*

## State of Washington

*Are there substantial pressures or motivations to misstate the balance?*

*Inherent Risk due to Misappropriation*

*Is the account balance or transaction class susceptible to sizable misappropriation?*

*Inherent Risk due to Non-Compliance*

*Are there any laws, contracts or grant agreements affecting the balance? If so, would non-compliance lead to sizable misstatements?*

*Are compliance requirements complex, hard to understand, subject to judgment or otherwise difficult to comply with?*

*Are there any motivations or pressures to not comply?*

### **STEP 2: Control Risk (CR)**

Assess control risk by system and assertion. This assessment should be based on the results of the control understanding, confirmation, and (if setting control risk to LOW) testing. If applicable, auditors will evaluate any control deficiencies and determine whether those deficiencies, individually or in combination, are significant deficiencies or material weaknesses.

*Control risk is the risk that material misstatements would not be prevented or detected timely by the system of internal control. Control risk could be thought of as the "vulnerability" of an entity to misstatements. Control risk exists independently of the inherent risk (the level of vulnerability exists independent of the level of threat).*

*Control risk is MAX in both of the following situations: (1) controls aren't tested or (2) controls are problematic and cannot be relied upon. In order to set control risk to LOW, the auditor must test that controls operated effectively throughout the period.*

*A material weakness exists when the design or operation of controls results in a reasonable possibility a material misstatement will not be prevented or detected and corrected in a timely manner. A significant deficiency is less severe than a material weakness, yet important enough to merit the attention of the governing body. **All potential material weaknesses and significant deficiencies should be discussed with the AIC, since they must be reported as findings.***

### **STEP 3: Risk of Material Misstatement (RMM)**

Assess the risk of material misstatement for each relevant assertion for each significant line item. The risk of material misstatement (RMM) is a combination of the auditor's separate assessment of inherent and control risk.

*In practice, the RMM is the amount of substantive evidence that's needed, and the only way to reduce the amount of needed substantive evidence (equal to the inherent risk) is to test controls. As such, when control risk is MAX, the RMM must always equal the inherent risk (IR).*

*When controls are tested & can be relied upon (are determined to be effective) it is a matter of professional judgment how much the RMM should be set lower than inherent risk (1 or 2 steps).*

## State of Washington

*Auditors should assess RMM by assertion, if different. For example, if RMM is assessed at MOD for the existence assertion, but LOW for the rights & obligations assertion, then document "MOD – existence and LOW – rights & obligations".*

### **STEP 4: Design Substantive Testing**

Design a substantive testing strategy that addresses the relevant assertion (identified risk) in the portion of the line item that relates to that risk.

*Planning identifies where to audit (significant balances, classes of transactions & disclosures) what to audit for (relevant assertions), and how much to audit (RMM). The quantity and quality of evidence obtained by substantive tests needs to match the level of risk. The higher the risk of material misstatement, the greater evidence needed. "Greater evidence" could either be greater quantity of evidence, greater quality of evidence, or some combination of greater quality and quantity.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6210](#) – Planning Financial Statement Audits**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits Planning Guide](#)**

Record of Work Done:

### **(1) Inherent Risk (IR):**

Based on our understanding of the line item, we assessed inherent risk as follows for each relevant assertion and significant class of transactions:

Valuation - IR for Valuation is **moderate**

Completeness– IR for completeness is **low**

### **(2) Control Risk (CR):**

We assessed control risk as follows for each system and relevant assertion:

**Auction Platform Software** – Valuation - **MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

## State of Washington

**eHub/AFRS** – Completeness - **MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **(3) Risk of Material Misstatement (RMM):**

We considered both inherent and control risk and assessed the risk of material misstatement as follows for each relevant assertion and significant class of transactions:

Valuation - Mod - RMM cannot be higher than IR.

Completeness - Low - RMM cannot be higher than IR.

### **(4) Testing Strategy:**

We designed our substantive testing strategy based on our assessment of the risk of material misstatement. We plan to perform the following tests:

Valuation:

Recalculate the total revenue to be recorded from the Final Results tab from the Auction Platform by multiplying the auction settlement price by the total number of allowances sold for each auction in 2024.

Tie the revenue to be recorded from the Final Results tab from the auction platform bid report to the public proceeds statement for each auction in 2024.

Tie the public proceeds report to what is recorded in eHub and then subsequently reported in AFRS for each auction in 2024.

Completeness:

Obtain the ACH transaction report or evidence of cash receipt of the Q4 auction revenue and ensure the total amount received ties to the receivable amount recorded at year end.

We anticipate that these tests will provide sufficient appropriate audit evidence to address the assessed risk of material misstatement for relevant assertions in significant classes of transactions.

### **G.3.PR.G - Licenses, Permits and Fees**

*Procedure Step:* Substantive Test

*Prepared By:* EJB, 9/17/2024

*Reviewed By:* RKM, 12/10/2024

# State of Washington

## Purpose/Conclusion:

### **Purpose:**

To determine whether all revenues relating to the period were reported as of 6/30/2024 (Completeness).

To determine whether revenues were reported at properly valued or calculated amounts (Valuation).

### **Conclusion:**

We determined revenues relating to the period were reported as of 6/30/2024.

We determined revenues were reported at properly valued or calculated amounts.

## Testing Strategy:

The following is a list of **considerations** for testing the completeness assertion for revenues. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

- Identify expected revenue streams based on understanding of fund activities and scan to see if revenue is reported for all such streams.

- Follow up on any unexpectedly missing streams.

- Identify new revenues (ex: new grants or programs) and follow up to verify that expected revenues have been reported.

- Confirm intergovernmental revenues with the other government or grantor or by reviewing appropriate correspondence.

*Note: intergovernmental revenues received from the State Treasurer should be addressed as part of the State Treasurer Distributions baseline test.*

- If revenue is receipted into a specific clearing account, or if third-party lockbox or receipting services are used, compare recorded revenue to a sum of monthly totals from bank, lockbox or service organization reports.

- Trace selected or sampled revenues from source documents to accounting records.

*Source documents may consist of billing, fine, or fee records. Or it may consist of service records that imply a billing, such as license or permit issuance.*

- Perform a multi-year trend of revenues and follow up on unexpected decreases.

- Search for manual journal entries that debit (decrease) revenues. Consider testing if any risk indicators are noted.

# State of Washington

## **Cut-Off**

Test transactions recorded in the next period to determine whether the revenue should have been recorded in the current period.

*Transactions recorded at the beginning of the next period would generally be considered at highest risk of being improperly shifted to that future period. Consider scanning and selecting transactions if high risk transactions can be identified by description or date fields. If the population is large, consider stratifying to either scan and select or test 100% of all large value transactions combined with a lower assurance sample for small dollar transactions.*

## **Detail Roll-up**

Compare year-end totals from general ledger to subsidiary software modules for selected revenues.

Review the government's reconciliation of general ledger to subsidiary ledgers.

*Detail roll-up testing is not sufficient audit evidence by itself since it only entails comparing different sets of the entity's own accounting records. However, it may be combined with other substantive tests to address identified risks. For example, if substantive testing is performed at the subledger level, it may be combined with a test that the subledger detail accurately rolls up to the general ledger or financial statements.*

The following is a list of **considerations** for testing the valuation assertion for revenues. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

## **Calculation**

Recalculate billed revenues on a check (one of each variation), CAATS or sample basis.

For large populations of standard billings, perform CAATS tests to identify unexpected or outlier transactions for further review.

Review related-party transactions to determine whether revenue transactions were correctly calculated.

## **Realizable Value**

Re-calculate a sample or selection of billings. If billings are calculated by software, the auditor could test and substantiate the automated control and also consider any risks associated with manual inputs used by software.

Evaluate the entity's calculation of the allowance amount for reasonableness. This evaluation should include comparing the entity's estimate to the entity's actual historical experience of collecting or writing-off receivables.

Trace the amount of bad debt approved by the governing body (per minutes) to reductions of receivables and bad debt expense to verify it was properly accounted for. *Note: approvals may be slightly more, as customers may pay after the bad debt has been approved but before it is written off.*

## **Estimation / Recognition**

Review calculation and support for assumptions of any estimated revenues.

# State of Washington

Accounting research to verify that revenues were reported in conformity with revenue recognition policies reported in the financial statement notes.

**Property Tax Revenues** - see separate step

Guidance/Criteria:

## **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

**BARS [3.6.9](#) Revenue Accruals in Governmental Funds**

**BARS [3.6.11](#) Suspense Funds**

Record of Work Done:

**Per [RCW 70A.65.100](#): Auctions of allowances (Contingent Expiration Date)**, section 9, "records containing the following information are confidential and are exempt from public disclosure in their entirety: a) Bidding information identified in subsection (8) of this section; (b) information contained in the secure, online electronic tracking system established by the department pursuant to RCW 70A.65.090(6); (c) Financial, proprietary, and other market sensitive information as determined by the department that is submitted to the department pursuant to this chapter; (d) Financial, proprietary, and other market sensitive information as determined by the department that is submitted to the independent contractor or the financial services administrator engaged by the department pursuant to subsection (3) of this section; and (e) Financial, proprietary, and other market sensitive information as determined by the department that is submitted to a jurisdiction with which the department has entered into a linkage agreement pursuant to RCW 70A.65.210, and which is shared with the department, the independent contractor, or the financial services administrator pursuant to a linkage agreement.

**Due to the above, we will not be documenting any specific amounts that we examine that are not reported in the public proceeds report. However, we will confirm the allowance settlement price was calculated correctly. See testing at: [[CCA Revenue Workbook](#)].**

## **Substantive tests performed to meet the Completeness assertion:**

Completeness:

Obtain the ACH transaction report or evidence of cash receipt of the Q4 auction revenue and ensure the total amount received ties to the receivable amount recorded at year end.

We observed the revenue recognition entry by examining all preparation documents provided to us by Carla Clarey, Revenue Receivables

## State of Washington

Manager, from the June auction (JV#461X2360 processed 7/2/2024). We reviewed the AFRS deposit Cash Receipts Journal Summary, as well as the cash receipts summary detailing the cash receipt on 7/2/2024 of the Q4 Auction results. The revenue recorded tied to the receivable reported, as well as the final settlement auction report tab and the public proceeds report. This test was met without error.

### **Substantive tests performed to meet the Valuation assertion:**

Valuation:

Recalculate the total revenue to be recorded from the Final Results tab from the Auction Platform by multiplying the auction settlement price by the total number of allowances sold for each auction in 2024 (four quarterly auctions and 2 APCR auctions).

Tie the revenue to be recorded from the Final Results tab from the auction platform bid report to the public proceeds statement for each auction in 2024.

Tie the public proceeds report to what is recorded in eHub for each auction in 2024.

The testing procedures are as follows:

Test A: We tested that the auction settlement price was calculated correctly by looking at the Auction Reports. The auction reports detailed the total amount of bids made by each entity participating in the auction. From this report, I was able to filter by bid amount from largest to smallest. I was then able to see the lowest bid that won an allowance. This bid is the auction settlement price that all participants pay at the conclusion of the auction.

Test B: We reviewed the Auction Results Tab which detailed the amount of allowances that were sold in total at the auction. We were able to recalculate the total amount of revenue due to the ECY by multiplying the auction settlement price by the total number of allowances sold.

Test C: The Final Auction Results tab showed the settlement price (auditor performed recalculation in Step A) and the total revenue to be recorded at ECY (recalculated in Step B), which we were able to tie to the public proceeds report available on the ECY's website. See testing workpaper for the JV#'s, as well as the date the funds were deposited.

Test D: The public proceeds reports then tied to each journal voucher recorded in eHub for each auction. This in turn, was recorded correctly in AFRS.

The above tests were all met without error.

### **H.1.PRG - Tax Collections for Other Governments**

*Procedure Step:* Summary & Conclusion

*Prepared By:* CJM, 11/20/2024

*Reviewed By:* RKM, 11/21/2024

# State of Washington

Purpose/Conclusion:

Testing Strategy:

Auditors are **required** to evaluate conclusions for substantive testing as follows:

*Auditors may wish to use the optional Lead Sheet available in the Store to summarize testing related to each balance and assertion.*

**1.** Determine whether the results of substantive testing indicate a need to modify the inherent risk assessment (IR), control risk assessment (CR), risk of material misstatement (RMM) or other aspects of planning (such as material balances or assertions). If so, document changes and consider the need for additional testing.

*If the results of substantive testing indicate a need to change control risk, auditors should also update the [Permanent File](#) by either correcting the documentation or by adding an update section describing changes to the top of the record of work done. For all changes to IR, CR, or RMM the [Material Balances](#) spreadsheet should be updated.*

*More significant changes to other aspects of planning (such as material balances or assertions) should be referenced in this step and documented in detail in the [Changes to FS Audit Plan](#) step.*

**2.** Evaluate whether the quality and quantity of evidence obtained is sufficient and appropriate in response to the risk of material misstatement. In making this determination, auditors should evaluate:

Information to be used as audit evidence:

Does evidence relate to the population, period of time and risk (assertion and “what could go wrong” from the Material Balance Spreadsheet)? If there are any gaps or uncertainties in the logical connection between the evidence and conclusions, is there a documented consideration and explanation?

Are the sources of information sufficiently reliable and appropriate for the risk (whether internal to the government, external, or auditor developed)? If key information is not from a sufficiently reliable source (for example, inquiry), then is it corroborated by information that is?

Are there any concerns about accuracy, completeness, authenticity, or bias in information? If so, did the auditor perform sufficient procedures to confirm reliability of that information?

Is information precise enough to catch if misstatements exceeded the tolerable level?

Is information detailed enough to conclude on whether or not there were misstatements?

## State of Washington

Was there any information that appeared contradictory or inconsistent? If so, was there a documented response to the inconsistencies or doubts about the reliability of evidence?

### Results:

How much misstatement was identified by testing, and the likelihood and magnitude of further potential misstatement?

How did misstatements occur and how often might they occur again in the population?

Were misstatements caused by control deficiencies or circumvention of controls?

If control deficiencies, is there a need to re-evaluate our understanding of controls in the [Permanent File](#) folder or assessment of control risk?

If circumvention, the [Management Override of Controls](#) step should address or reference this area. Auditors should also consider whether a fraud risk has been identified.

Did tests identify a different level or type of risk than the planned audit response was designed to address?

If likely misstatements are identified, are further procedures necessary to improve the precision of our estimate?

*To support the overall evaluation of audit risk and provide a basis for concluding on the overall sufficiency and appropriateness of evidence in the [FS Summary & Report](#) step, auditors should conclude in each area whether the auditor continues to believe that the tests performed and quality and quantity of evidence obtained are commensurate with RMM for all relevant risks (the "what could go wrong", in the [Material Balances](#) spreadsheet).*

If the auditor determines that evidence is not sufficient or appropriate, additional substantive testing should be done. If sufficient, appropriate evidence is not available for audit, the AIC should discuss the effect on our audit report with the AAM and AM.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6310](#) – Determining the Nature, Timing and Extent of Substantive Testing**

**SAO Audit Policy [3210](#) – Audit Evidence**

Record of Work Done:

### **(1) Do the results of substantive tests indicate a need to modify our risk assessment (IR, CR and RMM)?**

The results of substantive tests do not indicate a need to modify our risk assessment.

# State of Washington

## **(2) Was the quality and quantity of evidence obtained sufficient and appropriate?**

The quality and quantity of evidence obtained was sufficient and appropriate.

### **H.1.PRG - Tax Collections for Other Governments**

*Procedure Step:* Understanding of Line Item

*Prepared By:* CJM, 6/3/2024

*Reviewed By:* RKM, 6/11/2024

Purpose/Conclusion:

#### **Purpose / Conclusion:**

To gain an understanding of the line item and confirm the scope of testing as documented in the Significant Account Matrix.

Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

#### **STEP 1: Prior Audit Exceptions**

Document any exceptions noted during the prior audit. Follow-up to determine how the agency has responded to or corrected the issue, unless this work is anticipated as part of the testing strategy.

#### **STEP 2: Analyze Composition and Changes of Line Item**

Include link to the line item leadsheet. This will be completed at the end of the audit. Leadsheet analysis should be documented in this spreadsheet.

Inquire with agency staff about the activities and transactions that make up the balance and any changes to those activities or transactions in relation to the prior year.

## State of Washington

Determine relevant classes of transactions or account balances within the line item to analyze (such as agencies, funds, programs, departments, accounts, and/or objects), and use AFRS to create trends of those elements. This step should not include any specific dollar amounts associate with the line item.

Evaluate trends to identify:

- (1) What classes of transactions or account balances are primary to the identified risk. Auditors should specifically consider what elements are primary to the line item (comprising a large percentage of the line item), and which elements the identified risk would apply to, and which elements might be most susceptible to the identified risk (having a high risk of non-trivial misstatement for a relevant assertion, considering likelihood and impact of potential for misstatement).
- (2) What changes are primary to the identified risk, if applicable. Auditors should specifically consider whether the overall change to the line item from the prior year was significant, what elements were the primary drivers of overall change, whether any elements changed significantly from the prior year, and which changes (if any) might relate to the identified risk.
- (3) Any unusual or unexpected elements, amounts, or changes that may indicate a risk, whether the one identified in planning or a new one that may need to be considered for a change to the plan.

**Consider** other procedures to gain an understanding of the line item, such as review of key policy documents, review of program information or reports, inquiry of staff, budget information, or other analytical procedures.

### STEP 3: Update Significant Account Matrix

Based on your understanding of the line item, update the Significant Account Matrix with final conclusions on the agencies covered, account description, significant accounting systems, and risk (what could go wrong and relevant assertions). The account description should reflect the significant transaction streams or account balances relevant to the risk.

*The description of agencies, significant accounting systems, and what could go wrong in the Significant Account Matrix constitute the overall scope of substantive testing.*

*A transaction stream is significant based on the potential for misstatement. This is often due in part to its size (ie: comprising a large percentage of the total line item), but is ultimately a judgment about the susceptibility to the identified risk (for example, when the risk is understatement a small or omitted account may hold the most potential for the largest misstatement).*

*Significant accounting system(s) are those that contain key controls over significant classes of transactions included in the line item. Control systems identified in this step must match the Significant Account Matrix and have a separate control understanding documented.*

*Talk with the AIC if you identify any changes to the Significant Account Matrix.*

Guidance/Criteria.:

Record of Work Done.:

# State of Washington

## **(1) Prior Audit Exceptions:**

There were no exceptions noted in prior audit.

## **(2) Composition & Change Analysis:**

Line Item Leadsheet: [[Line Item Lead Sheet](#)].

Fund 034 - Local Sales and Use Tax - State share (6.5% per statute) and Add-on (decided by city and county)

Fund 01T - Local Leasehold Excise Tax

Fund 16C - Real Estate and Property Tax Administration Assistance

Fund 17A - County Enhanced 911 Excise Tax

Fund 768 - Local Real Estate Excise Tax (REET)

Fund 797 - Local Tourism Promotion Tax

On May 8, 2024, we met with Jason Hartwell, Tax Admin Manager, and on May 14, 2024, we met with Ayano Faasumalie, Revenue and Finance Rep Coordinator, to discuss any changes to the transactions and process for this line item in relation to the prior year. For fiscal year 2024, Business and Financial Services (B&FS) makes manual quarterly adjustments in AFRS until automated entries can be implemented in Automated Tax and Licensing Administration System (ATLAS). This quarterly adjustment process is similar to prior years. Per inquiry with B&FS staff, we also noted the composition of the balance remains the same as the prior year.

Upon review of the line item lead sheet for FY23 balances, we noted 98% of the balance is collections for fund 034, local sales and use tax. We expect the FY24 balance to remain similar based on our discussion with the agency. Therefore, we will focus our control understanding and testing on the local sales and use tax portion of the balance.

## **(3) Updates to Significant Account Matrix:**

No updates to the Significant Account Matrix is needed.

## **H.1.PR.G - Tax Collections for Other Governments**

*Procedure Step:* Controls - ATLAS

*Prepared By:* CJM, 6/4/2024

*Reviewed By:* RKM, 6/11/2024

# State of Washington

Purpose/Conclusion:

**Purpose:**

To gain an understanding of internal controls.

**Conclusion:**

We gained an understanding of internal controls as documented in the record of work done.

Testing Strategy:

**The following procedures are required for all material systems:**

1. List the financial statement balance(s) and relevant assertion(s) addressed by the understanding.
2. Gain an understanding of the internal control process, identify how transactions are recorded in AFRS, identify key controls over relevant assertion(s), and note any control weaknesses.
  - In gaining an understanding of controls, consider the overall understanding of State-Level control elements as documented in the "State-Level Controls" step as they relate to this particular system.
  - Identify controls systems covering all relevant assertions for all significant classes of transactions.
  - Standards require the auditor to gain an understanding of the significant accounting system(s) that contain key controls over significant classes of transactions included in the line item.
  - Control systems identified in this step must match the Material Account Matrix and have a separate control understanding documented.
  - Talk with the ACFR Specialist or AIC if you identify different systems than the ones anticipated in the Material Account Matrix.

For each material system, auditors must document:

A brief outline of the transaction flow from beginning to end.

An expanded description of key controls.

Business processes relevant to financial reporting of the relevant assertion for the material balance. Processes should encompass automated and manual procedures by which transactions or events are identified or initiated, authorized as needed, recorded, processed and corrected as needed.

Original accounting records and how records are rolled-up to intermediary ledgers and transferred to the general ledger (AFRS) or financial statements.

Detailed descriptions of key controls. Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a significant

## State of Washington

deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

The following is information to **consider** when identifying key controls and transaction flow.

“Key controls” refer to the few controls that together provide reasonable assurance that material misstatements will be prevented or detected and corrected. This is contrasted with ancillary or supporting controls, which – although helpful and recommended – would provide less than reasonable assurance by themselves.

The focus of the write-up is on the key controls. Key controls should be specifically identified (as “key controls”) in the write-up. This can be done in whatever way the auditor prefers, so long as it is obvious. Details that the auditor should document regarding key controls may include:

- Who or what initiates the control
- When (or how often) is the control applied
- Who performs the control
- As needed, the experience, knowledge and attitude of the person applying the control
- Detailed description of the control process or activity. For example, if the control is a review: what exactly is reviewed, what is the reviewer looking at or for and what are the reviewer’s criteria?
- How the key control is documented or evidenced
- If not obvious from the description, how the control prevents or timely detects and corrects misstatements
- Any exceptions or alternative processing to the normal process
- What happens when misstatements or issues are identified by the control

The “transaction flow” refers to the process by which transactions are initiated, authorized, recorded, processed and reported (as applicable). Outlining the transaction flow gives context to key controls, especially how transactions become subject to controls in the first place. If a control inherently ensures that all applicable transactions are included (ex: bank reconciliation where the assertion is existence), the auditor may decide to just start the write-up with the initiation of the control procedure and go from there.

Elements of the transaction flow are defined informally as follows:

- Initiation:* How are transactions initiated?
- Authorization:* How are transactions and accounting record maintenance authorized?
- Recording:* How are transactions or balances identified and recorded in financial accounting systems?
- Processing:* How are the transactions or balances processed after they are recorded (if at all)? Processing may be manual or automated and may occur at a subsidiary system level or at the general ledger level.

# State of Washington

*Reporting:* How are records translated into the financial statements? This part of the transaction flow extends the understanding to the actual financial statements that the audit is opining on. Since we already document an understanding of the financial reporting process in general, it is usually enough to simply reference this overall understanding. However, if there are important steps unique to the covered balances, it may be more appropriate to mention them here.

Although transaction flow is a good way to think about understanding and documenting a control system, auditors should not worry too much about documenting “each element, in order” because often elements may be combined, not noticeable, not applicable or occur in a different order.

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits](#) Planning Guide**

Record of Work Done:

## **Material Balance(s) and Assertions**

Internal controls in the Automated Tax and Licensing Administration System (ATLAS) address the following balance(s):

**Tax Collections for Other Governments** - Custodial Funds

For the following assertions:

**Classification** - There is a risk that revenues are incorrectly classified as local when they were actually state taxes.

**Valuation** - There is a risk that taxes were incorrectly valued (wrong tax rate).

**Completeness** - There is a risk that not all taxes collected on behalf of local governments have been identified.

## **Gain an Understanding of Internal Controls**

We met with Jason Hartwell, Tax Administration Manager, and Courtney Tornquist, Systems Specialist, on May 8, 2024 to discuss controls related to the Payments of Taxes to Other Governments.

Local Tax Rates

## State of Washington

Counties, cities, and local tax codes have the authority to assess local taxes in addition to the state's regular 6.5% sales and use tax (use tax is the same rate as sales tax, taxpayers would pay this when purchasing a television in Oregon for example). These taxes are regulated by ordinances or resolutions set by the local governments. Each jurisdiction has a collection agreement on file with DOR that includes the administration fee charged (if applicable) and how refunds and redistributions are handled. When a jurisdiction passes a resolution or ordinance to collect a new tax, they must provide DOR with written notification, a copy of certified election results and a copy of the ordinance or resolution. The jurisdiction must provide the documentation at least 75 days before the effective date (January 1, April 1, and July 1). Taxpayer Account Administration (TAA) has an Excise Tax Examiner (ETE) on the local tax team that will monitor and review election result documentation quarterly to verify if any new taxes or rates have passed.

### Local Tax (LT) Rate Testing in ATLAS

The process for updating the local tax rates is:

1. A LT manager receives documentation from a jurisdiction indicating they have passed a resolution/ordinance. Once the documents are reviewed/verified, the manager puts the changes on a spreadsheet and emails that spreadsheet to the LT system specialist.
2. In a test environment, a programmer updates rate tables as necessary. This environment is verified by reviewing the rates in the Automated Tax and Licensing Administration System (ATLAS) and from various ad hoc reports. Then the changes are moved to the production environment.
3. A programmer will then make system application changes in the test environments. The LT system specialist file test batches (tax returns) for this environment and ensures that they post and calculate properly. ATLAS is then verified for proper accumulation and distribution. Then the application changes are moved to the production environment.

The LT system specialist conducts testing in production to ensure accumulation and distribution amounts are accurate and only local tax codes are included prior to distribution to jurisdictions. TAA will also verify local tax calculations using the new rates on a monthly basis. Money is not distributed to local governments by OST until TAA verifies the data in ATLAS (**Key Control 1 - Valuation/Classification - Manual**). Distributions usually occur the following month after tax returns are due. This allows TAA to work through any identified issues.

### Calculation of Local Sales and Use Tax

Businesses are assigned a location code in ATLAS. The location codes feed back to the jurisdiction for tax collection and local taxes accumulate to the reported locations based on the taxes imposed in each jurisdiction. Filers are required to submit Excise Tax returns where local tax data is captured in ATLAS. The Combined Excise Tax Return form requires businesses input a location name and location code when reporting local sales tax collected. Based on the information input by the taxpayer, ATLAS captures the total taxes collected and sums it up by the type of local tax by location code (**Key Control 2 - Valuation - Automated**). Local sales and use tax are calculated and recorded within ATLAS similar to the other types of tax revenues reviewed at [\[Retail Sales and Use and B&O Taxes\]](#). If a return is filed with a wrong location code or any errors, the return will error out in the system and will not be recorded until it is manually reviewed and resolved by a TAA examiner. The error will go into a work queue.

# State of Washington

task that is pulled and reviewed by the examiners. If corrections are required, they will make the adjustment and save it in the system.

Local Sales and Use Tax are not the State's and are only collected and distributed by DOR on behalf of the local jurisdictions. When a taxpayer submits a payment, DOR initially uses ATLAS to record the amount in the Suspense Account within the Office of the State Treasurer (OST). The money is held in trust and redistributed monthly by OST. When the payment is applied to the tax return, ATLAS generates a JV to record a "Due to Other Funds" (Short-Term) in AFRS. On the last day of the month DOR enters a JV to reclassify the amount to be distributed by OST as "Due to Other Governments" (MC).

## **How Transactions are Recorded in AFRS:**

### Gross Receipts Accrual

For monthly filers, Excise Tax returns for June activity are due July 25th. For quarterly filers the tax returns for the 4th fiscal quarter (April, May, and June) are due July 31st. At June 30th, tax has been collected by businesses (taxpayers), from their customers, for sales occurring during the month of June; however, they are not required to file their tax returns and turn over the amount collected on their June sales until July 25th, when the June tax return is due. The Due to Other Governments portion is the amount collected by the tax payer for their location (i.e. city) and then sent to DOR when the taxpayer files and remits their monthly taxes (state and local). After year end, an AFRS entry is made to recognize these revenues and due to other governments in the proper accounting period (current year under audit). This is because at June 30th these revenues will not have been recorded (as received or as a receivable) due to Excise Tax returns not being received by year-end.

In August, B&FS runs a report (B9901FI1Y Gross Receipts Accrual Report) in ATLAS to pull data of June excise tax returns and the 4th fiscal quarter (April, May, and June) returns received from July 1st to August 15th. The Department estimates that 90 to 96% of the June returns and the 4th fiscal quarter (April, May, and June) returns are received by the time the report is run and therefore included on the report. Using this report, an AFRS entry is made to show the June returns received as a June 30th receivable and accrued revenue. The accrued revenue is an estimated amount of tax returns that will be paid within 12 months of the fiscal year end.

### Adjusting Entries

We met with Ayano Faasumalie, Revenue and Financial Reporting Coordinator, on May 14, 2024 to discuss the process for recording all tax collections and distributions for FY2024. Due to guidance received from OFM, DOR changed their reporting of local sales and use tax starting in FY21. This change resulted in all collections and distributions of taxes being recorded as additions and deductions in the Fiduciary Statement of Net Position. ATLAS already prepares monthly journal entries to record excise tax receivable, accrued revenue, and unavailable revenue. After ATLAS creates JVs, B&FS has 6 business days to review the JVs before it is transmitted to AFRS. The receivable and revenue calculations are then reversed out for the beginning of the next month. At the end of each month, Revenue Accounting will also prepare a monthly JV to record the distributions of taxes. Revenue Accounting will retrieve a report from the Treasury Management System (TM\$) that shows how much OST distributed to local jurisdictions. Based on this report, a JV is recorded in ATLAS to match the distribution from TM\$. If the JV does not match with the OST reports, the transaction will show up on DOR's unbalanced in-process report.

## State of Washington

Using the monthly JVs created by Revenue Accounting and the ATLAS automated JVs, the Revenue and Financial Reporting Coordinator prepares an adjusting entry to record all collections and distributions for each quarter. The Revenue and Financial Reporting Coordinator runs a Webi report for all data included in GL 5152 (Due To Other Governments) for the quarter to determine the amounts to be reported as collections (GL 3205) and distributions (GL 6505). She separates the Webi query into different excel tabs based on funds. For each fund and subsidiary account, she further separates the amounts into the following:

- Collection for Distribution
  - From the prior quarter to be distributed in the current
  - From the current quarter to be distributed in the current
- Distributions
- Collection for Future Distribution

The amounts are summarized in the quarterly Activities Summary by Fund spreadsheet and highlighted to track exactly where the figures came from. Based on the summary, the Revenue and Financial Reporting Coordinator prepares the journal voucher to record collections and distributions. The final JV is reviewed and approved by an Accounting Manager, to ensure all collections and distributions are recorded for the quarter (**Key Control 3 - Completeness - Manual**).

### Key controls are as follows:

**Key Control 1 - Valuation/Classification - Manual** - The Local Tax System Specialist conducts testing in production to ensure accumulation and distribution amounts are accurate and only local tax codes are included prior to distribution to jurisdictions.

Taxpayer Account Administration (TAA) will also verify local tax calculations using the new rates on a monthly basis.

**Key Control 2 - Valuation - Automated** - Based on the location code entered by the tax filer, ATLAS calculates the local sales and use taxes due.

**Key Control 3 - Completeness - Manual** - The Revenue and Financial Reporting Coordinator prepares an adjusting entry to record all collections and distributions for each quarter. The final JV is reviewed and approved by the Accounting Manager to ensure all collections and distributions are recorded for the year and match.

### Noted Weaknesses are as Follows:

None.

### H.1.PRG - Tax Collections for Other Governments

*Procedure Step:* Key Control 1 (Manual)

*Prepared By:* CJM, 6/4/2024

# State of Washington

Reviewed By: RKM, 6/11/2024

Purpose/Conclusion:

**Purpose:**

To confirm whether Taxpayer Account Administration verifies accumulation data in ATLAS prior to distribution to local governments (Key Control 1 for ATLAS) in order to assess control risk.

**Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated"*

## State of Washington

*step. Auditors should consider contacting Team IT Audit for assistance.*

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency.*

***All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.***

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider*

## State of Washington

*whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*

*B. Controls are not related to a "significant risk" identified in the audit plan.*

*C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*

*D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

**Key Control 1 Valuation/Classification - Manual** - The Local Tax System Specialist conducts testing in production to ensure accumulation and distribution amounts are accurate and only local tax codes are included prior to distribution to jurisdictions. Taxpayer Account Administration (TAA) will also verify local tax calculations using the new rates on a monthly basis.

The understanding for this system is documented above in the "Controls - ATLAS" step.

### **1. Confirmation of Key Manual Control:**

On May 8th, 2024, we spoke with Jason Hartwell, Tax Administration Manager for Local Tax, and Courtney Tornquist, System Specialist, about reconciliations performed on a monthly basis to ensure local tax accumulated per jurisdiction are accurate. Courtney performs the quarterly tax rate change testing as well as the monthly production testing. Courtney stated the monthly production testing is done on a sample basis to verify the accumulations are accurate before OST distributes the funds back to the local jurisdictions. During the monthly testing, she will also include jurisdictions that had recent changes. During the meeting they provided a walkthrough of the March 2024 production testing. The March testing included the following jurisdictions:

4 - Chelan

# State of Washington

9 - Douglas  
28 - San Juan

Each county selected for testing has its own individual tab and data feeds into the summary table where recalculations are compared to accumulation amounts from ATLAS. Any variances not attributed to rounding are investigated and corrected if needed. We noted the system specialist identified a few variances between ATLAS and the recalculated accumulation. The largest variances were reconciled and were identified as variances due to the payment timing of rural state shared tax. We noted the variances were reduced to reasonable differences (no more than 0.5% of variance for any jurisdiction). ***No issues noted.***

## **Noted Weaknesses are as follows:**

None

## **2. Preliminary Control Risk Assessment**

Based on our understanding and anticipated audit strategy, we assessed preliminary control risk as follows:

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

## **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

## **H.1.PRG - Tax Collections for Other Governments**

*Procedure Step:* Key Control 2 (Automated)

*Prepared By:* CJM, 10/16/2024

*Reviewed By:* RKM, 10/18/2024

Purpose/Conclusion:
---------------------

## **Purpose:**

To determine whether ATLAS calculates the local sales and use taxes due based on the location code entered by the tax filer (Key Control 2 for

## State of Washington

ATLAS) was in place in order to assess control risk.

### **Conclusion:**

Based on our understanding and test results, we concluded that the automated control **was** in place and operating effectively.

Based on our understanding, related general IT controls **were** in place and adequately designed to ensure that the control operated consistently during the audit period. However, we did not test the operating effectiveness of general IT controls.

Our understanding and control risk assessment, which incorporates these conclusions, is documented at [Controls - ATLAS].

Testing Strategy:

The following procedures are **required** for all automated key controls for financial and single audits:

### **STEP 1: Understand Automated Key Control**

Gain an understanding of the automated key control. The understanding can either be documented in the control system step or could be documented here in this step. Auditors should consider the following aspects of the automated control when gaining an understanding:

#### **Software Calculation:**

Is there written documentation of the calculation, and/or the source rates and factors used in the calculation?

*We would expect written documentation that defines the calculation and is an official, approved source for the formulas, rates and factors. This may be an approved policy or could be system documentation.*

What formulas are used to make the calculation?

What values or factors are used to make the calculation? For example:

- Rate tables used by the calculation
- Profile fields (i.e., applicable transaction types)
- Programmed/set formulas and/or values
- Constraints (i.e., effective date, minimums/maximums, etc.)

How is the calculation triggered or initiated?

How is the calculation recorded in the accounting system (or used in an end result)?

*g monitoring controls if personnel are responsible for both application settings and transaction processing controls.*

# State of Washington

## **STEP 2: Confirm and Test Automated Key Control**

Confirm and test the automated control. To test the automated control, consider the following procedures:

### **Software Calculation:**

Re-perform the calculation for selected transactions.

*Auditors would NOT normally use sampling for automated controls. Instead, auditors should judgmentally select one instance of each significant variation of the calculation. If the number of potential variations is large, auditors would judgmentally select based on risk factors (for example, the most common scenarios, or scenarios associated with identified risks, or scenarios that are not addressed by the entity's testing procedures).*

*In some cases, it may be possible for the auditor to reperform the calculation for the entire population.*

If any rate tables or values were updated during the period, view the current values (by observing the rate table or values in an admin menu or from a printed system report) and compare to approved sources.

*If no updates were made or there are only a few values, this risk could be addressed by re-performing the calculation. However, if source rate tables or values are large or complex, it may be more efficient to test these values directly than to recalculate a larger number of transactions.*

Consider the use of analytical procedures such as trends or descriptive statistics on the population (like average, minimum and maximum values, or a graph of values across the population) and follow up on any unexpected values or trends. *Analytical procedures would normally also count as a substantive test.*

### **Software Calculation:**

Inquire if the entity has experienced any errors or irregularities with the calculation. Also how often changes are made to the calculation, and how many changes (if any) were made during the year.

How can the software calculation (formulas, rates/values, settings/configurations) be changed or customized?

*Software calculations will usually have one or more administrative menus that allow the government to modify rate tables or other calculation values, or to configure the calculation or apply settings.*

*In other cases, software calculation formulas and/or values may be hard-coded into the system and require programmers to make the changes. If the government has access to source code, then it needs internal procedures for program changes. If the program is controlled by vendors, we would expect program change procedures and expectations to be included in the contract.*

What are the procedures to authorize and make program changes or configuration/setting changes to the software calculation?

## State of Washington

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

*If utilizing a test environment, there should be controls to ensure that the live environment is updated and is consistent with the live production environment. As management is responsible for the accuracy of their automated controls (i.e., in the live environment), we would expect there to be a procedure to confirm each key automated control once it is in the live environment. This could be manually re-performing the calculation, reviewing reports against known expectations, etc.*

How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change programming, but they may be responsible for patch management, master table data, and/or configurations.*

### **STEP 4: Confirm Key General IT Controls**

Confirm your understanding of key general IT controls to determine whether they have been placed in operation (*whether the entity has actually implemented key controls*).

### **STEP 5: Test Key General IT Controls**

Document whether general IT controls will be tested. Option 1 would result in control risk at MAX for the automated control. Either option 2 or 3 is necessary in order to set control risk at LOW. If general IT controls are tested, consider the following procedures:

#### **Software Calculation:**

If program changes or setting/configuration changes are logged, review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient*

## State of Washington

*evidence to conclude that no further testing of general IT controls is necessary.*

Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the calculation may also provide this evidence if the re-performance tests address all states of the calculation during the period.

If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

### **STEP 6: Final Control Risk**

Evaluate the results and document a final control risk assessment in the control system step. Consider whether any deficiencies identified with either the automated control or related general IT controls represent material weaknesses or significant deficiencies.

*Note: general IT control deficiencies do not necessarily mean the automated control is not properly functioning. General IT control deficiencies would normally be considered a significant deficiency or material weakness only if it caused an issue with the compliance requirement or assertion.*

### **Recommendation Review Requirement**

IT Security related information is considered category 3 data protected by Public Request Exemption RCW 42.56.420. Issues related to IT Security require the following special handling:

[Instructions](#) are located in Team IT Audit's System's Sharepoint page.

Details of IT Security related issues should NOT be included in any emails or helpdesks.

Exit, ML and Findings should be separately communicated in an IT Security Results Document.

Findings will be referenced, but not included in the audit report.

All IT security-related recommendations must be reviewed by [Team IT Audit](#).

Template language for common IT related recommendations can be found in [ARS Part 5 Chapter 8](#).

### **PUBLIC REQUEST EXEMPTION**

Some IT related information is protected by Public Request Exemption RCW 42.56.420 for cyber security purposes. The details documented in the record of work and support workpapers may qualify for this exemption. If so, auditors must include this statement in the record of work done and any related workpapers: **"This record contains information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited "**.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

# State of Washington

## SAO Audit Policy [2310](#) - Reporting Identified Audit Issues

## SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk

### [Information Technology](#) Planning Guide

Auditors may contact [Team IT Audit](#) with any testing strategy or control assessment questions or to request assistance from an IT Specialist.

**Software Calculation:** A **software calculation control** exists when the value of a transaction is determined by a software application. This process can be a key control when the entity relies on the system to generate calculations correctly to determine the amount of transactions (i.e., summarizing/account code allocation to post to general ledger, calculate student, utility, other charges, etc.).

**Automated Interfaces:** An interface is a process that moves information from one computer application to another. The interface can occur internally between systems maintained by a single agency, or between systems maintained by different agencies or private companies. The interface can also occur between modules within the same computer application.

The data transferred might be a file consisting of one or more records processed at a later time (batch), or it can be a real-time update. Risk associated with interfaces increases as the number of transactions or the number of other services and systems supported by the interfaced data increases.

Poor design or inadequate oversight can affect the transfer of transaction data among the systems. Interface controls are automated and/or manual processes designed to ensure transmission and processing of information is complete and accurate.

#### Manual vs. Automated Interfaces

A “manual interface” is the transfer of data from one system or module to another system or module, initiated and controlled by a user. An example of a manual interface is when customer accounts are downloaded from a utility billing system to be used to perform meter readings. When complete, the file with meter readings may be uploaded and posted to the customer accounts.

An “automated interface” is the transfer of data from one system or module to another system or module that happens automatically based on a schedule, or other predefined criteria. A common example of an automated interface is the payroll module of a system. Typically, a payroll batch is created in the payroll module. Once approved, the batch is automatically sent by the system to the general ledger or other applicable modules, such as accounts payable.

Entities should have reconciliation controls between their various applications regardless of the method used for interfacing.

## State of Washington

*Auditors should have determined whether system interfaces are automated as part of the Key Software Applications workpaper. **If not**, ask the following question to determine whether the system interface is manual or automated.*

*Is the data transferred from one system/module to another system/module by a user using an uploading and posting technique? For example, data is pulled from one system into a text file or other format, that is then uploaded into a different system or module by posting or in an upload feature of the module. If the answer to this question is yes, the interface would be considered "manual" since it is initiated and controlled by manually rather than through an automated process.*

**Edit Checks:** An **edit check** is a programmed routine designed to check input data or processing results for accuracy, compliance, or reasonableness. Types of edit checks include:

Range Checks: ensure that numeric values fall within specified ranges, minimums and/or maximums. For example, ensuring that a capital asset can only be entered as a positive amount, or a purchase order can only be submitted without secondary approval for less than a certain threshold.

Consistency Checks: verify that related data fields are consistent with each other. For example, ensuring that a patient's age matches their date of birth.

Format Checks: validate data formats (for example, dates as MM/DD/YYYY or phone numbers as ###-###-####).

Logical Checks: assess logical relationships between data fields. For instance, verifying that total debits equals total credits in a journal entry.

Duplicate Checks: identify duplicate records or entries. For example, preventing the same invoice from being entered twice.

Cross-Field Checks: compare data across different fields. For instance, ensuring that the start date of a project is before the end date.

Required Field Checks: ensure that mandatory fields are filled out. For instance, making sure that a patient's name and date of birth are provided.

Referential Integrity Checks: validate relationships between data tables. For example, confirming that a vendor number exists in the vendor master file as an active entity.

Outlier Checks: detect extreme or unexpected values. For instance, flagging water meter reading values that are extreme outliers for the customer type or account history.

Pattern Checks: look for specific patterns in data. For example, verifying that email addresses follow a valid format.

Edit checks may result in automatic rejection of a transaction, inability to proceed with a transaction, trigger for additional processing or review, or may simply result in a warning message to the user.

Edit checks may be identified as a key control when they are sufficiently relevant (ie: addressing the risk), precise (ie: able to catch all errors, rather than just being only reasonableness or limit check), and sufficiently strong (ie: prevent invalid transactions, rather than just generating a warning messages). Auditors may identify an individual edit or a group of edit checks together as a key control.

**Computer Generated Reports:** A **computer-generated report** is a report that is created by a computer program. The computer program,

## State of Washington

also referred to as a report generator or tool, takes data from a data source, such as a database, and displays it in a specified format. The process to generate a report often includes performing calculations on the data, such as summarizing, classifying, etc., before displaying, or can display the calculations on the report.

There are two types of computer-generated reports, pre-programmed and ad-hoc or customized reports.

Pre-programmed or canned reports are pre-defined reports where criteria and specifications are hard coded in the system. A canned report may allow limited parameters, (month/year, for example), but in general the information that will be displayed is pre-determined.

Ad-hoc or customized reports allow the user to drill down and customize what information is displayed on the report based on some allowed criteria, such as account codes, dollar amounts minimum, etc).

In contrast, a **manual report** is one that is created outside the system using data exports or is created ad hoc by a user. An example of a manual report is one that is created by copying data from a data source and pasting the data in an Excel spreadsheet or Word document or Powerpoint presentation where it is then processed further. With manual reports, each time a report is created, the data could be incorrect due to user error, such as not copying all relevant data, or processing errors. Therefore, these types of reports should be understood and tested similar to manual controls.

**Electronic Approvals:** Electronic approvals, electronic signatures and digital signatures are technically different, although often these terms are used interchangeably by entities.

Auditors should have determined whether the electronic approval is an automated control as part of the overall understanding of controls. For automated control purposes, an electronic approval is a software system functionality that:

Permits a user to approve transaction(s) within the software system

The system automatically documents, or logs, the data approved by the user and any subsequent manipulation

The acceptance or rejection of the transaction by the approver will trigger an additional software system process, such as posting of a transaction.

E-mail, scanned-in pictures of signatures, or font-changed signatures, etc. may be part of a control activity but are generally not considered an automated control and are not covered by this testing strategy.

### Electronic Signature vs Digital Signature

An "**electronic signature**" can look like a handwritten signature that has been scanned and then pasted into an electronic document. The reliability of this type of approval is variable. Recommend gaining an understanding of the process used to store and affix the signature to the document and then discuss the process with Team IT Audit before placing reliance on this control.

A "**digital signature**" is a legal signature with a formal certification process that documents who approved the document and ensures the

# State of Washington

document is not modified after certification. Reliability of this process is very high but has significant technical features. Recommend brainstorm with Team IT Audit before placing reliance on this control.

## **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

**Statements on Auditing Standards [AU-C 315](#) Understanding the Entity and Its Environment and Assessing the Risks of Material Misstatement** - paragraphs .A106-.A109 describe general and application controls and how they relate to audit risks

**Statements on Auditing Standards [AU-C 330](#) Performaing Audit Procedures in Response to Assessed Risks and Evaluating the Audit Evidence Obtained** - paragraphs .10b and .A33-.A34 describe requirements and guidance for testing indirect controls in conjunction with tests of controls, that is, testing key general controls in conjunction with a test of a key automated control

Record of Work Done.

**This record may contain information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited.**

**Key Control 2 Valuation - Automated** - Based on the location code entered by the tax filer, ATLAS calculates the local sales and use taxes due.

## **STEP 1: Understand Automated Key Control**

The understanding for this system is documented above in the "Controls - ATLAS" step.

## **STEP 2: Confirm and Test Automated Key Control:**

We obtained tax return information from ATLAS for a sample of taxpayers that paid local sales and use taxes during FY24 and re-performed the tax calculations. See testing at [[Local Tax Collection Distribution Testing - CONFIDENTIAL](#)]. Based on our understanding and test results, we concluded that the automated control **was** in place and operating effectively.

## **STEP 3: Understand General IT Controls**

On May 8, 2024, we met with Jason Hartwell, Tax Administration Manager, and Courtney Tornquist, IT Business Analyst, to gain an understanding of the general IT controls for ATLAS. Maintaining and updating the Department of Revenue's (DOR) Automated Tax and Licensing Administration System (ATLAS) is a large undertaking that requires coordination across multiple areas of the agency. Various division staff routinely prepare change requests (known as SQRs) to correct defects, update, or create new system functionality and configuration. SQRs are the mechanism used to facilitate the process and ultimately become the system of record for the development activities. SQRs must be reviewed and approved via a workflow process within the Fast Code Repository (FCR) environment before its implemented into ATLAS (**General IT Control 1**). Formulas and calculating factors are stored in ATLAS within a programming table and require a SQR to update an automated calculation. The calculations are triggered by the Tax Filer when they submit a tax return. When errors occur during the SQR process an alert will show in the workflow process and

# State of Washington

a developer will be assigned to correct the error.

## **SQR Workflow Process**

On May 23, 2024, we met with Lucas Kenall, ATLAS Development & Technology Services Manager. When a change to tax rates are needed a SQR submitter creates a request. A Change Manager reviews the request to ensure it is necessary and filled out correctly. When the request is approved a developer is assigned. The requested changes are made in a testing environment to ensure they are implemented correctly without affecting the active ATLAS rates. When the testing is complete the SQR is placed into staging where it is reviewed to ensure it will function correctly. Approvals from 2 members ATLAS development and Technology Services Team are needed to complete the process. When the staging is complete the SQR is passed to the migration step where it will be automatically deployed to ATLAS during non-business hours. Weekly the ATLAS services team ensures that migrations complete with the proper approvals by running a Migration Audit Report that show all migration statuses and approvals. Once the migration has completed successfully the SQR is closed.

## **STEP 4: Confirm Key General IT Controls**

**General IT Control 1:** SQRs must be reviewed and approved via a workflow process within the Fast Code Repository (FCR) environment before its implemented into ATLAS.

On May 8, 2024, Courtney Tornquist, System Specialist, provided us with screenshots of SQR 15578: Local Tax-Quarter 1 2024 changes. We reviewed the SQR workflow to ensure that each step in the process was signed off and approved before moving on to the required next step. The SQR was initiated by Jason Hartwell on October 18, 2023. The SQR was assigned to Courtney Tornquist. We reviewed the workflow logs for the SQR and noted that each step had notes and approvals showing adequate review. The SQR process was closed on March 12, 2024. **No issues noted.**

## **STEP 5: Test Key General IT Controls**

Not applicable - we are not planning to rely on automated controls and therefore do not need to test general controls; control risk will be assessed at MAX.

## **H.1.PR.G - Tax Collections for Other Governments**

*Procedure Step:* Key Control 3 (Manual)

*Prepared By:* CJM, 6/4/2024

*Reviewed By:* RKM, 6/11/2024

## State of Washington

Purpose/Conclusion:

**Purpose:**

To confirm an adjusting entry to record all collections and distributions for each quarter is prepared (Key Control 3 for ATLAS) in order to assess control risk.

**Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

## State of Washington

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency.*

***All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.***

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*

## State of Washington

*B. Controls are not related to a "significant risk" identified in the audit plan.*

*C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*

*D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

**Key Control 3 - Completeness - Manual** - The Revenue and Financial Reporting Coordinator prepares an adjusting entry to record all collections and distributions for each quarter. The final JV is reviewed and approved by the Accounting Manager to ensure all collections and distributions are recorded for the year and match.

The understanding for this system is documented above in the "Controls - ATLAS" step.

### **1. Confirmation of Key Manual Control:**

#### **Quarterly Adjusting Entry Review**

We obtained AFRS journal voucher number 14030250. We noted the explanation of the entry was "To record additions and deductions for Fund 01T, 034, 16C, 17A, 768, 797 for Qtr 1, FY 2024 (July - September, 2023)". Per the line item lead sheet, we noted the majority of the balance is included in fund 034, Local Sales and Use Tax, which is where we focused our control review and testing. We noted the total amount of local sales and use tax collected account was \$1,979,599,134. The collection amounts are based on the monthly JV entries automatically created by ATLAS. We agreed the amounts reported in the JV to a summary of all monthly JVs in quarter 1 from ATLAS. The total collection of local sales and use tax that was distributed in 2024 totaled to \$1,979,599,134. Amounts tie without exception. The JV was prepared by Ayano Faasumalie, Revenue and Financial Reporting Coordinator, on October 23, 2023 and reviewed by Binh Vu, Accounting Manager, on October 23, 2023. ***No issues noted.***

# State of Washington

## Noted Weaknesses are as follows:

None

## **2. Preliminary Control Risk Assessment**

Based on our understanding and anticipated audit strategy, we assessed preliminary control risk as follows:

**MAX-** We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

## **3. Control Risk at LOW – Test of Key Manual Control:**

Not applicable - we are not planning to rely on automated controls and therefore do not need to test general controls; control risk will be assessed at maximum.

## **H.1.PRG - Tax Collections for Other Governments**

*Procedure Step:* Risk Assessment

*Prepared By:* CJM, 7/25/2024

*Reviewed By:* RKM, 8/9/2024

Purpose/Conclusion:

### **Purpose / Conclusion:**

To assess inherent risk, control risk, and the risk of material misstatement in order to design an initial testing strategy for each assertion.

Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

1. Assess inherent risk for each relevant assertion. This assessment is based on understanding of the entity and the nature of the account balance or class of transactions.

*Inherent risk is the susceptibility of an assertion to a material misstatement, assuming that there are no related controls. Inherent risk can*

## State of Washington

*be thought of as the "threat" of misstatement. Inherent risk exists independently of control risk (the level of threat exists independent of the level of vulnerability to threats). Consider the following factors as your basis for this assessment:*

### *General Considerations*

*Does the balance include transactions that are difficult to audit or involve complex accounting issues?*

*Were there significant misstatements identified in previous audits or prior-period adjustments in the account balance or transaction class? If so, analyzing the cause of prior period misstatements will help in analyzing inherent risk.*

*Are there any inherent risk factors at the entity or industry level, such as changes in regulation or accounting rules, unique transactions or accounting practices, use of information technology, etc that affect the balance?*

### *Inherent Risk due to Error*

*How large are the transactions making up the balance? If the balance has only a few large transactions, even a single error may mean a significant misstatement.*

*Have there been changes in the transactions making up the balance that may increase risk? For example, significantly different composition, nature or volume of transactions may inherently disrupt established controls.*

*Are financial events originated or identified by accounting personnel or non-accounting personnel? This consideration is mainly for the completeness assertion.*

*Does the process to account for transactions involve judgment or estimation, complex calculations, numerous steps or significant manual steps?*

*Do transactions have widely varying attributes that need to be manually identified? For example, grant loans that are accounted for in one of several ways depending on the terms of the agreement.*

### *Inherent Risk due to Fraudulent Reporting (intentional misstatements)*

*Are there substantial pressures or motivations to misstate the balance?*

### *Inherent Risk due to Misappropriation*

*· Is the account balance or transaction class susceptible to sizable misappropriation?*

### *Inherent Risk due to Non-Compliance*

*Are there any laws, contracts or grant agreements affecting the balance? If so, would non-compliance lead to sizable misstatements?*

*Are compliance requirements complex, hard to understand, subject to judgment or otherwise difficult to comply with?*

*Are there any motivations or pressures to not comply?*

## State of Washington

2. Assess control risk by system and assertion. This assessment should be based on the results of the control understanding, confirmation, and testing (if applicable). If applicable, auditors will evaluate any control deficiencies and determine whether those deficiencies, individually or in combination, are significant deficiencies or material weaknesses.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. Control risk could be thought of as the "vulnerability" of an entity to misstatements. Control risk exists independently of the inherent risk (the level of vulnerability exists independent of the level of threat).*

*In order to set control risk to LOW, general controls would also need to be tested to provide evidence of the consistent operation of automated controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*

*A material weakness exists when the design or operation of controls results in a reasonable possibility a material misstatement will not be prevented or detected and corrected in a timely manner. A significant deficiency is less severe than a material weakness, yet important enough to merit the attention of the governing body.*

***All potential material weaknesses and significant deficiencies should be discussed with the AIC, since they must be reported as findings.***

3. Assess the risk of material misstatement for each relevant assertion for each material line item. The risk of material misstatement is a combination of the auditor's separate assessment of inherent and control risk.

*The Risk of Material Misstatement is a combined assessment of inherent and control risk based on auditor's judgment. If inherent and control risk are assessed differently, it is a matter of professional judgment as to whether the combined assessment is moderate or if one factor outweighs the other.*

4. Design a substantive testing strategy that addresses the relevant assertion in all significant transaction streams included within the material line item.

*In addition to identifying what to audit (material balances) and what to audit for (relevant assertions), planning has also identified how much to audit (risk of material misstatement). The quantity and quality of evidence obtained by substantive tests needs to match the level of risk. The higher the risk of material misstatement, the greater evidence needed. "Greater evidence" could either be greater quantity of evidence, greater quality of evidence, or some combination of greater quality and quantity.*

Guidance/Criteria.:

### **ADDITIONAL BACKGROUND**

# State of Washington

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6210](#) – Planning Financial Statement Audits**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits](#) Planning Guide**

Record of Work Done:
----------------------

**(1) Inherent Risk (IR):**

Based on our understanding of the line item, we assessed inherent risk as follows for each relevant assertion and significant class of transactions:

**Classification - Moderate**

**Completeness - Moderate**

**Valuation - Moderate**

**(2) Control Risk (CR):**

We assessed control risk as follows for each system and relevant assertion:

**Automated Tax and Licensing Administration System (ATLAS) -**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

**(3) Risk of Material Misstatement (RMM):**

We considered both inherent and control risk and assessed the risk of material misstatement as follows for each relevant assertion and significant class of transactions:

**Classification - Mod**

**Completeness - Mod**

**Valuation - Mod**

**(4) Testing Strategy:**

# State of Washington

We designed our substantive testing strategy based on our assessment of the risk of material misstatement.

**Classification** - We will review a sample of registered taxpayers and ensure tax types are properly categorized as Local Sales and Use Taxes.

We will review quarterly JVs to ensure amounts reported as collections/distributions for other governments are only local taxes.

**Completeness** - We will use the same sample of registered taxpayers as above, review ATLAS for a filed return, and trace revenue to the accumulation GL within ATLAS and to AFRS. We will also review quarterly JVs to ensure monthly automated accumulations within ATLAS were included in the JV and we will review quarterly collection/distribution JVs to ensure that collections and distributions match and are recorded at accurate values.

**Valuation** - We will recalculate taxes paid for the same sample of registered taxpayers as above, to ensure taxes are recorded at proper values and are based on local tax rates and not state tax rates.

We anticipate that these tests will provide sufficient appropriate audit evidence to address the assessed risk of material misstatement for relevant assertions in significant classes of transactions.

## H.1.PRG - Tax Collections for Other Governments

*Procedure Step:* Substantive Test

*Prepared By:* CJM, 10/16/2024

*Reviewed By:* RKM, 10/18/2024

Purpose/Conclusion.
---------------------

### **Purpose:**

To determine whether financial statements properly classify local tax collections (Classification).

To determine whether all local tax collections relating to the period were reported (Completeness).

To determine whether local tax collections were reported at properly valued or calculated amounts (Valuation),

### **Conclusion:**

We determined:

Financial statements properly classify local tax collections (Classification).

All local tax collections relating to the period were reported (Completeness).

Local tax collections were reported at properly valued or calculated amounts (Valuation).

# State of Washington

## Testing Strategy:

The following is a list of **considerations** for testing the completeness assertion for revenues. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

Identify expected revenue streams based on understanding of fund activities and scan to see if revenue is reported for all such streams.

Follow up on any unexpectedly missing streams.

Identify new revenues (ex: new grants or programs) and follow up to verify that expected revenues have been reported.

Confirm intergovernmental revenues with the other government or grantor or by reviewing appropriate correspondence.

*Note: intergovernmental revenues received from the State Treasurer should be addressed as part of the State Treasurer Distributions baseline test.*

If revenue is receipted into a specific clearing account, or if third-party lockbox or receipting services are used, compare recorded revenue to a sum of monthly totals from bank, lockbox or service organization reports.

Trace selected or sampled revenues from source documents to accounting records.

*Source documents may consist of billing, fine, or fee records. Or it may consist of service records that imply a billing, such as license or permit issuance.*

Perform a multi-year trend of revenues and follow up on unexpected decreases.

Search for manual journal entries that debit (decrease) revenues. Consider testing if any risk indicators are noted.

## Cut-Off

Test transactions recorded in the next period to determine whether the revenue should have been recorded in the current period.

*Transactions recorded at the beginning of the next period would generally be considered at highest risk of being improperly shifted to that future period. Consider scanning and selecting transactions if high risk transactions can be identified by description or date fields. If the population is large, consider stratifying to either scan and select or test 100% of all large value transactions combined with a lower assurance sample for small dollar transactions.*

## Detail Roll-up

Compare year-end totals from general ledger to subsidiary software modules for selected revenues.

Review the government's reconciliation of general ledger to subsidiary ledgers.

*Detail roll-up testing is not sufficient audit evidence by itself since it only entails comparing different sets of the entity's own accounting records. However, it may be combined with other substantive tests to address identified risks. For example, if substantive testing is performed at*

# State of Washington

*the subledger level, it may be combined with a test that the subledger detail accurately rolls up to the general ledger or financial statements.*

The following is a list of **considerations** for testing the valuation assertion for revenues. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

## **Calculation**

Recalculate billed revenues on a check (one of each variation), CAATS or sample basis.

For large populations of standard billings, perform CAATS tests to identify unexpected or outlier transactions for further review.

Review related-party transactions to determine whether revenue transactions were correctly calculated.

## **Realizable Value**

Re-calculate a sample or selection of billings. If billings are calculated by software, the auditor could test and substantiate the automated control and also consider any risks associated with manual inputs used by software.

Evaluate the entity's calculation of the allowance amount for reasonableness. This evaluation should include comparing the entity's estimate to the entity's actual historical experience of collecting or writing-off receivables.

Trace the amount of bad debt approved by the governing body (per minutes) to reductions of receivables and bad debt expense to verify it was properly accounted for. *Note: approvals may be slightly more, as customers may pay after the bad debt has been approved but before it is written off.*

## **Estimation / Recognition**

Review calculation and support for assumptions of any estimated revenues.

Accounting research to verify that revenues were reported in conformity with revenue recognition policies reported in the financial statement notes.

The following is a list of **considerations** for testing the classification assertion for revenues. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

## **Classification between Line items**

Scan revenue streams or types to evaluate whether they appear reasonable in relation to the line item description. Follow-up on any unexpected results with accounting research to determine correct classification.

Select or sample revenues from high risk populations and review supporting documentation that demonstrates correct classification of revenues.

Search for manual journal entries that re-classify existing revenue balances (transaction is a debit and credit to different revenue accounts). Consider testing if any risk indicators are noted.

## **Classification between Opinion Units**

## State of Washington

Search for manual journal entries that transfer revenues from one opinion unit to another without recording a balance sheet transaction, other than a direct charge to fund balance (debit and credit to revenue and fund balance for each opinion unit, respectively). Consider testing if any risk indicators are noted.

Scan revenue streams or types by fund and evaluate whether revenue streams or types appear reasonable in relation to the activities of the fund. Follow-up on any unexpected results with accounting research to determine correct classification.

Guidance/Criteria:

**BARS [3.6.9](#) Revenue Accruals in Governmental Funds**

**BARS [3.6.11](#) Suspense Funds**

**BARS [3.6.9](#) Revenue Accruals in Governmental Funds**

**BARS [1.5](#) Determining Operating/Nonoperating/Revenues/Expenses in Proprietary Funds**

**BARS [3.6.9](#) Revenue Accruals in Governmental Funds**

**BARS [3.6.11](#) Suspense Funds**

**BARS [3.6.13](#) Utility Tax (*applies only to cities*)** - should be accounted for as a revenue in the general fund (3164000) and expenditure in the utility fund (53P0040), if the utility passes the tax on to its customers then the additional charges should be recognized as revenue (343P000) directly in the utility fund not in the general fund

Record of Work Done:

### **Tax Collections for Other Governments Testing Coverage**

We reviewed the line item leadsheet [[Line Item Lead Sheet](#)] and noted Fund 034 - Local Sales & Use Tax accounts for the majority of all tax collections for other governments. We determined focusing our testing on Fund 034 collections would provide sufficient coverage over the balance to meet the relevant assertions. See testing details below.

### **Substantive tests performed to meet the Completeness assertion:**

We obtained a list of all active taxpayers that paid local sales and use taxes as of 6/30/2024 and randomly selected a sample of 30 taxpayers for various periods to ensure the return was accurately filed and posted to AFRS. Jason Hartwell, Tax Administration Manager, provided a screenshot of all taxpayers' tax returns entered in ATLAS as well as their payment of the calculated taxes. We reviewed the return for the selected taxpayers

## State of Washington

in ATLAS to ensure a return was filed and payments were received for the entire amount recorded in the return. See testing performed at [[Local Tax Collection Distribution Testing - CONFIDENTIAL](#)]. **No issues noted.**

Business and Financial Services makes an adjusting entry to record local tax collections as tax collections for other governments and tax payments to other governments to comply with GASB 84 regulations on a quarterly basis. When payments for local taxes are collected, ATLAS automatically accumulates revenues to the appropriate fund and GL in a monthly JV. The quarterly collection/distribution JVs includes the monthly accumulation JV activity and moves 5152 - Due to Other Governments to the revenues and expenditures GL (32XX and 65XX). We reviewed each quarter's adjusting JV to ensure:

- All automated ATLAS JVs are recorded and in the proper period
- Quarterly JV amounts only include local taxes
- Collections and Distributions for each month match

We noted the quarterly JVs were complete based on the testing above. See testing at [[Quarterly Collection Distribution JVs](#)]. **No issues noted.**

### **Substantive tests performed to meet the Valuation assertion:**

Using the same randomly selected sample of 30 taxpayers, as mentioned above, we recalculated taxes paid based on local tax rates to ensure that revenues related to local sales and use tax were valued at proper amounts and based on local tax rates and were not related to state tax revenues. Jason Hartwell, Tax Administration Manager, provided a screenshot of all selected taxpayers' tax returns entered in ATLAS. We obtained the local sales and use tax rates for each selected period from the DOR website. Based on the taxable amount in the tax returns, we recalculated the collected local sales and use tax. Any differences noted were small rounding errors. We determined all selected local sales and use tax collections/distributions were reported at properly valued and calculated amounts. See testing performed at [[Local Tax Collection Distribution Testing - CONFIDENTIAL](#)]. **No issues noted.**

### **Substantive tests performed to meet the Classification assertion:**

Using the same randomly selected sample of 30 taxpayers, as mentioned above, we tested to ensure that collections/distributions were properly categorized as Local Sales and Use Taxes. Jason Hartwell, Tax Administration Manager, provided a screenshot of all selected taxpayers' tax returns entered in ATLAS. We obtained the local sales and use tax rates for each selected period from the DOR website. We reviewed the ATLAS tax returns to ensure that only local agencies were included and selections were properly categorized as local city or county taxes collected as use, sales tax, or deferred sales tax. We determined all selected taxpayers were properly categorized and reported. See testing performed at [[Local Tax Collection Distribution Testing - CONFIDENTIAL](#)]. **No issues noted.**

Business and Financial Services makes an adjusting entry to record local tax collections as tax collections for other governments and tax payments to other governments to comply with GASB 84 regulations on a quarterly basis. When payments for local taxes are collected, ATLAS automatically accumulates revenues to the appropriate fund and GL in a monthly JV. The quarterly collection/distribution JVs includes the monthly accumulation JV activity and moves 5152 - Due to Other Governments to the revenues and expenditures GL (32XX and 65XX). We reviewed each quarter's

# State of Washington

adjusting JV to ensure:

Quarterly JV amounts only include local taxes

We noted the quarterly JVs were classified appropriately based on the testing above. See testing at [\[Quarterly Collection Distribution JVs\]](#). ***No issues noted.***

## H.2.PRG - Payments of Taxes to Other Governments

*Procedure Step:* Summary & Conclusion

*Prepared By:* CJM, 11/20/2024

*Reviewed By:* RKM, 11/21/2024

Purpose/Conclusion:

### **Purpose:**

To evaluate risk assessments and the sufficiency and appropriateness of evidence obtained based on results of substantive work.

### **Conclusion:**

We determined that **no** modifications were necessary to inherent risk, control risk, or the risk of material misstatement as assessed in planning.

We also determined that evidence obtained was sufficient and appropriate in response to the risk of material misstatement.

Testing Strategy:

Auditors are **required** to evaluate conclusions for substantive testing as follows:

*Auditors may wish to use the optional Lead Sheet available in the Store to summarize testing related to each balance and assertion.*

**1.** Determine whether the results of substantive testing indicate a need to modify the inherent risk assessment (IR), control risk assessment (CR), risk of material misstatement (RMM) or other aspects of planning (such as material balances or assertions). If so, document changes and consider the need for additional testing.

*If the results of substantive testing indicate a need to change control risk, auditors should also update the **Permanent File** by either correcting*

## State of Washington

*the documentation or by adding an update section describing changes to the top of the record of work done. For all changes to IR, CR, or RMM the **Material Balances** spreadsheet should be updated.*

*More significant changes to other aspects of planning (such as material balances or assertions) should be referenced in this step and documented in detail in the **Changes to FS Audit Plan** step.*

2. Evaluate whether the quality and quantity of evidence obtained is sufficient and appropriate in response to the risk of material misstatement. In making this determination, auditors should evaluate:

### Information to be used as audit evidence:

- Does evidence relate to the population, period of time and risk (assertion and “what could go wrong” from the Material Balance Spreadsheet)? If there are any gaps or uncertainties in the logical connection between the evidence and conclusions, is there a documented consideration and explanation?
- Are the sources of information sufficiently reliable and appropriate for the risk (whether internal to the government, external, or auditor developed)? If key information is not from a sufficiently reliable source (for example, inquiry), then is it corroborated by information that is?
- Are there any concerns about accuracy, completeness, authenticity, or bias in information? If so, did the auditor perform sufficient procedures to confirm reliability of that information?
- Is information precise enough to catch if misstatements exceeded the tolerable level?
- Is information detailed enough to conclude on whether or not there were misstatements?
- Was there any information that appeared contradictory or inconsistent? If so, was there a documented response to the inconsistencies or doubts about the reliability of evidence?

### Results:

- How much misstatement was identified by testing, and the likelihood and magnitude of further potential misstatement?
- How did misstatements occur and how often might they occur again in the population?
- Were misstatements caused by control deficiencies or circumvention of controls?
  - If control deficiencies, is there a need to re-evaluate our understanding of controls in the **Permanent File** folder or assessment of control risk?
  - If circumvention, the **Management Override of Controls** step should address or reference this area. Auditors should also consider whether a fraud risk has been identified.
  - Did tests identify a different level or type of risk than the planned audit response was designed to address?
  - If likely misstatements are identified, are further procedures necessary to improve the precision of our estimate?

*To support the overall evaluation of audit risk and provide a basis for concluding on the overall sufficiency and appropriateness of evidence in*

## State of Washington

*the **FS Summary & Report** step, auditors should conclude in each area whether the auditor continues to believe that the tests performed and quality and quantity of evidence obtained are commensurate with RMM for all relevant risks (the "what could go wrong", in the **Material Balances** spreadsheet).*

If the auditor determines that evidence is not sufficient or appropriate, additional substantive testing should be done. If sufficient, appropriate evidence is not available for audit, the AIC should discuss the effect on our audit report with the AAM and AM.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6310](#) – Determining the Nature, Timing and Extent of Substantive Testing**

**SAO Audit Policy [3210](#) – Audit Evidence**

Record of Work Done:

Based on test results, we re-evaluated risk assessments, procedures, evidence obtained and conclusions as follows:

#### **(1) Do the results of substantive tests indicate a need to modify our risk assessment (IR, CR and RMM)?**

The results of substantive tests do not indicate a need to modify our risk assessment.

#### **(2) Was the quality and quantity of evidence obtained sufficient and appropriate?**

The quality and quantity of evidence obtained was sufficient and appropriate.

### **H.2.PRG - Payments of Taxes to Other Governments**

*Procedure Step:* Understanding of Line Item

*Prepared By:* CJM, 6/3/2024

*Reviewed By:* RKM, 6/11/2024

# State of Washington

Purpose/Conclusion:

**Purpose / Conclusion:**

To gain an understanding of the line item and confirm the scope of testing as documented in the Significant Account Matrix.

Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

**STEP 1: Prior Audit Exceptions**

Document any exceptions noted during the prior audit. Follow-up to determine how the agency has responded to or corrected the issue, unless this work is anticipated as part of the testing strategy.

**STEP 2: Analyze Composition and Changes of Line Item**

Include link to the line item leadsheet. This will be completed at the end of the audit. Leadsheet analysis should be documented in this spreadsheet.

Inquire with agency staff about the activities and transactions that make up the balance and any changes to those activities or transactions in relation to the prior year.

Determine relevant classes of transactions or account balances within the line item to analyze (such as agencies, funds, programs, departments, accounts, and/or objects), and use AFRS to create trends of those elements. This step should not include any specific dollar amounts associate with the line item.

Evaluate trends to identify:

- (1) What classes of transactions or account balances are primary to the identified risk. Auditors should specifically consider what elements are primary to the line item (comprising a large percentage of the line item), and which elements the identified risk would apply to, and which elements might be most susceptible to the identified risk (having a high risk of non-trivial misstatement for a relevant assertion, considering likelihood and impact of potential for misstatement).
- (2) What changes are primary to the identified risk, if applicable. Auditors should specifically consider whether the overall change to the line item from the prior year was significant, what elements were the primary drivers of overall change, whether any elements changed significantly from the prior year, and which changes (if any) might relate to the identified risk.
- (3) Any unusual or unexpected elements, amounts, or changes that may indicate a risk, whether the one identified in planning or a new one that may need to be considered for a change to the plan.

**Consider** other procedures to gain an understanding of the line item, such as review of key policy documents, review of program information or

## State of Washington

reports, inquiry of staff, budget information, or other analytical procedures.

### STEP 3: Update Significant Account Matrix

Based on your understanding of the line item, update the Significant Account Matrix with final conclusions on the agencies covered, account description, significant accounting systems, and risk (what could go wrong and relevant assertions). The account description should reflect the significant transaction streams or account balances relevant to the risk.

*The description of agencies, significant accounting systems, and what could go wrong in the Significant Account Matrix constitute the overall scope of substantive testing.*

*A transaction stream is significant based on the potential for misstatement. This is often due in part to its size (ie: comprising a large percentage of the total line item), but is ultimately a judgment about the susceptibility to the identified risk (for example, when the risk is understatement a small or omitted account may hold the most potential for the largest misstatement).*

*Significant accounting system(s) are those that contain key controls over significant classes of transactions included in the line item. Control systems identified in this step must match the Significant Account Matrix and have a separate control understanding documented.*

*Talk with the AIC if you identify any changes to the Significant Account Matrix.*

Guidance/Criteria:

Record of Work Done:

#### **(1) Prior Audit Exceptions:**

There were no exceptions noted in prior audit.

#### **(2) Composition & Change Analysis:**

Line Item Leadsheet: [\[Line Item Lead Sheet\]](#).

Fund 034 - Local Sales and Use Tax - State share (6.5% per statute) and Add-on (decided by city and county)

Fund 01T - Local Leasehold Excise Tax

Fund 16C - Real Estate and Property Tax Administration Assistance

Fund 17A - County Enhanced 911 Excise Tax

Fund 768 - Local Real Estate Excise Tax (REET)

Fund 797 - Local Tourism Promotion Tax

On May 8, 2024, we met with Jason Hartwell, Tax Admin Manager, and on May 14, 2024, we met with Ayano Faasumalie, Revenue and Finance Rep Coordinator, to discuss any changes to the transactions and process for this line item in relation to the prior year. For fiscal year 2024,

# State of Washington

Business and Financial Services (B&FS) makes manual quarterly adjustments in AFRS until automated entries can be implemented in Automated Tax and Licensing Administration System (ATLAS). This quarterly adjustment process is similar to prior years. Per inquiry with B&FS staff, we also noted the composition of the balance remains the same as the prior year.

Upon review of the line item lead sheet for FY23 balances, we noted 98% of the balance is collections for fund 034, local sales and use tax. We expect the FY24 balance to remain similar based on our discussion with the agency. Therefore, we will focus our control understanding and testing on the local sales and use tax portion of the balance.

### **(3) Updates to Significant Account Matrix:**

No updates to the Significant Account Matrix is needed.

### **H.2.PRG - Payments of Taxes to Other Governments**

*Procedure Step:* Controls - ATLAS

*Prepared By:* CJM, 10/8/2024

*Reviewed By:* SHW, 10/9/2024

Purpose/Conclusion:

#### **Purpose:**

To gain an understanding of internal controls.

#### **Conclusion:**

We gained an understanding of internal controls as documented in the record of work done.

Testing Strategy:

#### **The following procedures are required for all material systems:**

1. List the financial statement balance(s) and relevant assertion(s) addressed by the understanding.

## State of Washington

2. Gain an understanding of the internal control process, identify how transactions are recorded in AFRS, identify key controls over relevant assertion(s), and note any control weaknesses.

In gaining an understanding of controls, consider the overall understanding of State-Level control elements as documented in the "State-Level Controls" step as they relate to this particular system.

Identify controls systems covering all relevant assertions for all significant classes of transactions.

Standards require the auditor to gain an understanding of the significant accounting system(s) that contain key controls over significant classes of transactions included in the line item.

Control systems identified in this step must match the Material Account Matrix and have a separate control understanding documented.

Talk with the ACFR Specialist or AIC if you identify different systems than the ones anticipated in the Material Account Matrix.

For each material system, auditors must document:

A brief outline of the transaction flow from beginning to end.

An expanded description of key controls.

Business processes relevant to financial reporting of the relevant assertion for the material balance. Processes should encompass automated and manual procedures by which transactions or events are identified or initiated, authorized as needed, recorded, processed and corrected as needed.

Original accounting records and how records are rolled-up to intermediary ledgers and transferred to the general ledger (AFRS) or financial statements.

Detailed descriptions of key controls. Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

The following is information to **consider** when identifying key controls and transaction flow.

"Key controls" refer to the few controls that together provide reasonable assurance that material misstatements will be prevented or detected and corrected. This is contrasted with ancillary or supporting controls, which – although helpful and recommended – would provide less than reasonable assurance by themselves.

The focus of the write-up is on the key controls. Key controls should be specifically identified (as "key controls") in the write-up. This can be done in whatever way the auditor prefers, so long as it is obvious. Details that the auditor should document regarding key controls may include:

Who or what initiates the control  
When (or how often) is the control applied  
Who performs the control

## State of Washington

As needed, the experience, knowledge and attitude of the person applying the control

Detailed description of the control process or activity. For example, if the control is a review: what exactly is reviewed, what is the reviewer looking at or for and what are the reviewer's criteria?

How the key control is documented or evidenced

If not obvious from the description, how the control prevents or timely detects and corrects misstatements

Any exceptions or alternative processing to the normal process

What happens when misstatements or issues are identified by the control

The "transaction flow" refers to the process by which transactions are initiated, authorized, recorded, processed and reported (as applicable). Outlining the transaction flow gives context to key controls, especially how transactions become subject to controls in the first place. If a control inherently ensures that all applicable transactions are included (ex: bank reconciliation where the assertion is existence), the auditor may decide to just start the write-up with the initiation of the control procedure and go from there.

Elements of the transaction flow are defined informally as follows:

*Initiation:* How are transactions initiated?

*Authorization:* How are transactions and accounting record maintenance authorized?

*Recording:* How are transactions or balances identified and recorded in financial accounting systems?

*Processing:* How are the transactions or balances processed after they are recorded (if at all)? Processing may be manual or automated and may occur at a subsidiary system level or at the general ledger level.

*Reporting:* How are records translated into the financial statements? This part of the transaction flow extends the understanding to the actual financial statements that the audit is opining on. Since we already document an understanding of the financial reporting process in general, it is usually enough to simply reference this overall understanding. However, if there are important steps unique to the covered balances, it may be more appropriate to mention them here.

Although transaction flow is a good way to think about understanding and documenting a control system, auditors should not worry too much about documenting "each element, in order" because often elements may be combined, not noticeable, not applicable or occur in a different order.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

# State of Washington

## Financial Statement Audits Planning Guide

Record of Work Done:

### **Material Balance(s) and Assertions**

Internal controls in the Automated Tax and Licensing Administration System (ATLAS) address the following balance(s):

#### **Payments of Taxes to Other Governments - Custodial Fund**

For the following assertions:

**Classification** - There is a risk that local tax payments to other governments were actually state taxes.

**Valuation** - There is a risk that tax payments were incorrectly valued (wrong tax rate).

**Completeness** - There is a risk that not all taxes collected on behalf of local governments have been identified and distributed to those government

### **Gain an Understanding of Internal Controls**

We met with Jason Hartwell, Tax Administration Manager, and Courtney Tornquist, Systems Specialist, on May 8, 2024 to discuss controls related to the Payments of Taxes to Other Governments.

#### Local Tax Rates

Counties, cities, and local tax codes have the authority to assess local taxes in addition to the state's regular 6.5% sales and use tax (use tax is the same rate as sales tax, taxpayers would pay this when purchasing a television in Oregon for example). These taxes are regulated by ordinances or resolutions set by the local governments. Each jurisdiction has a collection agreement on file with DOR that includes the administration fee charged (if applicable) and how refunds and redistributions are handled. When a jurisdiction passes a resolution or ordinance to collect a new tax, they must provide DOR with written notification, a copy of certified election results and a copy of the ordinance or resolution. The jurisdiction must provide the documentation at least 75 days before the effective date (January 1, April 1, and July 1). Taxpayer Account Administration (TAA) has an Excise Tax Examiner (ETE) on the local tax team that will monitor and review election result documentation quarterly to verify if any new taxes or rates have passed.

#### Local Tax (LT) Rate Testing in ATLAS

The process for updating the local tax rates is:

1. A LT manager receives documentation from a jurisdiction indicating they have passed a resolution/ordinance. Once the documents are

## State of Washington

reviewed/verified, the manager puts the changes on a spreadsheet and emails that spreadsheet to the LT system specialist.

2. In a test environment, a programmer updates rate tables as necessary. This environment is verified by reviewing the rates in the Automated Tax and Licensing Administration System (ATLAS) and from various ad hoc reports. Then the changes are moved to the production environment.

3. A programmer will then make system application changes in the test environments. The LT system specialist file test batches (tax returns) for this environment and ensures that they post and calculate properly. ATLAS is then verified for proper accumulation and distribution. Then the application changes are moved to the production environment.

The LT system specialist conducts testing in production to ensure accumulation and distribution amounts are accurate and only local tax codes are included prior to distribution to jurisdictions. TAA will also verify local tax calculations using the new rates on a monthly basis. Money is not distributed to local governments by OST until TAA verifies the data in ATLAS (**Key Control 1 - Valuation/Classification - Manual**). Distributions usually occur the following month after tax returns are due. This allows TAA to work through any identified issues.

### Calculation of Local Sales and Use Tax

Businesses are assigned a location code in ATLAS. The location codes feed back to the jurisdiction for tax collection and local taxes accumulate to the reported locations based on the taxes imposed in each jurisdiction. Filers are required to submit Excise Tax returns where local tax data is captured in ATLAS. The Combined Excise Tax Return form requires businesses input a location name and location code when reporting local sales tax collected. Based on the information input by the taxpayer, ATLAS captures the total taxes collected and sums it up by the type of local tax by location code (**Key Control 2 - Valuation - Automated**). Local sales and use tax are calculated and recorded within ATLAS similar to the other types of tax revenues reviewed at [Retail Sales and Use and B&O Taxes]. If a return is filed with a wrong location code or any errors, the return will error out in the system and will not be recorded until it is manually reviewed and resolved by a TAA examiner. The error will go into a work queue task that is pulled and reviewed by the examiners. If corrections are required, they will make the adjustment and save it in the system.

Local Sales and Use Tax are not the State's and are only collected and distributed by DOR on behalf of the local jurisdictions. When a taxpayer submits a payment, DOR initially uses ATLAS to record the amount in the Suspense Account within the Office of the State Treasurer (OST). The money is held in trust and redistributed monthly by OST. When the payment is applied to the tax return, ATLAS generates a JV to record a "Due to Other Funds" (Short-Term) in AFRS. On the last day of the month DOR enters a JV to reclassify the amount to be distributed by OST as "Due to Other Governments" (MC).

### **How Transactions are Recorded in AFRS:**

#### Gross Receipts Accrual

For monthly filers, Excise Tax returns for June activity are due July 25th. For quarterly filers the tax returns for the 4th fiscal quarter (April, May, and June) are due July 31st. At June 30th, tax has been collected by businesses (taxpayers), from their customers, for sales occurring during the month of June; however, they are not required to file their tax returns and turn over the amount collected on their June sales until July 25th,

## State of Washington

when the June tax return is due. The Due to Other Governments portion is the amount collected by the tax payer for their location (i.e. city) and then sent to DOR when the taxpayer files and remits their monthly taxes (state and local). After year end, an AFRS entry is made to recognize these revenues and due to other governments in the proper accounting period (current year under audit). This is because at June 30th these revenues will not have been recorded (as received or as a receivable) due to Excise Tax returns not being received by year-end.

In August, B&FS runs a report (B9901FI1Y Gross Receipts Accrual Report) in ATLAS to pull data of June excise tax returns and the 4th fiscal quarter (April, May, and June) returns received from July 1st to August 15th. The Department estimates that 90 to 96% of the June returns and the 4th fiscal quarter (April, May, and June) returns are received by the time the report is run and therefore included on the report. Using this report, an AFRS entry is made to show the June returns received as a June 30th receivable and accrued revenue. The accrued revenue is an estimated amount of tax returns that will be paid within 12 months of the fiscal year end.

### Adjusting Entries

We met with Ayano Faasumalie, Revenue and Financial Reporting Coordinator, on May 14, 2024 to discuss the process for recording all tax collections and distributions for FY2024. Due to guidance received from OFM, DOR changed their reporting of local sales and use tax starting in FY21. This change resulted in all collections and distributions of taxes being recorded as additions and deductions in the Fiduciary Statement of Net Position. ATLAS already prepares monthly journal entries to record excise tax receivable, accrued revenue, and unavailable revenue. After ATLAS creates JVs, B&FS has 6 business days to review the JVs before it is transmitted to AFRS. The receivable and revenue calculations are then reversed out for the beginning of the next month. At the end of each month, Revenue Accounting will also prepare a monthly JV to record the distributions of taxes. Revenue Accounting will retrieve a report from the Treasury Management System (TM\$) that shows how much OST distributed to local jurisdictions. Based on this report, a JV is recorded in ATLAS to match the distribution from TM\$. If the JV does not match with the OST reports, the transaction will show up on DOR's unbalanced in-process report.

Using the monthly JVs created by Revenue Accounting and the ATLAS automated JVs, the Revenue and Financial Reporting Coordinator prepares an adjusting entry to record all collections and distributions for each quarter. The Revenue and Financial Reporting Coordinator runs a Webi report for all data included in GL 5152 (Due To Other Governments) for the quarter to determine the amounts to be reported as collections (GL 3205) and distributions (GL 6505). She separates the Webi query into different excel tabs based on funds. For each fund and subsidiary account, she further separates the amounts into the following:

- Collection for Distribution

  - From the prior quarter to be distributed in the current

  - From the current quarter to be distributed in the current

- Distributions

- Collection for Future Distribution

The amounts are summarized in the quarterly Activities Summary by Fund spreadsheet and highlighted to track exactly where the figures came from. Based on the summary, the Revenue and Financial Reporting Coordinator prepares the journal voucher to record collections and

## State of Washington

distributions. The final JV is reviewed and approved by an Accounting Manager, to ensure all collections and distributions are recorded for the quarter (**Key Control 3 - Completeness - Manual**).

### Key controls are as follows:

**Key Control 1 - Valuation/Classification - Manual** - The Local Tax System Specialist conducts testing in production to ensure accumulation and distribution amounts are accurate and only local tax codes are included prior to distribution to jurisdictions.

Taxpayer Account Administration (TAA) will also verify local tax calculations using the new rates on a monthly basis.

**Key Control 2 - Valuation - Automated Calculation** - Based on the location code entered by the tax filer, ATLAS calculates the local sales and use taxes due.

**Key Control 3 - Completeness - Manual** - The Revenue and Financial Reporting Coordinator prepares an adjusting entry to record all collections and distributions for each quarter. The final JV is reviewed and approved by the Accounting Manager to ensure all collections and distributions are recorded for the year and match.

### Noted Weaknesses are as Follows:

None.

### H.2.PR.G - Payments of Taxes to Other Governments

*Procedure Step:* Key Control 1 (Manual)

*Prepared By:* CJM, 6/4/2024

*Reviewed By:* RKM, 6/11/2024

Purpose/Conclusion.*
----------------------

#### **Purpose:**

To confirm whether Taxpayer Account Administration verifies accumulation data in ATLAS prior to distribution to local governments (Key Control 1 for ATLAS) in order to assess control risk.

#### **Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

## State of Washington

### Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified*

## State of Washington

*issue represents a material weakness or significant deficiency.*

***All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.***

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

# State of Washington

## SAO Audit Policy [2310](#) - Reporting Identified Audit Issues

## SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk

Record of Work Done:

**Key Control 1 Valuation/Classification - Manual** - The Local Tax System Specialist conducts testing in production to ensure accumulation and distribution amounts are accurate and only local tax codes are included prior to distribution to jurisdictions. Taxpayer Account Administration (TAA) will also verify local tax calculations using the new rates on a monthly basis.

The understanding for this system is documented above in the "Controls - ATLAS" step.

### **1. Confirmation of Key Manual Control:**

On May 8th, 2024, we spoke with Jason Hartwell, Tax Administration Manager for Local Tax, and Courtney Tornquist, System Specialist, about reconciliations performed on a monthly basis to ensure local tax accumulated per jurisdiction are accurate. Courtney performs the quarterly tax rate change testing as well as the monthly production testing. Courtney stated the monthly production testing is done on a sample basis to verify the accumulations are accurate before OST distributes the funds back to the local jurisdictions. During the monthly testing, she will also include jurisdictions that had recent changes. During the meeting they provided a walkthrough of the March 2024 production testing. The March testing included the following jurisdictions:

- 4 - Chelan
- 9 - Douglas
- 28 - San Juan

Each county selected for testing has its own individual tab and data feeds into the summary table where recalculations are compared to accumulation amounts from ATLAS. Any variances not attributed to rounding are investigated and corrected if needed. We noted the system specialist identified a few variances between ATLAS and the recalculated accumulation. The largest variances were reconciled and were identified as variances due to the payment timing of rural state shared tax. We noted the variances were reduced to reasonable differences (no more than 0.5% of variance for any jurisdiction). ***No issues noted.***

### **Noted Weaknesses are as follows:**

None

# State of Washington

## **2. Preliminary Control Risk Assessment**

Based on our understanding and anticipated audit strategy, we assessed preliminary control risk as follows:

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

## **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

## **H.2.PRg - Payments of Taxes to Other Governments**

*Procedure Step:* Key Control 2 (Automated)

*Prepared By:* CJM, 9/30/2024

*Reviewed By:* RKM, 10/18/2024

Purpose/Conclusion:

### **Purpose:**

To determine whether ATLAS calculates the local sales and use taxes due based on the location code entered by the tax filer (Key Control 2 for ATLAS) was in place in order to assess control risk.

### **Conclusion:**

Based on our understanding and test results, we concluded that the automated control **was** in place and operating effectively.

Based on our understanding, related general IT controls **were** in place and adequately designed to ensure that the control operated consistently during the audit period. However, we did not test the operating effectiveness of general IT controls.

Our understanding and control risk assessment, which incorporates these conclusions, is documented at [Controls - ATLAS].

Testing Strategy:

The following procedures are **required** for all automated key controls for financial and single audits:

# State of Washington

## **STEP 1: Understand Automated Key Control**

Gain an understanding of the automated key control. The understanding can either be documented in the control system step or could be documented here in this step. Auditors should consider the following aspects of the automated control when gaining an understanding:

### **Software Calculation:**

Is there written documentation of the calculation, and/or the source rates and factors used in the calculation?

*We would expect written documentation that defines the calculation and is an official, approved source for the formulas, rates and factors. This may be an approved policy or could be system documentation.*

What formulas are used to make the calculation?

What values or factors are used to make the calculation? For example:

- Rate tables used by the calculation

- Profile fields (i.e., applicable transaction types)

- Programmed/set formulas and/or values

- Constraints (i.e., effective date, minimums/maximums, etc.)

How is the calculation triggered or initiated?

How is the calculation recorded in the accounting system (or used in an end result)?

### **Automated Interfaces:**

Is data transferred in real time (immediately) or in a batch? If batched, how often does the interface occur (daily, monthly, quarterly, etc.)?

What triggers the data transfer?

*Transfers could be manually initiated, could be hardcoded into either the sending or receiving system's programming, could be controlled by administrative menus (for integrated software modules), or could be run as automated jobs with third party software or programming.*

Could the interface process fail? If so, how would the entity recognize that the process failed?

*This may not be a relevant risk for integrated software, but may be the case for custom interfaces designed outside the software which may be subject to various points of failure.*

Will the interface process reject transactions or batches with errors? If so, who monitors rejections and follows up on rejected transactions to ensure correction (either in the sending or receiving systems) and how are corrections tracked and monitored?

## State of Washington

*For example, information that could trigger a rejection or isolated transaction and batch can include: invalid data, duplicate data, or missing factors. If errors are possible, we would expect the isolated data is reviewed, tracked and corrected in a timely manner.*

Are any reconciliations done to provide assurance that data transfer was complete and accurate?

*We would expect the local government to perform a reconciliation between source and destination systems to ensure the interfaced data is complete and accurate. This may be a manual reconciliation or spot-check, a system or dashboard report, or automated edit check. Depending on how often errors (if any) are expected, the reconciliation could be done each time the interface occurs, or on a monitoring basis, like annually.*

### Edit Checks:

Inquire if the entity has a written policy or documentation describing the approval process and protocols for reviewers?

What is the approval process in the application?

What transactions, data, tasks, or documents are approved?

Who are the preparers? How do preparers submit for approval?

Who are the authorized approvers? Are there backup approvers?

What documents or information are required to make approval judgment?

What is the next step once a transaction/data/ task/document is approved or denied?

Is there any exception situations where approval can be by-passed or waived?

Can the approver make changes to information during the approval stage? If so, is the preparer notified of the changes?

Can anyone make changes to the approved information after the approval stage? If so, are changes captured in an audit trail and is the audit trail (log) regularly reviewed and monitored to detect any unauthorized changes?

Does the application prevent users from approving their own work (self-approval)?

*Some applications have a feature preventing self-approval. If an application does not have a feature preventing self-approval, we would expect manual controls in place to ensure the segregation of duties between preparer and approver, if relevant to the risk.*

Does the application have high-level users that can also approve?

*High-Level Users (aka Users with elevated privileges, system or application "Administrators", "Super Users", etc.) typically have full access to change system settings and may have extensive function rights of software applications. Depending on entity's size and complexity, different high-level users may be responsible for the network vs. application level. High-level users represent a heightened risk for overriding segregation of duties and normal control processes.*

*We would expect entities to have compensating monitoring controls if personnel are responsible for both application settings and*

# State of Washington

*transaction processing controls.*

## Computer Generated Reports:

What information or exceptions is the report designed to identify (what is the purpose of the report)?

How is the report used and by whom?

For exception reports, who reviews the report and how do they follow up on exceptions?

*Auditors should consider whether the exception report reviewer has appropriate authority and information to effectively follow-up on report results. For fraud-related risks, also consider whether the review position is appropriately segregated from positions that can initiate transactions. For exception reports that regularly identify many transactions needing multi-step follow-up, the manual review and follow-up may be identified as a separate key control rather than documented and evaluated as an aspect of the automated exception report control.*

What are the report parameters or criteria? Does the report have any calculated fields? If so, what are the calculations?

*The ideal method of documenting an understanding of a computer generated report is to get a screenshot or printout of the report parameters. If using a report writer, this may be printed with the report, or may be accessed from a design view or intermediary screen. For custom or complex reports, this may be the SQL code.*

*For exception reports, auditors should pay special attention to the definition of an exception embodied in the report parameters.*

*NOTE: observation of the report parameters will also count as a confirmation of the report and could also be used to test the report.*

## Electronic Approvals:

Inquire if the entity has a written policy or documentation describing the approval process and protocols for reviewers?

What is the approval process in the application?

What transactions, data, tasks, or documents are approved?

Who are the preparers? How do preparers submit for approval?

Who are the authorized approvers? Are there backup approvers?

What documents or information are required to make approval judgment?

What is the next step once a transaction/data/ task/document is approved or denied?

Is there any exception situations where approval can be by-passed or waived?

Can the approver make changes to information during the approval stage? If so, is the preparer notified of the changes?

Can anyone make changes to the approved information after the approval stage? If so, are changes captured in an audit trail and is the audit trail (log) regularly reviewed and monitored to detect any unauthorized changes?

## State of Washington

Does the application prevent users from approving their own work (self-approval)?

*Some applications have a feature preventing self-approval. If an application does not have a feature preventing self-approval, we would expect manual controls in place to ensure the segregation of duties between preparer and approver, if relevant to the risk.*

Does the application have high-level users that can also approve?

*High-Level Users (aka Users with elevated privileges, system or application "Administrators", "Super Users", etc.) typically have full access to change system settings and may have extensive function rights of software applications. Depending on entity's size and complexity, different high-level users may be responsible for the network vs. application level. High-level users represent a heightened risk for overriding segregation of duties and normal control processes.*

*We would expect entities to have compensating monitoring controls if personnel are responsible for both application settings and transaction processing controls.*

### **STEP 2: Confirm and Test Automated Key Control**

Confirm and test the automated control. To test the automated control, consider the following procedures:

#### **Software Calculation:**

Re-perform the calculation for selected transactions.

*Auditors would NOT normally use sampling for automated controls. Instead, auditors should judgmentally select one instance of each significant variation of the calculation. If the number of potential variations is large, auditors would judgmentally select based on risk factors (for example, the most common scenarios, or scenarios associated with identified risks, or scenarios that are not addressed by the entity's testing procedures).*

*In some cases, it may be possible for the auditor to reperform the calculation for the entire population.*

If any rate tables or values were updated during the period, view the current values (by observing the rate table or values in an admin menu or from a printed system report) and compare to approved sources.

*If no updates were made or there are only a few values, this risk could be addressed by re-performing the calculation. However, if source rate tables or values are large or complex, it may be more efficient to test these values directly than to recalculate a larger number of transactions.*

Consider the use of analytical procedures such as trends or descriptive statistics on the population (like average, minimum and maximum values, or a graph of values across the population) and follow up on any unexpected values or trends. *Analytical procedures would normally also count as a substantive test.*

# State of Washington

## Automated Interfaces:

Re-perform a reconciliation, comparison or analytical procedure between both systems to determine whether data interfaced completely and accurately. Alternatively, review the entity's reconciliation or comparison if they perform one.

*For example, auditors could perform count totals and summarize the data to determine whether the same number of transactions reside in both systems, or the total amount from the sending system was posted to the receiving system. Whether this takes the form of a comparison (numbers expected to match exactly), reconciliation (when reconciling items are expected) or analytical procedure (if numerous adjustments or reconciling items are expected) will depend on the nature of the interface and client documentation.*

*Note: these procedures would also provide substantive evidence.*

Observe documentation, such as interface logs or email notifications, to determine whether interfaces complete per expected interval (daily, monthly, quarterly, etc.).

*We would expect the data transfer to be consistent based on the programmed schedule. If data is expected to be transferred on a weekly basis, we would expect to see some form of documentation showing the weekly transfer.*

Observe evidence that batch jobs are monitored such as tracking spreadsheets or emails.

When interfaces did not occur as expected, determine whether procedures were followed to resubmit job or that there was a logical reason no data was received/sent for the interval (for example, it was a holiday so there was no interface for that day).

## Edit Checks:

Re-perform the edit check for selected transactions.

*Auditors would NOT normally use sampling for automated controls. Instead, auditors should judgmentally select one instance of each significant variation of the check. If the number of potential variations is large, auditors would judgmentally select based on risk factors (for example, the most common scenarios, or scenarios associated with identified risks, or scenarios that are not addressed by the entity's testing procedures).*

*In some cases, it may be possible for the auditor to reperform the edit check for the entire population.*

Consider the use of analytical procedures such as trends or descriptive statistics on the population (like average, minimum and maximum values, or a graph of values across the population) and follow up on any unexpected values or trends. Analytical procedures would normally also count as a substantive test.

# State of Washington

## Computer Generated Reports:

For exception reports, inquire with the person assigned to review the report how frequently exceptions are noted by the report. Trace identified exceptions to documentation of correction or resolution.

Re-perform the report by either (a) generating it yourself in the entity's system (if the auditor has direct access to the system), (b) recreating the report using CAATS, or (c) by observing the report be generated in your presence. If observing, note any user-entered values or parameters and determine whether entered parameters were appropriate. Compare re-performed report to the one being tested.

## Electronic Approvals:

Observe a transaction to see the approval process and verify any key aspects of the process or limits.

If transaction data or reports include approval information, use CAATS to confirm that all transactions met authorization rules.

## **STEP 3: Understand General IT Controls**

Gain an understanding of the general IT controls that support the continued proper operation of the automated control. Identify key general IT controls and note any control weaknesses. Auditors should consider the following aspects of general IT controls when gaining an understanding:

## Software Calculation:

Inquire if the entity has experienced any errors or irregularities with the calculation. Also how often changes are made to the calculation, and how many changes (if any) were made during the year.

How can the software calculation (formulas, rates/values, settings/configurations) be changed or customized?

*Software calculations will usually have one or more administrative menus that allow the government to modify rate tables or other calculation values, or to configure the calculation or apply settings.*

*In other cases, software calculation formulas and/or values may be hard-coded into the system and require programmers to make the changes. If the government has access to source code, then it needs internal procedures for program changes. If the program is controlled by vendors, we would expect program change procedures and expectations to be included in the contract.*

What are the procedures to authorize and make program changes or configuration/setting changes to the software calculation?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

## State of Washington

*If utilizing a test environment, there should be controls to ensure that the live environment is updated and is consistent with the live production environment. As management is responsible for the accuracy of their automated controls (i.e., in the live environment), we would expect there to be a procedure to confirm each key automated control once it is in the live environment. This could be manually re-performing the calculation, reviewing reports against known expectations, etc.*

How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change programming, but they may be responsible for patch management, master table data, and/or configurations.*

### Automated Interfaces:

Inquire if the entity has experienced any errors or irregularities with the interface. Also how often changes are made to the interface, and how many changes (if any) were made during the year.

What are the procedures to authorize and make changes to the interface?

*Except for the most simple situations, we would normally expect update procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

*If the data transfer is already going to be checked or reconciled, then there may be less need for specific test procedures on program changes since any errors will be identified right away.*

How are program changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables*

## State of Washington

*or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

*If the program is controlled by a third-party, we would expect a process between the government and vendor that allows the government to make requests and receive communication at the completion of the request.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to vendor developed/supported coding that controls how the system processes the interfaced data, but they may be responsible for working the interface error queues and reconciling the interfaced data.*

### Edit Checks:

Inquire if the entity has experienced any errors or irregularities with the edit checks. Also how often changes are made to the checks, and how many changes (if any) were made during the year.

How can the edit check be changed or customized?

*Edit checks may be hard-coded into the system and require programmers to make the changes. If the government has access to source code, then it needs internal procedures for program changes. If the program is controlled by vendors, we would expect program change procedures and expectations to be included in the contract.*

*In other cases, edit checks may be established or configured through one or more administrative menus.*

What are the procedures to authorize and make program changes or configuration/setting changes?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

*If utilizing a test environment, there should be controls to ensure that the live environment is updated and is consistent with the live production environment. As management is responsible for the accuracy of their automated controls (i.e., in the live environment), we would expect there to be a procedure to confirm each key automated control once it is in the live environment. This could be manually re-performing the edit check, reviewing reports against known expectations, etc.*

## State of Washington

How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change programming, but they may be responsible for patch management, master table data, and/or configurations.*

### Computer Generated Reports:

Inquire if the entity has experienced any errors or irregularities with the report. Also how often changes are made to the report, and how many changes (if any) were made during the year.

How is the report triggered or initiated?

*For reports that are automatically triggered, the auditor would normally not identify job scheduling or monitoring as a general control since we would expect failure of the report to generate*

Is the report hardcoded into the program, or is it a custom or ad hoc report? Also, what manual inputs (if any) are required to run the report?

*What parameters, criteria (date ranges, fund number, departments) or instructions are entered by the user to generate the exception report. The more options entity personnel have to customize or modify the report, the higher the risk of human error and inaccurate or incomplete reports. Pre-programmed reports provide less flexibility than ad-hoc reports; however, if program change controls are in place, they are more consistent.*

If the report is hardcoded into the system, how are program changes made?

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change vendor developed reports, but they may be responsible for triggering, setting certain parameters, and/or following up on exception report results.*

## State of Washington

NOTE: if the auditor cannot identify sufficiently effective general IT controls, the automated control will need to be tested using the same methods as a manual control (ie: sampling throughout the period). For example, if the report is manually generated and highly dependent on a number of manual inputs each time, or if the report does not have formal change controls, such as an ad hoc report or excel-based report. In such cases, the automated report is controlled by limited access and the judgment of the report writer – that is, while the report is an automated component, there is also an integrated manual component to the control.

### Electronic Approvals:

How are users assigned preparer and approver roles? Are user accounts periodically checked for needed changes? See the [User Access](#) step in the Accountability folder for more control considerations.

If configurations or settings relevant to the approval process are controlled by an admin menu, who has access to this menu?

If the entity has access to source coding for approval controls, what are the procedures to authorize and make program changes?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to vendor developed/supported coding that controls how the electronic approval works, but they may be responsible for approval configurations or settings and/or user account management.*

### **STEP 4: Confirm Key General IT Controls**

Confirm your understanding of key general IT controls to determine whether they have been placed in operation (*whether the entity has actually implemented key controls*).

### **STEP 5: Test Key General IT Controls**

Document whether general IT controls will be tested. Option 1 would result in control risk at MAX for the automated control. Either option 2 or 3

# State of Washington

is necessary in order to set control risk at LOW. If general IT controls are tested, consider the following procedures:

## Software Calculation:

If program changes or setting/configuration changes are logged, review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the calculation may also provide this evidence if the re-performance tests address all states of the calculation during the period.

If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

## Automated Interfaces:

Review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, reconciling or comparing the data transfer (or reviewing the entity's reconciliation or comparison) may also provide this evidence if tests address all states of the interface during the period.

Inspect job processing error logs/reports. Observe evidence that errors in processing were isolated and resolved. For example, select a sample of rejected transactions and observe evidence to determine whether errors were appropriately corrected and the corrections were timely.

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

## Edit Checks:

If program changes or setting/configuration changes are logged, review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

## State of Washington

- Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the edit check may also provide this evidence if the re-performance tests address all states of the edit check during the period.
- If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.
- If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

### Computer Generated Reports:

- If the report is subject to program change controls (either due to being hardcoded or by being automatically triggered), review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

- If the report is subject to program change controls, review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the report may also provide this evidence if the re-performance tests address all states of the report during the period.
- If the report relies on manual inputs and report copies saved show the parameters entered, the auditor can check a selection or sample of reports to confirm that the report was run correctly.
- If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

### Electronic Approvals:

- Review user access report to verify that current users are appropriate. Also consider review of user access change logs (if available) to evaluate user account management throughout the period. See the User Access step in the Accountability folder for more testing considerations.
- If approvals are governed by significant settings/configurations, and such changes are logged, review the change log to verify the population of changes for the year.

*Verification that no configuration changes were made, along with the auditor's evaluation that no such changes are expected, would normally be sufficient evidence to conclude that no further testing is necessary.*

- If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.

## State of Washington

If the entity has access to source code, review the change log to verify the population of changes for the year. Then review programming change documentation or the entity's test documentation for selected or sampled changes.

*Verification that no program changes were made, along with the auditor's evaluation that no such changes are expected, would normally be sufficient evidence to conclude that no further testing is necessary.*

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the SOC Report Reliance workpaper in the Store.

### **STEP 6: Final Control Risk**

Evaluate the results and document a final control risk assessment in the control system step. Consider whether any deficiencies identified with either the automated control or related general IT controls represent material weaknesses or significant deficiencies.

*Note: general IT control deficiencies do not necessarily mean the automated control is not properly functioning. General IT control deficiencies would normally be considered a significant deficiency or material weakness only if it caused an issue with the compliance requirement or assertion.*

### **Recommendation Review Requirement**

IT Security related information is considered category 3 data protected by Public Request Exemption RCW 42.56.420. Issues related to IT Security require the following special handling:

[Instructions](#) are located in Team IT Audit's System's Sharepoint page.

Details of IT Security related issues should NOT be included in any emails or helpdesks.

Exit, ML and Findings should be separately communicated in an IT Security Results Document.

Findings will be referenced, but not included in the audit report.

All IT security-related recommendations must be reviewed by [Team IT Audit](#).

Template language for common IT related recommendations can be found in [ARS Part 5 Chapter 8](#).

### **PUBLIC REQUEST EXEMPTION**

Some IT related information is protected by Public Request Exemption RCW 42.56.420 for cyber security purposes. The details documented in the record of work and support workpapers may qualify for this exemption. If so, auditors must include this statement in the record of work done and any related workpapers: **"This record contains information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited "**.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

# State of Washington

## SAO Audit Policy [2310](#) - Reporting Identified Audit Issues

## SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk

### [Information Technology](#) Planning Guide

Auditors may contact [Team IT Audit](#) with any testing strategy or control assessment questions or to request assistance from an IT Specialist.

**Software Calculation:** A **software calculation control** exists when the value of a transaction is determined by a software application. This process can be a key control when the entity relies on the system to generate calculations correctly to determine the amount of transactions (i.e., summarizing/account code allocation to post to general ledger, calculate student, utility, other charges, etc.).

**Automated Interfaces:** An interface is a process that moves information from one computer application to another. The interface can occur internally between systems maintained by a single agency, or between systems maintained by different agencies or private companies. The interface can also occur between modules within the same computer application.

The data transferred might be a file consisting of one or more records processed at a later time (batch), or it can be a real-time update. Risk associated with interfaces increases as the number of transactions or the number of other services and systems supported by the interfaced data increases.

Poor design or inadequate oversight can affect the transfer of transaction data among the systems. Interface controls are automated and/or manual processes designed to ensure transmission and processing of information is complete and accurate.

#### Manual vs. Automated Interfaces

A “manual interface” is the transfer of data from one system or module to another system or module, initiated and controlled by a user. An example of a manual interface is when customer accounts are downloaded from a utility billing system to be used to perform meter readings. When complete, the file with meter readings may be uploaded and posted to the customer accounts.

An “automated interface” is the transfer of data from one system or module to another system or module that happens automatically based on a schedule, or other predefined criteria. A common example of an automated interface is the payroll module of a system. Typically, a payroll batch is created in the payroll module. Once approved, the batch is automatically sent by the system to the general ledger or other applicable modules, such as accounts payable.

Entities should have reconciliation controls between their various applications regardless of the method used for interfacing.

*Auditors should have determined whether system interfaces are automated as part of the Key Software Applications workpaper. **If not**, ask the*

# State of Washington

*following question to determine whether the system interface is manual or automated.*

*Is the data transferred from one system/module to another system/module by a user using an uploading and posting technique? For example, data is pulled from one system into a text file or other format, that is then uploaded into a different system or module by posting or in an upload feature of the module. If the answer to this question is yes, the interface would be considered "manual" since it is initiated and controlled by manually rather than through an automated process.*

**Edit Checks:** An **edit check** is a programmed routine designed to check input data or processing results for accuracy, compliance, or reasonableness. Types of edit checks include:

Range Checks: ensure that numeric values fall within specified ranges, minimums and/or maximums. For example, ensuring that a capital asset can only be entered as a positive amount, or a purchase order can only be submitted without secondary approval for less than a certain threshold.

Consistency Checks: verify that related data fields are consistent with each other. For example, ensuring that a patient's age matches their date of birth.

Format Checks: validate data formats (for example, dates as MM/DD/YYYY or phone numbers as ###-###-####).

Logical Checks: assess logical relationships between data fields. For instance, verifying that total debits equals total credits in a journal entry.

Duplicate Checks: identify duplicate records or entries. For example, preventing the same invoice from being entered twice.

Cross-Field Checks: compare data across different fields. For instance, ensuring that the start date of a project is before the end date.

Required Field Checks: ensure that mandatory fields are filled out. For instance, making sure that a patient's name and date of birth are provided.

Referential Integrity Checks: validate relationships between data tables. For example, confirming that a vendor number exists in the vendor master file as an active entity.

Outlier Checks: detect extreme or unexpected values. For instance, flagging water meter reading values that are extreme outliers for the customer type or account history.

Pattern Checks: look for specific patterns in data. For example, verifying that email addresses follow a valid format.

Edit checks may result in automatic rejection of a transaction, inability to proceed with a transaction, trigger for additional processing or review, or may simply result in a warning message to the user.

Edit checks may be identified as a key control when they are sufficiently relevant (ie: addressing the risk), precise (ie: able to catch all errors, rather than just being only reasonableness or limit check), and sufficiently strong (ie: prevent invalid transactions, rather than just generating a warning messages). Auditors may identify an individual edit or a group of edit checks together as a key control.

**Computer Generated Reports:** A **computer-generated report** is a report that is created by a computer program. The computer program, also referred to as a report generator or tool, takes data from a data source, such as a database, and displays it in a specified format. The process

## State of Washington

to generate a report often includes performing calculations on the data, such as summarizing, classifying, etc., before displaying, or can display the calculations on the report.

There are two types of computer-generated reports, pre-programmed and ad-hoc or customized reports.

Pre-programmed or canned reports are pre-defined reports where criteria and specifications are hard coded in the system. A canned report may allow limited parameters, (month/year, for example), but in general the information that will be displayed is pre-determined.

Ad-hoc or customized reports allow the user to drill down and customize what information is displayed on the report based on some allowed criteria, such as account codes, dollar amounts minimum, etc).

In contrast, a **manual report** is one that is created outside the system using data exports or is created ad hoc by a user. An example of a manual report is one that is created by copying data from a data source and pasting the data in an Excel spreadsheet or Word document or Powerpoint presentation where it is then processed further. With manual reports, each time a report is created, the data could be incorrect due to user error, such as not copying all relevant data, or processing errors. Therefore, these types of reports should be understood and tested similar to manual controls.

**Electronic Approvals:** Electronic approvals, electronic signatures and digital signatures are technically different, although often these terms are used interchangeably by entities.

Auditors should have determined whether the electronic approval is an automated control as part of the overall understanding of controls. For automated control purposes, an electronic approval is a software system functionality that:

Permits a user to approve transaction(s) within the software system

The system automatically documents, or logs, the data approved by the user and any subsequent manipulation

The acceptance or rejection of the transaction by the approver will trigger an additional software system process, such as posting of a transaction.

E-mail, scanned-in pictures of signatures, or font-changed signatures, etc. may be part of a control activity but are generally not considered an automated control and are not covered by this testing strategy.

### Electronic Signature vs Digital Signature

An “**electronic signature**” can look like a handwritten signature that has been scanned and then pasted into an electronic document. The reliability of this type of approval is variable. Recommend gaining an understanding of the process used to store and affix the signature to the document and then discuss the process with Team IT Audit before placing reliance on this control.

A “**digital signature**” is a legal signature with a formal certification process that documents who approved the document and ensures the document is not modified after certification. Reliability of this process is very high but has significant technical features. Recommend brainstorm

# State of Washington

with Team IT Audit before placing reliance on this control.

## **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

**Statements on Auditing Standards AU-C 315 Understanding the Entity and Its Environment and Assessing the Risks of Material Misstatement** - paragraphs .A106-.A109 describe general and application controls and how they relate to audit risks

**Statements on Auditing Standards AU-C 330 Performaing Audit Procedures in Response to Assessed Risks and Evaluating the Audit Evidence Obtained** - paragraphs .10b and .A33-.A34 describe requirements and guidance for testing indirect controls in conjunction with tests of controls, that is, testing key general controls in conjunction with a test of a key automated control

Record of Work Done.

**This record may contain information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited.**

**Key Control 2 Valuation - Automated** - Based on the location code entered by the tax filer, ATLAS calculates the local sales and use taxes due.

## **STEP 1: Understand Automated Key Control**

The understanding for this system is documented above in the "Controls - ATLAS" step.

## **STEP 2: Confirm and Test Automated Key Control:**

We obtained tax return information from ATLAS for a sample of taxpayers that paid local sales and use taxes during FY24 and re-performed the tax calculations. See testing at [[Local Tax Collection Distribution Testing - CONFIDENTIAL](#)]

## **STEP 3: Understand General IT Controls**

On May 8, 2024, we met with Jason Hartwell, Tax Administration Manager, and Courtney Tornquist, IT Business Analyst, to gain an understanding of the general IT controls for ATLAS. Maintaining and updating the Department of Revenue's (DOR) Automated Tax and Licensing Administration System (ATLAS) is a large undertaking that requires coordination across multiple areas of the agency. Various division staff routinely prepare change requests (known as SQRs) to correct defects, update, or create new system functionality and configuration. SQRs are the mechanism used to facilitate the process and ultimately become the system of record for the development activities. SQRs must be reviewed and approved via a workflow process within the Fast Code Repository (FCR) environment before its implemented into ATLAS (**General IT Control 1**). Formulas and calculating factors are stored in ATLAS within a programming table and require a SQR to update an automated calculation. The calculations are triggered by the Tax Filer when they submit a tax return. When errors occur during the SQR process an alert will show in the workflow process and a developer will be assigned to correct the error.

# State of Washington

## **SQR Workflow Process**

On May 23, 2024, we met with Lucas Kenall, ATLAS Development & Technology Services Manager. When a change to tax rates are needed a SQR submitter creates a request. A Change Manager reviews the request to ensure it is necessary and filled out correctly. When the request is approved a developer is assigned. The requested changes are made in a testing environment to ensure they are implemented correctly without affecting the active ATLAS rates. When the testing is complete the SQR is placed into staging where it is reviewed to ensure it will function correctly. Approvals from 2 members ATLAS development and Technology Services Team are needed to complete the process. When the staging is complete the SQR is passed to the migration step where it will be automatically deployed to ATLAS during non-business hours. Weekly the ATLAS services team ensures that migrations complete with the proper approvals by running a Migration Audit Report that show all migration statuses and approvals. Once the migration has completed successfully the SQR is closed.

## **STEP 4: Confirm Key General IT Controls**

**General IT Control 1:** SQRs must be reviewed and approved via a workflow process within the Fast Code Repository (FCR) environment before its implemented into ATLAS.

On May 8, 2024, Courtney Tornquist, System Specialist, provided us with screenshots of SQR 15578: Local Tax-Quarter 1 2024 changes. We reviewed the SQR workflow to ensure that each step in the process was signed off and approved before moving on to the required next step. The SQR was initiated by Jason Hartwell on October 18, 2023. The SQR was assigned to Courtney Tornquist. We reviewed the workflow logs for the SQR and noted that each step had notes and approvals showing adequate review. The SQR process was closed on March 12, 2024. **No issues noted.**

## **STEP 5: Test Key General IT Controls**

Not applicable - we are not planning to rely on automated controls and therefore do not need to test general controls; control risk will be assessed at MAX.

## **H.2.PRG - Payments of Taxes to Other Governments**

*Procedure Step:* Key Control 3 (Manual)

*Prepared By:* CJM, 6/4/2024

*Reviewed By:* RKM, 6/11/2024

Purpose/Conclusion:
---------------------

**Purpose:**

## State of Washington

To confirm an adjusting entry to record all collections and distributions for each quarter is prepared (Key Control 3 for ATLAS) in order to assess control risk.

### **Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.

Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.

When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision,

## State of Washington

the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.

A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency.

**All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.**

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.

If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.

An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.
- B. Controls are not related to a "significant risk" identified in the audit plan.
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially

## State of Washington

be relied upon for both the periods ending 2023 and 2024.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

**Key Control 3 Completeness - Manual** - The Revenue and Financial Reporting Coordinator prepares an adjusting entry to record all collections and distributions for each quarter. The final JV is reviewed and approved by the Accounting Manager to ensure all collections and distributions are recorded for the year and match.

The understanding for this system is documented above in the "Controls - ATLAS" step.

### **1. Confirmation of Key Manual Control:**

#### **Quarterly Adjusting Entry Review**

We obtained AFRS journal voucher number 14030250. We noted the explanation of the entry was "To record additions and deductions for Fund 01T, 034, 16C, 17A, 768, 797 for Qtr 1, FY 2024 (July - September, 2023)". Per the line item lead sheet, we noted the majority of the balance is included in fund 034, Local Sales and Use Tax, which is where we focused our control review and testing. We noted the total amount of local sales and use tax collected account was \$1,979,599,134. The collection amounts are based on the monthly JV entries automatically created by ATLAS. We agreed the amounts reported in the JV to a summary of all monthly JVs in quarter 1 from ATLAS. The total collection of local sales and use tax that was distributed in 2024 totaled to \$1,979,599,134. Amounts tie without exception. The JV was prepared by Ayano Faasumalie, Revenue and Financial Reporting Coordinator, on October 23, 2023 and reviewed by Binh Vu, Accounting Manager, on October 23, 2023. ***No issues noted.***

#### **Noted Weaknesses are as follows:**

None

### **2. Preliminary Control Risk Assessment**

# State of Washington

Based on our understanding and anticipated audit strategy, we assessed preliminary control risk as follows:

**MAX-** We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **3. Control Risk at LOW – Test of Key Manual Control:**

Not applicable - we are not planning to rely on automated controls and therefore do not need to test general controls; control risk will be assessed at maximum.

### **H.2.PRG - Payments of Taxes to Other Governments**

*Procedure Step:* Risk Assessment

*Prepared By:* CJM, 7/25/2024

*Reviewed By:* RKM, 8/9/2024

Purpose/Conclusion:

#### **Purpose / Conclusion:**

To assess inherent risk, control risk, and the risk of material misstatement in order to design an initial testing strategy for each assertion.

Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

#### **STEP 1: Inherent Risk (IR)**

Assess inherent risk for each relevant assertion. This assessment is based on understanding of the entity and the nature of the account balance or class of transactions.

*Inherent risk is the susceptibility of an assertion to material misstatement. It is our assessment of "total threat", which includes both "natural risk" and identified risk indicators, without any regard to any potential control activities. As inherent risk is fully independent of control risk, any understanding of controls cannot be used to increase/decrease the assessment of inherent risk. Consider the following factors as your*

# State of Washington

*basis for this assessment:*

## *General Considerations*

*Does the balance include transactions that are difficult to audit or involve complex accounting issues?*

*Were there significant misstatements identified in previous audits or prior-period adjustments in the account balance or transaction class? If so, analyzing the cause of prior period misstatements will help in analyzing inherent risk.*

*Are there any inherent risk factors at the entity or industry level, such as changes in regulation or accounting rules, unique transactions or accounting practices, use of information technology, etc that affect the balance?*

## *Inherent Risk due to Error*

*How large are the transactions making up the balance? If the balance has only a few large transactions, even a single error may mean a significant misstatement.*

*Have there been changes in the transactions making up the balance that may increase risk? For example, significantly different composition, nature or volume of transactions may inherently disrupt established controls.*

*Are financial events originated or identified by accounting personnel or non-accounting personnel? This consideration is mainly for the completeness assertion.*

*Does the process to account for transactions involve judgment or estimation, complex calculations, numerous steps or significant manual steps?*

*Do transactions have widely varying attributes that need to be manually identified? For example, grant loans that are accounted for in one of several ways depending on the terms of the agreement.*

## *Inherent Risk due to Fraudulent Reporting (intentional misstatements)*

*Are there substantial pressures or motivations to misstate the balance?*

## *Inherent Risk due to Misappropriation*

*Is the account balance or transaction class susceptible to sizable misappropriation?*

## *Inherent Risk due to Non-Compliance*

*Are there any laws, contracts or grant agreements affecting the balance? If so, would non-compliance lead to sizable misstatements?*

*Are compliance requirements complex, hard to understand, subject to judgment or otherwise difficult to comply with?*

*Are there any motivations or pressures to not comply?*

## **STEP 2: Control Risk (CR)**

Assess control risk by system and assertion. This assessment should be based on the results of the control understanding, confirmation, and (if setting control risk to LOW) testing. If applicable, auditors will evaluate any control deficiencies and determine whether those deficiencies, individually or in combination, are significant deficiencies or material weaknesses.

*Control risk is the risk that material misstatements would not be prevented or detected timely by the system of internal control. Control risk could be thought of as the "vulnerability" of an entity to misstatements. Control risk exists independently of the inherent risk (the level of vulnerability exists independent of the level of threat).*

## State of Washington

*Control risk is MAX in both of the following situations: (1) controls aren't tested or (2) controls are problematic and cannot be relied upon. In order to set control risk to LOW, the auditor must test that controls operated effectively throughout the period.*

*A material weakness exists when the design or operation of controls results in a reasonable possibility a material misstatement will not be prevented or detected and corrected in a timely manner. A significant deficiency is less severe than a material weakness, yet important enough to merit the attention of the governing body. **All potential material weaknesses and significant deficiencies should be discussed with the AIC, since they must be reported as findings.***

### **STEP 3: Risk of Material Misstatement (RMM)**

Assess the risk of material misstatement for each relevant assertion for each significant line item. The risk of material misstatement (RMM) is a combination of the auditor's separate assessment of inherent and control risk.

*In practice, the RMM is the amount of substantive evidence that's needed, and the only way to reduce the amount of needed substantive evidence (equal to the inherent risk) is to test controls. As such, when control risk is MAX, the RMM must always equal the inherent risk (IR).*

*When controls are tested & can be relied upon (are determined to be effective) it is a matter of professional judgment how much the RMM should be set lower than inherent risk (1 or 2 steps).*

*Auditors should assess RMM by assertion, if different. For example, if RMM is assessed at MOD for the existence assertion, but LOW for the rights & obligations assertion, then document "MOD – existence and LOW – rights & obligations".*

### **STEP 4: Design Substantive Testing**

Design a substantive testing strategy that addresses the relevant assertion (identified risk) in the portion of the line item that relates to that risk.

*Planning identifies where to audit (significant balances, classes of transactions & disclosures) what to audit for (relevant assertions), and how much to audit (RMM). The quantity and quality of evidence obtained by substantive tests needs to match the level of risk. The higher the risk of material misstatement, the greater evidence needed. "Greater evidence" could either be greater quantity of evidence, greater quality of evidence, or some combination of greater quality and quantity.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6210](#) – Planning Financial Statement Audits**

# State of Washington

## SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk

### [Financial Statement Audits](#) Planning Guide

Record of Work Done:

#### **(1) Inherent Risk (IR):**

Based on our understanding of the line item, we assessed inherent risk as follows for each relevant assertion and significant class of transactions:

**Classification - Moderate**

**Completeness - Moderate**

**Valuation - Moderate**

#### **(2) Control Risk (CR):**

We assessed control risk as follows for each system and relevant assertion:

##### **Automated Tax and Licensing Administration System (ATLAS) -**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

#### **(3) Risk of Material Misstatement (RMM):**

We considered both inherent and control risk and assessed the risk of material misstatement as follows for each relevant assertion and significant class of transactions:

**Classification - Mod**

**Completeness - Mod**

**Valuation - Mod**

#### **(4) Testing Strategy:**

We designed our substantive testing strategy based on our assessment of the risk of material misstatement.

**Classification** - We will review a sample of registered taxpayers and ensure tax types are properly categorized as Local Sales and Use Taxes. We will review quarterly JVs to ensure amounts reported as collections/distributions for other governments are only local taxes.

## State of Washington

**Completeness** - We will use the same sample of registered taxpayers as above, review ATLAS for a filed return, and trace revenue to the accumulation GL within ATLAS and to AFRS. We will also review quarterly JVs to ensure monthly automated accumulations within ATLAS were included in the JV and we will review quarterly collection/distribution JVs to ensure that collections and distributions match and are recorded at accurate values.

**Valuation** - We will recalculate taxes paid for the same sample of registered taxpayers as above, to ensure taxes are recorded at proper values and are based on local tax rates and not state tax rates.

We anticipate that these tests will provide sufficient appropriate audit evidence to address the assessed risk of material misstatement for relevant assertions in significant classes of transactions.

### H.2.PRG - Payments of Taxes to Other Governments

*Procedure Step:* Substantive Test

*Prepared By:* CJM, 10/18/2024

*Reviewed By:* RKM, 10/22/2024

Purpose/Conclusion:

**Purpose:**

To determine whether financial statements properly classify local tax collections (Classification).

To determine whether all local tax collections relating to the period were reported (Completeness).

To determine whether local tax collections were reported at properly valued or calculated amounts (Valuation),

**Conclusion:**

We determined:

Financial statements properly classify local tax collections (Classification).

All local tax collections relating to the period were reported (Completeness).

Local tax collections were reported at properly valued or calculated amounts (Valuation).

Testing Strategy:

The following is a list of **considerations** for testing the classification assertion for revenues. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

# State of Washington

## **Classification between Line items**

Scan revenue streams or types to evaluate whether they appear reasonable in relation to the line item description. Follow-up on any unexpected results with accounting research to determine correct classification.

Select or sample revenues from high risk populations and review supporting documentation that demonstrates correct classification of revenues.

Search for manual journal entries that re-classify existing revenue balances (transaction is a debit and credit to different revenue accounts). Consider testing if any risk indicators are noted.

## **Classification between Opinion Units**

Search for manual journal entries that transfer revenues from one opinion unit to another without recording a balance sheet transaction, other than a direct charge to fund balance (debit and credit to revenue and fund balance for each opinion unit, respectively). Consider testing if any risk indicators are noted.

Scan revenue streams or types by fund and evaluate whether revenue streams or types appear reasonable in relation to the activities of the fund. Follow-up on any unexpected results with accounting research to determine correct classification.

## **Property Taxes** - see separate step

The following is a list of **considerations** for testing the completeness assertion for revenues. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

Identify expected revenue streams based on understanding of fund activities and scan to see if revenue is reported for all such streams.

Follow up on any unexpectedly missing streams.

Identify new revenues (ex: new grants or programs) and follow up to verify that expected revenues have been reported.

Confirm intergovernmental revenues with the other government or grantor or by reviewing appropriate correspondence.

*Note: intergovernmental revenues received from the State Treasurer should be addressed as part of the State Treasurer Distributions baseline test.*

If revenue is receipted into a specific clearing account, or if third-party lockbox or receipting services are used, compare recorded revenue to a sum of monthly totals from bank, lockbox or service organization reports.

Trace selected or sampled revenues from source documents to accounting records.

*Source documents may consist of billing, fine, or fee records. Or it may consist of service records that imply a billing, such as license or permit issuance.*

# State of Washington

Perform a multi-year trend of revenues and follow up on unexpected decreases.

Search for manual journal entries that debit (decrease) revenues. Consider testing if any risk indicators are noted.

## **Cut-Off**

Test transactions recorded in the next period to determine whether the revenue should have been recorded in the current period.

*Transactions recorded at the beginning of the next period would generally be considered at highest risk of being improperly shifted to that future period. Consider scanning and selecting transactions if high risk transactions can be identified by description or date fields. If the population is large, consider stratifying to either scan and select or test 100% of all large value transactions combined with a lower assurance sample for small dollar transactions.*

## **Detail Roll-up**

Compare year-end totals from general ledger to subsidiary software modules for selected revenues.

Review the government's reconciliation of general ledger to subsidiary ledgers.

*Detail roll-up testing is not sufficient audit evidence by itself since it only entails comparing different sets of the entity's own accounting records. However, it may be combined with other substantive tests to address identified risks. For example, if substantive testing is performed at the subledger level, it may be combined with a test that the subledger detail accurately rolls up to the general ledger or financial statements.*

The following is a list of **considerations** for testing the valuation assertion for revenues. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

## **Calculation**

Recalculate billed revenues on a check (one of each variation), CAATS or sample basis.

For large populations of standard billings, perform CAATS tests to identify unexpected or outlier transactions for further review.

Review related-party transactions to determine whether revenue transactions were correctly calculated.

## **Realizable Value**

Re-calculate a sample or selection of billings. If billings are calculated by software, the auditor could test and substantiate the automated control and also consider any risks associated with manual inputs used by software.

Evaluate the entity's calculation of the allowance amount for reasonableness. This evaluation should include comparing the entity's estimate to the entity's actual historical experience of collecting or writing-off receivables.

## State of Washington

Trace the amount of bad debt approved by the governing body (per minutes) to reductions of receivables and bad debt expense to verify it was properly accounted for. *Note: approvals may be slightly more, as customers may pay after the bad debt has been approved but before it is written off.*

### Estimation / Recognition

Review calculation and support for assumptions of any estimated revenues.

Accounting research to verify that revenues were reported in conformity with revenue recognition policies reported in the financial statement notes.

**Property Tax Revenues** - see separate step

Guidance/Criteria:

### **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

**BARS [1.5](#) Determining Operating/Nonoperating/Revenues/Expenses in Proprietary Funds**

**BARS [3.6.9](#) Revenue Accruals in Governmental Funds**

**BARS [3.6.11](#) Suspense Funds**

**BARS [3.6.13](#) Utility Tax (*applies only to cities*)** - should be accounted for as a revenue in the general fund (3164000) and expenditure in the utility fund (53P0040), if the utility passes the tax on to its customers then the additional charges should be recognized as revenue (343P000) directly in the utility fund not in the general fund

Record of Work Done:

### **Tax Collections for Other Governments Testing Coverage**

We reviewed the line item leadsheet [[Line Item Lead Sheet](#)] and noted Fund 034 - Local Sales & Use Tax accounts for the majority all payments of taxes to other governments. We determined focusing our testing on Fund 034 collections would provide sufficient coverage over the balance to meet the relevant assertions. *We performed testing of the local tax collections/distributions simultaneously at the H.1 folder.* See testing details below.

**Substantive tests performed to meet the Completeness assertion:**

## State of Washington

We obtained a list of all active taxpayers that paid local sales and use taxes as of 6/30/2024 and randomly selected a sample of 30 taxpayers for various periods to ensure the return was accurately filed and posted to AFRS. Jason Hartwell, Tax Administration Manager, provided a screenshot of all selected taxpayers' tax returns entered in ATLAS as well as their payment of the calculated taxes. We reviewed the return for the selected taxpayers in ATLAS to ensure a return was filed and payments were received for the entire amount recorded in the return. See testing performed at [Local Tax Collection Distribution Testing - CONFIDENTIAL]. **No issues noted.**

Business and Financial Services makes an adjusting entry to record local tax collections as tax collections for other governments and tax payments to other governments to comply with GASB 84 regulations on a quarterly basis. When payments for local taxes are collected, ATLAS automatically accumulates revenues to the appropriate fund and GL in a monthly JV. The quarterly collection/distribution JVs includes the monthly accumulation JV activity and moves 5152 - Due to Other Governments to the revenues and expenditures GL (32XX and 65XX). We reviewed each quarter's adjusting JV to ensure:

- All automated ATLAS JVs are recorded and in the proper period
- Quarterly JV amounts only include local taxes
- Collections and Distributions for each month match

We noted the quarterly JVs were complete based on the testing above. See testing at [Quarterly Collection Distribution JVs]. **No issues noted.**

### **Substantive tests performed to meet the Valuation assertion:**

Using the same randomly selected sample of 30 taxpayers, as mentioned above, we recalculated taxes paid based on local tax rates to ensure that revenues related to local sales and use tax were valued at proper amounts and based on local tax rates and were not related to state tax revenues. Jason Hartwell, Tax Administration Manager, provided a screenshot of all selected taxpayers' tax returns entered in ATLAS. We obtained the local sales and use tax rates for each selected period from the DOR website. Based on the taxable amount in the tax returns, we recalculated the collected local sales and use tax. Any differences noted were small rounding errors. We determined all selected local sales and use tax collections/distributions were reported at properly valued and calculated amounts. See testing performed at [Local Tax Collection Distribution Testing - CONFIDENTIAL]. **No issues noted.**

### **Substantive tests performed to meet the Classification assertion:**

Using the same randomly selected sample of 30 taxpayers, as mentioned above, we tested to ensure that collections/distributions were properly categorized as Local Sales and Use Taxes. Jason Hartwell, Tax Administration Manager, provided a screenshot of all selected taxpayers' tax returns entered in ATLAS. We obtained the local sales and use tax rates for each selected period from the DOR website. We reviewed the ATLAS tax returns to ensure that only local agencies were included and selections were properly categorized as local city or county taxes collected as use, sales tax, or deferred sales tax. We determined all selected taxpayers were properly categorized and reported. See testing performed at [Local Tax Collection Distribution Testing - CONFIDENTIAL]. **No issues noted.**

Business and Financial Services makes an adjusting entry to record local tax collections as tax collections for other governments and tax payments

## State of Washington

to other governments to comply with GASB 84 regulations on a quarterly basis. When payments for local taxes are collected, ATLAS automatically accumulates revenues to the appropriate fund and GL in a monthly JV. The quarterly collection/distribution JVs includes the monthly accumulation JV activity and moves 5152 - Due to Other Governments to the revenues and expenditures GL (32XX and 65XX). We reviewed each quarter's adjusting JV to ensure:

Quarterly JV amounts only include local taxes

We noted the quarterly JVs were classified appropriately based on the testing above. See testing at [[Quarterly Collection Distribution JVs](#)]. ***No issues noted.***

### H.3.PRG - Cash & Cash Equivalents

*Procedure Step:* Summary & Conclusion

*Prepared By:* DRR, 12/9/2024

*Reviewed By:* RKM, 12/9/2024

Purpose/Conclusion.:

#### **Purpose:**

To evaluate risk assessments and the sufficiency and appropriateness of evidence obtained based on results of substantive work.

#### **Conclusion:**

We determined that **no** modifications were necessary to inherent risk, control risk, or the risk of material misstatement as assessed in planning.

We also determined that evidence obtained was sufficient and appropriate in response to the risk of material misstatement.

Testing Strategy.:

Auditors are **required** to evaluate conclusions for substantive testing as follows:

*Auditors may wish to use the optional Lead Sheet available in the Store to summarize testing related to each balance and assertion.*

**1.** Determine whether the results of substantive testing indicate a need to modify the inherent risk assessment (IR), control risk assessment (CR), risk of material misstatement (RMM) or other aspects of planning (such as material balances or assertions). If so, document changes and consider

## State of Washington

the need for additional testing.

*If the results of substantive testing indicate a need to change control risk, auditors should also update the [Permanent File](#) by either correcting the documentation or by adding an update section describing changes to the top of the record of work done. For all changes to IR, CR, or RMM the [Material Balances](#) spreadsheet should be updated.*

*More significant changes to other aspects of planning (such as material balances or assertions) should be referenced in this step and documented in detail in the [Changes to FS Audit Plan](#) step.*

2. Evaluate whether the quality and quantity of evidence obtained is sufficient and appropriate in response to the risk of material misstatement. In making this determination, auditors should evaluate:

### Information to be used as audit evidence:

Does evidence relate to the population, period of time and risk (assertion and “what could go wrong” from the Material Balance Spreadsheet)? If there are any gaps or uncertainties in the logical connection between the evidence and conclusions, is there a documented consideration and explanation?

Are the sources of information sufficiently reliable and appropriate for the risk (whether internal to the government, external, or auditor developed)? If key information is not from a sufficiently reliable source (for example, inquiry), then is it corroborated by information that is?

Are there any concerns about accuracy, completeness, authenticity, or bias in information? If so, did the auditor perform sufficient procedures to confirm reliability of that information?

Is information precise enough to catch if misstatements exceeded the tolerable level?

Is information detailed enough to conclude on whether or not there were misstatements?

Was there any information that appeared contradictory or inconsistent? If so, was there a documented response to the inconsistencies or doubts about the reliability of evidence?

### Results:

How much misstatement was identified by testing, and the likelihood and magnitude of further potential misstatement?

How did misstatements occur and how often might they occur again in the population?

Were misstatements caused by control deficiencies or circumvention of controls?

If control deficiencies, is there a need to re-evaluate our understanding of controls in the [Permanent File](#) folder or assessment of control risk?

If circumvention, the [Management Override of Controls](#) step should address or reference this area. Auditors should also consider whether a fraud risk has been identified.

Did tests identify a different level or type of risk than the planned audit response was designed to address?

## State of Washington

If likely misstatements are identified, are further procedures necessary to improve the precision of our estimate?

*To support the overall evaluation of audit risk and provide a basis for concluding on the overall sufficiency and appropriateness of evidence in the **FS Summary & Report** step, auditors should conclude in each area whether the auditor continues to believe that the tests performed and quality and quantity of evidence obtained are commensurate with RMM for all relevant risks (the "what could go wrong", in the **Material Balances** spreadsheet).*

If the auditor determines that evidence is not sufficient or appropriate, additional substantive testing should be done. If sufficient, appropriate evidence is not available for audit, the AIC should discuss the effect on our audit report with the AAM and AM.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6310](#) – Determining the Nature, Timing and Extent of Substantive Testing**

**SAO Audit Policy [3210](#) – Audit Evidence**

Record of Work Done:

Based on test results, we re-evaluated risk assessments, procedures, evidence obtained and conclusions as follows:

### **(1) Do the results of substantive tests indicate a need to modify our risk assessment (IR, CR and RMM)?**

We determined that **no** modifications were necessary to inherent risk, control risk, or the risk of material misstatement as assessed in planning.

### **(2) Was the quality and quantity of evidence obtained sufficient and appropriate?**

We also determined that evidence obtained was sufficient and appropriate in response to the risk of material misstatement.

### **H.3.PRG - Cash & Cash Equivalents**

*Procedure Step:* Understanding of Line Item

*Prepared By:* DRR, 12/6/2024

*Reviewed By:* RKM, 12/9/2024

# State of Washington

Purpose/Conclusion:

**Purpose / Conclusion:**

To gain an understanding of the line item and confirm the scope of testing as documented in the Significant Account Matrix.

We determined the large increase in GL 1110 Fund 148 was due to an error by the College. **See issue [V: WSU\_Cash and Accrued Liabilities (Part of ML)]. See AOM [Aggregation of Misstatements (GAAP)].**

Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

**STEP 1: Prior Audit Exceptions**

Document any exceptions noted during the prior audit. Follow-up to determine how the agency has responded to or corrected the issue, unless this work is anticipated as part of the testing strategy.

**STEP 2: Analyze Composition and Changes of Line Item**

Include link to the line item leadsheet. This will be completed at the end of the audit. Leadsheet analysis should be documented in this spreadsheet.

Inquire with agency staff about the activities and transactions that make up the balance and any changes to those activities or transactions in relation to the prior year.

Determine relevant classes of transactions or account balances within the line item to analyze (such as agencies, funds, programs, departments, accounts, and/or objects), and use AFRS to create trends of those elements. This step should not include any specific dollar amounts associate with the line item.

Evaluate trends to identify:

- (1) What classes of transactions or account balances are primary to the identified risk. Auditors should specifically consider what elements are primary to the line item (comprising a large percentage of the line item), and which elements the identified risk would apply to, and which elements might be most susceptible to the identified risk (having a high risk of non-trivial misstatement for a relevant assertion, considering likelihood and impact of potential for misstatement).
- (2) What changes are primary to the identified risk, if applicable. Auditors should specifically consider whether the overall change to the line item from the prior year was significant, what elements were the primary drivers of overall change, whether any elements changed significantly from the prior year, and which changes (if any) might relate to the identified risk.

## State of Washington

(3) Any unusual or unexpected elements, amounts, or changes that may indicate a risk, whether the one identified in planning or a new one that may need to be considered for a change to the plan.

**Consider** other procedures to gain an understanding of the line item, such as review of key policy documents, review of program information or reports, inquiry of staff, budget information, or other analytical procedures.

### STEP 3: Update Significant Account Matrix

Based on your understanding of the line item, update the Significant Account Matrix with final conclusions on the agencies covered, account description, significant accounting systems, and risk (what could go wrong and relevant assertions). The account description should reflect the significant transaction streams or account balances relevant to the risk.

*The description of agencies, significant accounting systems, and what could go wrong in the Significant Account Matrix constitute the overall scope of substantive testing.*

*A transaction stream is significant based on the potential for misstatement. This is often due in part to its size (ie: comprising a large percentage of the total line item), but is ultimately a judgment about the susceptibility to the identified risk (for example, when the risk is understatement a small or omitted account may hold the most potential for the largest misstatement).*

*Significant accounting system(s) are those that contain key controls over significant classes of transactions included in the line item. Control systems identified in this step must match the Significant Account Matrix and have a separate control understanding documented.*

*Talk with the AIC if you identify any changes to the Significant Account Matrix.*

Guidance/Criteria.:

Record of Work Done.:

### **(1) Prior Audit Exceptions:**

We reviewed the prior audit and did not note any exceptions relevant to these line items.

### **(2) Composition & Change Analysis:**

Line Item Leadsheet: [[Line Item Lead Sheet](#)].

We met with Angela Marie Dobbins, Executive Director, and Tami Bidle, Associate Controller on November 21, 2024 to gain an understanding of the Cash & Cash Equivalents balance. Per Tami, the majority of this balance is comprised of two bank accounts, both held at Bank of America and the LGIP Accounts. The bank accounts are the Non-Federal Account and the Student Loan Account.

When reviewing the leadsheet and the ACFR data for the college, we noted that the overall balance balance increased approximately \$188.7 million over the prior year. This was primarily due to an increase in GL 1110 "Cash in Bank" for fund 148 of \$311 million. This large increase was

## State of Washington

due to an error the College identified after we requested bank statements and bank reconciliations to test the balance. **See issue and AOM links in conclusion.**

Additionally, we noted there were several large decreases in GL 1205 "Temporary/Pooled Cash Investments" for funds 148, 149 and 846 totalling approximately \$94.2 million. Lastly, there was a significant decrease in GL 5155 "Due to Other Funds - Pooled Cash & Investments" for fund 148 of \$95.9 million.

### **(3) Updates to Significant Account Matrix:**

We identified no changes that need to be made to the Significant Account Matrix.

### **H.3.PR.G - Cash & Cash Equivalents**

*Procedure Step:* Controls - Cash Reconciliations

*Prepared By:* DRR, 11/26/2024

*Reviewed By:* RKM, 12/9/2024

Purpose/Conclusion.\*

#### **Purpose:**

To gain an understanding of internal controls.

#### **Conclusion:**

We gained an understanding of internal controls as documented in the record of work done. We noted that the College did not perform a thorough review to ensure all entries were recorded in the State's accounting system. **See issue [V: WSU Cash and Accrued Liabilities (Part of ML)].**

Testing Strategy.\*

**The following procedures are required for all material systems:**

1. List the financial statement balance(s) and relevant assertion(s) addressed by the understanding.

## State of Washington

2. Gain an understanding of the internal control process, identify how transactions are recorded in AFRS, identify key controls over relevant assertion(s), and note any control weaknesses.

In gaining an understanding of controls, consider the overall understanding of State-Level control elements as documented in the "State-Level Controls" step as they relate to this particular system.

Identify controls systems covering all relevant assertions for all significant classes of transactions.

Standards require the auditor to gain an understanding of the significant accounting system(s) that contain key controls over significant classes of transactions included in the line item.

Control systems identified in this step must match the Material Account Matrix and have a separate control understanding documented.

Talk with the ACFR Specialist or AIC if you identify different systems than the ones anticipated in the Material Account Matrix.

For each material system, auditors must document:

A brief outline of the transaction flow from beginning to end.

An expanded description of key controls.

Business processes relevant to financial reporting of the relevant assertion for the material balance. Processes should encompass automated and manual procedures by which transactions or events are identified or initiated, authorized as needed, recorded, processed and corrected as needed.

Original accounting records and how records are rolled-up to intermediary ledgers and transferred to the general ledger (AFRS) or financial statements.

Detailed descriptions of key controls. Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

The following is information to **consider** when identifying key controls and transaction flow.

"Key controls" refer to the few controls that together provide reasonable assurance that material misstatements will be prevented or detected and corrected. This is contrasted with ancillary or supporting controls, which – although helpful and recommended – would provide less than reasonable assurance by themselves.

The focus of the write-up is on the key controls. Key controls should be specifically identified (as "key controls") in the write-up. This can be done in whatever way the auditor prefers, so long as it is obvious. Details that the auditor should document regarding key controls may include:

Who or what initiates the control

When (or how often) is the control applied

Who performs the control

## State of Washington

As needed, the experience, knowledge and attitude of the person applying the control

Detailed description of the control process or activity. For example, if the control is a review: what exactly is reviewed, what is the reviewer looking at or for and what are the reviewer's criteria?

How the key control is documented or evidenced

If not obvious from the description, how the control prevents or timely detects and corrects misstatements

Any exceptions or alternative processing to the normal process

What happens when misstatements or issues are identified by the control

The "transaction flow" refers to the process by which transactions are initiated, authorized, recorded, processed and reported (as applicable). Outlining the transaction flow gives context to key controls, especially how transactions become subject to controls in the first place. If a control inherently ensures that all applicable transactions are included (ex: bank reconciliation where the assertion is existence), the auditor may decide to just start the write-up with the initiation of the control procedure and go from there.

Elements of the transaction flow are defined informally as follows:

*Initiation:* How are transactions initiated?

*Authorization:* How are transactions and accounting record maintenance authorized?

*Recording:* How are transactions or balances identified and recorded in financial accounting systems?

*Processing:* How are the transactions or balances processed after they are recorded (if at all)? Processing may be manual or automated and may occur at a subsidiary system level or at the general ledger level.

*Reporting:* How are records translated into the financial statements? This part of the transaction flow extends the understanding to the actual financial statements that the audit is opining on. Since we already document an understanding of the financial reporting process in general, it is usually enough to simply reference this overall understanding. However, if there are important steps unique to the covered balances, it may be more appropriate to mention them here.

Although transaction flow is a good way to think about understanding and documenting a control system, auditors should not worry too much about documenting "each element, in order" because often elements may be combined, not noticeable, not applicable or occur in a different order.

Guidance/Criteria:
--------------------

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

# State of Washington

## SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk

### [Financial Statement Audits](#) Planning Guide

Record of Work Done:

Internal controls in Cash Reconciliations address the following balance(s):

Cash & Cash Equivalents

For the following assertions:

Existence - There is risk that reported cash and cash equivalents don't match reconciled bank accounts and records.

#### **Gain an Understanding of Internal Controls**

We met with Angela Marie Dobbins, Executive Director, and Tami Bidle, Associate Controller on November 21, 2024 to gain an understanding of the cash reconciliation process. We also met with Arthur Whitten, Director of Treasury Services, and Jill Renna, Senior Treasury Analyst on November 26, 2024 to gain an understanding of the Local Government Investment Pool (LGIP) investment process.

Washington State University has approximately 30 bank accounts, however, most of these accounts do not roll up into FBG - Higher Education Special Revenue. Workday requires that each fund has a bank account attached and this is how the College is able to determine which fund is associated with the accounts and allows the College to determine how to upload the cash data into AFRS and which amount will be rolled up into special revenue rollup fund FBG.

#### **Cash Reconciliation**

After month end, the Bank Team staff will obtain the bank statements for their accounts, and run multiple Workday reports for each of these accounts. The two most important Workday reports for the reconciliations are the Outstanding Payments, and In-Transit reports, which will provide the Bank Team with lists of all the reconciling items they will use to reconcile the bank accounts. The reconciliations will typically be performed by Gail Nash, Fiscal Manager, and she will send them to Tami Bidle, Associate Controller, who will review the reconciliation to ensure that there aren't any transactions missing from the reconciliation and that the cash reported in Workday exists (**Key Control #1 - Existence**).

#### **Investments**

Washington State University has 3 LGIP accounts - one operating account, one for major gifts (Engineering Building Construction), and one for the student corporation. We will document the process for the operating account - Fund 148, as this is the main account that rolls up into FBG - Higher Education Special Revenue, but the process is similar for all of the LGIP accounts.

Arthur Whitten, Director of Treasury Services, and Matt Skinner, Deputy Chief Financial Officer, are the only WSU employees who can make LGIP

## State of Washington

transactions. On a daily basis, Jill Renna, Senior Treasury Analyst, will log the daily withdrawal and deposit transactions for the LGIP into Workday. At month end, Jill will use Secure Access Washington (SAW) to download the LGIP statements, and run a report of the LGIP balances in Workday to ensure that all of the transactions are recorded in Workday. To record monthly earnings on investments and the reinvestment of these earnings into Workday, Arthur will typically create the journal entry and the Vice President of Finance will review the JE to ensure that investment earnings existed at period end **(Key Control #2 - Existence)**.

Once these tie outs have been completed, Arthur will let Tami Bidle, Associate Controller, know that the investment balance is ready for upload to AFRS, and she will perform the last verification before uploading the Workday balances into AFRS in their monthly upload.

### **How Transactions are Recorded in AFRS:**

Once a month, WSU's Banking Team will close their books, and upload their Workday data into AFRS.

### **Key Controls are as Follows:**

**Key Control #1** - The Associate Controller will review reconciliations and reconciling items to ensure reported cash existed at period end **(Existence)**.

**Key Control #2** - Journal Entries are created and reviewed to ensure that investment earnings are recorded and existed at period end **(Existence)**.

### **Noted Weaknesses are as Follows:**

The University did not perform a thorough review to ensure all entries were recorded in the State's accounting system. **See issue in conclusion.**

### **H.3.PRG - Cash & Cash Equivalents**

*Procedure Step:* Key Control #1 (Manual)

*Prepared By:* DRR, 11/26/2024

*Reviewed By:* RKM, 12/7/2024

Purpose/Conclusion.
---------------------

### **Purpose:**

To confirm cash reconciliations were reviewed by the Associate Controller **(Key Control 1 - Cash Reconciliations)** in order to assess control risk.

# State of Washington

## **Conclusion:**

We have gained an understanding of internal controls and assessed control risk at **maximum**. Therefore, we **will not** place reliance on controls. Our understanding of internal controls and control risk assessment will be used to help plan the nature, timing and extent of substantive testing.

We noted **no** material weaknesses or significant deficiencies in internal controls. However, we did note that the College does not document the bank reconciliation review. **See issue** [E: WSU Bank Reconciliation Review Documentation].

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent

## State of Washington

material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency.*

***All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.***

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. *Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. *Controls are not related to a "significant risk" identified in the audit plan.*

## State of Washington

*C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*

*D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

### **Cash and Cash Equivalents - Existence**

**Key Control 1 (Existence - Manual):** The Associate Controller will review reconciliations and reconciling items to ensure reported cash existed at period end (**Existence**).

The understanding for this system is documented above in the "Controls - Cash Reconciliations" step.

### **STEP 1: Confirm Key Controls**

Angie Dobbins, Executive Director/Controller, screenshared Washington State University's June 2024 bank reconciliation for the Non-Federal Local Funds Account ending in 4972. We noted that the banks adjusted ending balance was \$6,143,897.95 and the General Ledger balance was \$6,148,017.69 for a difference of \$4,119.74. We can see that the control is in place and that the College is performing reconciliations, but there was no documentation that the review is taking place. As such, we have made a recommendation for the College to document who performed the reconciliation, who reviewed/approved the reconciliation and the dates on their documents. **See issue in conclusion.**

### **STEP 2: Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **STEP 3: Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

# State of Washington

## H.3.PRG - Cash & Cash Equivalents

*Procedure Step:* Key Control #2 (Manual)

*Prepared By:* DRR, 11/26/2024

*Reviewed By:* RKM, 12/7/2024

### Purpose/Conclusion:

#### **Purpose:**

To confirm investment earning journal entries were reviewed by the Vice President of Finance (**Key Control 2 - Cash Reconciliations**) in order to assess control risk.

#### **Conclusion:**

We have gained an understanding of internal controls and assessed control risk at **maximum**. Therefore, we **will not** place reliance on controls. Our understanding of internal controls and control risk assessment will be used to help plan the nature, timing and extent of substantive testing.

We noted **no** material weaknesses or significant deficiencies in internal controls.

### Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has*

## State of Washington

*been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency.*

***All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.***

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional*

## State of Washington

*testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

### **Cash and Cash Equivalents - Existence**

**Key Control 2 (Existence - Manual):** Journal Entries are created and reviewed to ensure that investment earnings are recorded and existed at period end (**Existence**).

The understanding for this system is documented above in the "Controls - Cash Reconciliations" step.

# State of Washington

## **STEP 1: Confirm Key Controls**

Arthur Whitten, Director of Treasury Services, shared his screen via Teams on November 26, 2024 to show their fiscal year end journal entry # JE0000274205 to record LGIP investment earnings. We noted that the total debits/credits for the JE were \$2,646,103.02. The JE was created by Arthur on July 1, 2024 and was approved by Arthur's supervisor Matt Skinner, Vice President of Finance on July 2, 2024. **No issues noted.**

## **STEP 2: Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

## **STEP 3: Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

## **H.3.PR.G - Cash & Cash Equivalents**

*Procedure Step:* Risk Assessment

*Prepared By:* DRR, 11/25/2024

*Reviewed By:* RKM, 12/7/2024

Purpose/Conclusion:

### **Purpose / Conclusion:**

To assess inherent risk, control risk, and the risk of material misstatement in order to design an initial testing strategy for each assertion.

Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

## **STEP 1: Inherent Risk (IR)**

Assess inherent risk for each relevant assertion. This assessment is based on understanding of the entity and the nature of the account balance or class of transactions.

## State of Washington

*Inherent risk is the susceptibility of an assertion to material misstatement. It is our assessment of "total threat", which includes both "natural risk" and identified risk indicators, without any regard to any potential control activities. As inherent risk is fully independent of control risk, any understanding of controls cannot be used to increase/decrease the assessment of inherent risk. Consider the following factors as your basis for this assessment:*

### *General Considerations*

*Does the balance include transactions that are difficult to audit or involve complex accounting issues?*

*Were there significant misstatements identified in previous audits or prior-period adjustments in the account balance or transaction class? If so, analyzing the cause of prior period misstatements will help in analyzing inherent risk.*

*Are there any inherent risk factors at the entity or industry level, such as changes in regulation or accounting rules, unique transactions or accounting practices, use of information technology, etc that affect the balance?*

### *Inherent Risk due to Error*

*How large are the transactions making up the balance? If the balance has only a few large transactions, even a single error may mean a significant misstatement.*

*Have there been changes in the transactions making up the balance that may increase risk? For example, significantly different composition, nature or volume of transactions may inherently disrupt established controls.*

*Are financial events originated or identified by accounting personnel or non-accounting personnel? This consideration is mainly for the completeness assertion.*

*Does the process to account for transactions involve judgment or estimation, complex calculations, numerous steps or significant manual steps?*

*Do transactions have widely varying attributes that need to be manually identified? For example, grant loans that are accounted for in one of several ways depending on the terms of the agreement.*

### *Inherent Risk due to Fraudulent Reporting (intentional misstatements)*

*Are there substantial pressures or motivations to misstate the balance?*

### *Inherent Risk due to Misappropriation*

*Is the account balance or transaction class susceptible to sizable misappropriation?*

### *Inherent Risk due to Non-Compliance*

*Are there any laws, contracts or grant agreements affecting the balance? If so, would non-compliance lead to sizable misstatements?*

*Are compliance requirements complex, hard to understand, subject to judgment or otherwise difficult to comply with?*

*Are there any motivations or pressures to not comply?*

## **STEP 2: Control Risk (CR)**

Assess control risk by system and assertion. This assessment should be based on the results of the control understanding, confirmation, and (if setting control risk to LOW) testing. If applicable, auditors will evaluate any control deficiencies and determine whether those deficiencies, individually or in combination, are significant deficiencies or material weaknesses.

## State of Washington

*Control risk is the risk that material misstatements would not be prevented or detected timely by the system of internal control. Control risk could be thought of as the "vulnerability" of an entity to misstatements. Control risk exists independently of the inherent risk (the level of vulnerability exists independent of the level of threat).*

*Control risk is MAX in both of the following situations: (1) controls aren't tested or (2) controls are problematic and cannot be relied upon. In order to set control risk to LOW, the auditor must test that controls operated effectively throughout the period.*

*A material weakness exists when the design or operation of controls results in a reasonable possibility a material misstatement will not be prevented or detected and corrected in a timely manner. A significant deficiency is less severe than a material weakness, yet important enough to merit the attention of the governing body. **All potential material weaknesses and significant deficiencies should be discussed with the AIC, since they must be reported as findings.***

### **STEP 3: Risk of Material Misstatement (RMM)**

Assess the risk of material misstatement for each relevant assertion for each significant line item. The risk of material misstatement (RMM) is a combination of the auditor's separate assessment of inherent and control risk.

*In practice, the RMM is the amount of substantive evidence that's needed, and the only way to reduce the amount of needed substantive evidence (equal to the inherent risk) is to test controls. As such, when control risk is MAX, the RMM must always equal the inherent risk (IR).*

*When controls are tested & can be relied upon (are determined to be effective) it is a matter of professional judgment how much the RMM should be set lower than inherent risk (1 or 2 steps).*

*Auditors should assess RMM by assertion, if different. For example, if RMM is assessed at MOD for the existence assertion, but LOW for the rights & obligations assertion, then document "MOD – existence and LOW – rights & obligations".*

### **STEP 4: Design Substantive Testing**

Design a substantive testing strategy that addresses the relevant assertion (identified risk) in the portion of the line item that relates to that risk.

*Planning identifies where to audit (significant balances, classes of transactions & disclosures) what to audit for (relevant assertions), and how much to audit (RMM). The quantity and quality of evidence obtained by substantive tests needs to match the level of risk. The higher the risk of material misstatement, the greater evidence needed. "Greater evidence" could either be greater quantity of evidence, greater quality of evidence, or some combination of greater quality and quantity.*

Guidance/Criteria.†

### **ADDITIONAL BACKGROUND**

# State of Washington

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6210](#) – Planning Financial Statement Audits**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits](#) Planning Guide**

Record of Work Done.
----------------------

**(1) Inherent Risk (IR):**

Based on our understanding of the line item, we assessed inherent risk as follows for each relevant assertion and significant class of transactions:

Existence – HIGH

**(2) Control Risk (CR):**

We assessed control risk as follows for each system and relevant assertion:

Cash Reconciliation – **MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

**(3) Risk of Material Misstatement (RMM):**

We considered both inherent and control risk and assessed the risk of material misstatement as follows for each relevant assertion and significant class of transactions:

Existence – HIGH

**(4) Testing Strategy:**

We designed our substantive testing strategy based on our assessment of the risk of material misstatement. We plan to perform the following tests:

We will test fiscal year end cash and cash equivalent balances to ensure that cash and cash equivalent existed at fiscal year end.

We anticipate that these tests will provide sufficient appropriate audit evidence to address the assessed risk of material misstatement for relevant assertions in significant classes of transactions.

**H.3.PR.G - Cash & Cash Equivalents**

# State of Washington

*Procedure Step:* Substantive Test  
*Prepared By:* DRR, 12/9/2024  
*Reviewed By:* RKM, 12/9/2024

## Purpose/Conclusion:

### **Purpose:**

To determine whether reported cash and cash equivalents existed as of the end of the period (**Existence**).

### **Conclusion:**

We determined that reported cash equivalents existed as of the end of the period, and we determined that **reported cash did not exist** as of the end of the period. **See issue here** [V: WSU Cash and Accrued Liabilities (Part of ML)].

## Testing Strategy:

### **SAO Policy Requirement: Confirming or Verifying Cash & Investment Balances**

Confirmations can either be blind or a positive confirmation. In a blind confirmation (sweep), the auditor requests information on all accounts the bank holds for the entity (by entity name and/or EIN). In a positive confirmation, the auditor lists accounts (or accounts and balances) per the entity and asks the bank to confirm that the information is correct.

Confirm cash and investment account balances with County Treasurer, bank and/or brokerage. Use the template confirmation form provided in the Store when needed.

Confirmations can be mailed to addresses listed on the Bank Confirmation Address List available on the Auditor Reference Guide. If the bank notifies you of a different address, please contact Team Audit Support to update the list.

Banks may confirm incorrect amounts either due to a simple mistake, use of a wrong confirmation date or incorrectly including or excluding accounts. The first step in resolving differences should be to check information against the entity's bank statements and then call the bank to specifically confirm any difference.

Confirming investments may involve physical inspection, confirmation with the issuer, confirmation with the custodian, confirmation of unsettled transactions with the broker/dealer, confirmation with the counterparty, and/or reading executed partnership or similar agreements. When confirming investments, ensure investments are held in the entity's name.

## State of Washington

*If confirmations are not used*, auditors must at minimum verify balances to the County Treasurer, bank and/or brokerage statements. If this is done, the auditor should consider the risk that the statements were altered and should examine papers for indications of alteration.

The following is a list of **additional considerations** for testing the existence assertion for cash and investments. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

### **Bank Reconciliations**

If the auditor is comparing reconciled (confirmed) bank or county treasurer balances to the GL (rather than confirmed amounts within an expected variance due to reconciling items), the auditor should consider performing some or all of the following tests to verify the accuracy of the reconciliations. Note that testing the reconciliation will provide evidence of both the existence and completeness of cash and investment balances.

Trace (or compare summed) bank balances per statements to reconciliations.

Trace (or compare summed) book balances per reconciliations to the general ledger or financial statements.

*If a cash account is allocable to a particular fund, the balance in the general ledger should be recorded in the same fund.*

Scan the reconciliation for reasonableness. Look for unusual, unexpected or vaguely described reconciling items, lack of support or detail, very large reconciling items, very old reconciling items, and missing or extra elements that would indicate that the reconciliation was being performed incorrectly.

Foot the reconciliation for accuracy.

Trace deposits in transit to the subsequent month's bank statement, considering reasonableness of the in-transit period.

Trace outstanding checks to cash disbursement journal.

Check that any other reconciling items are valid and have been properly accounted for (ex: large debit or credit memos).

Check reconciliation against prior and/or subsequent reconciliations for reasonableness of amounts and items included and to trace reconciling items from the previous and/or subsequent period.

### **Other Tests**

Inquire whether any checks or deposits were being held at year end for budget, cash flow or other purposes.

Confirm investments purchased but not received as of year-end

Confirm investments sold but still held as of year-end

Confirm interest due or accrued but not yet received as of year-end

Search for manual journal entries that debit (increase) cash. Consider testing if risk indicators are noted.

# State of Washington

Review reconciliations of clearing and transmittal accounts.

See accountability steps for testing strategies related to petty cash and imprest funds, which are not expected to be material to the financial statements.

*Auditors may perform additional procedures to confirm information in the deposit and investment note disclosure in this step or in the Notes to the Financial Statements step. Auditors should contact the Investment Specialist if they note significant interest rate or other risks with the government's deposits or investments.*

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**Outstanding Checks and Deposits in Transit** – Per TIS section 1100.08 (AICPA Technical Questions and Answers), outstanding checks should be reported as a reduction of cash and the amount of deposits in transit should be reported as cash. A check is considered outstanding from the time that it is out of the payor's control – when mailed or delivered to the payee – until the time it clears the bank. Cash should represent amounts within the control of the reporting entity, that is, the amount of cash in banks plus cash and checks on hand and deposits in transit minus the amount of outstanding checks.

**SAO Audit Policy [6350](#) – External Confirmations**

**[Investments](#) Area Guide**

**[LGIP Fund Summary Reports](#)** - includes a list of local government accounts and balances in the Local Government Investment Pool

Record of Work Done:

## **Substantive tests performed to meet the Existence / Occurrence assertion:**

We ran a query using the ACFR database to determine which balances were significant for testing. We initially determined that GL 1110 fund 148 and GL 1206 fund 148 were the significant balances for our testing as they provided 81 percent coverage of the Washington State University (WSU) roll up fund FBG cash & cash equivalent balance. We asked Angie Dobbins, Executive Director/Controller, and Tami Bidle, Associate Controller, for the June and July 2024 bank statements and reconciliations related to these AFRS balances.

After our request, Angie mentioned that as they analyzed the cash reported in AFRS GL 1110 for fund 148, the University identified an entry that was not entered into AFRS and would need to be corrected. She mentioned the balance in GL 1110 fund 148 would change from \$311,373,440.20 to approximately \$5,193,359.83. Once we became aware of the issue above, we updated our balances for testing to ensure we obtained sufficient

## State of Washington

coverage of the roll up fund FBG cash and cash equivalent balances for WSU. We modified out testing coverage to approximately 87 percent of the FBG cash and cash equivalent balance for WSU. We determined that this was sufficient coverage of the balance. See "Summary" tab here [[Cash & Cash Equivalent Testing](#)]. **See issue and AOM links in the conclusion above.**

### LGIP Balances

We obtained the June 30, 2024, Local Government Investment Pool (LGIP) statements from Arthur Whitten, Director of Treasury Services. We were able to tie ending account balances directly to our AFRS database query results to ensure the LGIP balances existed without exception. See LGIP testing here [[Cash & Cash Equivalent Testing](#)]. **No issues noted.**

### Temporary / Pooled Cash Investment Balances

We obtained the June 30, 2024, investment statement for account ending 6300, and "Final AFRS Investment Trial Balance 063024.xlsx" from Arthur Whitten, Director of Treasury Services. We used the investment statement to find the ending historical/revalued costs for total assets and cash equivalents, and to manually calculate the total short term investments. We used the trial balance to recalculate the percentage of the investment account balance that would be uploaded to AFRS in each fund using the figures we took from the investment statements. We were able to recalculate the percentage of the investment balance that would be uploaded to AFRS with a variance that was below the floor. See investments testing here [[Cash & Cash Equivalent Testing](#)] **No issues noted.**

### I.1.PRG - Cash & Investments

*Procedure Step:* Summary & Conclusion

*Prepared By:* CJM, 11/20/2024

*Reviewed By:* CJG, 11/21/2024

Purpose/Conclusion.*
----------------------

#### **Purpose:**

To evaluate risk assessments and the sufficiency and appropriateness of evidence obtained based on results of substantive work.

#### **Conclusion:**

We determined that **no** modifications were necessary to inherent risk, control risk, or the risk of material misstatement as assessed in planning.

We also determined that evidence obtained was sufficient and appropriate in response to the risk of material misstatement.

# State of Washington

## Testing Strategy:

Auditors are **required** to evaluate conclusions for substantive testing as follows:

*Auditors may wish to use the optional Lead Sheet available in the Store to summarize testing related to each balance and assertion.*

**1.** Determine whether the results of substantive testing indicate a need to modify the inherent risk assessment (IR), control risk assessment (CR), risk of material misstatement (RMM) or other aspects of planning (such as material balances or assertions). If so, document changes and consider the need for additional testing.

*If the results of substantive testing indicate a need to change control risk, auditors should also update the **Permanent File** by either correcting the documentation or by adding an update section describing changes to the top of the record of work done. For all changes to IR, CR, or RMM the **Material Balances** spreadsheet should be updated.*

*More significant changes to other aspects of planning (such as material balances or assertions) should be referenced in this step and documented in detail in the **Changes to FS Audit Plan** step.*

**2.** Evaluate whether the quality and quantity of evidence obtained is sufficient and appropriate in response to the risk of material misstatement. In making this determination, auditors should evaluate:

### Information to be used as audit evidence:

Does evidence relate to the population, period of time and risk (assertion and "what could go wrong" from the Material Balance Spreadsheet)? If there are any gaps or uncertainties in the logical connection between the evidence and conclusions, is there a documented consideration and explanation?

Are the sources of information sufficiently reliable and appropriate for the risk (whether internal to the government, external, or auditor developed)? If key information is not from a sufficiently reliable source (for example, inquiry), then is it corroborated by information that is?

Are there any concerns about accuracy, completeness, authenticity, or bias in information? If so, did the auditor perform sufficient procedures to confirm reliability of that information?

Is information precise enough to catch if misstatements exceeded the tolerable level?

Is information detailed enough to conclude on whether or not there were misstatements?

Was there any information that appeared contradictory or inconsistent? If so, was there a documented response to the inconsistencies or doubts about the reliability of evidence?

### Results:

## State of Washington

How much misstatement was identified by testing, and the likelihood and magnitude of further potential misstatement?

How did misstatements occur and how often might they occur again in the population?

Were misstatements caused by control deficiencies or circumvention of controls?

If control deficiencies, is there a need to re-evaluate our understanding of controls in the [Permanent File](#) folder or assessment of control risk?

If circumvention, the [Management Override of Controls](#) step should address or reference this area. Auditors should also consider whether a fraud risk has been identified.

Did tests identify a different level or type of risk than the planned audit response was designed to address?

If likely misstatements are identified, are further procedures necessary to improve the precision of our estimate?

*To support the overall evaluation of audit risk and provide a basis for concluding on the overall sufficiency and appropriateness of evidence in the [FS Summary & Report](#) step, auditors should conclude in each area whether the auditor continues to believe that the tests performed and quality and quantity of evidence obtained are commensurate with RMM for all relevant risks (the "what could go wrong", in the [Material Balances](#) spreadsheet).*

If the auditor determines that evidence is not sufficient or appropriate, additional substantive testing should be done. If sufficient, appropriate evidence is not available for audit, the AIC should discuss the effect on our audit report with the AAM and AM.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6310](#) – Determining the Nature, Timing and Extent of Substantive Testing**

**SAO Audit Policy [3210](#) – Audit Evidence**

Record of Work Done:

Based on test results, we re-evaluated risk assessments, procedures, evidence obtained and conclusions as follows:

### **(1) Do the results of substantive tests indicate a need to modify our risk assessment (IR, CR and RMM)?**

We determined the results of substantive tests do not indicate a need to modify our risk assessment (IR, CR and RMM).

### **(2) Was the quality and quantity of evidence obtained sufficient and appropriate?**

We determined the quality and quantity of evidence obtained was sufficient and appropriate.

# State of Washington

## I.1.PRG - Cash & Investments

*Procedure Step:* Understanding of Line Item

*Prepared By:* SHW, 4/30/2024

*Reviewed By:* RKM, 5/6/2024

Purpose/Conclusion:

**Purpose / Conclusion:**

To gain an understanding of cash and investments managed by the State Treasurer's Office.

Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

**STEP 1: Prior Audit Exceptions**

Document any exceptions noted during the prior audit. Follow-up to determine how the agency has responded to or corrected the issue, unless this work is anticipated as part of the testing strategy.

**STEP 2: Analyze Composition and Changes of Line Item**

Include link to the line item leadsheet. This will be completed at the end of the audit. Leadsheet analysis should be documented in this spreadsheet.

Inquire with agency staff about the activities and transactions that make up the balance and any changes to those activities or transactions in relation to the prior year.

Determine relevant classes of transactions or account balances within the line item to analyze (such as agencies, funds, programs, departments, accounts, and/or objects), and use AFRS to create trends of those elements. This step should not include any specific dollar amounts associate with the line item.

Evaluate trends to identify:

## State of Washington

(1) What classes of transactions or account balances are primary to the identified risk. Auditors should specifically consider what elements are primary to the line item (comprising a large percentage of the line item), and which elements the identified risk would apply to, and which elements might be most susceptible to the identified risk (having a high risk of non-trivial misstatement for a relevant assertion, considering likelihood and impact of potential for misstatement).

(2) What changes are primary to the identified risk, if applicable. Auditors should specifically consider whether the overall change to the line item from the prior year was significant, what elements were the primary drivers of overall change, whether any elements changed significantly from the prior year, and which changes (if any) might relate to the identified risk.

(3) Any unusual or unexpected elements, amounts, or changes that may indicate a risk, whether the one identified in planning or a new one that may need to be considered for a change to the plan.

**Consider** other procedures to gain an understanding of the line item, such as review of key policy documents, review of program information or reports, inquiry of staff, budget information, or other analytical procedures.

### STEP 3: Update Significant Account Matrix

Based on your understanding of the line item, update the Significant Account Matrix with final conclusions on the agencies covered, account description, significant accounting systems, and risk (what could go wrong and relevant assertions). The account description should reflect the significant transaction streams or account balances relevant to the risk.

*The description of agencies, significant accounting systems, and what could go wrong in the Significant Account Matrix constitute the overall scope of substantive testing.*

*A transaction stream is significant based on the potential for misstatement. This is often due in part to its size (ie: comprising a large percentage of the total line item), but is ultimately a judgment about the susceptibility to the identified risk (for example, when the risk is understatement a small or omitted account may hold the most potential for the largest misstatement).*

*Significant accounting system(s) are those that contain key controls over significant classes of transactions included in the line item. Control systems identified in this step must match the Significant Account Matrix and have a separate control understanding documented.*

*Talk with the AIC if you identify any changes to the Significant Account Matrix.*

Guidance/Criteria.:

Record of Work Done.:

#### **(1) Prior Audit Exceptions:**

We noted in the prior years audit that interest earned, totaling \$27,141,123, was reported as accrued interest rather than investments by the State Treasurer's Office. We made a verbal recommendation that the Treasurer and OFM include interest earned and received in June as part of cash and investments reported at fiscal year end. We followed up with Denise Nguyen, OST Accounting Services Manager, on April 8, 2024 and found no changes have been made to the Treasurer's accounting policies/procedures to date but they expect to confer with OFM to discuss

# State of Washington

accounting changes prior to FY24 year-end close.

## **(2) Composition & Change Analysis:**

Line Item Lead Sheet: [[Line Item Lead Sheet](#)]

The Office of the State Treasurer's (OST's) responsibilities include managing the cash flow of all major state accounts and allocating cash to investments (both long-term and short-term). Here, we will gain an understanding of the following balances as shown on the lead sheet:

Cash and Cash Equivalents (sort codes 1A and AC)

Restricted Cash and Investments (sort codes 1H and AF)

Investments (sort code AM)

OST's allocation to investments includes the Local Government Investment Pool (LGIP). LGIP investments (sort codes AM, DJ, BE, LF, and TW) are examined by an external CPA audit, and we will place reliance on their work as documented at: [[Work of Other Auditors - LGIP](#)].

For interim planning, we selected the majority of cash and cash equivalents and investment accounts as significant accounts in the significant balance spreadsheet at: [[Interim Planning Significant Balance Spreadsheet](#)]. SAO policy requires that we select all cash balances as material, however, the Higher Education Student Services Fund contains balances that are quantitatively small and spread across multiple Colleges and Universities. Cash and Pooled Investments can be separated into the following treasury type codes for analysis:

T = Treasury

U = Treasury Trust

L = Local (Accounts outside control of OST)

We used the treasury codes referenced above to determine cash coverage for each agency and opinion unit. Only the Treasury (T) and Treasury Trust (U) accounts are under the Treasurer's control. Local accounts (L) are controlled by each agency or department. Therefore, in computing our cash and investment(s) line item audit coverage, we will exclude funds held in local accounts.

## **Restricted Cash and Investments**

Restricted Cash and Investment line item(s) include the following GL account balances: \*Note: GL Codes listed in [SAAM 75.40.20](#)

### **GL 1140 Restricted Cash and Investments - Current Operations**

GL code is used to record restricted cash and investments held by escrow agents and trustees that will be used in current operations for the payment of current liabilities.

Fund Statement Sort Code: GL Sort Code AF, Restricted Cash and Investments (AFRS D54 Table)

Statement of Net Position Sort Code: Gov't Wide Sort Code 1H, Restricted Cash and Investments (AFRS D54 Table)

# State of Washington

## **GL 1240 Restricted Cash and Investments - Noncurrent**

GL code is used to record cash and investments held by escrow agents and trustees that are restricted and will not be used in current operations.  
Fund Statement Sort Code: GL Sort Code AF, Restricted Cash and Investments, DM Restricted Cash and Investments- Non-current (AFRS D54 Table)  
Statement of Net Position Sort Code: Gov't Wide Sort Code 1H, Restricted Cash and Investments, 1S Restricted Cash and Investments - Non-current (AFRS D54 Table)

## **GL 1150 Cash with Fiscal Agents**

GL code is used to record cash deposited with fiscal agents for the payment of state obligations. Amounts held may be restricted.

OFM requires agencies to complete a disclosure form at FYE to identify any balances that may need to be restricted. OFM staff makes a worksheet adjustment to allocate restricted cash and investment balances at the roll-up fund level. This adjustment is not reflected in AFRS but will affect the balances on the financial statements. The current year adjustments will be reviewed as part of our year-end procedures for the FY24 ACFR audit.

## **(3) Updates to Significant Account Matrix:**

We identified no updates to the Significant Account Matrix based on our understanding of the line item.

## **I.1.PRG - Cash & Investments**

*Procedure Step:* Controls - TM\$  
*Prepared By:* SHW, 4/30/2024  
*Reviewed By:* RKM, 8/22/2024

Purpose/Conclusion.*
----------------------

### **Purpose:**

To gain an understanding of internal controls.

### **Conclusion:**

We gained an understanding of internal controls as documented in the record of work done.

# State of Washington

Testing Strategy:

**The following procedures are required for all material systems:**

1. List the financial statement balance(s) and relevant assertion(s) addressed by the understanding.
2. Gain an understanding of the internal control process, identify how transactions are recorded in AFRS, identify key controls over relevant assertion(s), and note any control weaknesses.
  - In gaining an understanding of controls, consider the overall understanding of State-Level control elements as documented in the "State-Level Controls" step as they relate to this particular system.
  - Identify controls systems covering all relevant assertions for all significant classes of transactions.
  - Standards require the auditor to gain an understanding of the significant accounting system(s) that contain key controls over significant classes of transactions included in the line item.
  - Control systems identified in this step must match the Material Account Matrix and have a separate control understanding documented.
  - Talk with the ACFR Specialist or AIC if you identify different systems than the ones anticipated in the Material Account Matrix.

For each material system, auditors must document:

A brief outline of the transaction flow from beginning to end.

An expanded description of key controls.

Business processes relevant to financial reporting of the relevant assertion for the material balance. Processes should encompass automated and manual procedures by which transactions or events are identified or initiated, authorized as needed, recorded, processed and corrected as needed.

Original accounting records and how records are rolled-up to intermediary ledgers and transferred to the general ledger (AFRS) or financial statements.

Detailed descriptions of key controls. Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

The following is information to **consider** when identifying key controls and transaction flow.

"Key controls" refer to the few controls that together provide reasonable assurance that material misstatements will be prevented or detected and corrected. This is contrasted with ancillary or supporting controls, which – although helpful and recommended – would provide less than reasonable assurance by themselves.

## State of Washington

The focus of the write-up is on the key controls. Key controls should be specifically identified (as "key controls") in the write-up. This can be done in whatever way the auditor prefers, so long as it is obvious. Details that the auditor should document regarding key controls may include:

- Who or what initiates the control

- When (or how often) is the control applied

- Who performs the control

- As needed, the experience, knowledge and attitude of the person applying the control

- Detailed description of the control process or activity. For example, if the control is a review: what exactly is reviewed, what is the reviewer looking at or for and what are the reviewer's criteria?

- How the key control is documented or evidenced

- If not obvious from the description, how the control prevents or timely detects and corrects misstatements

- Any exceptions or alternative processing to the normal process

- What happens when misstatements or issues are identified by the control

The "transaction flow" refers to the process by which transactions are initiated, authorized, recorded, processed and reported (as applicable). Outlining the transaction flow gives context to key controls, especially how transactions become subject to controls in the first place. If a control inherently ensures that all applicable transactions are included (ex: bank reconciliation where the assertion is existence), the auditor may decide to just start the write-up with the initiation of the control procedure and go from there.

Elements of the transaction flow are defined informally as follows:

*Initiation:* How are transactions initiated?

*Authorization:* How are transactions and accounting record maintenance authorized?

*Recording:* How are transactions or balances identified and recorded in financial accounting systems?

*Processing:* How are the transactions or balances processed after they are recorded (if at all)? Processing may be manual or automated and may occur at a subsidiary system level or at the general ledger level.

*Reporting:* How are records translated into the financial statements? This part of the transaction flow extends the understanding to the actual financial statements that the audit is opining on. Since we already document an understanding of the financial reporting process in general, it is usually enough to simply reference this overall understanding. However, if there are important steps unique to the covered balances, it may be more appropriate to mention them here.

Although transaction flow is a good way to think about understanding and documenting a control system, auditors should not worry too much about documenting "each element, in order" because often elements may be combined, not noticeable, not applicable or occur in a different order.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

# State of Washington

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits](#) Planning Guide**

Record of Work Done:
----------------------

Internal controls in the **Treasury Management System (TM\$)** address the following balance(s):

## ***Cash and Cash Equivalents***

- Governmental Activities - GOV - Opinion Unit
- Business-Type Activities - BUS - Opinion Unit
- Fund FAA - General Fund - Opinion Unit
- Fund FBF - Wildlife and Natural Resources - Opinion Unit
- Fund FBG - Higher Education Special Revenue Fund - Opinion Unit
- Fund FEA - Higher Education Endowment - Opinion Unit
- Fund FFJ - Health Insurance - Opinion Unit
- Aggregate Remaining Funds - NON - Opinion Unit

## **For the following assertions:**

- Existence - That cash and cash equivalents are not on hand, in transit, on deposit with third parties (depositories) in the name of the State, or are held by a third party (trust or custodian agent) on behalf of the State.
- Completeness - Accrued investment income may not be recognized and as a result all cash/investments are not reported.

## ***Investments***

- Fund FAA - General Fund - Opinion Unit
- Fund FFH - Higher Education Student Services - Opinion Unit

## **For the following assertions:**

- Existence - That investments are not on hand, in transit, on deposit with third parties (depositories) in the name of the State, or are held by a third party (trust or custodian agent) on behalf of the State.

# State of Washington

Completeness - All investments are not reported.

Classification - Investments may not be classified as to current and long term based on maturity dates and are not reported in the proper fund type

## ***Restricted Cash and Investments***

Governmental Activities - GOV - Opinion Unit

Fund FAA - General Fund - Opinion Unit

Fund FBG - Higher Education Special Revenue Fund - Opinion Unit

Aggregate Remaining Funds - NON- Opinion Unit

## For the following assertion:

Classification - OFM as the financial statement preparer may be unaware of restrictions placed on cash and investments based on information in AFRS.

NOTE: The controls ensuring that cash is properly restricted take place at OFM, not the Office of the State Treasurer (TRE), and will be addressed in the "Controls - Restricted C&I" step.

## **Gain an Understanding of Internal Controls**

### **A. Background**

#### **Funds:**

The Office of the State Treasurer (TRE) invests daily for Fund 076, the State Treasury Income Account for State Agencies and Fund 523, the Public Funds Investment Account, for the Local Government Investment Pool (LGIP). It also invests on an irregular basis for Fund 845, which is a separately managed account (SMA). This account holds longer term securities, so its activities are irregular.

#### **Bank Contracts:**

TRE contracts with two different banks:

The Concentration Account is contracted with US Bank and holds all Treasury and Treasury Trust Funds.

The Custodian Account is contracted with Northern Trust for investment purposes.

TRE uses US Bank to hold the LGIP funds.

An external auditor audits cash held in the LGIP account and we rely on the work of the external auditor.

#### **System:**

TRE uses the Treasury Management System (TM\$) as the primary system to account for the cash investing cycle. It is a subsidiary accounting system that uploads to AFRS at the end of each business day.

# State of Washington

## Key Roles

Three divisions at TRE perform integral parts of the investment process: The Investment Division, the Investment Accounting Division, and the Cash Management Division. The following summarizes their functions:

Investment Division – execute trades throughout the day, enter into TM\$. Initiates the wiring of funds to and from Custodian Account.

Investment Accounting Division – verify trade tickets settled for the day and confirm in TM\$. Following day, reconcile AFRS balances from previous day.

Cash Management Division – moves money by executing daily wires in or out between the concentration (US Bank), LGIP, verifies all wires have completed properly and that accounting documents are entered into TM\$, and backs up the Investment Accounting Division for work on custodian (Northern Trust) accounts.

*See auditor prepared flowchart for high-level overview of daily process at: [OST Flowchart of Key Controls Cash & Inv]*

We gained an understanding of controls at each division, as documented below:

### 1. Investment Division Staff

This division directs the investing of excess cash through sales and purchases of investments. Investment staff determine the investing amounts for fund 076 and 523 on a daily basis, and fund 845 when needed. The investment division initiates and wires funds from the LGIP to local governments when they receive requests for withdrawals from members. LGIP staff also account for all incoming wires from local governments that are deposited in the pool. Employees initiate wires to transfer funds from Northern Trust (custodian bank) to fund(s) 076, 523 and 845. **We verified and updated our understanding with Chris Matoon, Portfolio Administrator, on March 26, 2024.**

### 2. Investment Accounting Division Staff

Staff ensure portfolio transactions are accounted for properly. Accounting staff also ensure that the bank, TM\$, and AFRS reconcile. The Investment Accounting Division cross-trains their staff members so different roles may be performed by multiple staff members. **We verified and updated our understanding with Denise Nguyen, Accounting Services Manager, and Alexis Lopez, Fiscal Analyst Accounting Manager, on April 4, 2024**

### 3. Cash Management Division Staff

By law, this group acts as the bank for most state agencies. Cash management staff perform duties linking the State's bank concentration account and state agencies. A few agencies, like Higher Education and Employment Security Department, operate locally controlled bank accounts outside TRE. Once the Investment Division initiates a wire, Cash Management Staff receive the authority and responsibility to process wire payments, ACH files (between agencies), and receipt investment transaction sales. **We verified and updated our understanding with Vicki Boudia, Banking Services Administrator, on April 2, 2024.**

## B. Control Activities

### Day 1 - Trade Purchases/Sales

# State of Washington

## **Investment Division Process**

Every morning, Shawn Reed, Portfolio Manager, reviews the cash projections to see what will settle that day to determine overnight investment needs. Shawn informed us that she will also check bank balances to review the prior day's activity. Portfolio managers review TM\$ reports to determine investment decisions for longer term portfolios.

## ***Placing Trades***

Investment Division Staff purchase and sell investments throughout the day using the Bloomberg investment platform. Most of these trades settle on the following business day after the actual trade date except for overnight repos (repurchase agreements), which settle on the same day. Chris Mattoon, Portfolio Administrator, uses trade tickets produced in Bloomberg from all investment staff members and enters trades into TM\$. Shawn Reed or Amanda Hudson, Portfolio Manager, perform Chris's duties if he is unavailable. Northern Trust, TRE's custodian bank, determines investment valuation. Investment Division staff receive an electronic feed from Northern Trust of the fair market value amount(s) through TM\$.

Northern Trust constructs its prices from a variety of sources, with the three main sources used being ICE-IDC, Thomson-Reuters, and Bloomberg. Investment professionals consider their main sources as three of the most highly reputable, trusted, and widely used pricing sources for the current investment market. Investment staff determined they can rely on Northern Trust's fair value pricing based on the reputation of their pricing sources and trusts the provided accuracy. Portfolio Managers rely on their experience in trading to determine if Northern Trust provided an unreasonable price. When investment staff determine a price is unreasonable, they run reports in Bloomberg to further evaluate the price. For example, Bloomberg's "B-val" report performs a simulation of a similar security, which is compared to Northern Trust's valuation. TM\$ alerts Investment Division staff when prices change in excess of 10% of their previous value via an email to staff with a report which they use to investigate the price warning. This is extremely rare and has not occurred in FY24 as the Treasurer invests in high quality dollar denominated debt securities with quoted market prices and collateralized mortgage obligations are not allowed.

After trades occur, the Portfolio Administrator manually prepares the daily ticket summary in Excel with all the settling purchases and sales for the day. Once complete, the Portfolio Administrator emails the trade tickets and daily ticket summary to the Investment Accounting Division (**Key Control #1 - Existence, Completeness**). Portfolio Managers email trade tickets for investment transactions that could include purchases and sales of treasury notes, bonds, and discount notes to the Accounting Division email box, who then validate the information entered into TM\$. Once these trades settle, the tickets will be included on a future daily ticket summary. Repurchase agreements, cash deposits, and cash withdrawals settle on the same date as the trade. Investment Division staff email the Investment Accounting Division with all settled transactions for the day along with the daily ticket summary, which ensures timely settlement. This process concludes Day 1 activities and transitions to Day 2, as further described below.

## ***Initiation and Review of Incoming and Outgoing Investment Wires***

The Investment Division initiates all wires between the Custodian account (Northern Trust) and the Concentration account. Each afternoon, the Investment Division accesses a report from Northern Trust (Custodian) showing that all trades have settled and reports the cash balance in each of the accounts. A Portfolio Administrator matches the cash balances to what is displayed in TM\$. If there are no discrepancies, the Administrator

## State of Washington

initiates the wire. To initiate the wire, an Administrator logs into Northern Trust's website using their user name and password as well as a multi-factor authentication security token. After the wire is initiated, a second employee from the Investment Division releases the wire after comparing the wire amounts to the displayed amount in TM\$. Northern Trust's website prevents the same person from initiating and reviewing the wire (**Key Control #2 - Existence**).

### **Investment Accounting Division Process**

As noted above, the Investment Division sends trade tickets for future settlement to the Investment Accounting Division's inbox. Once the Investment Accounting staff receive the new trade tickets in the afternoon, they print out the TM\$ "Trade Verification." A fiscal analyst cross checks the tickets to the TM\$ "Trade Verification" screen printout, ensuring key information such as fund number, transaction type, CUSIP, settlement amount, trade and settlement date(s) par amounts, interest rate, broker name, and security classification all match. Investment Accounting Staff also compare the information in TM\$ on the "Detail Projection Receivable-Cash Receipts" report with the projection report from Northern Trust-"Projected Cash Detail-today" report (**Key Control #3 - Existence, Completeness**). Investment Accounting Staff confirm reports against the cash detail to confirm values are the same and identify any unexpected changes or transactions in advance. The Investment Division and the Investment Accounting division communicate throughout the day to ensure there are no discrepancies or errors known between departments.

### **Day 2 - Final Confirmation and Investment Activities**

#### **Investment Accounting Division Process**

On the day following the trade date, a fiscal analyst repeats procedures from the previous day with updated reports to ensure all information in TM\$ is accurate. Another fiscal analyst then reviews the work at a subtotal level by reviewing the Confirmation screen in TM\$ and the "Projected Cash Detail-Today" from Northern Trust to re-confirm the final transaction amounts. Chris Mattoon, Portfolio Administrator, from the Investment Division, emails the Accounting Services Division with any differences he sees between Northern Trust and TRE. The fiscal analyst also verifies and adjusts interest amounts where rounding is needed. Rounding typically causes differences between Northern Trust's rate calculations and individual line item subtotals. When values differ, TRE uses Northern Trust values as they are the exact amounts received by Northern Trust.

The fiscal analyst prints out the TM\$ Verification Screen and verifies it with the daily trade tickets and other transactions to make sure all the transactions exist and are completely recorded in TM\$. The analyst also ties TM\$ to a "Daily Ticket Summary" report, which is sent to the Investment Accounting Division by the Investment Division Staff when they are done with the morning trading. The "Daily Ticket Summary" also contains information on reverse repurchase, repurchase trades, and CDs. These transactions trade and settle on the same date and do not have activity on day one (see write up above of day one).

For all three funds (076 Concentration Account, 523 LGIP and 845 SMA), if the total amount received from sales, maturity, and interest, is less than the amount needed for planned purchases, the Investment Division wires the difference between US Bank and Northern Trust. If the amount coming in from maturity is more than the amount of scheduled purchases, TRE receives a wire for the difference from Northern Trust to US Bank. Investment Accounting Staff receive another email from Chris Mattoon, Portfolio Administrator, to notify them that the investment activities have

## State of Washington

settled for the day. Investment Accounting then use the Pre-Confirm report and checks it against the TM\$ Confirmation Screen (**Key Control #3 - Existence, Completeness**). This control ensures investment data input is correct, all transactions are recorded in the correct period, transactions actually exist, and TM\$ settle amounts are correct.

To create the accounting transactions & documents in TM\$, Investment Accounting staff click the "confirmation" button and TM\$ automatically sends an email to the Cash Management Division and the Investment Accounting alerting them to the confirmation status.

After the final confirmation in TM\$, the fiscal analyst clicks the reports button to receive emailed reports from TM\$, which are used for reconciliation purposes later on:

- Purchases for Accounting Transactions for Funds 076 and 523 (and fund 845 if applicable)
- Redemptions for Accounting Transactions for Funds 076 and 523
- Investment Accounting Transactions for Fiscal Month (All funds)
- Cash Receipts Journal Report
- Non-Cash Summary
- Cash Disbursement Journal Report
- Cash Receipts Detail
- Non-Cash Journal Detail
- Cash Disbursements Journal Detail

The analyst accesses TM\$ Document Detail Browse to print the cash documents automatically created by TM\$, to ensure all transactions are completed. A "V" next to a transaction means it was automatically validated and a "C" means it will be manually validated by the Cash Management Division. The fiscal analyst ticks/matches the details to the transaction summaries, the confirmation screen, and the document detail browse amounts.

### Cash Management Division Process

Every afternoon, Vicki Boudia, Banking Services Administrator, or other designated staff, reconciles all of the outgoing payments for investment activity for the day (**Key Control #4 - Existence, Completeness**). Once all wires are confirmed, processed, and settled, Vicki reconciles outgoing payments to TM\$ in an excel template called "Afternoon Reconciliation." It reconciles the total outgoing wire and ACH amounts to the individual wire/ACH transactions. The reconciliation does not net wire transactions. Around 2:00 pm, the Cash Management Division receives the daily automated TM\$ email confirming that all investment activity for the day has settled. The email contains the wire template name, and the account and routing numbers used for the investment activities. TM\$ generates this email once Investment Accounting Staff click the daily confirmation button within TM\$.

Vicki logs into US Bank SinglePoint Application using her password store feature. The application does not require a token ID since there are no wires being initiated or released. Vicki prints the daily outgoing wire report "Current Day Summary and Detail Report" from US Bank Single Point

## State of Washington

and labels each transaction with the corresponding agency. Vicki highlights the dollar amount, agency, receiving bank and other relevant information on the report. Then she validates that the amounts on the wire out report match the documents cash management receives (the memo from accounting, TM\$ email, and EFT JV).

Once Vicki validates all the documents match, she signs the wire out report. Investment staff serve as primary and secondary approvers for all wires and Vicki performs a third review. The reconciliation continues until there are no variances. Finally, Vicki pulls an "ACH Log Browse" Report in TM\$ and confirms that the status of all transactions is "match" and "ack" for acknowledged. Vicki pulls the TM\$ document listing by category for the outgoing payments. She double checks that both a document and bank transaction are verified and entered into TM\$, which then interfaces with AFRS.

### **Day 3 (Prior Day) - Reconciliation** **Investment Accounting Division Process**

Investment Accounting perform the reconciliation of the prior day TM\$ Confirmation Report to Northern Trust Cash Transaction Detail Report using an excel spreadsheet. They receive the "Settled Transactions with Debit Credit" from Northern Trust, which shows the daily investment activity and any outstanding cash balance (which should be zero since the goal is to match inflows and outflows of funds from the account) (Day 2). The fiscal analyst places the information from the Northern Trust report and the TM\$ confirmation screen on a "Cash Balance Reconciliation" spreadsheet, to make sure they agree **(Key Control #5 - Existence, Completeness, Classification)**.

Investment Accounting receives scheduled reports by email from AFRS Enterprise Reporting (ER). Investment Accounting staff review the "AFRS Un-Balanced In-Process Report" for funds 076, 523, and 845. This is in the backup reports package.

They review "AFRS Transaction History," Revenue, & Expenditure reports from ER for the three funds. A fiscal analyst reconciles these reports to TM\$. A fiscal analyst performs a reconciliation of the TM\$ book amount listed for the investments to the amount recorded in AFRS in GL 1205 (Temporary and/or Pooled Cash Investments). The reconciliation compares information from AFRS Enterprise General Ledger Trial Balance Report to the book value on the TM\$ Investment Statement, which involves staff making tick marks on copies of the reports. Staff review the AFRS 4300 GLs (Cash in Custody of State Treasurer) daily by adding the prior day's ending balances from the AFRS General Ledger Trial Balance Reports and compare the total to the TM\$ Fund book balance for the day using the "DlyBalRecon" Spreadsheet. In addition to the daily reconciliation, staff performs a monthly reconciliation for fund 076, 523, and 845 to ensure that the par and market value amount on the monthly Northern Trust Position Report agrees to the monthly investment statement holding report.

### ***Cash Management Division Process***

A fiscal analyst performs a full reconciliation of the previous day's transactions. The fiscal analyst obtains a US Bank Statement from the bank's web site and compares it to the TM\$ Valid Bank Transactions Reconciliation Report Screen for the previous day **(Key Control #5 - Existence, Completeness, Classification)**.

## State of Washington

### **How Transactions are Recorded in AFRS:**

TM\$ automatically prepares vouchers for upload into AFRS. Agency Accounting staff prepare manual JVs for items like miscellaneous bank fees and reimbursements (076). An Accounts Payable staff member creates the JV and the Accounts Payable Manager reviews the JV's daily before releasing them. IT staff upload the automatically prepared accounting documents for the entire agency. On the following day, a fiscal analyst reconciles the AFRS general ledger(s) relevant to cash, the balance-in-process report, and TM\$ to ensure they agree and amounts are posted to the proper account. The Investment Accounting Manager performs a high-level review of this reconciliation, which is also performed at the end of each month.

### **Classification of Investments Between Current and Non-Current at Year-End**

TRE uses GL1205 for all investments throughout the year, which is reconciled daily as described above. At the end of the year, Investment Accounting staff prepare JV's to reclassify investments based on their scheduled maturity date. TM\$ produces the report "Investment Statement for General Ledger Postings" for funds 523 (LGIP), 076 (Concentration), and 845 (SMA). At fiscal year-end, the Investment Accounting Manager and other staff work together to run the TM\$ report, export it into Excel, and review the worksheet to determine if any corrections are needed. Based on the maturity date(s), the report allocates the investments into the following separate categories:

<b>GL 1205</b>	Temporary and/or pooled cash investments-liquid/mature 3 months from purchase (short-term investments)
<b>GL 1209</b>	Short-term portion of long-term investments (maturing by 6/30/2023)
<b>GL 1210</b>	Investments-Maturing past 6/30/2023 (non-current)

Once Investment Accounting staff have determined the correct allocation and made necessary adjustments (if any), they enter a JV in AFRS to apportion the balances among the appropriate accounts. A fiscal analyst prepares and enters the JV and the accounting manager approves and releases the batch. Once released into AFRS, TRE prepares a "Disclosure Form A" with the final amounts, which OFM requires annually. The form allocates investments by type and by maturity (**Key Control #6 - Classification**).

### **Key controls are as follows:**

**Key Control 1 (Existence, Completeness):** Verification of Trade Data – Investment Division staff input data for trades into TM\$ daily. The trade tickets are emailed to Investment Accounting, who check that the information has been entered correctly on the trade verification screen in TM\$.

**Key Control 2 (Existence):** Investment Division Staff initiate and review all incoming and outgoing investment wires.

**Key Control 3 (Existence, Completeness):** Re-verification of activity for today's confirmation and new trades on settlement date - Investment Accounting reconcile a "Projected Cash Detail - Today" report from Northern Trust to the TM\$ "Investment Custody Wires" report. In addition, a daily reconciliation of the TM\$ pre-confirmation report to all of the transactions of the daily investing activities is performed.

## State of Washington

**Key Control 4 (Existence, Completeness):** Afternoon reconciliation of outgoing payments - Cash Management Staff reconcile all outgoing investment activity for the day.

**Key Control 5 (Existence, Completeness, Classification):** Reconciliation of Northern Trust, TM\$, AFRS, and US Bank - Investment Accounting Staff compare various TM\$ reports to Northern Trust reports from the prior day to ensure nothing has been posted to the incorrect fund.

**Key Control 6 (Classification):** Investment Accounting staff allocates investments between current and non-current based on maturity date in TM\$.

### Noted Weaknesses are as Follows:

None noted.

### I.1.PRG - Cash & Investments

*Procedure Step:* Key Control #1 - TM\$ (Manual)

*Prepared By:* SHW, 4/4/2024

*Reviewed By:* RKM, 5/6/2024

Purpose/Conclusion:

#### **Purpose:**

To confirm investment division staff input and verify trade data (key control #1 for TM\$) in order to assess control risk.

#### **Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

## State of Washington

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.

Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.

When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.

A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency.

**All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.**

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

## State of Washington

If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.

If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.

An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.
- B. Controls are not related to a "significant risk" identified in the audit plan.
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.

Guidance/Criteria:
--------------------

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

# State of Washington

Record of Work Done:

## **Cash & Investments - Existence, Completeness**

**Key Control #1** - Investment division staff input and verify trade data for TM\$.

The understanding for this system is documented above in the "Controls - TM\$" step.

### **1. Confirmation of Key Manual Control:**

**Key Control 1: Verification of Trade Data – Investment Division staff input data for trades into TM\$ daily. The trade tickets are emailed to Investment Accounting, who check that the information has been entered correctly on the trade verification screen in TM\$.**

#### Investment Division:

We reviewed a Bloomberg trade ticket dated 3/20/24 for US Treasury Notes, Cusip 91282CGPO, Broker = Santander US Capital Market, Settle date = 3/20/24; Quantity = 15,000,000; Principal = \$14,783,789.06; Yield = 4.401362.

TRE staff noted this trade as "45094 Buy Credit 3.20". We traced the trade ticket to the "Daily Ticket Summary" excel spreadsheet where it was combined with purchase 45093 and TM\$ Confirmation Screen. We confirmed that everything matched. ***No issues noted.***

We reviewed the Northern Trust "Projected Cash Detail -Today" report, dated 3/20/24. The report showed the following: 20 Mar 2024, 91282CGPO "UNITED STATES OF AMER TREAS NOTES" Shares 03-19-2024 At a price of \$98.558593 NET AND OTHER CHARGES \$32,608.700, We also reviewed the 3/20/24 TM\$ Trade Verification Screenshot. All transaction information matched. ***No issues noted.***

#### Accounting Division:

We reviewed the trade tickets that the Investment Division emailed to the Investment Accounting Division, dated 3/20/24. The trade tickets include information such as the CUSIP number, broker name, amount, and trade date. We noted that tick marks were made next to each piece of input information (e.g. buy/sell, quantity, principal, and settle date) of the investment on the tickets. We reviewed the Daily Ticket Summary for 3/20/24 and noted it ties to the TM\$ Trade Verification Screenshot. ***No issues noted.***

### **Noted Weaknesses are as follows:**

None

### **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

# State of Washington

## **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

### **I.1.PRG - Cash & Investments**

*Procedure Step:* Key Control #2 - TM\$ (Manual)

*Prepared By:* SHW, 3/27/2024

*Reviewed By:* RKM, 5/6/2024

Purpose/Conclusion:

#### **Purpose:**

To confirm staff review investment wires (key control #2 for TM\$) in order to assess control risk.

#### **Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls .Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation.

## State of Washington

Describe the manual and automated processing that you observed or performed and responses to your inquiries.

Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.

When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.

A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency.

**All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.**

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.

## State of Washington

If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.

An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.
- B. Controls are not related to a "significant risk" identified in the audit plan.
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

### **Cash & Investments - Existence**

**Key Control #2** - Investment Wire Review for TM\$

The understanding for this system is documented above in the "Controls - TM\$" step.

# State of Washington

## **1. Confirmation of Key Manual Control:**

**Key Control 2: Investment Division Staff initiate and review all incoming and outgoing investment wires.**

### Control Walk-Through:

We reviewed the TM\$ Confirmation Screen for 3/20/24 and noted the following wires: Fund 523 - \$5,150,737,444.42 IN and \$5,150,045,050.00 OUT, Fund 076 \$29,671,117.50 IN and \$44,839,888.12 OUT and Fund 456 \$2,550.00 OUT for a net of \$14,478,926.20 OUT.

We reviewed the 3/20/24 TM\$ Investment Custody Wires report and the "Previous Day Summary and Detail" reports from US Bank for the LGIP account and Custodian accounts. The TM\$ Investment Custody Wires report shows outgoing wires to Northern Trust for \$15,171,320.62 from the Concentration Account, \$692,394.42 from the Northern Trust to the LGIP, and \$79,415,000.00 from the Concentration Account for a late day trade. The amounts agree to the days wire confirmation report. We reviewed the confirmation email for the trades that have settled for 3/20/24. Chris Mattoon, Portfolio Administrator, sent the email to the TRE MI Investment Team Mailboxes and noted "All trades have settled. Wires (3) are ready for release, Three more secLend wires are also in need of release" Shawn Reed, Portfolio Manager, replied to the email from Chris Mattoon on the same day noting "Wires approved." This confirmed that the wire was prepared by Chris and approved by a second Portfolio Administrator. We also reviewed the "Projected Cash Detail - Today" report as well as the Northern Trust Settlements Report for 3/20/24, which supported the detail in the wire confirmation report and the total wire out for the day of \$14,478,926.20 confirming amounts have settled. We reviewed the US Bank previous day summary and detail report for 3/20/24 and verified wires were initiated and confirmed by different OST investment division staff. *No issues noted.*

### **Noted Weaknesses are as follows:**

None

## **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

## **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

### **I.1.PRG - Cash & Investments**

*Procedure Step:* Key Control #3 - TM\$ (Manual)

# State of Washington

*Prepared By:* SHW, 4/4/2024

*Reviewed By:* RKM, 5/6/2024

Purpose/Conclusion:

**Purpose:**

To confirm staff re-verify daily trade activity and perform a daily reconciliation (key control #3 for TM\$) in order to assess control risk.

**Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

### **Cash & Investments - Existence, Completeness**

**Key Control #3** - Staff re-verify daily trade activity and perform a daily reconciliation for TM\$.

The understanding for this system is documented above in the "Controls - TM\$" step.

#### **1. Confirmation of Key Manual Control:**

**Key Control 3: Re-verification of activity for today's confirmation and new trades on settlement date - Investment Accounting reconcile a "Projected Cash Detail - Today" report from Northern Trust to the TM\$ "Investment Custody Wires" report. In addition, a daily reconciliation of the TM\$ pre-confirmation report to all of the transactions of the daily investing activities is performed.**

Investment Accounting Division staff reconcile a "Projected Cash Detail - Today" report (also called the Settlements Report) from Northern Trust to the TM\$ "Investment Custody Wires" report. We reviewed a daily reconciliation of the TM\$ pre-confirmation report to all of the transactions of the daily investing activities is performed as well as a Trade Verification Screenshot.

## State of Washington

We reviewed a TM\$ Trade Verification Screen that contained trades to be settled on 3/20/24, "Projected Cash Detail - Today" report from Northern Trust for 3/20/24, the "Daily Ticket Summary" report for 3/20/24, and the TM\$ "Investment Custody Wires" report for settlement date 3/20/24. We noted that staff use tickmarks across the Trade Verification Screen and all boxes in the "Verified" column were marked. We confirmed the amounts between the reports tied. Investment Accounting Division performs this comparison to re-confirm the final transaction amounts.

We reviewed the Pre-Confirmation Report from TM\$ that shows information such as the Fund, CUSIP, Trade Date, Settlement Date, Settlement Amount, and Par value. We traced Bloomberg trade ticket for Invoice 45094 to the Pre-Confirmation Report for 3/20/24 and tied the transaction tied to the confirmation screen in TM\$ and the "Projected Cash Detail - Today" report from Northern Trust. ***No issues noted.***

### **Noted Weaknesses are as follows:**

None

### **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

## **Cash & Investments - Existence, Completeness**

**Key Control #4** - Cash Management Staff reconcile all outgoing investment activity for the day for TM\$

The understanding for this system is documented above in the "Controls - TM\$" step.

### **1. Confirmation of Key Manual Control:**

**Key Control 4: Afternoon reconciliation of outgoing payments - Cash Management Staff reconcile all outgoing investment activity for the day.**

**Auditor's Note:** When the daily trades result in a net wire out, TRE staff utilize an EFTJV Recon file to ensure the amounts paid are correct. When the trades result in a net wire in, TRE staff utilize a DIB screenshot and reconcile it against the trades for the day.

We reviewed an email from TM\$ with the subject - "3/20/24 - Daily Confirmation WOST - InvAcct". The email lists details of a wire confirmation with Northern Trust for \$15,171,320.62 out of the Concentration Account and \$692,394.42 from the Northern Trust to the LGIP. We also reviewed the 3/20/24 EFTJV Reconciliation docusigned by Kelly Millner, Fiscal Analyst 2 and approved by Ryan Pitroff, Cash Management Manager. Total bank wires out for the day (\$109,553,330.08) were reconciled to Northern Trust, book transfers, LGIP and agency EFT JV's with \$0 variance. We noted that the amounts on the bank statement and the TM\$ reconciliation matched. We also reviewed the AFRS JV/A8 (24032001) and verified amounts recorded tied to the days activity. *No issues noted.*

### **Noted Weaknesses are as follows:**

None

# State of Washington

## **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

# State of Washington

## **Cash & Investments - Existence, Completeness, Classification**

**Key Control #5** - Investment Accounting Staff compare various TM\$ reports to Northern Trust reports to ensure nothing has been posted to the incorrect fund for TM\$.

The understanding for this system is documented above in the "Controls - TM\$" step.

### **1. Confirmation of Key Manual Control:**

**Key Control 5: Reconciliation of Northern Trust, TM\$, AFRS, and US Bank - Investment Accounting Staff compare various TM\$ reports to Northern Trust reports from the prior day to ensure nothing has been posted to the incorrect fund.**

We reviewed the Investment Accounting reconciliation of fund 523 for 3/20/24. The reconciliation verified the daily change (uninvested amount left in the fund at the end of the day) of fund 523 (\$669.29) to custodian (Northern Trust), AFRS, TM\$, and US Bank. We also verified the reconciliation was prepared by Alexis Lopez, Fiscal Analyst, and approved by Allison Mrochek, Fiscal Analyst 2. *No issues noted.*

We reviewed the documents listed in the table below. We noted that AFRS ties to TM\$ Investment Statement balance for Fund 523. Northern Trust daily change agrees to the US Bank Statement. The accounting reconciliation ties the AFRS GLs, TM\$ Fund 523 Investment Statement, Northern Trust, and US Bank daily changes together to ensure that Northern Trust, TM\$, AFRS, and US Bank information is correct. *No issues noted.*

Documents & Accounts	AFRS Subsidiary GL TB	TM\$ 523 Investment Stmt	Settled Transactions (NT)	US Bank Statement	Accounting Reconciliation
<b>AFRS GL 1205</b>	\$22,251,969,813.22	\$22,251,969,813.22

**Noted Weaknesses are as follows:**

None

### **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

# State of Washington

## **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

### **I.1.PRG - Cash & Investments**

*Procedure Step:* Key Control #6 - TM\$ (Manual)

*Prepared By:* SHW, 4/8/2024

*Reviewed By:* RKM, 5/6/2024

Purpose/Conclusion:

#### **Purpose:**

To confirm the current and non-current investment determination (key control #6 for TM\$) in order to assess control risk.

#### **Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls .Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.

## State of Washington

Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.

When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.

A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency.

**All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.**

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.

If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the

## State of Washington

appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.

An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.
- B. Controls are not related to a "significant risk" identified in the audit plan.
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

### **Cash & Investments - Classification, Valuation**

**Key Control #6** - Current and Non-current investment determination for TM\$

The understanding for this system is documented above in the "Controls - TM\$" step.

**Auditor's Note: Substantive testing for this key control cannot occur before Phase 2 cut-off in September 6, 2024.**

# State of Washington

## **1. Confirmation of Key Manual Control:**

### **Key Control 6: Investment Accounting staff allocates investments between current and non-current based on maturity date in TM\$**

Our confirmation uses documents retained in the PY audit file under TM\$ Testing, Test 6.

We reviewed the "Investment Statement for General Ledger Postings" for 6/30/2023 from TM\$. It shows information such as the Investment number, CUSIP, Settlement Date, Trade Date, and Days from settlement or trade to maturity. The investments are organized in columns by which ones should remain in GL1205 (where all investments are held throughout the year), or be moved to GL 1209 or GL 1210 (based on maturity date).

GL1205 = Liquid/Mature 3 months from purchase

GL1209 = Maturing by 6/30/2023

GL1210 = Maturing past 6/30/2023

If investments have been allocated to the incorrect column, staff will mark the report and deduct or add amounts to the total at the end of the report. The report we looked at had check marks next to the GL account totals verifying they were the correct amounts to be allocated.

We reviewed the AFRS JV "A7-A" used to reallocate the funds. We tied the following transaction details to the "Investment Statement for General Ledger Postings":

1209v/1205 – Fund 076 - \$7,131,602,834.59

1210v/1205 – Fund 076 - \$10,021,581,729.43

1209v/1205 – Fund 523 - \$11,953,807,957.68

1210v/1205 – Fund 523 - \$1,040,955,363.66

1209v/1205 – Fund 845 - \$244,598,134.34

1210v/1205 – Fund 845 - \$736,256,671.61

The JV is marked as prepared by Katie Davis, Fiscal Analyst, on 7/25/23 and signed as approved by Denise Nguyen, Accounting Services Manager, on 7/31/23. *No issues noted.*

### **Noted Weaknesses are as follows:**

None

## **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

# State of Washington

## **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

### **I.1.PRG - Cash & Investments**

*Procedure Step:* Risk Assessment - TM\$

*Prepared By:* SHW, 9/18/2024

*Reviewed By:* RKM, 9/30/2024

Purpose/Conclusion:

#### **Purpose / Conclusion:**

To assess inherent risk, control risk, and the risk of material misstatement in order to design an initial testing strategy for each assertion.

Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

1. Assess inherent risk for each relevant assertion. This assessment is based on understanding of the entity and the nature of the account balance or class of transactions.

*Inherent risk is the susceptibility of an assertion to a material misstatement, assuming that there are no related controls. Inherent risk can be thought of as the "threat" of misstatement. Inherent risk exists independently of control risk (the level of threat exists independent of the level of vulnerability to threats). Consider the following factors as your basis for this assessment:*

#### *General Considerations*

*Does the balance include transactions that are difficult to audit or involve complex accounting issues?*

*Were there significant misstatements identified in previous audits or prior-period adjustments in the account balance or transaction class? If so, analyzing the cause of prior period misstatements will help in analyzing inherent risk.*

*Are there any inherent risk factors at the entity or industry level, such as changes in regulation or accounting rules, unique transactions or accounting practices, use of information technology, etc that affect the balance?*

*Inherent Risk due to Error*

## State of Washington

*How large are the transactions making up the balance? If the balance has only a few large transactions, even a single error may mean a significant misstatement.*

*Have there been changes in the transactions making up the balance that may increase risk? For example, significantly different composition, nature or volume of transactions may inherently disrupt established controls.*

*Are financial events originated or identified by accounting personnel or non-accounting personnel? This consideration is mainly for the completeness assertion.*

*Does the process to account for transactions involve judgment or estimation, complex calculations, numerous steps or significant manual steps?*

*Do transactions have widely varying attributes that need to be manually identified? For example, grant loans that are accounted for in one of several ways depending on the terms of the agreement.*

*Inherent Risk due to Fraudulent Reporting (intentional misstatements)*

*Are there substantial pressures or motivations to misstate the balance?*

*Inherent Risk due to Misappropriation*

*· Is the account balance or transaction class susceptible to sizable misappropriation?*

*Inherent Risk due to Non-Compliance*

*Are there any laws, contracts or grant agreements affecting the balance? If so, would non-compliance lead to sizable misstatements?*

*Are compliance requirements complex, hard to understand, subject to judgment or otherwise difficult to comply with?*

*Are there any motivations or pressures to not comply?*

2. Assess control risk by system and assertion. This assessment should be based on the results of the control understanding, confirmation, and testing (if applicable). If applicable, auditors will evaluate any control deficiencies and determine whether those deficiencies, individually or in combination, are significant deficiencies or material weaknesses.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. Control risk could be thought of as the "vulnerability" of an entity to misstatements. Control risk exists independently of the inherent risk (the level of vulnerability exists independent of the level of threat).*

*In order to set control risk to LOW, general controls would also need to be tested to provide evidence of the consistent operation of automated controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*

## State of Washington

*A material weakness exists when the design or operation of controls results in a reasonable possibility a material misstatement will not be prevented or detected and corrected in a timely manner. A significant deficiency is less severe than a material weakness, yet important enough to merit the attention of the governing body.*

***All potential material weaknesses and significant deficiencies should be discussed with the AIC, since they must be reported as findings.***

3. Assess the risk of material misstatement for each relevant assertion for each material line item. The risk of material misstatement is a combination of the auditor's separate assessment of inherent and control risk.

*The Risk of Material Misstatement is a combined assessment of inherent and control risk based on auditor's judgment. If inherent and control risk are assessed differently, it is a matter of professional judgment as to whether the combined assessment is moderate or if one factor outweighs the other.*

4. Design a substantive testing strategy that addresses the relevant assertion in all significant transaction streams included within the material line item.

*In addition to identifying what to audit (material balances) and what to audit for (relevant assertions), planning has also identified how much to audit (risk of material misstatement). The quantity and quality of evidence obtained by substantive tests needs to match the level of risk. The higher the risk of material misstatement, the greater evidence needed. "Greater evidence" could either be greater quantity of evidence, greater quality of evidence, or some combination of greater quality and quantity.*

Guidance/Criteria.7

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6210](#) – Planning Financial Statement Audits**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits](#) Planning Guide**

Record of Work Done.7

### **(1) Inherent Risk (IR):**

## State of Washington

Based on our understanding of the line item, we assessed inherent risk as follows for each relevant assertion and significant class of transactions:

Existence - **High**  
Completeness - **Mod**  
Classification - **High**

### **(2) Control Risk (CR):**

We assessed control risk as follows for each system and relevant assertion:

Existence - **MAX**  
Completeness - **MAX**  
Classification - **MAX**

We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **(3) Risk of Material Misstatement (RMM):**

We considered both inherent and control risk and assessed the risk of material misstatement as follows for each relevant assertion and significant class of transactions:

Existence - **High**  
Completeness - **Mod**  
Classification - **High**

### **(4) Testing Strategy:**

Considering the relevant assertions and risk of material misstatement we developed a substantive testing strategy. We also considered AU-C Section 501.A1-.A4 regarding sufficient and appropriate audit evidence for "Investments in Securities and Derivative Instruments". The State Treasurer's portfolio consists primarily of short term high quality securities reported at fair value. There are no derivatives or collateralized mortgage obligations and debt securities are reported as Level 2 with observable inputs including quoted prices for similar securities and interest rates.

We plan to perform the following tests:

Confirm the balances for Fund 076, Fund 523, and Fund 845 in TM\$ with the amount recorded at US Bank at year-end (Existence).  
Confirm par and fair value amounts for Fund 076, Fund 523, and Fund 845 in TM\$ with the amount recorded in Northern Trust at year-end (Existence).

# State of Washington

Recalculate the investment income and accrued revenue amounts to ensure accuracy, completeness, and reliability of TM\$ (Completeness).

Reconcile the balances for Fund 076, Fund 523, and Fund 845 in TM\$ with the amounts recorded in AFRS at year-end (Completeness, Existence).

Reconcile the aggregate amount of cash in general ledger numbers 4310 and 4320 to the Treasurer's cash balance in TM\$ at year-end (Completeness, Existence).

Review year-end journal entries for the apportionment of cash between current and long-term investments (Classification).

**Note:** Cash and Investments in the Treasurer's Local Government Investment Pool (LGIP) are reported in a stand alone financial statement which will be audited by a CPA firm and reliance will be placed on that audit.

See work performed here: [Work of Other Auditors - LGIP](#)

We anticipate that these tests will provide sufficient appropriate audit evidence to address the assessed risk of material misstatement for relevant assertions in significant classes of transactions.

## I.1.PRG - Cash & Investments

*Procedure Step:* Controls - Restricted C&I

*Prepared By:* SHW, 4/9/2024

*Reviewed By:* RKM, 4/30/2024

Purpose/Conclusion:

### **Purpose:**

To gain an understanding of internal controls.

### **Conclusion:**

We gained an understanding of internal controls as documented in the record of work done.

Testing Strategy:

**The following procedures are required for all material systems:**

## State of Washington

1. List the financial statement balances and relevant assertions addressed by the understanding.
2. Gain an understanding of the internal control process, identify how transactions are recorded in AFRS, identify key controls over relevant assertion(s), and note any control weaknesses.

In gaining an understanding of controls, consider the overall understanding of COSO elements as documented in the "Entity-wide COSO Evaluation" step as they relate to this particular system.

Identify controls systems covering all relevant assertions for all significant classes of transactions.

Standards require the auditor to gain an understanding of the significant accounting system(s) that contain key controls over significant classes of transactions included in the line item.

Control systems identified in this step must match the Matrix and have a separate control understanding documented.

Talk with the ACFR Specialist or ACFR AIC if you identify different systems than the ones anticipated in the Matrix.

### **For each material system, auditors must document:**

Business processes relevant to financial reporting of the relevant assertion for the material balance. Processes should encompass automated and manual procedures by which transactions or events are identified or initiated, authorized as needed, recorded, processed and corrected as needed.

Original accounting records and how records are rolled-up to intermediary ledgers and transferred to the general ledger (AFRS) or financial statements.

Detailed descriptions of key controls. Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

**A brief outline of the transaction flow from beginning to end.**

**An expanded description of key controls.**

"Key controls" refer to the few controls that together provide reasonable assurance that material misstatements will be prevented or detected and corrected. This is contrasted with ancillary or supporting controls, which – although helpful and recommended – would provide less than reasonable assurance by themselves.

The focus of the write-up is on the key controls. Key controls should be specifically identified (as "key controls") in the write-up. This can be done in whatever way the auditor prefers, so long as it is obvious. Details that the auditor should document regarding key controls may include:

When (or how often) is the control applied

Who or what initiates the control

Who performs the control

To the extent needed, the experience, knowledge and attitude of the person applying the control

## State of Washington

Detailed description of the control process or activity. For example, if the control is a review: what exactly is reviewed, what is the reviewer looking at or for and what are the reviewer's criteria?

How the key control is documented or evidenced

If not obvious from the description, how the control prevents or timely detects and corrects misstatements

Any alternative processing or exceptions to the normal process

What happens when misstatements or issues are identified by the control

The "transaction flow" refers to the process by which transactions are initiated, authorized, recorded, processed and reported (as applicable). Outlining the transaction flow gives context to key controls, especially how transactions become subject to controls in the first place. If a control inherently ensures that all applicable transactions are included (ex: bank reconciliation where the assertion is existence), the auditor may decide to just start the write-up with the initiation of the control procedure and go from there.

Elements of the transaction flow are defined informally as follows:

*Initiation:* How are transactions initiated?

*Authorization:* How are transactions and accounting record maintenance authorized?

*Recording:* How are transactions or balances identified and recorded in financial accounting systems?

*Processing:* How are the transactions or balances processed after they are recorded (if at all)? Processing may be manual or automated and may occur at a subsidiary system level or at the general ledger level.

*Reporting:* How are records translated into the financial statements? This part of the transaction flow extends the understanding to the actual financial statements that the audit is opining on. Since we already document an understanding of the financial reporting process in general, it is usually enough to simply reference this overall understanding. However, if there are important steps unique to the covered balances, it may be more appropriate to mention them here.

Although transaction flow is a good way to think about understanding and documenting a control system, auditors should not worry too much about documenting "each element, in order" because often elements may be combined, not noticeable, not applicable or occur in a different order.

Guidance/Criteria:
--------------------

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

# State of Washington

Record of Work Done:

Internal controls for the **worksheet adjustments** address the following balance(s):

## **Restricted Cash and Investments**

Governmental Activities - GOV - Opinion Unit  
Fund FAA - General Fund - Opinion Unit  
Fund FBG - Higher Education Special Revenue Fund - Opinion Unit  
Aggregate Remaining Funds - NON- Opinion Unit

For the following assertion:

**Classification** - OFM as the financial statement preparer may be unaware of restrictions placed on cash and investments based on information in AFRS.

## **Gain an Understanding of Internal Controls**

We met with Laura Lopez, Statewide Consultant, on April 3, 2024, to review OFM's process of accounting and reclassifying restricted cash and investments.

OFM State Wide Accounting requires **all** state agencies complete a year-end "Cash and Investments Restricted Disclosure" to determine the classification of all cash and investments not available in current operations or restricted for a specific purpose (**Key Control 1- Classification**).

AFRS loads data into the disclosure form application each night, which automatically prefills the GL data for certain forms, including the Cash and Investment Restricted disclosure form. The [disclosure form](#) includes the following sections:

- Question 1 - Prefills Account and amount for GL Code 1140 (Restricted Cash and Investments-Current Operations) at June 30
- Question 2 - Prefills Account and amount for GL Code 1240 (Restricted Cash and Investments- Non-Current) at June 30
- Question 3 - Prefills Account and amount for AFRS in GL Code 1150 (Cash with Fiscal Agents) at June 30
- Question 4 - Unspent Bond Proceeds: Amounts are not prefilled but contain data in dropdown boxes. The disclosure form contains the following dropdown GLs: 1110, 1120, 1205, 1206, 1209, 1210, 4310.
- Question 5 - Other Externally Restricted Cash & Investments: Agencies holding funds for balances and accounts outside of these sections (other externally restricted cash and investments held outside the state treasury) must provide the account, GL Code, amount and nature of the external restriction.

Agencies complete the disclosure form online. OFM provides instructions on how to complete the form in [SAAM 90.40.20](#).

# State of Washington

Laura Lopez initiates an analytical pre-review of the related GLs before agencies begin submitting disclosure forms. The analysis includes certifying AFRS data to ensure the forms are complete and accurate (**Key Control 2 - Classification**). She reviews the composition of the balances then reviews unusual GL information. Laura also reviews submitted disclosure forms to ensure the information provided is complete and that the balance is properly restricted or should be restricted based on the agency's explanation. Each agency head or CFO must certify that the statements listed are true for their agency on the "Financial Disclosure Certification" form (**Key Control 3 - Classification**). The certification process includes affirming AFRS data and any other statements are accurate and complete. See [SAAM 90.40.95](#) for the certification. If Laura determines that an agency needs to prepare a disclosure, she contacts the agency to have them prepare and sign it. Sara Rupe, Deputy Statewide Accounting Director, and Anna Quichocho, Statewide Accounting Manager, review the final fund statements to ensure classification is correct (**Key Control 4 - Classification**).

## **How Transactions are Recorded in AFRS:**

Based on the analysis described above, OFM performs a worksheet adjustment outside of AFRS. OFM manually adjusts the fund statements and does not upload them to AFRS because adjustments work in conjunction with the data provided by AFRS. OFM uses WDesk, a program that has separate columns to include AFRS amounts, adjustments made, and new amounts (AFRS + adjustments). If OFM identifies an error before prior to Phase 2 financial closure, they request that the agency makes a correction in AFRS.

## **Summary of Key Controls**

**Key Control 1** - OFM State Wide Accounting requires all state agencies complete a year-end "Cash and Investments Restricted Disclosure" to determine the classification of all cash and investments not available in current operations or restricted for a specific purpose

**Key Control 2** - Prior to the receipt of all disclosure forms, a fiscal analyst (Laura Lopez) starts an analytical pre-review of the related GLs. This includes certifying AFRS data to ensure the forms are complete and accurate.

**Key Control 3** - Each agency head or CFO must certify that their statements listed are true for their agency on the Financial Disclosure Certification form.

**Key Control 4** - The final fund statements are reviewed by Sara Rupe, Deputy Statewide Accounting Director, and Anna Quichocho, Statewide Accounting Manager, to ensure classification is correct.

## **Noted Weaknesses are as follows:**

None noted.

## **I.1.PRG - Cash & Investments**

*Procedure Step:* Key Control #1 - OFM (Manual)

# State of Washington

*Prepared By:* SHW, 4/3/2024

*Reviewed By:* RKM, 4/30/2024

Purpose/Conclusion:

**Purpose:**

To confirm Cash & Investment Restricted Disclosures (key control #1 for AFRS) in order to assess control risk.

**Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.

Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.

When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated"

## State of Washington

step. Auditors should consider contacting Team IT Audit for assistance.

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.

A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency.

**All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.**

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.

If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.

An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider

## State of Washington

whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.

B. Controls are not related to a "significant risk" identified in the audit plan.

C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.

D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

### **Restricted Cash & Investments - Classification**

**Key Control 1** - Cash & Investments Restricted Disclosure for AFRS

The understanding for this system is documented above in the "Controls - Restricted C&I" step.

#### **1. Confirmation of Key Manual Control:**

**Key Control 1** - OFM State Wide Accounting requires **all** state agencies complete a year-end "Cash and Investments Restricted Disclosure" to determine the classification of all cash and investments not available in current operations or restricted for a specific purpose.

This control confirmation uses documents from the previous fiscal year.

We viewed the [disclosure form](#) for agency 540 (Employment Security Department) for fiscal year 2023 using the following criteria: Enterprise Reporting, Financial Reports, Disclosure Reports, State, Cash/Investment, Restricted Cash and Investments. We noted that GL Code 1150 totaled \$3,367,209,993. OFM determined the funds were correctly classified. ***No issues noted.***

# State of Washington

We reviewed all agencies Financial Disclosure Certification Forms submissions as part of the FY23 audit at B.2.5 and found all agencies submitted the appropriate and required disclosures. ***No issue noted.***

## **Noted Weaknesses are as follows:**

None

## **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

## **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

## **I.1.PRQ - Cash & Investments**

*Procedure Step:* Key Control #2 - OFM (Manual)

*Prepared By:* SHW, 4/8/2024

*Reviewed By:* RKM, 4/30/2024

Purpose/Conclusion:

### **Purpose:**

To confirm Analytical pre-review of related GLs (key control #2 for AFRS) in order to assess control risk.

### **Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

## State of Washington

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.

Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.

When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.

A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency.

**All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.**

## State of Washington

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.

If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.

An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.
- B. Controls are not related to a "significant risk" identified in the audit plan.
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.

Purpose/Conclusion:
---------------------

## **Purpose / Conclusion:**

To assess inherent risk, control risk, and the risk of material misstatement in order to design an initial testing strategy for each assertion.

# State of Washington

## Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

1. Assess inherent risk for each relevant assertion. This assessment is based on understanding of the entity and the nature of the account balance or class of transactions.

*Inherent risk is the susceptibility of an assertion to a material misstatement, assuming that there are no related controls. Inherent risk can be thought of as the "threat" of misstatement. Inherent risk exists independently of control risk (the level of threat exists independent of the level of vulnerability to threats). Consider the following factors as your basis for this assessment:*

### *General Considerations*

*Does the balance include transactions that are difficult to audit or involve complex accounting issues?*

*Were there significant misstatements identified in previous audits or prior-period adjustments in the account balance or transaction class? If so, analyzing the cause of prior period misstatements will help in analyzing inherent risk.*

*Are there any inherent risk factors at the entity or industry level, such as changes in regulation or accounting rules, unique transactions or accounting practices, use of information technology, etc that affect the balance?*

### *Inherent Risk due to Error*

*How large are the transactions making up the balance? If the balance has only a few large transactions, even a single error may mean a significant misstatement.*

*Have there been changes in the transactions making up the balance that may increase risk? For example, significantly different composition, nature or volume of transactions may inherently disrupt established controls.*

*Are financial events originated or identified by accounting personnel or non-accounting personnel? This consideration is mainly for the completeness assertion.*

*Does the process to account for transactions involve judgment or estimation, complex calculations, numerous steps or significant manual steps?*

*Do transactions have widely varying attributes that need to be manually identified? For example, grant loans that are accounted for in one of several ways depending on the terms of the agreement.*

### *Inherent Risk due to Fraudulent Reporting (intentional misstatements)*

*Are there substantial pressures or motivations to misstate the balance?*

### *Inherent Risk due to Misappropriation*

## State of Washington

*· Is the account balance or transaction class susceptible to sizable misappropriation?*

### *Inherent Risk due to Non-Compliance*

*Are there any laws, contracts or grant agreements affecting the balance? If so, would non-compliance lead to sizable misstatements?*

*Are compliance requirements complex, hard to understand, subject to judgment or otherwise difficult to comply with?*

*Are there any motivations or pressures to not comply?*

2. Assess control risk by system and assertion. This assessment should be based on the results of the control understanding, confirmation, and testing (if applicable). If applicable, auditors will evaluate any control deficiencies and determine whether those deficiencies, individually or in combination, are significant deficiencies or material weaknesses.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. Control risk could be thought of as the "vulnerability" of an entity to misstatements. Control risk exists independently of the inherent risk (the level of vulnerability exists independent of the level of threat).*

*In order to set control risk to LOW, general controls would also need to be tested to provide evidence of the consistent operation of automated controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*

*A material weakness exists when the design or operation of controls results in a reasonable possibility a material misstatement will not be prevented or detected and corrected in a timely manner. A significant deficiency is less severe than a material weakness, yet important enough to merit the attention of the governing body.*

***All potential material weaknesses and significant deficiencies should be discussed with the AIC, since they must be reported as findings.***

3. Assess the risk of material misstatement for each relevant assertion for each material line item. The risk of material misstatement is a combination of the auditor's separate assessment of inherent and control risk.

*The Risk of Material Misstatement is a combined assessment of inherent and control risk based on auditor's judgment. If inherent and control risk are assessed differently, it is a matter of professional judgment as to whether the combined assessment is moderate or if one factor outweighs the other.*

4. Design a substantive testing strategy that addresses the relevant assertion in all significant transaction streams included within the material line

## State of Washington

item.

*In addition to identifying what to audit (material balances) and what to audit for (relevant assertions), planning has also identified how much to audit (risk of material misstatement). The quantity and quality of evidence obtained by substantive tests needs to match the level of risk. The higher the risk of material misstatement, the greater evidence needed. "Greater evidence" could either be greater quantity of evidence, greater quality of evidence, or some combination of greater quality and quantity.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6210](#) – Planning Financial Statement Audits**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits Planning Guide](#)**

Record of Work Done:

### **(1) Inherent Risk (IR):**

Based on our understanding of the line item, we assessed inherent risk as follows for each relevant assertion and significant class of transactions:

Classification – **High**

### **(2) Control Risk (CR):**

We assessed control risk as follows for each system and relevant assertion:

#### **Restricted Cash & Investments (Classification) – MAX**

**MAX** – We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **(3) Risk of Material Misstatement (RMM):**

We considered both inherent and control risk and assessed the risk of material misstatement as follows for each relevant assertion and significant class of transactions:

# State of Washington

## Restricted Cash & Investments (Classification) – High

### **(4) Testing Strategy:**

Based on our assessment of the risk of material misstatement, we plan to perform the following tests:

Obtain year-end cash and investment disclosure forms and verify restricted amounts are properly reported in the proper GL.  
Obtain and review worksheet adjustments prepared by OFM restricting cash or investments in the governmental or business-type activities, general fund, and aggregate non-major opinion units.

We anticipate that these tests will provide sufficient appropriate audit evidence to address the assessed risk of material misstatement for relevant assertions in significant classes of transactions.

### **I.1.PRG - Cash & Investments**

*Procedure Step:* Substantive Tests

*Prepared By:* CJM, 11/19/2024

*Reviewed By:* CJG, 11/21/2024

Purpose/Conclusion.*
----------------------

#### **Purpose:**

Existence: To determine whether reported cash and investments existed as of the end of the period.

Completeness: To determine whether the financial statements report all cash and investment balances held as of the end of the period.

Classification: To determine whether the financial statements properly classify cash and investment balances in conformity with generally accepted accounting principles (GAAP).

#### **Conclusion:**

Existence: We determined reported cash and investments existed as of the end of the period. ***No issues noted.***

Completeness: We determined whether the financial statements report all cash and investment balances held as of the end of the period. ***No issues noted.***

Classification: We determined whether the financial statements properly classify cash and investment balances in conformity with generally

## State of Washington

accepted accounting principles (GAAP) except for accrued interest of \$35,378,092.08 improperly classified as interest receivable rather than cash and investments. E: OST Investment Fair Value Excludes Interest Aggregation of Misstatements (GAAP)

Testing Strategy:

**Add the testing strategy for each relevant assertion from the TeamStore.**

### **SAO Policy Requirement: Confirming or Verifying Cash & Investment Balances**

Confirmations can either be blind or a positive confirmation. In a blind confirmation (sweep), the auditor requests information on all accounts the bank holds for the entity (by entity name and/or EIN). In a positive confirmation, the auditor lists accounts (or accounts and balances) per the entity and asks the bank to confirm that the information is correct.

Confirm cash and investment account balances with County Treasurer, bank and/or brokerage. Use the template confirmation form provided in the Store when needed.

Confirmations can be mailed to addresses listed on the Bank Confirmation Address List available on the Auditor Reference Guide. If the bank notifies you of a different address, please contact Team Audit Support to update the list.

Banks may confirm incorrect amounts either due to a simple mistake, use of a wrong confirmation date or incorrectly including or excluding accounts. The first step in resolving differences should be to check information against the entity's bank statements and then call the bank to specifically confirm any difference.

Confirming investments may involve physical inspection, confirmation with the issuer, confirmation with the custodian, confirmation of unsettled transactions with the broker/dealer, confirmation with the counterparty, and/or reading executed partnership or similar agreements. When confirming investments, ensure investments are held in the entity's name.

*If confirmations are not used*, auditors must at minimum verify balances to the County Treasurer, bank and/or brokerage statements. If this is done, the auditor should consider the risk that the statements were altered and should examine papers for indications of alteration.

The following is a list of **additional considerations** for testing the existence assertion for cash and investments. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

### **Bank Reconciliations**

If the auditor is comparing reconciled (confirmed) bank or county treasurer balances to the GL (rather than confirmed amounts within an expected variance due to reconciling items), the auditor should consider performing some or all of the following tests to verify the accuracy of the reconciliations. Note that testing the reconciliation will provide evidence of both the existence and completeness of cash and investment balances.

## State of Washington

Trace (or compare summed) bank balances per statements to reconciliations.

Trace (or compare summed) book balances per reconciliations to the general ledger or financial statements.

*If a cash account is allocable to a particular fund, the balance in the general ledger should be recorded in the same fund.*

Scan the reconciliation for reasonableness. Look for unusual, unexpected or vaguely described reconciling items, lack of support or detail, very large reconciling items, very old reconciling items, and missing or extra elements that would indicate that the reconciliation was being performed incorrectly.

Foot the reconciliation for accuracy.

Trace deposits in transit to the subsequent month's bank statement, considering reasonableness of the in-transit period.

Trace outstanding checks to cash disbursement journal.

Check that any other reconciling items are valid and have been properly accounted for (ex: large debit or credit memos).

Check reconciliation against prior and/or subsequent reconciliations for reasonableness of amounts and items included and to trace reconciling items from the previous and/or subsequent period.

### Other Tests

Inquire whether any checks or deposits were being held at year end for budget, cash flow or other purposes.

Confirm investments purchased but not received as of year-end

Confirm investments sold but still held as of year-end

Confirm interest due or accrued but not yet received as of year-end

Search for manual journal entries that debit (increase) cash. Consider testing if risk indicators are noted.

Review reconciliations of clearing and transmittal accounts.

See accountability steps for testing strategies related to petty cash and imprest funds, which are not expected to be material to the financial statements.

*Auditors may perform additional procedures to confirm information in the deposit and investment note disclosure in this step or in the Notes to the Financial Statements step. Auditors should contact the Investment Specialist if they note significant interest rate or other risks with the government's deposits or investments.*

-----  
The following is a list of **considerations** for testing the completeness assertion for cash and investments. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

# State of Washington

## Completeness of Confirmed Accounts

When testing completeness of confirmed accounts, specifically consider the following accounts that are most often missed:

- Accounts related to bond reserves or bond payments

- Accounts related to subsidiary entities or fiduciary funds

- Transmittal accounts (sometimes called "depository accounts") where funds are deposited and periodically "swept" to the main bank account. This is associated most often with property management (with Housing Authorities) and for certain County Treasurers.

- Clearing accounts (also known as "zero-balance accounts" because the expected reconciled balance is zero) related to AP or payroll. Most entities use at least one such account (for federal payroll tax payments).

- In large entities, accounts opened in the name of the department or in the name of a departmental program.

Obtain a list of all bank and investment accounts as of FYE from the entity.

- Scan the list for expected new accounts as a result of new activity (ex: bond issuance) or new process (ex: switching from centralized to decentralized receipting processes).

- Inquire with selected departments to ensure that there are no other accounts that had been opened by the departments.

Compare the entity-prepared list to the prior audit and confirm all accounts that were open last year but closed during the audit period. Inquire of appropriate entity personnel as to when the account was closed, and the reason for closing the account (which may indicate the opening of other new accounts). To verify, obtain final bank statement showing zero balance and any correspondence from the bank confirming the account closure.

Perform a bank sweep by sending blind confirmations to banks that the entity uses and other local banks (confirmations requiring the bank to list all accounts, rather than confirm the entity's list).

## Other Tests

Consider whether the government has any unreported cash and investments, including security or other deposits, held by fiscal agents, vendors, related parties or other governments as part of joint projects or programs.

Confirm investments purchased but not received as of year-end.

Confirm interest due or accrued but not yet received as of year-end.

Search for manual journal entries that credit (decrease) cash. Consider testing if risk indicators are noted.

## State of Washington

Scan bank accounts during the last month of the fiscal year for unusual transactions, particularly on the last day of the fiscal year. If large bank transfers are noted, trace to the bank reconciliation to ensure these are properly accounted for.

*Auditors may perform additional procedures to confirm information in the deposit and investment note disclosure in this step or in the Notes to the Financial Statements step. Auditors should contact the Investment Specialist if they note significant interest rate or other risks with the government's deposits or investments.*

-----

The following is a list of **considerations** for testing the rights and obligations assertion for cash and investments. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

### **Legality of Deposits and Investments**

See steps located in the Accountability cabinet under Assets | Investments sub-folder for testing strategies related to the legality of deposits and investments.

### **Ownership and Encumbrances**

Verify names on accounts through confirmation requests.

Review any contracts or agreements related to the bank account or funds to ensure the account is owned by the entity or if it is only held in trust (if so, it should be presented as a restricted asset with an offsetting liability or as a fiduciary fund, depending on the nature of the arrangement).

Inquire regarding any compensating balance agreements.

*Compensating balance agreements are where an entity contractually agrees to hold a certain amount of money on deposit with a bank, usually at a reduced interest rate, as a condition for approval of a loan.*

If applicable, evaluate whether negative cash or investment balances or overdrawn accounts represent instances of noncompliance (for example, prohibitions against interfund borrowing).

Ensure that refundable deposits held by the entity (such as security deposits) are accounted for as a restricted asset and offset by a liability.

### **Investment Pools (if applicable)**

Check that investment pools are properly established by interlocal agreement (other than the State Treasurer's LGIP which is established by statute).

## State of Washington

Consider whether the government's policy for valuing investments might result in one fund benefiting another based on its method for allocating interest revenues within the pool.

*Auditors may perform additional procedures to confirm information in the deposit and investment note disclosure in this step or in the Notes to the Financial Statements step. Auditors should contact the Investment Specialist if they note significant interest rate or other risks with the government's deposits or investments.*

### **Investment Pools (if applicable)**

Check that investment pools are properly established by interlocal agreement (other than the State Treasurer's LGIP which is established by statute).

## State of Washington

Consider whether the government's policy for valuing investments might result in one fund benefiting another based on its method for allocating interest revenues within the pool.

*Auditors may perform additional procedures to confirm information in the deposit and investment note disclosure in this step or in the Notes to the Financial Statements step. Auditors should contact the Investment Specialist if they note significant interest rate or other risks with the government's deposits or investments.*

-----  
***Auditors are required to contact the Investment Specialist** if they note any **Alternative Investments** [potentially reported at NAV (as a practical expedient)], investments valued at **Level 3** in the fair value hierarchy, or investments with significant interest rate, illiquid level 2 measurements, or other risks with the government's deposits or investments. These types of investments are at higher risk of material misstatement and auditors must perform specific procedures required by standards when applicable.*

The following is a list of **considerations** for testing the valuation assertion for cash and investments. As the valuation assertion for investments often involves greater auditing considerations due to the complexity of measuring investments, the audit approach can vary significantly depending upon the fair value measurements used and the associated risk of material misstatement based on the results from planning procedures (inherent and control risk assessments) which are the basis to the auditor's design of substantive tests. The valuation method used for the measurement or disclosure (for example, cost, equity method, or fair value, and hierarchy level) is a significant factor in properly designing tests of valuation.

### Valuation of Investments

#### **Auditors can utilize three possible audit approaches to testing fair value measurements:**

Develop an independent fair value estimate (generally more effective for Level 1 measurements).

Trace amounts reported for selected or sampled investments to quoted market prices.

Test management's estimation process (generally more effective for Level 3 and the least liquid Level 2 measurements or when management's process already incorporates all of the relevant and reliable valuation sources that are available). Evaluate methodology and support for investments where fair market value is not determined by quoted market prices.

Determine whether the entity's policies for valuing its investments are in conformity with GAAP and appropriately applied to investments.

Test how management made the accounting estimate and the data on which it is based (including valuation techniques used by the entity in its valuations). Test the operating effectiveness of the controls over how management made the accounting estimate, together with appropriate substantive procedures.

## State of Washington

Develop a point estimate or range to evaluate management's estimate (auditor might decide to develop a point estimate or range to evaluate management's point estimate if the auditor (a) is not able to obtain an understanding of the process used to generate the price, including controls over the process of how reliably the price is determined, or (b) does not have access to the model, including the assumptions and other inputs used).

Test subsequent events and transactions (evidence of subsequent purchases, sales or other relevant transactions has to be available).

Determine whether events occurring up to the date of the auditor's report provide audit evidence regarding the accounting estimate.

A government may use quoted prices provided by third parties, such as pricing services or brokers, **if the government has determined that those prices are developed in accordance with GASB 72.**

The following list pertain to potential audit approached to gain evidence regarding information from third-party pricing sources used by management:

For level 1 inputs, comparing the information from third-party pricing sources with observable market prices (reputable online sources)

Reviewing disclosures provided by third-party pricing sources about their controls and processes, valuation techniques, inputs, and assumptions

Testing the controls that the user management has in place to assess the reliability of information from third-party pricing sources

Performing procedures at the third-party pricing source to understand and test the controls and processes, valuation techniques, inputs, and assumptions used for asset classes or specific investments of interest

Evaluating whether the prices obtained from third-party pricing sources are reasonable in relation to prices from other third-party pricing sources, the entity's estimate, or the auditor's own estimate

Evaluating the reasonable of valuation techniques, inputs, and assumptions

Developing a point estimate or range for some investments priced by the third-party pricing source and evaluating whether the results are within a reasonable range of each other

Obtaining a service auditor's report that covers the controls over the validation of the prices\*

### **Investment Pools (if applicable)**

Determine whether pool investments are reported at fair market value, unless a governmental external investment pool operates in conformity with GASB 79 p. 4, or if the external investment pool operates by policy consistent with SEC's Rule 2a7 for regulated money markets (a 2a7-like pool), in which case investments may be reported at amortized cost.

Review or recalculate allocation of gains, losses and investment expenses from pooled cash and investments to individual funds invested in the pool (internal investment pool).

*Auditors may perform additional procedures to confirm information in the deposit and investment note disclosure in this step or in the Notes to*

# State of Washington

*the Financial Statements step*

## **Valuation Related Disclosures**

In accordance with GASB 72 p. 80, valuation and related disclosures required should be organized by type of asset or liability. The following should be taken into consideration when determining the level of detail and disaggregation and how much emphasis to place on each disclosure requirement:

- The nature, characteristics, and risks of an asset or a liability

- The level of the fair value hierarchy within which the fair value measurement is categorized

- Whether a GASB standards specifies a type for an asset or a liability

- The objective or the mission of the government (disclosures should distinguish between the primary government and its discretely presented component units.)

- The characteristics of the government

- Relative significance of assets and liabilities

- Whether separately issued financial statements are available

- Line items presented in the statement of net position

The following are among the required note disclosures related to investments at fair value:

- For recurring and nonrecurring fair value measurements:

  - Fair value measurement at end of reporting period

  - Fair value hierarchy level (except for investments that are measured at the NAV per share)

  - Descriptions of valuation techniques used

  - Change in valuation technique, if applicable, that has a significant impact on measurement, including the reason for making the changes

- For nonrecurring fair value measurements, the reason for the measurement

## State of Washington

Policy for determining which investments, if any, are reported at amortized cost

For any investments in external investment pools that are not SEC-registered, a brief description of any regulatory oversight for the pool and whether the fair value of the position in the pool is the same as the value of the pool shares

Any involuntary participation in an external investment pool

If an entity cannot obtain information from a pool sponsor to allow it to determine the fair value of its investment in the pool, the methods used and significant assumptions made in determining that fair value and the reasons for having had to make such an estimate

Any income from investments associated with one fund that is assigned to another fund

---

The following is a list of **considerations** for testing the classification assertion for cash and investments. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

### **Classification between Line Items**

Verify that amounts have been properly classified as cash, cash equivalents or investments on financial statements (see policy/criteria tab for definitions).

Verify that externally restricted amounts are classified as restricted

### **Classification between Opinion Units**

Search for manual journal entries that transfer cash from one opinion unit to another without recording an operating statement transaction (debit and credit to cash and fund balance for each opinion unit, respectively). Consider testing if any risk indicators are noted.

Search for manual journal entries that re-classify existing cash balances (transaction is a debit and credit to different cash accounts). Consider testing if any risk indicators are noted.

Compare budgeted interest earnings to actual and follow-up on any significant difference.

Calculate an estimated implied interest rate for each opinion unit by dividing interest earnings by the average of beginning and ending cash and investment balances. Compare across opinion units and follow-up on unexpected results.

Review cash transfers or journal entries that move cash without debiting an expenditure to determine if cash was improperly moved.

# State of Washington

Check that any suspense funds were reported at 0 as of fiscal year end (per [BARS 3.6.11](#)).

Scan titles of fiduciary funds and follow up with additional procedures to verify the nature of any funds that appear to be misclassified.

## **Presentation of Overdrawn Balances**

Determine whether overdrawn cash balances are properly reported as liabilities rather than as negative cash balances.

Determine whether interfund balances are properly recorded for overspent or over-committed agency funds.

*Auditors may perform additional procedures to confirm information in the deposit and investment note disclosure in this step or in the Notes to the Financial Statements step. Auditors should contact the Investment Specialist if they note significant interest rate or other risks with the government's deposits or investments.*

Guidance/Criteria:
--------------------

**Add the Guidance/Criteria for each relevant assertion from the TeamStore. You may also include other resources that you used for testing.**

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**Outstanding Checks and Deposits in Transit** – Per TIS section 1100.08 (AICPA Technical Questions and Answers), outstanding checks should be reported as a reduction of cash and the amount of deposits in transit should be reported as cash. A check is considered outstanding from the time that it is out of the payor's control – when mailed or delivered to the payee – until the time it clears the bank. Cash should represent amounts within the control of the reporting entity, that is, the amount of cash in banks plus cash and checks on hand and deposits in transit minus the amount of outstanding checks.

# State of Washington

**Agreements** - paragraph 66 "Significant violations during the period of legal or contractual provisions for deposits and investments ... and the actions taken to address such violations should also be disclosed. ..."

## **GASB 38 Certain Financial Statement Note Disclosures**

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

GASB 72 paragraph 69, as amended, requires all investments be measured at fair value except as follows:

- Investments in nonparticipating interest-earning investment contracts (such as nonnegotiable certificates of deposit) – Cost-based measure (see GASB 31, p. 8.)

- Investments in unallocated insurance contracts – Reported as interest-earning investment contracts

- Money market investments and participating interest-earning investment contracts with remaining maturity at time of purchase of one year or less and are held by governments other than external investment pools – Amortized Cost

- Investments held by qualified external investment pools – Amortized Cost

- Investment in qualified external investment pools – Amortized cost (governmental external investment pool meets criteria of GASB 79, p.4)

- Synthetic guaranteed investment contracts (SGICs) that are fully benefit responsive – Contract value

- Investments in life insurance contracts – Cash surrender value

Fair value measurements should be made consistent with the provisions of GASB Codification *3100 Fair Value Measurement*.

### **Valuation Methods**

To measure fair value, GASB 72 p. 18, requires governments to use valuation techniques that are appropriate in the circumstances and for which sufficient data are available, maximizing the use of observable inputs and minimizing the use of unobservable inputs. A government should use one or more of the following three approaches to measure fair value (GASB 72 p. 23-27):

- Market Approach – uses prices and other relevant information generated by market transactions involving identical or similar assets, liabilities, or groups of assets and liabilities. Techniques consistent with market approach are include:

  - Quoted market prices

  - Market multiples technique

  - Matrix pricing technique

- Income Approach – converts future amounts (i.e. cash flows or revenues and expenses) to a single current (discounted) amount.

When the income approach is applied, the fair value measurement reflects current market expectations about future amounts.

Valuation methods consistent with the income approach include:

# State of Washington

Present value techniques

Option pricing models

Multi-period excess earnings methods

Cost Approach – reflects the amount that would be required currently to replace the present service capacity of an asset. Fair value is determined based on the cost to a market participant (buyer) to acquire or construct a substitute asset of comparable utility, adjusted for obsolescence.

Governments may invest in a variety of investments –fix income securities (i.e. asset backed securities), exchange-traded equity securities, government investment pools, and alternative investments (i.e. private equity funds, hedge funds, real estate) (pension and endowment funds). The valuation assertion often involves greater auditing considerations due to the complexity of measuring investments. The audit approach will vary significantly depending upon the fair value measurements used and the associated risk of material misstatement. The valuation method used for the measurement or disclosure (cost, equity method, or fair value) is a significant factor in properly designing tests of valuation.

[LGIP Fund Summary Reports](#) - includes a list of local government accounts and balances in the Local Government Investment Pool

### **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

### **BARS [3.8.6](#) Use of Payroll and Claims Funds**

### **[GASB Codification 3100](#) Fair Value Measurement and Application**

---

#### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**Cash** - Consistent with common usage, cash includes currency on hand, demand deposits, and deposits in other kinds of accounts that have the general characteristics of demand deposit accounts in that the government may deposit additional cash at any time and also effectively withdraw cash at any time without prior notice or penalty (SGAS 9, footnote 5).

**Cash Equivalent** – Defined by GASB Codification 2450.106 as short-term, highly liquid investments that are both (a) readily convertible to known amounts of cash and (b) so near their maturity that they present insignificant risk of changes in value because of interest rates; generally only investments with original maturities of three months or less (at time of purchase) meet this definition. Original maturity means the original

## State of Washington

maturity to the entity holding the investment. For example, both a three-month U.S. Treasury bill and a three-year Treasury note purchased three months from maturity qualify as cash equivalents. However, a Treasury note purchased three years ago does not become a cash equivalent when its remaining term is three months. [GASB 9, fn 6]

**Restricted Cash and Investments** – Cash and investments should be classified as restricted whenever externally imposed restrictions (those imposed through law or by creditors, grantors, contributors or regulations of other governments) change the normal understanding of the availability of the asset. For example, a normal understanding of cash and investments is that the government is not limited in its ability to use the cash and investments to pay current liabilities (GASB 34 par 34 and 99).

Record of Work Done.:
-----------------------

**Test 1: Confirm the balances for Fund 076 Concentration, Fund 523 LGIP, and Fund 845 SMA, in TM\$ with the amount recorded by US Bank as of June 30, 2024**  
**(Existence)**

We obtained and reviewed the bank reconciliations performed by Ryan Pitroff, Banking Services Manager, Cash Management Division, for all three funds at 6/30/2024. See bank reconciliations and TM\$ Balance Summaries for Fund 076 Concentration Tests 1-5, Concentration Account Bank Recon, 523 LGIP Tests 1-5, LGIP Account Bank Recon and 854 SMA . We tied the balances of each fund to the corresponding US Bank statements for each account, see here: OST Test 1. We compared the balance per US Bank, to the balance in the TM\$ balance summaries, and as shown on the bank reconciliation worksheet for each account. We selected the largest positive and negative reconciling items, amounting to 83.5% of the total, to do further testing on. See summary of coverage selection and detail of testing on the Fund 076 reconciliation worksheet here: . **We confirmed that**

## State of Washington

**the reported balances for Fund 076 Concentration, Fund 523 LGIP and Fund 845 SMA existed as of 6/30/2024 per TM\$ and US Bank. No issues noted.**

**Test 2: Confirm investments tie between Northern Trust and TM\$ and to confirm the par and market value amounts for Fund 076, Fund 523, and Fund 845 in TM\$ with the amount recorded at Northern Trust and outside banks as of June 30, 2024 (Existence):**

See testing performed at [OST Test 2](#) & holding statements at [Test 2 ReconInvestmentStatementJune2024](#) for Funds 076, 523, and 845 to reconcile total investment balances at par and market value(s) per TM\$ to the Custodian Bank at 6/30/2024. We obtained the Northern Trust Asset Detail and identified securities reported in TM\$ that were not reported on the asset detail. We obtained bank statements from Katie Davis, Fiscal Analyst to confirm that all reported investments in TM\$ valid support from an entity apart from the Treasurer's office. [Test 2 - Bank Statements](#) We agreed amounts to statements and noted the last 4 digits of the account number in the reference column on our reconciliation. Katie Davis also provided us with the time deposit excel spreadsheet, the Linked Deposit Program spreadsheet and the LGIP CD tracking spreadsheet to agree amounts for the CD, TCD and Linked Deposit accounts. **We determined that TM\$ contains a complete list of investments between what is reported by Northern Trust and banks holding cash investments. We confirmed that par and market value amounts for Fund 076, Fund 523 and Fund 845 agreed to the amounts recorded with Northern Trust as of June 30, 2024 except for an issue related to the par and fair value of investments not including interest paid on 6/30 totaling \$35,378,092.08 As a result interest and dividends receivable were overstated and cash and cash equivalents were understated.** [E: OST Investment Fair Value Excludes Interest](#)

**Test 3: Verify investments in the custody of Northern Trust includes accrued revenue at June 30, 2024 which agrees to TM\$ (Completeness):**

We used the substantive sampling spreadsheet to determine our sample size, linked here: [OST Test 3](#). We used the TM\$ Accrued Revenue Statements for Fund(s) 076, 523, and 845 to select a sample of 38 investments in order to recalculate their accrued interest revenue. See detailed calculation methodology within our referenced work paper for the different types of securities. We excluded bank account deposits because the interest cannot be computed in auditor recalculations due to daily fluctuations in account balance. We cross referenced selected investments to the TM\$ Investment Statements for Fund(s) 076, 523, and 845 at [Test 3 Investment Statmtent for GL Postings 2024 June 30](#). We recalculated accrued interest revenue on selected investments at: [OST Test 3](#) tab "Testing".

Some of the selected securities are "Floating Rate Notes," which have a variable rate of return. These securities have "FRN" as part of the security description. Due to the complexity of the formula to determine accrued revenue, we obtained charts showing how OST calculated the accrued revenue daily. We cross referenced the Investment Number selected for testing against the Investment Statement (Sorted by Security Class Number) [OST Test 3](#) to obtain the CUSIP and confirm the security class. We used the security class tab [OST Test 3](#) to gain greater detail on how the security's accrued interest is calculated (Prime or SOFR Floater).

Details about Treasury Note FRNs can be found here: <https://treasurydirect.gov/marketable-securities/floating-rate-notes/>. The interest rate is the sum of the highest accepted discount rate of the most recent 13-week Treasury bill with a "spread" rate, which is fixed for the life

## State of Washington

of the FRN. The interest rate changes weekly. **We recalculated the accrued interest by using the earnings per \$100 interest payment period from the Treasury website and multiplying it by the note face value.**

Details about the SOFR rate (Secured Overnight Financing Rate) can be found here: [<https://www.newyorkfed.org/markets/reference-rates/sofr>]. The SOFR can change daily. **Our samples did not contain investments using the SOFR this year.**

Details about the US prime rate can be found here: [<https://fred.stlouisfed.org/series/PRIME>]. The interest rate changes as the Federal Reserve sets the federal funds target rate. **We noted that for notes using the prime rate that the book yield rates changed on days where the Federal Reserve changed the federal funds target rate.**

**We determined that TM\$ is performing the accrued interest rate correctly for SOFR and Prime calculations as evidenced by changes in the book yield rate. We will rely on the calculation tables as a recalculation for SOFR and Prime note securities.**

We performed our recalculation for the accrued revenue of 38 investments with no variances from the amounts that were calculated by TM\$, ignoring rounding in the recalculations. No further work necessary. *No issues noted.*

### **Test 4: Reconcile balances for Fund 076, Fund 523, and Fund 845 in TM\$ with the amount recorded in AFRS at year-end and Disclosure Form A- Investment Disclosures (Completeness, Existence)**

We reconciled the investment balances for each fund reported in TM\$ with balances reported in AFRS, and Disclosure Form A (Investment Disclosures). See testing performed at: OST Test 4. We ran AFRS queries to obtain the AFRS balances for Funds 523, 076, and 845. See tab "2024 AFRS Investment Balance(s)". We obtained the Investment Disclosures from Katie Davis, Fiscal Analyst. We included the Disclosure Form A for each fund within the OST\_Test\_4 spreadsheet, see tab(s) "2024 Inv Disclosure 523/076/845". We linked amounts on the "2024 Reconciliation" tab directly to supporting numbers on the Disclosure Form (Book Value) and AFRS queries. We also included the Investment Statements for 6/30/2024 from TM\$ for all Funds to ensure they also agreed to Disclosure Form A. See tab(s) "2024 Fund 523/076/845 GL" in the above referenced work paper. **We were able to reconcile the balances for Funds 076, 523, and 845 (Completeness, Existence) without exception. No issues noted.**

### **Test 5: Reconcile the aggregate amount of cash in GL's 4310 and 4320 to the Treasurer's cash balance in TM\$ at year-end (Completeness, Existence)**

We obtained the aggregate amount of cash in GLs 4310 -Current Treasury Cash Activity, and 4320 -Beginning Treasury Cash Balance Admin Agency, from the FY24 ACFR database. We then reconciled the aggregate amount of cash in GLs 4310 and 4320 for all agencies and all funds with the amount of cash reported by OST. See detailed testing performed here: OST Test 5.

We reconciled the total Treasury and Treasury Trust cash reported on the Statement of Receipts and Disbursements for the State Treasury with

## State of Washington

the amounts reported in AFRS for GLs 4310 and 4320. Fund(s) 076 and 523 are not included in the Treasury's Receipts and Disbursements Report, so we subtracted the amount of cash in Fund 076 (Treasury/Trust fund) and Fund 523 (LGIP) from the aggregate amount of cash in GLs 4310 and 4320. We linked AFRS amounts on the "Reconciliation" tab directly to supporting amounts from AFRS queries. Ending book balance for Treasury and Treasury Trust Funds was \$19,363,177,988.69. Total reported in AFRS excluding Fund(s) 076 and 523 was \$19,363,177,988.69. **We were able to determine that reported cash and investments existed as of the end of the period, without exception. No issues noted.**

We also reconciled the amount of cash reported in GLs 4310 and 4320 with the amount of cash held in the concentration account (Fund 076). We began with the aggregate amount of cash in GLs 4310 and 4320 and added the outstanding warrants reported on the Statement of Receipts and Disbursements Test 5 Receipts and Disbursements June 2024. We subtracted the LGIP cash balance in AFRS of \$911.90 and cash on hand in the amount of \$65,233.16 per the Daily Cash on Hand Activity Report at: Test 5 Cash on Hand FY 24. We subtracted bank errors in the amount of 26,703.32 per TM\$: Test 4 Concentration TM\$ Accounting Recon Screen. The remaining difference was explained by reviewing Ryan Pitroff's June 2024 reconciliation for the concentration account: Tests 1-5, Concentration Account Bank Recon. We removed agency deposits recorded by OST as of July 1st and added in NSF adjustments, bank adjustments, and the physical deposit exception. See detailed testing performed here: OST Test 5. We reconciled the aggregate amount of cash in GL's 4310 and 4320 to the Treasurer's cash balance in TM\$ at year-end (Existence) without exception. **No issues noted.**

### **Test 6: Review year-end journal entry to ensure investments were properly allocated between short-term and long-term (Classification)**

We obtained and reviewed the AFRS JV #090IN019 dated 7/26/24 OST Test 6 and traced allocation amounts to GL 1209 and 1210 to the corresponding investment statements for Fund(s) 076, 523, and 845 (also included in Test 6 Apportion Investments FY24 see total amounts on pages 24, 29, and 43). Allocation balances agreed to the totals reported for each GL on the Investment Statements. We also ran an AFRS query and compared the total(s) by GL and fund number. See testing performed at: OST Test 6 **We confirmed that investments were appropriately classified between short term and long-term at June 30, 2024 (Classification). No issues noted**

### **Restricted Cash & Investments: Obtain year-end cash and investment disclosure forms and verify restricted amounts are properly reported in the proper GL (Classification)**

See testing performed at: OST Restricted Cash Testing. We obtained a list of worksheet adjustments from OFM and placed the fund statement adjustments in the "2024 Worksheet Entries - Fund" tab and government-wide adjustments in the "2024 Worksheet Entries GovtWide" tab. We sorted entries to filter out increases to sort codes AF and/ or DM for fund level entries, and 1H and 1S for government wide restricted cash and investments. We also obtained a disclosure report for restricted cash and investments from Enterprise Reporting: Financial Reports, Disclosure Reports, State, Cash/Investment, and then selected the report titled "Cash and Investments-Restricted Cash and Investments". We ran the report and added it to our work papers at tab "Disclosure 2024".

We performed the following procedures to ensure worksheet adjustments were supported by corresponding disclosures:

## State of Washington

1. We traced each fund level worksheet adjustment that increased restricted cash and investments (sort code AF) to supporting disclosures in sections 3, 4 and 5 of the Restricted Cash and Investments Disclosure Report, which is used to report cash with fiscal agents (GL 1150), unspent bond proceeds, and other externally restricted cash and investments. See tabs "2024 Worksheet Entries - Fund" [OST Restricted Cash Testing](#) and "Disclosure 2024" [OST Restricted Cash Testing](#)
2. We reviewed line items from the Disclosure Report that were not reclassified per the OFM worksheet to ensure they meet the definition of restricted cash (per GASB 62) and ensure they were not incorrectly omitted. See [GASB 62, paragraph 31](#), for definition. We determined that balances were properly reported. **No issues noted.**
3. We tied the worksheet adjustments at the government-wide and business-type level to the corresponding fund-level worksheet entries. Government -wide and business-type activities worksheet adjustments that increased sorts codes 1H were traced to the totals of the fund-level worksheet entries. See tab "2024 Worksheet Entries GovtWide" [OST Restricted Cash Testing](#) **No issues noted.**

### **Restricted Cash & Investments: Obtain and review worksheet adjustments prepared by OFM restricting cash or investments in the governmental or business-type activities, general fund, and aggregate non-major opinion units (Classification)**

See testing performed at: [OST Restricted Cash Testing](#). To verify that restricted amounts are properly reported, we obtained the restricted cash and investment disclosure report from Enterprise Reporting and performed the following procedures:

1. We ran an ACFR query for sort code(s) AF and DM. See tab "2024 Query AF, DM" [OST Restricted Cash Testing](#). We summarized the balances at the rollup fund level. See tab "ACFR Restricted Rollup Fund 24" [OST Restricted Cash Testing](#). We compared the balance for each rollup fund to the corresponding disclosures on section 1 of the disclosure report to ensure amounts agree. **No issues noted.**
2. We added the fund-level worksheet adjustments for each rollup fund, to the amount disclosed in section 1 of the disclosure report (GLs 1140 and 1240), and tied amounts reported for each opinion unit on the financial statements [\[2024 ACFR for SAO Version No. 1 11.15.2024\]](#) at: [\[OST Restricted Cash Testing\]](#). See tab "ACFR Restricted Rollup Fund 24."

### **Reconciliation to Material Account Matrix**

We performed additional procedures to reconcile the balances audited at OST to the Final Significant Account Matrix [Final Planning Significant Account Matrix](#) Cash and Investment balances. See [OST Recon Significant Account Matrix](#) for testing. Our detailed understanding is documented below.

#### **A. Sort Code AC**

We ran a query in the FY24 ACFR database for sort code AC by GL account number including all funds and performed a reconciliation to determine the total cash balance covered by auditor procedures at the State Treasury and the total audited as part of other procedures. See the "FY24 Summary\_AC" tab in our workpaper [OST Recon Significant Account Matrix](#) . By running the AC query by detail agency, we separated the

## State of Washington

balances into the following categories:

### **B. Sort Code(s) AM and DJ**

**Audited at OST** (54% of balance)- All balances for agency 090 including totals for GLs 4310 (Current Treasury Activity) and 4320 (Beginning Treasury Cash Balance Admin Agency) which were reconciled as part of our substantive testing at OST (Test 5). At year-end, OST makes an adjustment to allocate the fair value gain to receipt funds at the rollup level in GL 1280-Valuation Allowance-Investments. We reviewed the adjustment obtained from Katie Davis, Fiscal Analyst, and ran a query using the FY24 ACFR Database to confirm the total fair value gain. See tab "OST JV090IN023" in our workpaper for details:  
OST Recon Significant Account Matrix.

**OFM year-end adjustments** at the rollup fund level (64% of balance) At year-end OFM does a number of adjustments to allocate balances at the rollup fund level. Adjustments over \$5 million are reviewed as part of Financial Statement Preparation at:  
Adjustments.

**SIB Accounts** audited by other CPA: A portion of the balance (-18% of the balance) was attributable to the State Investment Board. (The negative cash, due to owner funds, is cleared in OFM agency 700 year-end adjustments) These balances are audited by an outside CPA firm, and we will rely on their work at: Work of Other Auditors - SIB

**Worker's Compensation Funds-** A portion of the balance (-0.02%) was audited as part of the Worker's Compensation Audit at S1WorkersCompensationFunds-FS24.

**Not reconciled at OST-** (0.02% of the balance) - Not in the custody of the State Treasurer. The remaining balance is comprised of amounts not included in the Treasurer's balance audited at OST. See column I on tab" FY24 Summary\_AC" in our workpaper:  
OST Recon Significant Account Matrix. GLs 1130 and 1150 are by definition not funds in the custody of the State Treasurer. Transactions in the "in-process" accounts are considered outstanding until they are cleared by OST and adjusted to GL 4310. Balances in these accounts are not recorded by the State Treasurer and represent outstanding transactions that agencies must include as reconciling adjustments in tying their cash balances to OST.

In total, we concluded that the amount of \$31,662,728,669 on the final significant account matrix for Sort Code AC is covered by audit procedures. This represents 98% of the balance. **No issues noted.**

### **B. Sort Code(s) AM and DJ**

We ran additional queries for sort codes AM and DJ for all funds at agency 090 by GL account number. The balances in AM and DJ consist primarily of funds in the Treasury Income Account (Fund 076) and the Public Investment Account (Fund 523). A small portion of the total was attributable to allocations to GL 1280 and 1216. We were able to tie balances from our query to the Significant Account Matrix for the corresponding GL sort codes. See tabs "FY24 AM\_Detail" and "FY24 DJ\_Detail" in our workpaper for details. **No issues noted.**

# State of Washington

## I.2.PRG - Non Depreciable Assets

*Procedure Step:* Summary & Conclusion

*Prepared By:* NJH, 10/17/2024

*Reviewed By:* RKM, 11/19/2024

Purpose/Conclusion:

**Purpose:**

To evaluate risk assessments and the sufficiency and appropriateness of evidence obtained based on results of substantive work.

**Conclusion:**

We determined that **no** modifications were necessary to inherent risk, control risk, or the risk of material misstatement as assessed in planning.

We also determined that evidence obtained was sufficient and appropriate in response to the risk of material misstatement.

Testing Strategy:

Auditors are **required** to evaluate conclusions for substantive testing as follows:

*Auditors may wish to use the optional Lead Sheet available in the Store to summarize testing related to each balance and assertion.*

**1.** Determine whether the results of substantive testing indicate a need to modify the inherent risk assessment (IR), control risk assessment (CR), risk of material misstatement (RMM) or other aspects of planning (such as material balances or assertions). If so, document changes and consider the need for additional testing.

*If the results of substantive testing indicate a need to change control risk, auditors should also update the **Permanent File** by either correcting the documentation or by adding an update section describing changes to the top of the record of work done. For all changes to IR, CR, or RMM the **Material Balances** spreadsheet should be updated.*

*More significant changes to other aspects of planning (such as material balances or assertions) should be referenced in this step and documented in detail in the **Changes to FS Audit Plan** step.*

**2.** Evaluate whether the quality and quantity of evidence obtained is sufficient and appropriate in response to the risk of material misstatement. In

# State of Washington

making this determination, auditors should evaluate:

## Information to be used as audit evidence:

- Does evidence relate to the population, period of time and risk (assertion and “what could go wrong” from the Material Balance Spreadsheet)? If there are any gaps or uncertainties in the logical connection between the evidence and conclusions, is there a documented consideration and explanation?
- Are the sources of information sufficiently reliable and appropriate for the risk (whether internal to the government, external, or auditor developed)? If key information is not from a sufficiently reliable source (for example, inquiry), then is it corroborated by information that is?
- Are there any concerns about accuracy, completeness, authenticity, or bias in information? If so, did the auditor perform sufficient procedures to confirm reliability of that information?
- Is information precise enough to catch if misstatements exceeded the tolerable level?
- Is information detailed enough to conclude on whether or not there were misstatements?
- Was there any information that appeared contradictory or inconsistent? If so, was there a documented response to the inconsistencies or doubts about the reliability of evidence?

## Results:

- How much misstatement was identified by testing, and the likelihood and magnitude of further potential misstatement?
- How did misstatements occur and how often might they occur again in the population?
- Were misstatements caused by control deficiencies or circumvention of controls?
  - If control deficiencies, is there a need to re-evaluate our understanding of controls in the [Permanent File](#) folder or assessment of control risk?
  - If circumvention, the [Management Override of Controls](#) step should address or reference this area. Auditors should also consider whether a fraud risk has been identified.
- Did tests identify a different level or type of risk than the planned audit response was designed to address?
- If likely misstatements are identified, are further procedures necessary to improve the precision of our estimate?

*To support the overall evaluation of audit risk and provide a basis for concluding on the overall sufficiency and appropriateness of evidence in the [FS Summary & Report](#) step, auditors should conclude in each area whether the auditor continues to believe that the tests performed and quality and quantity of evidence obtained are commensurate with RMM for all relevant risks (the “what could go wrong”, in the [Material Balances](#) spreadsheet).*

If the auditor determines that evidence is not sufficient or appropriate, additional substantive testing should be done. If sufficient, appropriate evidence is not available for audit, the AIC should discuss the effect on our audit report with the AAM and AM.

# State of Washington

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6310](#) – Determining the Nature, Timing and Extent of Substantive Testing**

**SAO Audit Policy [3210](#) – Audit Evidence**

Record of Work Done:

Based on test results, we re-evaluated risk assessments, procedures, evidence obtained and conclusions as follows:

### **(1) Do the results of substantive tests indicate a need to modify our risk assessment (IR, CR and RMM)?**

We determined that **no** modifications were necessary to inherent risk, control risk, or the risk of material misstatement as assessed in planning.

### **(2) Was the quality and quantity of evidence obtained sufficient and appropriate?**

We determined that evidence obtained was sufficient and appropriate in response to the risk of material misstatement.

## **I.2.PRG - Non Depreciable Assets**

*Procedure Step:* Understanding of Line Item

*Prepared By:* NJH, 6/10/2024

*Reviewed By:* BM2, 11/20/2024

Purpose/Conclusion:

### **Purpose / Conclusion:**

To gain an understanding of the line item and confirm the scope of testing as documented in the Significant Account Matrix.

# State of Washington

## Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

### **STEP 1: Prior Audit Exceptions**

Document any exceptions noted during the prior audit. Follow-up to determine how the agency has responded to or corrected the issue, unless this work is anticipated as part of the testing strategy.

### **STEP 2: Analyze Composition and Changes of Line Item**

Include link to the line item leadsheet. This will be completed at the end of the audit. Leadsheet analysis should be documented in this spreadsheet.

Inquire with agency staff about the activities and transactions that make up the balance and any changes to those activities or transactions in relation to the prior year.

Determine relevant classes of transactions or account balances within the line item to analyze (such as agencies, funds, programs, departments, accounts, and/or objects), and use AFRS to create trends of those elements. This step should not include any specific dollar amounts associate with the line item.

Evaluate trends to identify:

- (1) What classes of transactions or account balances are primary to the identified risk. Auditors should specifically consider what elements are primary to the line item (comprising a large percentage of the line item), and which elements the identified risk would apply to, and which elements might be most susceptible to the identified risk (having a high risk of non-trivial misstatement for a relevant assertion, considering likelihood and impact of potential for misstatement).
- (2) What changes are primary to the identified risk, if applicable. Auditors should specifically consider whether the overall change to the line item from the prior year was significant, what elements were the primary drivers of overall change, whether any elements changed significantly from the prior year, and which changes (if any) might relate to the identified risk.
- (3) Any unusual or unexpected elements, amounts, or changes that may indicate a risk, whether the one identified in planning or a new one that may need to be considered for a change to the plan.

**Consider** other procedures to gain an understanding of the line item, such as review of key policy documents, review of program information or reports, inquiry of staff, budget information, or other analytical procedures.

### **STEP 3: Update Significant Account Matrix**

Based on your understanding of the line item, update the Significant Account Matrix with final conclusions on the agencies covered, account description, significant accounting systems, and risk (what could go wrong and relevant assertions). The account description should reflect the significant transaction streams or account balances relevant to the risk.

## State of Washington

*The description of agencies, significant accounting systems, and what could go wrong in the Significant Account Matrix constitute the overall scope of substantive testing.*

*A transaction stream is significant based on the potential for misstatement. This is often due in part to its size (ie: comprising a large percentage of the total line item), but is ultimately a judgment about the susceptibility to the identified risk (for example, when the risk is understatement a small or omitted account may hold the most potential for the largest misstatement).*

*Significant accounting system(s) are those that contain key controls over significant classes of transactions included in the line item. Control systems identified in this step must match the Significant Account Matrix and have a separate control understanding documented.*

*Talk with the AIC if you identify any changes to the Significant Account Matrix.*

Guidance/Criteria:

Record of Work Done:

### **(1) Prior Audit Exceptions:**

None.

### **(2) Composition & Change Analysis:**

Line Item Leadsheet: [[Line Item Lead Sheet](#)].

Each year we review the two most recent fiscal year data due to timing between when the audit was started and when the CY ACFR database is available. This allows us to gain an understanding of the line item based on the most relevant data available at the time of beginning the audit.

#### Balance Breakdown for 2023/2022

We reviewed the balances for fiscal years 2023 and 2022 and determined that the line item balance was composed of five account balances. Of these accounts, 93% were covered within the GL account 2120, fund 997, which is Land and Other Non-Depreciable Assets. GL account 2120 is made up of the transportation infrastructure including highways, bridges, tunnels, and safety rest areas. Assets are recorded using the modified approach, which requires assets to be maintained at levels set by the agency and verified by biennial inspections/assessments. The assets are grouped into three categories: Pavement, Bridges, and Safety Rest Areas.

Related to this account there are three balances related to maintenance expenses. As of FY2023, 96.4% are broken out between pavements (57.4%) and bridges (39%).

During our control understanding with Pavements on 5/21/24 and Bridges on 5/22/24 we inquired about any major changes. Both informed us there were no major changes with pavements and bridges in FY24.

# State of Washington

## **(3) Updates to Significant Account Matrix:**

None

## **I.2.PRG - Non Depreciable Assets**

*Procedure Step:* Controls - CPMS/TRAINS/WSPMS

*Prepared By:* NJH, 8/20/2024

*Reviewed By:* BM2, 11/20/2024

Purpose/Conclusion.:

### **Purpose:**

To gain an understanding of internal controls.

### **Conclusion:**

We gained an understanding of internal controls as documented in the record of work done.

Testing Strategy.:

### **The following procedures are required for all material systems:**

1. List the financial statement balance(s) and relevant assertion(s) addressed by the understanding.
2. Gain an understanding of the internal control process, identify how transactions are recorded in AFRS, identify key controls over relevant assertion(s), and note any control weaknesses.  
In gaining an understanding of controls, consider the overall understanding of State-Level control elements as documented in the "State-Level Controls" step as they relate to this particular system.  
Identify controls systems covering all relevant assertions for all significant classes of transactions.  
Standards require the auditor to gain an understanding of the significant accounting system(s) that contain key controls over significant classes of transactions included in the line item.

## State of Washington

Control systems identified in this step must match the Material Account Matrix and have a separate control understanding documented. Talk with the ACFR Specialist or AIC if you identify different systems than the ones anticipated in the Material Account Matrix.

For each material system, auditors must document:

- A brief outline of the transaction flow from beginning to end.

- An expanded description of key controls.

- Business processes relevant to financial reporting of the relevant assertion for the material balance. Processes should encompass automated and manual procedures by which transactions or events are identified or initiated, authorized as needed, recorded, processed and corrected as needed.

- Original accounting records and how records are rolled-up to intermediary ledgers and transferred to the general ledger (AFRS) or financial statements.

- Detailed descriptions of key controls. Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

The following is information to **consider** when identifying key controls and transaction flow.

“Key controls” refer to the few controls that together provide reasonable assurance that material misstatements will be prevented or detected and corrected. This is contrasted with ancillary or supporting controls, which – although helpful and recommended – would provide less than reasonable assurance by themselves.

The focus of the write-up is on the key controls. Key controls should be specifically identified (as “key controls”) in the write-up. This can be done in whatever way the auditor prefers, so long as it is obvious. Details that the auditor should document regarding key controls may include:

- Who or what initiates the control

- When (or how often) is the control applied

- Who performs the control

- As needed, the experience, knowledge and attitude of the person applying the control

- Detailed description of the control process or activity. For example, if the control is a review: what exactly is reviewed, what is the reviewer looking at or for and what are the reviewer’s criteria?

- How the key control is documented or evidenced

- If not obvious from the description, how the control prevents or timely detects and corrects misstatements

- Any exceptions or alternative processing to the normal process

- What happens when misstatements or issues are identified by the control

## State of Washington

The “transaction flow” refers to the process by which transactions are initiated, authorized, recorded, processed and reported (as applicable). Outlining the transaction flow gives context to key controls, especially how transactions become subject to controls in the first place. If a control inherently ensures that all applicable transactions are included (ex: bank reconciliation where the assertion is existence), the auditor may decide to just start the write-up with the initiation of the control procedure and go from there.

Elements of the transaction flow are defined informally as follows:

*Initiation:* How are transactions initiated?

*Authorization:* How are transactions and accounting record maintenance authorized?

*Recording:* How are transactions or balances identified and recorded in financial accounting systems?

*Processing:* How are the transactions or balances processed after they are recorded (if at all)? Processing may be manual or automated and may occur at a subsidiary system level or at the general ledger level.

*Reporting:* How are records translated into the financial statements? This part of the transaction flow extends the understanding to the actual financial statements that the audit is opining on. Since we already document an understanding of the financial reporting process in general, it is usually enough to simply reference this overall understanding. However, if there are important steps unique to the covered balances, it may be more appropriate to mention them here.

Although transaction flow is a good way to think about understanding and documenting a control system, auditors should not worry too much about documenting “each element, in order” because often elements may be combined, not noticeable, not applicable or occur in a different order.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits](#) Planning Guide**

Record of Work Done:

### **Material Balance and Assertions:**

# State of Washington

Internal controls in the CPMS/TRAINS/WSPMS address the following balance(s):

Non Depreciable Assets

For the following assertions:

Valuation - There is a risk that the Washington State Legislature is not sufficiently funding infrastructure for the DOT to perform preservation maintenance. There is a risk DOT is reporting infrastructure using the modified approach when it should be reported using the historical cost approach because average preservation thresholds are not met. Governmental activities capital assets would be incorrectly valued and presented (depreciation would not be reported). Net position would be incorrectly valued. An error would cause an overstatement in the accounts.

Classification - There is risk the state is not adequately maintaining the state highway system and the assets are misclassified as non-depreciable rather than depreciable assets.

## **Gain an Understanding of Internal Controls**

We met with the following DOT staff on to gain an understanding of internal controls over Non Depreciable Assets:

Pavements - Meeting held on 5/21/24

Karen Strauss, State Pavement Management Engineer

Jianhua Li, State Pavement Management Engineer

Jesse Daniels, WSDOT Audit Liaison

Bridges - Meeting held on 5/22/24

Evan Grimm, Bridge and Structures Engineer

Gyung-Seop Shim, Bridge Management Engineer

Roman Peralta, Bridge Preservation Engineer

Jesse Daniels, WSDOT Audit Liaison

## **Pavement**

### **Data Collection**

WSDOT Pavement condition assessment data collection only takes place when there are dry road conditions from April through mid-October. The same lane on each roadway is reviewed each year to determine the deterioration over time to know when those roads need maintenance. The data collection, assessment, and reporting processes begin when the roads are consistently dry enough to measure (usually sometime in March or April) and the assessment for the year will start almost immediately afterward because data is coming into the office every week. The field data collection involves three staff from the pavement team: two for the distress van and one for the friction vehicle. One staff member remains in the office and begins the review of the distress videos. After the data collection is completed and the weather does not allow for collection, the field collection team assists with the review of distress videos in the office. The Pavement Management Unit works to complete the review process

## State of Washington

during the spring of the following year so the final report to the FHWA, DOT Gray Notebook, and the financial statement can occur by the fiscal year end for the previous calendar year assessment. For this year, the Pavement Office is currently working with the 2023 collection data and expect it to be available during the summer of 2024.

Data collection is done by WSDOT Materials Laboratory Technicians utilizing a pavement distress data collection van and a friction measurement vehicle. The distress collection van collects data several ways using the Pathway system which is the pavement software program used by the Washington State Pavement Management System (WSPMS) that is on the pavement collection vans. While driving over at least one lane of all highway routes each year the van collects data in both directions on divided highways. The vehicle continuously measures the depth of rutting and roughness using laser measurements. The International Roughness Index (IRI) or laser data collection, is required to be reported to the Federal Highway Administration (FHWA) annually and they also calibrate the laser annually. There are digital video cameras that take pictures, with views provided from the driver's view, view of the edge of the roadway, a downward facing camera, and a 3D detailed close-up of the lane width of the road. The 3D images are used to see cracking and takes a photo every 26 feet. This data is recorded on a portable hard drive which is removed when the vehicle comes back to the office, either nightly (for local collection) or at least weekly (for trips far from the office). In the Materials Lab, the hard drive data is downloaded to servers in the office for analysis. All data is broken up into 2-hour sections (sets). The friction vehicle tests approximately half the state each year, divided roughly by east and west sides of the state. The friction testing vehicle consists of a truck, which has a large water tank and a friction trailer towed by the truck that measures the friction and reports it to a computer in the truck cab. The friction is measured using a locked wheel trailer with a rubber tire and water applied to the roadway. The driver will press a button and water out of a large water tank in the trailer will come out in front of the tire and an immediate reading will display in the truck. The friction measurements are taken every mile on all highway routes (both directions if divided). The truck also measures friction on bridge decks for special projects and High Friction Surface Treatment areas (HFSTs). This data is recorded in the vehicle and brought in daily (if local), or at least weekly (if not local), to download onto servers. If the driver notices friction reading below the threshold, he will circle around and drive the area again to ensure the reading was correct. If he determines the reading is accurate and below the threshold, it will be immediately reported and sent to the regional office. An internal policy requires immediate action from the regional office because conditions are considered unsafe. Each year, the data is summarized. Any friction measurements below the minimum are reported to the region traffic, materials, and maintenance engineers immediately by the Pavement Unit staff during collection season.

### Reporting, Rating, & Classification

Pavement is classified as either very good, good, fair, poor, or very poor for three separate metrics: The roughness, based on the IRI (International Roughness Index), the rutting of the roadway, and the cracking in the pavement surface. The roughness & rutting data collected by the distress collection van via the pathway system is assigned a rating by the Washington State Pavement Management System (WSPMS), while the cracking is initially analyzed by a DOT pavement engineer and then assigned a rating by the WSPMS. Additionally, the friction truck and trailer measures the friction, but is not used in determining the modified approach to infrastructure. Karen noted that for reporting purposes, cracking is the leading indicator of when pavement needs to be assessed for repairs/additions and is the primary criteria used internally and externally for reporting the pavements condition. The following is the assessment criteria thresholds from the FY23 ACFR RSI on Infrastructure:

Category	PSC	IRI	Rutting
----------	-----	-----	---------

## State of Washington

Very Good	80 - 100	< 96	< 0.24
Good	60 - 79	96 - 170	0.24 - 0.41
Fair	40 - 59	171 - 220	0.42 - 0.58
Poor	20 - 39	221 - 320	0.59 - 0.74
Very Poor	0 - 19	> 320	> 0.74

The data from the data collection vehicle recorded by the Pathway System is stored on physical hard drives and uploaded into the WSPMS system every night in the DOT Material Laboratory. WSPMS has internal formulas and proprietary code that translates the raw collection data into about 1/10 of a mile segments or "preservation units" all initially given the highest criteria rating for each area. WSDOT, like many other DOT state agencies in the US, can set quantitative metrics for good, fair, or poor and a sliding scale to correspond with those metrics. Karen noted that, as an example, Idaho uses a 1-5 scale for rating each of these individual areas while WSDOT uses 0-100 for PSC, 0-500 for IRI, & 0.00-1.00 for rutting as shown in the figure above. For roughness, rutting, & cracking, the WSPMS has backend mathematical formulas and code that transforms the raw data collected from the collection vans to calculate the PRC (Pavement Roughness Condition), the PPC (Pavement Profile Condition - Rutting), and the PSC (Pavement Structural Condition) into numerical values and then subtracts those values from each of the upper limit for each criteria rating to get the final values for each criteria and then categorically assigned a qualitative rating of either very good, good, fair, poor, or very poor **(Key Control #1 - Automated Software Calculation - Valuation/Classification)**. For cracking, prior to a PSC value assigned, an experienced DOT pavement engineer will scan & review the 3-D images and pictures recorded from the collection van and will analyze each video segment and note when they see a crack/inconsistency in the pavements surface. They will note it in the pathway system using "Asphalt Concrete Pavement (ACP) Hot Keys" and "Portland Cement Concrete Pavement (PCCP) Hot Keys" **(Key Control #2 - Manual - Classification)**. When cracking assessment is completed, the raw data is assigned a PSC value in the WSPMS system by translating the hot key inputs entered by the rater and subtracting the aggregated values from 100 to arrive at the final value for cracking. Once all three criteria are assigned a PRC, PPC, or PSC value by the WSPMS system, the WSPMS system has backend system code with logical tests to categorically assign a qualitative rating of either very good, good, fair, poor, or very poor to each pavement section for each criteria. The WSPMS system is only accessible by selected DOT staff within the Pavement department and given certain read/write capabilities as it pertains to the backend code that is responsible for calculating the different criteria values and ratings. Vyenna Kynull, IT App Development Sr/Sc, is the only Pavement staff with access to the code as of FY24, and maintains a log of updated changes or historical access to the code editor for WSPMS to ensure that no changes were made outside of her designated purview. Additionally, the WSPMS system is only accessible by those who have DOT internal network access and are current staff within the DOT directory as given credentials by the DOT IT Network team **(Key General IT Control - see [Key Control #1 (Automated) - Pavement])**.

Infrastructure Projects

## State of Washington

Karen Strauss, State Pavement Management Engineer, explained that her team is only responsible for the preservation and projects to preserve existing highways and do not have anything to do with capital projects. Karen and Jianhua Li, State Pavement Management Engineer, receive the data and ratings from WSPMS and they provide the regions with the information and ask them to analyze the data and update a list of projects they think are necessary. Karen and Jianhua then discuss the data and the suggestions from regions and they make final needs-based recommendations to send to the Capital Program Development and Management Office (CPDM). The final decision for which projects to fund comes from CPDM and the funding provided from legislation. The Capital Program Management System (CPMS) is where all highway construction (and bridge) projects are entered. The CPDM office receives the recommendations and need from the pavement engineers and once they make a decision to fund a project, the regional offices are then sent instructions to fill out their proposals in CPMS. Karen and Jianhua's pavement team is not involved with CPMS.

### **Bridges**

WSDOT performs inspections (condition assessments) on all vehicular bridges and culverts in excess of 20 feet in length. These same structures under 20 feet are also assessed, but are not governed by the same regulations as ones in excess of 20 feet. Most of these bridges and culverts are inspected on a two-year cycle, with some lower-risk bridges inspected on a four-year interval and some higher-risk bridges inspected on an annual basis. The assessment (condition rating) may determine whether a bridge is high risk or low risk. Special inspections, like those for underwater bridge components, are inspected at least once every five years. Federal Highway Administration (FHWA) gives requirements/recommendations as to when bridges need to be assessed based on previously assessed condition.

WSDOT's bridge inspection program complies with all requirements of the FHWA. The Federal Bridge Inspection standards are specified in the code of federal regulations 23 CFR 650 subpart C. WSDOT has documented its inspection process in the Washington State Bridge Inspection Manual M36-64.13 with the latest version published December 2023. The FHWA performs annual reviews of WSDOT's National Bridge Inspection Program (NBIP). The FHWA has developed 23 metrics that are assessed as part of the compliance reviews. The reviews are completed every calendar year, with the latest one being complete in December 2023.

### Inspections

All inspections are completed by National Bridge Inspector Standards (NBIS) certified inspectors. Bridge inspector names and certification numbers are entered and stored in BridgeWorks, a WSDOT developed application, used to record and document the inspections. Most inspections have a lead inspector and co-inspector, but the lead inspector is the only one required to be certified.

Inspectors give a rating to the primary bridge elements (deck, superstructure, and substructure) or culvert using the NBIS codes. NBIS codes are ranged from 0 (failed/collapsed) to 8 (good) using standards established by FHWA.

After the field inspection is performed, the inspection documentation (pictures, inspection, categories, bridge information, etc.) is entered into BridgeWorks. There is a monthly report sent to supervisors that lists all reports that have been locked, but not scanned so inspectors and supervisors can track the release of reports. The condition assessment procedures listed below are performed on an annual basis to ensure the

## State of Washington

percentage of bridges assessed as "fair or better" is within the guidelines of GASB No. 34 (to allow reporting using a modified approach).

Bridge Preservation Office Engineers review the draft inspection reports to ensure the data is accurate and there were no entry errors. The inspection reports are released in the Bridge Engineering Information System (BEIS) after the review is completed. Reports are required to be reviewed and released within 90 days of the inspection date.

The Bridge Asset management Engineer uses the bridge inspection data to determine network condition. A bridge's overall condition is determined by a national standard established by the FHWA and described in the 23 CFR 515. WSDOT has also developed a [folio](#) that summarizes the information as part of the MAP-21 rules.

The primary NBI code for each of the major bridge elements (deck, superstructure, and substructure) is determined based on the inspection results and in accordance with the table below:

Category National Bridge Inventory Code Description
(NBI code 8 or 7) A range from no problems noted to some minor deterioration of structural elements.
(NBI code 6 or 5) All primary structural elements are sound but may have deficiencies such as minor section loss, deterioration, cracking, spalling or scour.
(NBI code 4 or less) Advanced deficiencies such as section loss, deterioration, cracking, spalling, scour or seriously affected primary structural components

The overall bridge condition code is determined by the lowest code for each of the major bridge elements (deck, superstructure, and substructure). If any major element is coded at "4" or less, the overall bridge condition rating is "poor". If all the primary NBI codes are above a "4", but one or more is a "5" or "6", the overall bridge condition rating is "fair". If all the primary NBI codes are a "7" or greater, the overall bridge condition rating is "good". The culvert condition rating is similar.

The Bridge Asset Management Engineer, Hyung-Seop Shim, compiles the assessments into a summary report with a good, fair, or poor rating for each bridge. The percentage of bridge deck area for each rating is used to determine the percentage of bridges at fair or better and compliance with the modified approach for infrastructure (**Key Control #3 - Manual - Valuation/Classification**).

### How Transactions are Recorded in AFRS:

Projects for Capital Outlays and the need for a project is initiated by technical experts at various divisions who review assessment information and determine a need for repair, maintenance, or replacement of an asset. Needs are transmitted to the Capital Program Development and Management Office (CPDM) which then sends scoping instructions to the regional offices. The regional offices then write proposals based on the

## State of Washington

need and determine the projected scope and cost of the project. Regional offices enter the proposal into the Capital Program Management System (CPMS). The completed proposal is given to the CPDM Office, who is responsible for programming projects that fit within identified capital budgets. The Bridge Management Engineers and Pavement Management Engineers we spoke with are not involved with project decisions and entering into CPMS. They perform the assessments and the decision is made by legislation for which preservation projects to fund.

Based on the information entered into CPMS, the Accounting and Financial Services (AFS) division, with the help of CPDM, determine whether an activity should be capitalized and enter the award into the Contract Administration Payment System (CAPS). CAPS, the mainframe system used for construction project management in the regional offices, maintains payment and administrative information related to ongoing construction contracts and projects. CAPS creates payment vouchers to pay contractors by feeding the data to TRAINS. Data is fed to TRAINS by an overnight automatic interface. The Project Office enters the payment information and the release of payment information into TRAINS and the payment processing is done by a Contract Specialist. A daily CAPS to TRAINS reconciliation is performed by a Contract Specialist and the Accounting and Financial Services Division.

TRAINS automatically records all expenditures in AFRS as transportation expenditures. These are recorded in AFRS via nightly upload. At the end of each quarter, the Transportation Financial Consultant (Beth De Vul) prepares a JV to adjust the transportation expenditure balance for the amounts that should be recorded as non-depreciable assets. Then, the Accounting and Reporting unit performs monthly TRAINS/AFRS fund and GL reconciliations to ensure expenditures are properly classified within AFRS.

We confirmed with Jesse Daniels that what DOT classifies as non-depreciable assets for reporting purposes (bridges & pavement) goes through the same process/channel as capital outlays when it comes to how they are recorded in AFRS & TRAINS. Subsequently, because all capital outlays are tracked in CPMS and are assigned a sub-program and ITC to be reviewed in the Capitalization Matrix and ALL equipment and capital projects are recorded in AFRS as a transportation expenditure, the quarterly JV by Beth De Vul to reclassify each asset/project into the correct account/group is also applicable here to the pavements and bridges to be correctly classified as "non-depreciable" assets.

### Key Controls are as Follows:

**Key Control #1 - (Automated Software Calculation) - Valuation/Classification:** For roughness, rutting, & cracking, the WSPMS has backend mathematical formulas and code that transforms the raw data collected from the collection vans to calculate the PRC (Pavement Roughness Condition), PPC (Pavement Profile Condition - Rutting), and PSC (Pavement Structural Condition) into numerical values and the subtracts those values from each of the upper limit for each criteria rating to get the final values for each criteria and then categorically assigned a qualitative rating of either very good, good, fair, poor, or very poor.

**Key Control #2 (Manual) - Classification:** For cracking, prior to a PSC value assigned, an experienced DOT pavement engineer will scan & review the 3-D images and pictures recorded from the collection van and will analyze each video segment and note when they see a crack/inconsistency in the pavements surface. They will note it in the pathway system using "Asphalt Concrete Pavement (ACP) Hot Keys" and "Portland Cement Concrete Pavement (PCCP) Hot Keys".

**Key Control #3 (Manual) - Valuation/Classification:** The Bridge Asset Management Engineer compiles the assessments into a summary report with a good, fair, or poor rating for each bridge. The percentage of bridge deck area for each rating is used to determine the percentage of bridges at fair or better and compliance with the modified approach for infrastructure.

# State of Washington

## Noted Weaknesses are as Follows:

None

### I.2.PRG - Non Depreciable Assets

*Procedure Step:* Key Control #1 (Automated) - Pavement

*Prepared By:* NJH, 8/22/2024

*Reviewed By:* BM2, 11/20/2024

#### Purpose/Conclusion:

##### **Purpose:**

To determine whether For roughness, rutting, & cracking, the WSPMS has backend mathematical formulas and code that transforms the raw data collected from the collection vans to calculate the PRC (Pavement Roughness Condition), PPC (Pavement Profile Condition - Rutting), and PSC (Pavement Structural Condition) into numerical values and the subtracts those values from each of the upper limit for each criteria rating to get the final values for each criteria and then categorically assigned a qualitative rating of either very good, good, fair, poor, or very poor (**Key Control #1 for WSPMS**) was in place and operating effectively and to consider related general IT controls in order to assess control risk.

##### **Conclusion:**

Based on our understanding and test results, we concluded that the automated control **was** in place and operating effectively.

Based on our understanding, related general IT controls **were** in place and adequately designed to ensure that the control operated consistently during the audit period. However, we did not test the operating effectiveness of general IT controls.

Our understanding and control risk assessment, which incorporates these conclusions, is documented at [\[Risk Assessment\]](#).

#### Testing Strategy:

The following procedures are **required** for all automated key controls for financial and single audits:

##### **STEP 1: Understand Automated Key Control**

Gain an understanding of the automated key control. The understanding can either be documented in the control system step or could be

## State of Washington

documented here in this step. Auditors should consider the following aspects of the automated control when gaining an understanding:

### Software Calculation:

Is there written documentation of the calculation, and/or the source rates and factors used in the calculation?

*We would expect written documentation that defines the calculation and is an official, approved source for the formulas, rates and factors. This may be an approved policy or could be system documentation.*

What formulas are used to make the calculation?

What values or factors are used to make the calculation? For example:

- Rate tables used by the calculation
- Profile fields (i.e., applicable transaction types)
- Programmed/set formulas and/or values
- Constraints (i.e., effective date, minimums/maximums, etc.)

How is the calculation triggered or initiated?

How is the calculation recorded in the accounting system (or used in an end result)?

### Automated Interfaces:

Is data transferred in real time (immediately) or in a batch? If batched, how often does the interface occur (daily, monthly, quarterly, etc.)?

What triggers the data transfer?

*Transfers could be manually initiated, could be hardcoded into either the sending or receiving system's programming, could be controlled by administrative menus (for integrated software modules), or could be run as automated jobs with third party software or programming.*

Could the interface process fail? If so, how would the entity recognize that the process failed?

*This may not be a relevant risk for integrated software, but may be the case for custom interfaces designed outside the software which may be subject to various points of failure.*

Will the interface process reject transactions or batches with errors? If so, who monitors rejections and follows up on rejected transactions to ensure correction (either in the sending or receiving systems) and how are corrections tracked and monitored?

*For example, information that could trigger a rejection or isolated transaction and batch can include: invalid data, duplicate data, or missing factors. If errors are possible, we would expect the isolated data is reviewed, tracked and corrected in a timely manner.*

## State of Washington

Are any reconciliations done to provide assurance that data transfer was complete and accurate?

*We would expect the local government to perform a reconciliation between source and destination systems to ensure the interfaced data is complete and accurate. This may be a manual reconciliation or spot-check, a system or dashboard report, or automated edit check. Depending on how often errors (if any) are expected, the reconciliation could be done each time the interface occurs, or on a monitoring basis, like annually.*

### Edit Checks:

Inquire if the entity has a written policy or documentation describing the approval process and protocols for reviewers?

What is the approval process in the application?

What transactions, data, tasks, or documents are approved?

Who are the preparers? How do preparers submit for approval?

Who are the authorized approvers? Are there backup approvers?

What documents or information are required to make approval judgment?

What is the next step once a transaction/data/ task/document is approved or denied?

Is there any exception situations where approval can be by-passed or waived?

Can the approver make changes to information during the approval stage? If so, is the preparer notified of the changes?

Can anyone make changes to the approved information after the approval stage? If so, are changes captured in an audit trail and is the audit trail (log) regularly reviewed and monitored to detect any unauthorized changes?

Does the application prevent users from approving their own work (self-approval)?

*Some applications have a feature preventing self-approval. If an application does not have a feature preventing self-approval, we would expect manual controls in place to ensure the segregation of duties between preparer and approver, if relevant to the risk.*

Does the application have high-level users that can also approve?

*High-Level Users (aka Users with elevated privileges, system or application "Administrators", "Super Users", etc.) typically have full access to change system settings and may have extensive function rights of software applications. Depending on entity's size and complexity, different high-level users may be responsible for the network vs. application level. High-level users represent a heightened risk for overriding segregation of duties and normal control processes.*

*We would expect entities to have compensating monitoring controls if personnel are responsible for both application settings and transaction processing controls.*

# State of Washington

## Computer Generated Reports:

What information or exceptions is the report designed to identify (what is the purpose of the report)?

How is the report used and by whom?

For exception reports, who reviews the report and how do they follow up on exceptions?

*Auditors should consider whether the exception report reviewer has appropriate authority and information to effectively follow-up on report results. For fraud-related risks, also consider whether the review position is appropriately segregated from positions that can initiate transactions. For exception reports that regularly identify many transactions needing multi-step follow-up, the manual review and follow-up may be identified as a separate key control rather than documented and evaluated as an aspect of the automated exception report control.*

What are the report parameters or criteria? Does the report have any calculated fields? If so, what are the calculations?

*The ideal method of documenting an understanding of a computer generated report is to get a screenshot or printout of the report parameters. If using a report writer, this may be printed with the report, or may be accessed from a design view or intermediary screen. For custom or complex reports, this may be the SQL code.*

*For exception reports, auditors should pay special attention to the definition of an exception embodied in the report parameters.*

*NOTE: observation of the report parameters will also count as a confirmation of the report and could also be used to test the report.*

## Electronic Approvals:

Inquire if the entity has a written policy or documentation describing the approval process and protocols for reviewers?

What is the approval process in the application?

What transactions, data, tasks, or documents are approved?

Who are the preparers? How do preparers submit for approval?

Who are the authorized approvers? Are there backup approvers?

What documents or information are required to make approval judgment?

What is the next step once a transaction/data/ task/document is approved or denied?

Is there any exception situations where approval can be by-passed or waived?

Can the approver make changes to information during the approval stage? If so, is the preparer notified of the changes?

Can anyone make changes to the approved information after the approval stage? If so, are changes captured in an audit trail and is the audit trail (log) regularly reviewed and monitored to detect any unauthorized changes?

Does the application prevent users from approving their own work (self-approval)?

## State of Washington

*Some applications have a feature preventing self-approval. If an application does not have a feature preventing self-approval, we would expect manual controls in place to ensure the segregation of duties between preparer and approver, if relevant to the risk.*

Does the application have high-level users that can also approve?

*High-Level Users (aka Users with elevated privileges, system or application "Administrators", "Super Users", etc.) typically have full access to change system settings and may have extensive function rights of software applications. Depending on entity's size and complexity, different high-level users may be responsible for the network vs. application level. High-level users represent a heightened risk for overriding segregation of duties and normal control processes.*

*We would expect entities to have compensating monitoring controls if personnel are responsible for both application settings and transaction processing controls.*

### **STEP 2: Confirm and Test Automated Key Control**

Confirm and test the automated control. To test the automated control, consider the following procedures:

#### **Software Calculation:**

Re-perform the calculation for selected transactions.

*Auditors would NOT normally use sampling for automated controls. Instead, auditors should judgmentally select one instance of each significant variation of the calculation. If the number of potential variations is large, auditors would judgmentally select based on risk factors (for example, the most common scenarios, or scenarios associated with identified risks, or scenarios that are not addressed by the entity's testing procedures).*

*In some cases, it may be possible for the auditor to reperform the calculation for the entire population.*

If any rate tables or values were updated during the period, view the current values (by observing the rate table or values in an admin menu or from a printed system report) and compare to approved sources.

*If no updates were made or there are only a few values, this risk could be addressed by re-performing the calculation. However, if source rate tables or values are large or complex, it may be more efficient to test these values directly than to recalculate a larger number of transactions.*

Consider the use of analytical procedures such as trends or descriptive statistics on the population (like average, minimum and maximum values, or a graph of values across the population) and follow up on any unexpected values or trends. *Analytical procedures would normally also count as a substantive test.*

#### **Automated Interfaces:**

## State of Washington

Re-perform a reconciliation, comparison or analytical procedure between both systems to determine whether data interfaced completely and accurately. Alternatively, review the entity's reconciliation or comparison if they perform one.

*For example, auditors could perform count totals and summarize the data to determine whether the same number of transactions reside in both systems, or the total amount from the sending system was posted to the receiving system. Whether this takes the form of a comparison (numbers expected to match exactly), reconciliation (when reconciling items are expected) or analytical procedure (if numerous adjustments or reconciling items are expected) will depend on the nature of the interface and client documentation.*

*Note: these procedures would also provide substantive evidence.*

Observe documentation, such as interface logs or email notifications, to determine whether interfaces complete per expected interval (daily, monthly, quarterly, etc.).

*We would expect the data transfer to be consistent based on the programmed schedule. If data is expected to be transferred on a weekly basis, we would expect to see some form of documentation showing the weekly transfer.*

Observe evidence that batch jobs are monitored such as tracking spreadsheets or emails.

When interfaces did not occur as expected, determine whether procedures were followed to resubmit job or that there was a logical reason no data was received/sent for the interval (for example, it was a holiday so there was no interface for that day).

### Edit Checks:

Re-perform the edit check for selected transactions.

*Auditors would NOT normally use sampling for automated controls. Instead, auditors should judgmentally select one instance of each significant variation of the check. If the number of potential variations is large, auditors would judgmentally select based on risk factors (for example, the most common scenarios, or scenarios associated with identified risks, or scenarios that are not addressed by the entity's testing procedures).*

*In some cases, it may be possible for the auditor to reperform the edit check for the entire population.*

Consider the use of analytical procedures such as trends or descriptive statistics on the population (like average, minimum and maximum values, or a graph of values across the population) and follow up on any unexpected values or trends. Analytical procedures would normally also count as a substantive test.

### Computer Generated Reports:

## State of Washington

For exception reports, inquire with the person assigned to review the report how frequently exceptions are noted by the report. Trace identified exceptions to documentation of correction or resolution.

Re-perform the report by either (a) generating it yourself in the entity's system (if the auditor has direct access to the system), (b) recreating the report using CAATS, or (c) by observing the report be generated in your presence. If observing, note any user-entered values or parameters and determine whether entered parameters were appropriate. Compare re-performed report to the one being tested.

### Electronic Approvals:

Observe a transaction to see the approval process and verify any key aspects of the process or limits.

If transaction data or reports include approval information, use CAATS to confirm that all transactions met authorization rules.

### **STEP 3: Understand General IT Controls**

Gain an understanding of the general IT controls that support the continued proper operation of the automated control. Identify key general IT controls and note any control weaknesses. Auditors should consider the following aspects of general IT controls when gaining an understanding:

### Software Calculation:

Inquire if the entity has experienced any errors or irregularities with the calculation. Also how often changes are made to the calculation, and how many changes (if any) were made during the year.

How can the software calculation (formulas, rates/values, settings/configurations) be changed or customized?

*Software calculations will usually have one or more administrative menus that allow the government to modify rate tables or other calculation values, or to configure the calculation or apply settings.*

*In other cases, software calculation formulas and/or values may be hard-coded into the system and require programmers to make the changes. If the government has access to source code, then it needs internal procedures for program changes. If the program is controlled by vendors, we would expect program change procedures and expectations to be included in the contract.*

What are the procedures to authorize and make program changes or configuration/setting changes to the software calculation?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

*If utilizing a test environment, there should be controls to ensure that the live environment is updated and is consistent with the live production environment. As management is responsible for the accuracy of their automated controls (i.e., in the live environment), we*

## State of Washington

*would expect there to be a procedure to confirm each key automated control once it is in the live environment. This could be manually re-performing the calculation, reviewing reports against known expectations, etc.*

How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change programming, but they may be responsible for patch management, master table data, and/or configurations.*

### Automated Interfaces:

Inquire if the entity has experienced any errors or irregularities with the interface. Also how often changes are made to the interface, and how many changes (if any) were made during the year.

What are the procedures to authorize and make changes to the interface?

*Except for the most simple situations, we would normally expect update procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

*If the data transfer is already going to be checked or reconciled, then there may be less need for specific test procedures on program changes since any errors will be identified right away.*

How are program changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

## State of Washington

*If the program is controlled by a third-party, we would expect a process between the government and vendor that allows the government to make requests and receive communication at the completion of the request.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to vendor developed/supported coding that controls how the system processes the interfaced data, but they may be responsible for working the interface error queues and reconciling the interfaced data.*

### Edit Checks:

Inquire if the entity has experienced any errors or irregularities with the edit checks. Also how often changes are made to the checks, and how many changes (if any) were made during the year.

How can the edit check be changed or customized?

*Edit checks may be hard-coded into the system and require programmers to make the changes. If the government has access to source code, then it needs internal procedures for program changes. If the program is controlled by vendors, we would expect program change procedures and expectations to be included in the contract.*

*In other cases, edit checks may be established or configured through one or more administrative menus.*

What are the procedures to authorize and make program changes or configuration/setting changes?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

*If utilizing a test environment, there should be controls to ensure that the live environment is updated and is consistent with the live production environment. As management is responsible for the accuracy of their automated controls (i.e., in the live environment), we would expect there to be a procedure to confirm each key automated control once it is in the live environment. This could be manually re-performing the edit check, reviewing reports against known expectations, etc.*

How are program changes or configuration/setting changes monitored or reviewed?

## State of Washington

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change programming, but they may be responsible for patch management, master table data, and/or configurations.*

### Computer Generated Reports:

Inquire if the entity has experienced any errors or irregularities with the report. Also how often changes are made to the report, and how many changes (if any) were made during the year.

How is the report triggered or initiated?

*For reports that are automatically triggered, the auditor would normally not identify job scheduling or monitoring as a general control since we would expect failure of the report to generate*

Is the report hardcoded into the program, or is it a custom or ad hoc report? Also, what manual inputs (if any) are required to run the report?

*What parameters, criteria (date ranges, fund number, departments) or instructions are entered by the user to generate the exception report. The more options entity personnel have to customize or modify the report, the higher the risk of human error and inaccurate or incomplete reports. Pre-programmed reports provide less flexibility than ad-hoc reports; however, if program change controls are in place, they are more consistent.*

If the report is hardcoded into the system, how are program changes made?

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change vendor developed reports, but they may be responsible for triggering, setting certain parameters, and/or following up on exception report results.*

NOTE: if the auditor cannot identify sufficiently effective general IT controls, the automated control will need to be tested using the same methods as a manual control (ie: sampling throughout the period). For example, if the report is manually generated and highly dependent

## State of Washington

on a number of manual inputs each time, or if the report does not have formal change controls, such as an ad hoc report or excel-based report. In such cases, the automated report is controlled by limited access and the judgment of the report writer – that is, while the report is an automated component, there is also an integrated manual component to the control.

### Electronic Approvals:

How are users assigned preparer and approver roles? Are user accounts periodically checked for needed changes? See the [User Access](#) step in the Accountability folder for more control considerations.

If configurations or settings relevant to the approval process are controlled by an admin menu, who has access to this menu?

If the entity has access to source coding for approval controls, what are the procedures to authorize and make program changes?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to vendor developed/supported coding that controls how the electronic approval works, but they may be responsible for approval configurations or settings and/or user account management.*

### **STEP 4: Confirm Key General IT Controls**

Confirm your understanding of key general IT controls to determine whether they have been placed in operation (*whether the entity has actually implemented key controls*).

### **STEP 5: Test Key General IT Controls**

Document whether general IT controls will be tested. Option 1 would result in control risk at MAX for the automated control. Either option 2 or 3 is necessary in order to set control risk at LOW. If general IT controls are tested, consider the following procedures:

# State of Washington

## Software Calculation:

If program changes or setting/configuration changes are logged, review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the calculation may also provide this evidence if the re-performance tests address all states of the calculation during the period.

If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

## Automated Interfaces:

Review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, reconciling or comparing the data transfer (or reviewing the entity's reconciliation or comparison) may also provide this evidence if tests address all states of the interface during the period.

Inspect job processing error logs/reports. Observe evidence that errors in processing were isolated and resolved. For example, select a sample of rejected transactions and observe evidence to determine whether errors were appropriately corrected and the corrections were timely.

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

## Edit Checks:

If program changes or setting/configuration changes are logged, review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

## State of Washington

- Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the edit check may also provide this evidence if the re-performance tests address all states of the edit check during the period.
- If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.
- If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

### Computer Generated Reports:

- If the report is subject to program change controls (either due to being hardcoded or by being automatically triggered), review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

- If the report is subject to program change controls, review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the report may also provide this evidence if the re-performance tests address all states of the report during the period.
- If the report relies on manual inputs and report copies saved show the parameters entered, the auditor can check a selection or sample of reports to confirm that the report was run correctly.
- If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

### Electronic Approvals:

- Review user access report to verify that current users are appropriate. Also consider review of user access change logs (if available) to evaluate user account management throughout the period. See the User Access step in the Accountability folder for more testing considerations.
- If approvals are governed by significant settings/configurations, and such changes are logged, review the change log to verify the population of changes for the year.

*Verification that no configuration changes were made, along with the auditor's evaluation that no such changes are expected, would normally be sufficient evidence to conclude that no further testing is necessary.*

- If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.

## State of Washington

If the entity has access to source code, review the change log to verify the population of changes for the year. Then review programming change documentation or the entity's test documentation for selected or sampled changes.

*Verification that no program changes were made, along with the auditor's evaluation that no such changes are expected, would normally be sufficient evidence to conclude that no further testing is necessary.*

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the SOC Report Reliance workpaper in the Store.

### **STEP 6: Final Control Risk**

Evaluate the results and document a final control risk assessment in the control system step. Consider whether any deficiencies identified with either the automated control or related general IT controls represent material weaknesses or significant deficiencies.

*Note: general IT control deficiencies do not necessarily mean the automated control is not properly functioning. General IT control deficiencies would normally be considered a significant deficiency or material weakness only if it caused an issue with the compliance requirement or assertion.*

### **Recommendation Review Requirement**

IT Security related information is considered category 3 data protected by Public Request Exemption RCW 42.56.420. Issues related to IT Security require the following special handling:

[Instructions](#) are located in Team IT Audit's System's Sharepoint page.

Details of IT Security related issues should NOT be included in any emails or helpdesks.

Exit, ML and Findings should be separately communicated in an IT Security Results Document.

Findings will be referenced, but not included in the audit report.

All IT security-related recommendations must be reviewed by [Team IT Audit](#).

Template language for common IT related recommendations can be found in [ARS Part 5 Chapter 8](#).

### **PUBLIC REQUEST EXEMPTION**

Some IT related information is protected by Public Request Exemption RCW 42.56.420 for cyber security purposes. The details documented in the record of work and support workpapers may qualify for this exemption. If so, auditors must include this statement in the record of work done and any related workpapers: **"This record contains information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited "**.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

# State of Washington

## SAO Audit Policy [2310](#) - Reporting Identified Audit Issues

## SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk

### [Information Technology](#) Planning Guide

Auditors may contact [Team IT Audit](#) with any testing strategy or control assessment questions or to request assistance from an IT Specialist.

**Software Calculation:** A **software calculation control** exists when the value of a transaction is determined by a software application. This process can be a key control when the entity relies on the system to generate calculations correctly to determine the amount of transactions (i.e., summarizing/account code allocation to post to general ledger, calculate student, utility, other charges, etc.).

**Automated Interfaces:** An interface is a process that moves information from one computer application to another. The interface can occur internally between systems maintained by a single agency, or between systems maintained by different agencies or private companies. The interface can also occur between modules within the same computer application.

The data transferred might be a file consisting of one or more records processed at a later time (batch), or it can be a real-time update. Risk associated with interfaces increases as the number of transactions or the number of other services and systems supported by the interfaced data increases.

Poor design or inadequate oversight can affect the transfer of transaction data among the systems. Interface controls are automated and/or manual processes designed to ensure transmission and processing of information is complete and accurate.

#### Manual vs. Automated Interfaces

A “manual interface” is the transfer of data from one system or module to another system or module, initiated and controlled by a user. An example of a manual interface is when customer accounts are downloaded from a utility billing system to be used to perform meter readings. When complete, the file with meter readings may be uploaded and posted to the customer accounts.

An “automated interface” is the transfer of data from one system or module to another system or module that happens automatically based on a schedule, or other predefined criteria. A common example of an automated interface is the payroll module of a system. Typically, a payroll batch is created in the payroll module. Once approved, the batch is automatically sent by the system to the general ledger or other applicable modules, such as accounts payable.

Entities should have reconciliation controls between their various applications regardless of the method used for interfacing.

*Auditors should have determined whether system interfaces are automated as part of the Key Software Applications workpaper. **If not**, ask the*

# State of Washington

*following question to determine whether the system interface is manual or automated.*

*Is the data transferred from one system/module to another system/module by a user using an uploading and posting technique? For example, data is pulled from one system into a text file or other format, that is then uploaded into a different system or module by posting or in an upload feature of the module. If the answer to this question is yes, the interface would be considered "manual" since it is initiated and controlled by manually rather than through an automated process.*

**Edit Checks:** An **edit check** is a programmed routine designed to check input data or processing results for accuracy, compliance, or reasonableness. Types of edit checks include:

Range Checks: ensure that numeric values fall within specified ranges, minimums and/or maximums. For example, ensuring that a capital asset can only be entered as a positive amount, or a purchase order can only be submitted without secondary approval for less than a certain threshold.

Consistency Checks: verify that related data fields are consistent with each other. For example, ensuring that a patient's age matches their date of birth.

Format Checks: validate data formats (for example, dates as MM/DD/YYYY or phone numbers as ###-###-####).

Logical Checks: assess logical relationships between data fields. For instance, verifying that total debits equals total credits in a journal entry.

Duplicate Checks: identify duplicate records or entries. For example, preventing the same invoice from being entered twice.

Cross-Field Checks: compare data across different fields. For instance, ensuring that the start date of a project is before the end date.

Required Field Checks: ensure that mandatory fields are filled out. For instance, making sure that a patient's name and date of birth are provided.

Referential Integrity Checks: validate relationships between data tables. For example, confirming that a vendor number exists in the vendor master file as an active entity.

Outlier Checks: detect extreme or unexpected values. For instance, flagging water meter reading values that are extreme outliers for the customer type or account history.

Pattern Checks: look for specific patterns in data. For example, verifying that email addresses follow a valid format.

Edit checks may result in automatic rejection of a transaction, inability to proceed with a transaction, trigger for additional processing or review, or may simply result in a warning message to the user.

Edit checks may be identified as a key control when they are sufficiently relevant (ie: addressing the risk), precise (ie: able to catch all errors, rather than just being only reasonableness or limit check), and sufficiently strong (ie: prevent invalid transactions, rather than just generating a warning messages). Auditors may identify an individual edit or a group of edit checks together as a key control.

**Computer Generated Reports:** A **computer-generated report** is a report that is created by a computer program. The computer program, also referred to as a report generator or tool, takes data from a data source, such as a database, and displays it in a specified format. The process

## State of Washington

to generate a report often includes performing calculations on the data, such as summarizing, classifying, etc., before displaying, or can display the calculations on the report.

There are two types of computer-generated reports, pre-programmed and ad-hoc or customized reports.

Pre-programmed or canned reports are pre-defined reports where criteria and specifications are hard coded in the system. A canned report may allow limited parameters, (month/year, for example), but in general the information that will be displayed is pre-determined.

Ad-hoc or customized reports allow the user to drill down and customize what information is displayed on the report based on some allowed criteria, such as account codes, dollar amounts minimum, etc).

In contrast, a **manual report** is one that is created outside the system using data exports or is created ad hoc by a user. An example of a manual report is one that is created by copying data from a data source and pasting the data in an Excel spreadsheet or Word document or Powerpoint presentation where it is then processed further. With manual reports, each time a report is created, the data could be incorrect due to user error, such as not copying all relevant data, or processing errors. Therefore, these types of reports should be understood and tested similar to manual controls.

**Electronic Approvals:** Electronic approvals, electronic signatures and digital signatures are technically different, although often these terms are used interchangeably by entities.

Auditors should have determined whether the electronic approval is an automated control as part of the overall understanding of controls. For automated control purposes, an electronic approval is a software system functionality that:

Permits a user to approve transaction(s) within the software system

The system automatically documents, or logs, the data approved by the user and any subsequent manipulation

The acceptance or rejection of the transaction by the approver will trigger an additional software system process, such as posting of a transaction.

E-mail, scanned-in pictures of signatures, or font-changed signatures, etc. may be part of a control activity but are generally not considered an automated control and are not covered by this testing strategy.

### Electronic Signature vs Digital Signature

An “**electronic signature**” can look like a handwritten signature that has been scanned and then pasted into an electronic document. The reliability of this type of approval is variable. Recommend gaining an understanding of the process used to store and affix the signature to the document and then discuss the process with Team IT Audit before placing reliance on this control.

A “**digital signature**” is a legal signature with a formal certification process that documents who approved the document and ensures the document is not modified after certification. Reliability of this process is very high but has significant technical features. Recommend brainstorm

# State of Washington

with Team IT Audit before placing reliance on this control.

## **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

**Statements on Auditing Standards [AU-C 315](#) Understanding the Entity and Its Environment and Assessing the Risks of Material Misstatement** - paragraphs .A106-.A109 describe general and application controls and how they relate to audit risks

**Statements on Auditing Standards [AU-C 330](#) Performaing Audit Procedures in Response to Assessed Risks and Evaluating the Audit Evidence Obtained** - paragraphs .10b and .A33-.A34 describe requirements and guidance for testing indirect controls in conjunction with tests of controls, that is, testing key general controls in conjunction with a test of a key automated control

Record of Work Done.

**This record may contain information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited.**

## **Non-Depreciable Assets - Valuation/Classification**

**Key Control #1 - (Automated Software Calculation) - Valuation/Classification:** For roughness, rutting, & cracking, the WSPMS has backend mathematical formulas and code that transforms the raw data collected from the collection vans to calculate the PRC (Pavement Roughness Condition), the PPC (Pavement Profile Condition - Rutting), and the PSC (Pavement Structural Condition) into numerical values and the subtracts those values from each of the upper limit for each criteria rating to get the final values for each criteria and then categorically assigned a qualitative rating of either very good, good, fair, poor, or very poor.

The understanding for this system is documented above in the [[Controls - CPMS/TRAINS/WSPMS](#)] step.

## **STEP 1: Understand Automated Key Control**

To gain an understanding of this automated control, we met with Karen Strauss, State Pavement Management Engineer, & Vyenna Kynull, IT App Development Sr/Sc, on 8/20/24. The understanding of this automated key control is documented at [[Controls - CPMS/TRAINS/WSPMS](#)].

## **STEP 2: Confirm Automated Key Control:**

To confirm this automated control we met with we met with Karen Strauss, State Pavement Management Engineer, & Vyenna Kynull, IT App Development, on 8/20/24 and requested a live walk through of the WSPMS code base and backend development environment to ensure the code for calculating different pavement values was in place. Vyenna shared with us the CS Code environment class that holds all of the code for the reporting classifications called "GFPReportBC.cs". within this view we were able to identify a string of "if, else" statements for various classifications. For the "very good" rating for PSC, we were able to view the code as follows:

## State of Washington

```
(if (index>=80){  
    return "Very Good";  
...}).
```

Vyenna then proceeded to explain that the different variables created and used in conjunction with data pulled from the "WSPMS Azure data table" which pulls queries directly from the WSPMS database after the pavement collection data is uploaded to the system every night. We were able to confirm that the automated control is in place and using relevant data pertaining to the control identified. ***No issues noted.***

### **STEP 3: Understand General IT Controls**

To gain an understanding of this automated control, we met with Karen Strauss, State Pavement Management Engineer, & Vyenna Kynull, IT App Development Sr/Scc, on 8/20/24. The understanding of this automated key control is documented at [[Controls - CPMS/TRAINS/WSPMS](#)].

### **STEP 4: Confirm Key General IT Controls**

**Key General IT Control:** The WSPMS system is only accessible by those who have DOT internal network access and are current staff within the DOT directory as given credentials by the DOT IT Network team.

To confirm the general IT control identified at [[Controls - CPMS/TRAINS/WSPMS](#)], we met with Karen Strauss, State Pavement Management Engineer, & Vyenna Kynull, IT App Development Sr/Scc, on 8/20/24. Vyenna performed a walk through of the WSPMS code base and backend development environment. Vyenna shared the WSPMS object explorer that holds all of the databases and indexes within the WSPMS system. The example we reviewed was the "WSPMSSurveyINdexHistory" object that had >30 different tables for various historical log reports. One of these included the data table "hist.WSPMSPinChangeLogHistory" which is a list of all designated WSPMS access pin number changes. We believe this is sufficient evidence of the IT control in place within the WSPMS system and were able to confirm this key control. ***No issues noted.***

### **STEP 5: Test Key General IT Controls**

Not applicable - we are not planning to rely on automated controls and therefore do not need to test general controls; control risk will be assessed at MAX.

## **I.2.PR.G - Non Depreciable Assets**

**Procedure Step:** Key Control #2 (Manual) - Pavement

**Prepared By:** NJH, 8/20/2024

**Reviewed By:** BM2, 11/20/2024

## State of Washington

Purpose/Conclusion:

**Purpose:**

To confirm For cracking, prior to a PSC value assigned, an experienced DOT pavement engineer will scan & review the 3-D images and pictures recorded from the collection van and will analyze each video segment and note when they see a crack/inconsistency in the pavements surface. They will note it in the pathway system using "Asphalt Concrete Pavement (ACP) Hot Keys" and "Portland Cement Concrete Pavement (PCCP) Hot Keys" (**Key Control #2 - CPMS/TRAINS**) in order to assess control risk.

**Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

## State of Washington

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency.*

***All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.***

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*

## State of Washington

*B. Controls are not related to a "significant risk" identified in the audit plan.*

*C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*

*D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

**Key Control #2 (Classification):** For cracking, prior to a PSC value assigned, an experienced DOT pavement engineer will scan & review the 3-D images and pictures recorded from the collection van and will analyze each video segment and note when they see a crack/inconsistency in the pavements surface. They will note it in the pathway system using "Asphalt Concrete Pavement (ACP) Hot Keys" and "Portland Cement Concrete Pavement (PCCP) Hot Keys".

The understanding for this system is documented above in the [[Controls - CPMS/TRAINS/WSPMS](#)] step.

### **1. Confirmation of Key Manual Control:**

To confirm this key control, we met with Marsha Mawdsley (Transportation Planning Specialist) & Dirk Brier (Transportation Planning Specialist) on 7/1/24 to have them perform a walkthrough of the pavement condition assessment. As noted in our understanding of this control, the pavement collection van uses sensors to record two points of data, the roughness (IRI) and the rutting. Dirk noted that the data is stored local on hard drives on the van and is backed up to the Pathway servers every night where the software reads the sensor data and assigns it a score. The only manual criteria that is scored is the cracking in the pavement. Marsha showed us her screen which had a dash cam view of the road (what the driver was seeing) as well as the view of the pavement itself. There were two pavement windows and Marsha informed us one was a 2-D view showing how the surface looks when it's normally visible and another view which was 3-D showing deeper areas of the pavement not normally visible. The data is stored in Pathway as "sets" and Dirk noted that each set would only ever contain about a maximum of about 120

## State of Washington

miles of pavement to assess. Marsha visually scans each segment, which is every three feet, and notes when she sees a crack/inconsistency in the pavement. She notes it in the pathway system using "Asphalt Concrete Pavement (ACP) Hot Keys" and "Portland Cement Concrete Pavement (PCCP) Hot Keys". We obtained a physical copy of this sheet with all of the hot keys on them for our records. These are a list of hot key commands that tie to certain markings/descriptions she can use when she identifies a crack. For example, she would often use keys N & M which are coded for spalling ratings (high & low).

During the walkthrough, we watched as Marsha inspect PCCP pavement footage collected from the second lane on I-5 South in Tukwila as well as ACP pavement footage collected from the second lane on I-5 South in Lynnwood. We confirmed with Dirk that all of the data assessed by Marsha (or another DOT pavement staff member) from a particular data set of footage will be checked using a random sample of that footage by which he will review the assessment made and determine if it is correct or not. This helps them ensure that the hot key ratings used are continually accurate and that the assessors, like Marsha, are continuing to notice the correct inconsistencies in the pavement. ***From our walkthrough we can confirm that pavement condition assessments are completed to ensure highways are inventoried and assessed to allow reporting using the modified approach for infrastructure. No issues noted.***

### **Noted Weaknesses are as follows:**

**None**

### **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

### **I.2.PR.G - Non Depreciable Assets**

*Procedure Step:* Key Control #3 (Manual) - Bridges

*Prepared By:* NJH, 8/20/2024

*Reviewed By:* BM2, 11/20/2024

# State of Washington

Purpose/Conclusion:

**Purpose:**

To confirm the Bridge Asset Management Engineer compiles the assessments into a summary report with a good, fair, or poor rating for each bridge. The percentage of bridge deck area for each rating is used to determine the percentage of bridges at fair or better and compliance with the modified approach for infrastructure **(Key Control #3 - CPMS/TRAINS)** in order to assess control risk.

**Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. 3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. *Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. *Controls are not related to a "significant risk" identified in the audit plan.*

## State of Washington

*C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*

*D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

**Key Control #3 (Valuation/Classification):** The Bridge Asset Management Engineer compiles the assessments into a summary report with a good, fair, or poor rating for each bridge. The percentage of bridge deck area for each rating is used to determine the percentage of bridges at fair or better and compliance with the modified approach for infrastructure.

The understanding for this system is documented above in the [[Controls - CPMS/TRAINS/WSPMS](#)] step.

### **1. Confirmation of Key Manual Control:**

To confirm this key control, Hyung-Seop Shim, the Bridge Asset Management Engineer, along with a few members of his team, Roman Peralta & Paul Evans, performed a verbal walkthrough of how the assessment summary report is created and updated for the most recent bridge assessments.

We also received the WSDOT G-F-P Bridge Summary titled "SAOreport2024" from Jesse Daniels, Audit Liaison, on 6/11/24. This report had to be updated and we received a new copy the next day on 6/12/24. We inquired about this update during our walkthrough and Paul Evans noted that a new FHWA revision of the [Specifications for the National Bridge Inventory](#) had slightly revised commentary on how the width is calculated/included in the overall calculation of deck area. We compared & calculated the percentage change in total bridge deck area and found that the overall change was insignificant (0.27%).

Hyung informed us that he uses a query tool through the Bridgeworks (WSBIS) database servers to extract and organize bridge information from

## State of Washington

the Main Bridge Inspection databases. He will query out the WSDOT bridges over 20 feet in length that carry Vehicular Traffic (including Ferry Terminals and Bridges Shared with Border States [Oregon and Idaho]) and classify each bridge condition based on their inspection codes. The resulting summary report is provided for use in the WSDOT Grey Notebook and to allow for staff to report using the modified approach according to GASB-34. Similar to the RSI, the WSDOT Grey Notebook is posted every year but the actual bridge assessments are only completed and updated every two years.

We noted the summary report contains a summary of percentage of bridge deck area in poor, fair, and good condition. For the most recent calendar year under bridge review (2023), it showed that 92.4% of bridges were either in good or fair condition. This information will be updated in the RSI for FY24, as inspections are completed and reported on every two years. We determined bridges are assessed, their condition is rated and the ratings are compiled into a summary report that provides WSDOT the basis for compliance with the modified approach for infrastructure. **No issues noted.**

### **Noted Weaknesses are as follows:**

**None**

### **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

### **I.2.PRG - Non Depreciable Assets**

*Procedure Step:* Risk Assessment

*Prepared By:* NJH, 7/2/2024

*Reviewed By:* BM2, 11/20/2024

Purpose/Conclusion.\*

**Purpose / Conclusion:**

# State of Washington

To assess inherent risk, control risk, and the risk of material misstatement in order to design an initial testing strategy for each assertion.

Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

## **STEP 1: Inherent Risk (IR)**

Assess inherent risk for each relevant assertion. This assessment is based on understanding of the entity and the nature of the account balance or class of transactions.

*Inherent risk is the susceptibility of an assertion to material misstatement. It is our assessment of "total threat", which includes both "natural risk" and identified risk indicators, without any regard to any potential control activities. As inherent risk is fully independent of control risk, any understanding of controls cannot be used to increase/decrease the assessment of inherent risk. Consider the following factors as your basis for this assessment:*

### *General Considerations*

*Does the balance include transactions that are difficult to audit or involve complex accounting issues?*

*Were there significant misstatements identified in previous audits or prior-period adjustments in the account balance or transaction class? If so, analyzing the cause of prior period misstatements will help in analyzing inherent risk.*

*Are there any inherent risk factors at the entity or industry level, such as changes in regulation or accounting rules, unique transactions or accounting practices, use of information technology, etc that affect the balance?*

### *Inherent Risk due to Error*

*How large are the transactions making up the balance? If the balance has only a few large transactions, even a single error may mean a significant misstatement.*

*Have there been changes in the transactions making up the balance that may increase risk? For example, significantly different composition, nature or volume of transactions may inherently disrupt established controls.*

*Are financial events originated or identified by accounting personnel or non-accounting personnel? This consideration is mainly for the completeness assertion.*

*Does the process to account for transactions involve judgment or estimation, complex calculations, numerous steps or significant manual steps?*

*Do transactions have widely varying attributes that need to be manually identified? For example, grant loans that are accounted for in one of several ways depending on the terms of the agreement.*

### *Inherent Risk due to Fraudulent Reporting (intentional misstatements)*

*Are there substantial pressures or motivations to misstate the balance?*

### *Inherent Risk due to Misappropriation*

*Is the account balance or transaction class susceptible to sizable misappropriation?*

## State of Washington

### *Inherent Risk due to Non-Compliance*

*Are there any laws, contracts or grant agreements affecting the balance? If so, would non-compliance lead to sizable misstatements?*

*Are compliance requirements complex, hard to understand, subject to judgment or otherwise difficult to comply with?*

*Are there any motivations or pressures to not comply?*

### **STEP 2: Control Risk (CR)**

Assess control risk by system and assertion. This assessment should be based on the results of the control understanding, confirmation, and (if setting control risk to LOW) testing. If applicable, auditors will evaluate any control deficiencies and determine whether those deficiencies, individually or in combination, are significant deficiencies or material weaknesses.

*Control risk is the risk that material misstatements would not be prevented or detected timely by the system of internal control. Control risk could be thought of as the "vulnerability" of an entity to misstatements. Control risk exists independently of the inherent risk (the level of vulnerability exists independent of the level of threat).*

*Control risk is MAX in both of the following situations: (1) controls aren't tested or (2) controls are problematic and cannot be relied upon. In order to set control risk to LOW, the auditor must test that controls operated effectively throughout the period.*

*A material weakness exists when the design or operation of controls results in a reasonable possibility a material misstatement will not be prevented or detected and corrected in a timely manner. A significant deficiency is less severe than a material weakness, yet important enough to merit the attention of the governing body. **All potential material weaknesses and significant deficiencies should be discussed with the AIC, since they must be reported as findings.***

### **STEP 3: Risk of Material Misstatement (RMM)**

Assess the risk of material misstatement for each relevant assertion for each significant line item. The risk of material misstatement (RMM) is a combination of the auditor's separate assessment of inherent and control risk.

*In practice, the RMM is the amount of substantive evidence that's needed, and the only way to reduce the amount of needed substantive evidence (equal to the inherent risk) is to test controls. As such, when control risk is MAX, the RMM must always equal the inherent risk (IR).*

*When controls are tested & can be relied upon (are determined to be effective) it is a matter of professional judgment how much the RMM should be set lower than inherent risk (1 or 2 steps).*

*Auditors should assess RMM by assertion, if different. For example, if RMM is assessed at MOD for the existence assertion, but LOW for the rights & obligations assertion, then document "MOD – existence and LOW – rights & obligations".*

# State of Washington

## **STEP 4: Design Substantive Testing**

Design a substantive testing strategy that addresses the relevant assertion (identified risk) in the portion of the line item that relates to that risk.

*Planning identifies where to audit (significant balances, classes of transactions & disclosures) what to audit for (relevant assertions), and how much to audit (RMM). The quantity and quality of evidence obtained by substantive tests needs to match the level of risk. The higher the risk of material misstatement, the greater evidence needed. "Greater evidence" could either be greater quantity of evidence, greater quality of evidence, or some combination of greater quality and quantity.*

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6210](#) – Planning Financial Statement Audits**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits Planning Guide](#)**

Record of Work Done:

## **(1) Inherent Risk (IR):**

Based on our understanding of the line item, we assessed inherent risk as follows for each relevant assertion and significant class of transactions:

Valuation - Low

Classification - Low

## **(2) Control Risk (CR):**

We assessed control risk as follows for each system and relevant assertion:

### **CPMS/TRAINS - Valuation/Classification**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

## **(3) Risk of Material Misstatement (RMM):**

# State of Washington

We considered both inherent and control risk and assessed the risk of material misstatement as follows for each relevant assertion and significant class of transactions:

Valuation - Low

Classification - Low

## **(4) Testing Strategy:**

We designed our substantive testing strategy based on our assessment of the risk of material misstatement. We plan to perform the following tests:

Test a sample of bridge assessments from the bridge summary report (with a good, fair, or poor rating given for each bridge) to determine the percentage of bridges at fair or better and compliance with the modified approach for infrastructure (Valuation & Classification).

We will rely on the FY2022 State ACFR work performed over highway pavement assessments to determine whether the review is completed to support compliance with the modified approach (Valuation & Classification).

We anticipate that these tests will provide sufficient appropriate audit evidence to address the assessed risk of material misstatement for relevant assertions in significant classes of transactions.

## **I.2.PRG - Non Depreciable Assets**

*Procedure Step:* Substantive Test - CPMS/TRAINS/WSPMS

*Prepared By:* NJH, 11/8/2024

*Reviewed By:* RKM, 11/20/2024

Purpose/Conclusion:

## **Bridges:**

### **Purpose:**

To determine whether infrastructure assets are reported at properly valued and calculated amounts. To determine whether financial statements properly classify infrastructure assets in conformity with generally accepted accounting principles (GAAP).

### **Conclusion:**

We determined bridge inspections were completed as required and support valuation of bridge infrastructure using the modified approach. We determined bridge inspections were completed as required and support the classification of bridge infrastructure using the modified approach. **No**

# State of Washington

*issues noted.*

## **Pavement:**

### **Purpose:**

To determine whether infrastructure assets are reported at properly valued and calculated amounts. To determine whether financial statements properly classify infrastructure assets in conformity with generally accepted accounting principles (GAAP).

### **Conclusion:**

We determined pavement was reported at properly valued and calculated amounts. We determined pavement assessments were completed as required and support the classification of pavement using the modified approach. However, we noted one minor issue related to DOT not being in compliance with their two year cycle of assessments. See issue at: [\[V: DOT RSI Modified Approach: Infrastructure - Pavement\]](#).

Testing Strategy:

### **Valuation:**

The following is a list of **considerations** for testing the valuation assertion for capital and infrastructure assets. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

### **Incorrect Depreciation Calculations**

Perform an analytical review of depreciation expense by type of asset for reasonableness.

Re-calculate depreciation expense for a sample of assets or in conjunction with a test of automated controls (if depreciation is automatically calculated by the system). Consider testing the inputs used for the calculation to determine whether they are reasonable and in line with any applicable policies; i.e. useful life, salvage value, etc. Alternatively, test calculations, extensions and footing of subsidiary records if records are maintained on spreadsheets.

Evaluate capital asset policies for componentization or grouping of assets to determine if it has been consistently followed and will result in a rational method of depreciation. See BARS [3.3.10.150](#) for guidance.

Evaluate estimated useful life and scrap value factors for reasonableness. This test could be done in general (on the government's accounting policies), for selected asset classes or for selected or sampled asset records.

*If testing selected high risk assets, auditors should consider assets that are nearly or fully depreciated (see BARS [3.3.10.130](#)), assets with unusually high or low useful lives for their type, and assets with unusually high scrap values.*

Compare estimated useful lives for assets with replacement schedules / policies and capital budgets.

*We would expect that assets on a regular replacement schedule (such as equipment, vehicles, road surfacing, etc) or that are included for replacement in the capital budget would have estimated useful lives that match the government's replacement plans for the asset.*

# State of Washington

Consider whether the date placed in service for assets is reasonable given when the asset begins being used or is substantially complete as this will have an effect on when depreciation begins. See information in BARS [3.3.10.90](#) about when to move a project out of CIP.

## **Impairment**

Check that the measurement method used for write-offs is in accordance with GAAP (GASB 42.12-15). Review or recalculate the portion of historical cost that should be written off for impaired capital assets. *Note: auditor would normally use the same measurement method used by the government unless it the auditor finds it inappropriate for the circumstances or unallowable under GAAP.*

## **Incorrect Historical Cost of Assets**

Trace recorded cost to supporting documentation. *Note: This test would normally be limited to recent additions, since documentation for historical assets has likely passed the records retention period.*

Evaluate the reasonableness of any estimates of the historical cost of capital assets.

Evaluate the reasonableness and support for any estimates of the acquisition value (per GASB 72) of donated capital assets.

## **Conversion to GAAP**

For governments converting to GAAP reporting, examine valuation method for retroactively reported infrastructure assets and verify that the valuation method used is one of the methods prescribed by the County Road Advisory Board.

## **Modified Approach**

Check that infrastructure is being depreciated unless the modified approach is used. If the modified approach is used, verify that the government has met criteria of GASB 34 par 23-26.

## **Allocation**

On the government-wide statement of activities, review allocation of depreciation for capital assets for governmental funds. Depreciation expense will be reported as a component of the direct expense shown in the statement of activities. Request spreadsheet for allocation.

## **Classification:**

The following is a list of **considerations** for testing the classification assertion for capital and infrastructure assets. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

## **Assets Reported as the Wrong Category**

Scan asset descriptions to determine if assets appear correctly categorized.

Compare asset classification and descriptions to observations and/or review of supporting documentation.

## State of Washington

Test that assets reported in Construction in Progress have not yet been substantially completed. See BARS [3.3.10.90](#). Consider using the L&I [prevailing wage reporting database](#) to scan for projects that may have been completed during the audit period. Identify any significant surplus assets that the government intends to sell from review minutes and check that these are appropriately classified as "assets held for sale."

### **Assets Reported in the Wrong Opinion Unit**

Scan subsidiary ledgers to see if capital and infrastructure assets appear related to the fund they are reported in. Follow-up on all unexpected assets.

Search for manual journal entries that transfer capital assets from one opinion unit to another without recording an operating statement transaction (debit and credit to capital assets and fund balance for each opinion unit, respectively). Consider testing if any risk indicators are noted.

Consider results of recent physical inventory. Follow up on any discrepancies or missing assets that could have been a result of assets moving between departments/funds.

### **Improper Capitalization of Expenditures**

Inquire as to the types of costs the government capitalizes for purchases, construction, software development (if applicable) or other types of assets. Research and follow-up on any practice that appears in conflict with GAAP or in conflict with policy assumptions underlying estimated useful lives, scrap values or any grouping or componentization methodologies used to capitalize assets.

Review supporting documentation for selected capitalized improvements or repair / maintenance expenses to determine whether capitalization criteria was met and were consistent with policy assumptions underlying estimated useful lives, scrap values and any grouping or componentization methodologies used to capitalize assets. See BARS [3.3.10.150](#) for information regarding componentization of assets.

Review supporting documentation for constructed assets to check that all capitalized costs meet GAAP criteria.

Check that any capitalized costs in connection with pollution remediation meet GASB 49 par 22 exceptions (since costs would normally be an expense against the pollution remediation liability).

Review supporting documentation for software development to check that all capitalized costs meet GAAP criteria.

Check that uncapitalized collections (works of art or historical artifacts) meet GAAP criteria for being expensed.

Guidance/Criteria:
--------------------

### **Valuation:**

#### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

2012 GAAFR page 451 describes generally accepted estimation methods for when the historical cost of an asset is unknown. NOTE: The County Road Advisory Board (CRAB) worked with local governments to develop several methods for valuing historical infrastructure assets when GASB 34

# State of Washington

was implemented.

## **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

### **BARS [3.3.9](#) Capital Asset Management System Requirements**

**BARS [3.3.10](#) Capital Asset Accounting** - guidance on determining ownership of capital assets.

### **BARS [3.9.2](#) Property Transfers**

GAAP criteria for reporting capital assets

**[GASB Codification Section 1400](#) Reporting Capital Assets**

**[GASB Comprehensive Implementation Guide Chapter 7](#) Basic Financial Statements and Mangement's Discussion and Analysis, sections 7.9-7.21**

## **Classification:**

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

GASB 72 (codified at section 3100) distinguishes between classification as capital assets and investments. Since land, rental properties or other tangible property is not an eligible investment for local governments, we would not expect to see any property reported as an investment. Surplus assets awaiting sale should be classified as "assets held for sale." See GASB 72 par B47 for discussion of multi-use assets, such as a city building with the first floor rented out to retail stores. In such cases, the unit of account should be considered the building as a whole in order for reporting to demonstrate legal compliance for investments.

## **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

### **BARS [3.3.9](#) Capital Asset Management System Requirements**

GAAP criteria for reporting capital assets

**[GASB Codification Section 1400](#) Reporting Capital Assets**

# State of Washington

## [GASB Comprehensive Implementation Guide Chapter 7](#) Basic Financial Statements and Management's Discussion and Analysis, sections 7.9-7.21

Record of Work Done:

### **Bridges:**

Substantive tests performed to meet the Valuation assertion:

See testing performed and results at [\[Bridge Testing\]](#).

To meet the valuation assertion, we selected a sample of 21 bridges from the G-F-P Bridge Assessment we received titled *SAO Report-2024\_updated deck area* from Hyung-seop Shuim, Bridge Management Engineer for DOT. We used the criteria of "Vehicular bridges/Culverts reported to the NBI (>20 ft long)" which makes up about 80% of all bridges included in the assessment, which we deemed a sufficient coverage amount for the assertion. We then had Hyung update the qualitative and quantitative parameters we created that we deemed necessary to obtain in order to substantiate a conclusion. These parameters include the inspection date, the primary inspector, whether or not the bridge is included in WSBIS software, and the frequency the bridge is inspected. All of these parameters were not originally included in the bridge assessment report we received. We then calculated the next assessment date of inspection needed to determine if the bridge was assessed within the 24 or 48 month inspection cycle using calendar year end 12/31/23 (since assessments are performed on a calendar year basis) as referenced in the [WSDOT Bridge Inspection Manual](#) to be included in the FY24 ACFR Required Supplementary Information (RSI). To meet the valuation assertion, we determined if each bridge selected in our sample was included in the assessment and was assigned an NBI rating of fair or good. We were able to confirm the population was complete on the "Pop. Completeness & Tie Out" tab by comparing the total WSDOT reported bridges with the number of bridges reported to the NBI > 20ft that received a rating. We determined that the population used for sampling had an overall rating of "Fair" or better for 94% of the bridges. There was no variance noted within the population, and we consider the population complete for testing purposes. To meet the valuation assertion, we determined if each bridge selected in our sample was included in the assessment and was assigned an NBI rating of fair or good.

Based on our evaluation of results and sampling risk, we determined the sample provided a reasonable basis for conclusions about the population. We determined bridge inspections were completed as required and support valuation of bridge infrastructure using the modified approach. ***No issues noted.***

Substantive tests performed to meet the Classification assertion:

See testing performed and results at [\[Bridge Testing\]](#).

To meet the classification assertion, we selected a sample of 21 bridges from the G-F-P Bridge Assessment we received titled *SAO Report-2024\_updated deck area* from Hyung-seop Shuim, Bridge Management Engineer for DOT. We used the criteria of "Vehicular bridges/Culverts reported to the NBI (>20 ft long)" which makes up about 80% of all bridges included in the assessment, which we deemed a sufficient coverage

## State of Washington

amount for the assertion. We then had Hyung update the qualitative and quantitative parameters we created that we deemed necessary to obtain in order to substantiate a conclusion. These parameters include the inspection date, the primary inspector, whether or not the bridge is included in WSBIS software, and the frequency the bridge is inspected. All of these parameters were not originally included in the bridge assessment report we received. We then calculated the next assessment date of inspection needed to determine if the bridge was assessed within the 24 or 48 month inspection cycle using calendar year end 12/31/23 (since assessments are performed on a calendar year basis) as referenced in the [WSDOT Bridge Inspection Manual](#) to be included in the FY24 ACFR Required Supplementary Information (RSI). We were able to confirm the population was complete on the "Pop. Completeness & Tie Out" tab by comparing the total WSDOT reported bridges with the number of bridges reported to the NBI > 20ft that received a rating. We determined that the population used for sampling had an overall rating of "Fair" or better for 94% of the bridges. To meet the classification assertion, we determined if each bridge's inspection date selected in our sample was within the allotted 24 month inspection cycle to be included in the FY ACFR RSI under the modified approach.

Based on our evaluation of results and sampling risk, we determined the sample provided a reasonable basis for conclusions about the population. We determined bridge inspections were completed as required and support the classification of bridge infrastructure using the modified approach. ***No issues noted.***

### **Pavements:**

#### Substantive tests performed to meet the Valuation & Classification assertion:

Our original test from the risk assessment stated we will "test a sample of highway pavement assessments to determine whether the review is completed to support compliance with the modified approach". DOT's original plan was to include a 2023 percentage in the RSI. This would have been in compliance with their two year cycle of pavement assessments. As the audit progressed we became aware of a data reporting issue. Karen Straus, State Pavement Management Engineer, stated that the most recent data could not be provided due to rating data not being transmitted correctly and was missing. See memo at: [\[2023 GFP Percentage Memo 11-1-2024\]](#). We determined to issue a recommendation related to DOT not being in compliance with their two year cycle of assessments. See issue at: [\[V: DOT RSI Modified Approach: Infrastructure - Pavement\]](#).

Due to this issue OFM elected to report the same percentage as last year. RSI includes the last pavement assessment data which was completed during calendar year 2021. In response to this decision we updated our test in the risk assessment to state "We will rely on the FY2022 State ACFR work performed over highway pavement assessments to determine whether the review is completed to support compliance with the modified approach". We reviewed the FY22 State ACFR audit at: [\[S1Washington-FS22 - H.2.PR - Non Depreciable Assets\]](#). We found that in the FY22 audit we sampled and tested from the calendar year 2021 data and determined the pavement condition assessments are performed by a qualified staff member and assessments collected the necessary data to support the given rating and allow for reporting using the modified approach.

GASB section I.1400.105 notes that assessments must be performed at least every three years. While DOT didn't perform a pavement assessment in 2023 we determined they are still in compliance with GAAP since the last assessment was completed in calendar year 2021. To continue to

## State of Washington

meet the GASB requirement in FY25, they would need to conduct the next assessment by December 31, 2024.

### I.3.PRG - Depreciable Assets (Net of Depreciation)

*Procedure Step:* Summary & Conclusion

*Prepared By:* NJH, 10/17/2024

*Reviewed By:* RKM, 11/19/2024

Purpose/Conclusion:

**Purpose:**

To evaluate risk assessments and the sufficiency and appropriateness of evidence obtained based on results of substantive work.

**Conclusion:**

We determined that **no** modifications were necessary to inherent risk, control risk, or the risk of material misstatement as assessed in planning.

We also determined that evidence obtained was sufficient and appropriate in response to the risk of material misstatement.

Testing Strategy:

Auditors are **required** to evaluate conclusions for substantive testing as follows:

*Auditors may wish to use the optional Lead Sheet available in the Store to summarize testing related to each balance and assertion.*

**1.** Determine whether the results of substantive testing indicate a need to modify the inherent risk assessment (IR), control risk assessment (CR), risk of material misstatement (RMM) or other aspects of planning (such as material balances or assertions). If so, document changes and consider the need for additional testing.

*If the results of substantive testing indicate a need to change control risk, auditors should also update the **Permanent File** by either correcting the documentation or by adding an update section describing changes to the top of the record of work done. For all changes to IR, CR, or RMM the **Material Balances** spreadsheet should be updated.*

*More significant changes to other aspects of planning (such as material balances or assertions) should be referenced in this step and*

# State of Washington

*documented in detail in the [Changes to FS Audit Plan](#) step.*

2. Evaluate whether the quality and quantity of evidence obtained is sufficient and appropriate in response to the risk of material misstatement. In making this determination, auditors should evaluate:

Information to be used as audit evidence:

Does evidence relate to the population, period of time and risk (assertion and “what could go wrong” from the Material Balance Spreadsheet)? If there are any gaps or uncertainties in the logical connection between the evidence and conclusions, is there a documented consideration and explanation?

Are the sources of information sufficiently reliable and appropriate for the risk (whether internal to the government, external, or auditor developed)? If key information is not from a sufficiently reliable source (for example, inquiry), then is it corroborated by information that is?

Are there any concerns about accuracy, completeness, authenticity, or bias in information? If so, did the auditor perform sufficient procedures to confirm reliability of that information?

Is information precise enough to catch if misstatements exceeded the tolerable level?

Is information detailed enough to conclude on whether or not there were misstatements?

Was there any information that appeared contradictory or inconsistent? If so, was there a documented response to the inconsistencies or doubts about the reliability of evidence?

Results:

How much misstatement was identified by testing, and the likelihood and magnitude of further potential misstatement?

How did misstatements occur and how often might they occur again in the population?

Were misstatements caused by control deficiencies or circumvention of controls?

If control deficiencies, is there a need to re-evaluate our understanding of controls in the [Permanent File](#) folder or assessment of control risk?

If circumvention, the [Management Override of Controls](#) step should address or reference this area. Auditors should also consider whether a fraud risk has been identified.

Did tests identify a different level or type of risk than the planned audit response was designed to address?

If likely misstatements are identified, are further procedures necessary to improve the precision of our estimate?

*To support the overall evaluation of audit risk and provide a basis for concluding on the overall sufficiency and appropriateness of evidence in the [FS Summary & Report](#) step, auditors should conclude in each area whether the auditor continues to believe that the tests performed and quality and quantity of evidence obtained are commensurate with RMM for all relevant risks (the “what could go wrong”, in the [Material Balances](#) spreadsheet).*

## State of Washington

If the auditor determines that evidence is not sufficient or appropriate, additional substantive testing should be done. If sufficient, appropriate evidence is not available for audit, the AIC should discuss the effect on our audit report with the AAM and AM.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6310](#) – Determining the Nature, Timing and Extent of Substantive Testing**

**SAO Audit Policy [3210](#) – Audit Evidence**

Record of Work Done:

Based on test results, we re-evaluated risk assessments, procedures, evidence obtained and conclusions as follows:

### **(1) Do the results of substantive tests indicate a need to modify our risk assessment (IR, CR and RMM)?**

We determined that **no** modifications were necessary to inherent risk, control risk, or the risk of material misstatement as assessed in planning.

### **(2) Was the quality and quantity of evidence obtained sufficient and appropriate?**

We determined that evidence obtained was sufficient and appropriate in response to the risk of material misstatement.

### **I.3.PR.G - Depreciable Assets (Net of Depreciation)**

*Procedure Step:* Understanding of Line Item

*Prepared By:* NJH, 7/2/2024

*Reviewed By:* RKM, 7/5/2024

Purpose/Conclusion:

### **Purpose / Conclusion:**

To gain an understanding of the line item and confirm the scope of testing as documented in the Significant Account Matrix.

# State of Washington

## Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

### **STEP 1: Prior Audit Exceptions**

Document any exceptions noted during the prior audit. Follow-up to determine how the agency has responded to or corrected the issue, unless this work is anticipated as part of the testing strategy.

### **STEP 2: Analyze Composition and Changes of Line Item**

Include link to the line item leadsheet. This will be completed at the end of the audit. Leadsheet analysis should be documented in this spreadsheet.

Inquire with agency staff about the activities and transactions that make up the balance and any changes to those activities or transactions in relation to the prior year.

Determine relevant classes of transactions or account balances within the line item to analyze (such as agencies, funds, programs, departments, accounts, and/or objects), and use AFRS to create trends of those elements. This step should not include any specific dollar amounts associate with the line item.

Evaluate trends to identify:

- (1) What classes of transactions or account balances are primary to the identified risk. Auditors should specifically consider what elements are primary to the line item (comprising a large percentage of the line item), and which elements the identified risk would apply to, and which elements might be most susceptible to the identified risk (having a high risk of non-trivial misstatement for a relevant assertion, considering likelihood and impact of potential for misstatement).
- (2) What changes are primary to the identified risk, if applicable. Auditors should specifically consider whether the overall change to the line item from the prior year was significant, what elements were the primary drivers of overall change, whether any elements changed significantly from the prior year, and which changes (if any) might relate to the identified risk.
- (3) Any unusual or unexpected elements, amounts, or changes that may indicate a risk, whether the one identified in planning or a new one that may need to be considered for a change to the plan.

**Consider** other procedures to gain an understanding of the line item, such as review of key policy documents, review of program information or reports, inquiry of staff, budget information, or other analytical procedures.

### **STEP 3: Update Significant Account Matrix**

Based on your understanding of the line item, update the Significant Account Matrix with final conclusions on the agencies covered, account description, significant accounting systems, and risk (what could go wrong and relevant assertions). The account description should reflect the

## State of Washington

significant transaction streams or account balances relevant to the risk.

*The description of agencies, significant accounting systems, and what could go wrong in the Significant Account Matrix constitute the overall scope of substantive testing.*

*A transaction stream is significant based on the potential for misstatement. This is often due in part to its size (ie: comprising a large percentage of the total line item), but is ultimately a judgment about the susceptibility to the identified risk (for example, when the risk is understatement a small or omitted account may hold the most potential for the largest misstatement).*

*Significant accounting system(s) are those that contain key controls over significant classes of transactions included in the line item. Control systems identified in this step must match the Significant Account Matrix and have a separate control understanding documented.*

*Talk with the AIC if you identify any changes to the Significant Account Matrix.*

Guidance/Criteria:

Record of Work Done:

### **(1) Prior Audit Exceptions:**

None.

### **(2) Composition & Change Analysis:**

Line Item Leadsheet: [[Line Item Lead Sheet](#)].

There are two funds that contain depreciable assets for DOT, 410 & 997.

**Fund 410:** A proprietary fund (Transportation Equipment Fund - TEF) is updated whenever equipment is purchased. The Transportation Equipment Fund (TEF) is the primary holder of equipment inventory and financial information related to it. Equipment is purchased and maintained through TEF and then leased to WSDOT for project work. Financial information for this inventory is in FEMS. Capital assets purchased by (or donated to) a Proprietary Fund type remain in the fund, assets purchased by a Governmental Fund type are recorded in the General Capital Asset Subsidiary account (Fund 997).

**Fund 997:** A Governmental fund which includes all other capital assets. The Minor Capital portion of this fund includes all those vehicles and equipment that are purchased directly and not a part of TEF.

We did a break out of the account balances over the prior 2 years for the Net Depreciable Assets at WSDOT as documented at [[Line Item Lead Sheet](#)]. Additionally, a breakdown of the current balances were calculated to determine the composition of the individual general ledger accounts as a percentage of coverage, as documented in the Balance Breakdown tab at [[Line Item Lead Sheet](#)]. We determined we can get adequate testing

## State of Washington

coverage by selection of the following funds GL accounts:

Fund 997, GL 2210, 2220, 2410, & 2420 (Consists mainly of buildings & ferries)

Fund 410, GL 2410 & 2420 (Consists mainly of TEF Equipment)

This accounts for a majority of the total balance of Net Depreciable Assets and was determined to be sufficient coverage for the audit.

### **(3) Updates to Significant Account Matrix:**

None

### **I.3.PRG - Depreciable Assets (Net of Depreciation)**

*Procedure Step:* Controls - TEF - TRAINS/FEMS

*Prepared By:* NJH, 7/11/2024

*Reviewed By:* RKM, 8/12/2024

Purpose/Conclusion:

#### **Purpose:**

To gain an understanding of internal controls.

#### **Conclusion:**

We gained an understanding of internal controls as documented in the record of work done.

Testing Strategy:

#### **The following procedures are required for all material systems:**

1. List the financial statement balance(s) and relevant assertion(s) addressed by the understanding.
2. Gain an understanding of the internal control process, identify how transactions are recorded in AFRS, identify key controls over relevant assertion(s), and note any control weaknesses.  
In gaining an understanding of controls, consider the overall understanding of State-Level control elements as documented in the "State-Level Controls" step as they relate to this particular system.

## State of Washington

Identify controls systems covering all relevant assertions for all significant classes of transactions.

Standards require the auditor to gain an understanding of the significant accounting system(s) that contain key controls over significant classes of transactions included in the line item.

Control systems identified in this step must match the Material Account Matrix and have a separate control understanding documented.

Talk with the ACFR Specialist or AIC if you identify different systems than the ones anticipated in the Material Account Matrix.

For each material system, auditors must document:

A brief outline of the transaction flow from beginning to end.

An expanded description of key controls.

Business processes relevant to financial reporting of the relevant assertion for the material balance. Processes should encompass automated and manual procedures by which transactions or events are identified or initiated, authorized as needed, recorded, processed and corrected as needed.

Original accounting records and how records are rolled-up to intermediary ledgers and transferred to the general ledger (AFRS) or financial statements.

Detailed descriptions of key controls. Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

The following is information to **consider** when identifying key controls and transaction flow.

“Key controls” refer to the few controls that together provide reasonable assurance that material misstatements will be prevented or detected and corrected. This is contrasted with ancillary or supporting controls, which – although helpful and recommended – would provide less than reasonable assurance by themselves.

The focus of the write-up is on the key controls. Key controls should be specifically identified (as “key controls”) in the write-up. This can be done in whatever way the auditor prefers, so long as it is obvious. Details that the auditor should document regarding key controls may include:

Who or what initiates the control

When (or how often) is the control applied

Who performs the control

As needed, the experience, knowledge and attitude of the person applying the control

Detailed description of the control process or activity. For example, if the control is a review: what exactly is reviewed, what is the reviewer looking at or for and what are the reviewer’s criteria?

How the key control is documented or evidenced

## State of Washington

If not obvious from the description, how the control prevents or timely detects and corrects misstatements  
Any exceptions or alternative processing to the normal process  
What happens when misstatements or issues are identified by the control

The “transaction flow” refers to the process by which transactions are initiated, authorized, recorded, processed and reported (as applicable). Outlining the transaction flow gives context to key controls, especially how transactions become subject to controls in the first place. If a control inherently ensures that all applicable transactions are included (ex: bank reconciliation where the assertion is existence), the auditor may decide to just start the write-up with the initiation of the control procedure and go from there.

Elements of the transaction flow are defined informally as follows:

*Initiation:* How are transactions initiated?

*Authorization:* How are transactions and accounting record maintenance authorized?

*Recording:* How are transactions or balances identified and recorded in financial accounting systems?

*Processing:* How are the transactions or balances processed after they are recorded (if at all)? Processing may be manual or automated and may occur at a subsidiary system level or at the general ledger level.

*Reporting:* How are records translated into the financial statements? This part of the transaction flow extends the understanding to the actual financial statements that the audit is opining on. Since we already document an understanding of the financial reporting process in general, it is usually enough to simply reference this overall understanding. However, if there are important steps unique to the covered balances, it may be more appropriate to mention them here.

Although transaction flow is a good way to think about understanding and documenting a control system, auditors should not worry too much about documenting “each element, in order” because often elements may be combined, not noticeable, not applicable or occur in a different order.

Guidance/Criteria:
--------------------

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits](#) Planning Guide**

# State of Washington

Record of Work Done:

## **Material Balance and Assertions**

Internal controls in the TRAINS/FEMS address the following balance:

Depreciable Assets (Net of Depreciation)

For the following assertions:

Existence - There is a risk that capital assets have been replaced, sold or impaired.

Valuation - The amount reported for this line item does not represent actual capitalized costs of assets constructed, purchased, or donated as of the report date.

Valuation - Capital assets are not stated at historical or estimated historical cost.

Valuation - Depreciation may be incorrectly calculated because the wrong asset class code or useful life is entered into the system.

## **Significant Accounting Systems:**

**Fleet Equipment Management System (FEMS)** - Inventory system for fleet equipment and calculating depreciation.

**Transportation Reporting and Accounting and Information System (TRAINS)** - TRAINS is used to post expenditures using Payment Vouchers or Journal Vouchers. TRAINS does not allow the creator to review and approve their own work. All additions, regardless of categorization, get recorded in TRAINS as "transportation expenditures" and then have to be broken out through a reconciling JV. See "*How Transactions are Recorded in AFRS*" section below.

## **Other Systems (Not Significant Systems):**

**Transportation Assets Reporting and Tracking System (TARTS)** – Text file showing value and life-to-date depreciation from capital asset inventory systems.

**COGNOS Datamart and Financial Information Retrieval System (FIRS)** - Read only systems used to access WSDOT accounting system expenditures in the capitalization process.

## **Purchase and Capitalization of Transportation Equipment:**

We met with the following staff on 5/13/24 to discuss the purchase and capitalization of transportation equipment for the Transportation Equipment Fund (TEF):

Jesse Daniels - WSDOT Audit Liaison

Charleen Emmons - Budget and Finance Manager for TEF

Beth De Vaul - AFS Transportation Financial Consultant

Suzi Freeland - Accounting and Reporting Manager

## State of Washington

Below is a discussion on the controls concerning fleet equipment inventory, capitalized asset additions, deletions, and depreciation reported:

Vehicles or equipment are purchased when required through the Transportation Equipment Fund, a non-appropriated, proprietary, internal service fund, budgeted through OFM. Equipment owned in the Fund is rented to only other WSDOT programs, and rent is collected from the programs that are using the vehicle or equipment. Typical vehicles purchased through the fund are road clearing equipment and vehicles for use by DOT personnel. Much of the equipment maintained is heavy equipment with a total 8,552 (as of January 31, 2024- based on TARTS file) items in the depreciable equipment inventory. WSDOT refers to the process of collecting rent revenue and using it to fund TEF operations, including maintenance of equipment through the fund, as a cost recovery program.

Transportation equipment is managed by the agency's Fleet and Equipment Operations, through the Fleet Equipment Management System (FEMS). The equipment's total acquisition costs and depreciation are listed and tracked in FEMS. When a need for equipment is identified, a purchase order must be created after the proper approvals are received by necessary supervisors. All purchase orders are tracked through a spreadsheet and then the information will be updated to the FEMS system once a "tech spec" has been done on the purchase, identifying the proper equipment category. Once the item requested is budgeted and ordered in the system, it will stay in ordered status until it is actually received. The depreciation calculation is an automated process in FEMS once the item is listed in the system with its initial value, expected salvage value at service life end, and service life are entered (**Key Control #1 - Automated Software Calculation - Valuation**). Book value at the end of any month is the capital value less life-to-date depreciation. On a monthly basis, the Budget and Finance Manager, reviews new entries in FEMS (from the prior month) to ensure it is accurate (recorded at cost and donated assets are recorded at their estimated value at time of donation) and reconciles with supporting documentation, such as invoices, work orders, etc. (**Key Control #2 - Valuation**).

The information for service life is from SAAM (Addendum to Schedule A, Subsection [30.50.10.b](#)) except where DOT experience has shown that a different service life is indicated. For those pieces of equipment DOT requests written approval from Office of Financial Management (OFM) to document the change in depreciation due to change in service life.

Equipment expenditures are capitalized based upon the procedures in Section 2-5 Capital Assets and Inventories in WSDOT Accounting Manual M 13-82 and [SAAM 30.20.20](#). According to SAAM, equipment expenditures are a capital asset if there is a unit cost (including ancillary costs) of \$5,000 or greater. WSDOT in general capitalizes extraordinary repairs, betterments, or improvements that increase the future benefits of an existing asset by extending its useful life, increasing the capacity or efficiency, or providing a substantial improvement in the quality of output or a reduction in operating costs. Betterments are not added to a vehicle's value until the betterment is installed. Once a betterment is installed to a vehicle, the value will be updated in FEMS.

The actual existence of the vehicles and equipment is verified with a complete physical inventory performed every other year (**Key Control #3 - Existence**). The inventory verification process is required to be complete by June 30 every other year and requires pictures to be attached as part of the inventory process. Vehicle use can also be monitored through review of fuel card usage, since the cards are specific to each vehicle.

## State of Washington

When items are identified for disposal due to overuse (too many miles or hours), obsolescence, or past their scheduled life span, they are disposed of through procedures defined in [SAAM 30.40.45](#) and other related regulations and are sold as a surplus through the Department of Enterprise Services (DES).

### Monthly Review and Transfer of Data to Headquarters

Each month after the close of the month for TRAINS, FEMS provides a report of all units that are capitalized for depreciation. This process occurs after the end of the month, usually in the second week of the month to allow all areas to report. Each unit is identified by number and the monthly depreciation amount is included. These reports are divided by the region they are part of six total regions and Headquarters.

The Budget Finance Manager reviews the monthly fixed asset and depreciation calculations and reports for vehicles and equipment inventoried in FEMS. They first check to make sure that the report is different from the previous month. Their expectation is there will be differences due not only to the fact that it would be a different month but also that the automatic depreciation amount in FEMS will be calculated with a full month of depreciation for any new equipment purchased or donated during the month. The Budget Finance Manager also looks for units that show \$0 depreciation for the month to research and address later in the monthly depreciation reconciliation process. They also review the disposal report from FEMS to make sure that all the disposed equipment is properly identified and valued.

After the report is reviewed and determined to be reasonable, it is released as a detailed flat file from FEMS, to the Transportation Financial Consultant and TARTS, with a summary total amount to TRAINS where it sits in transit until released. While in transit, TRAINS compares the flat file to the depreciation that is calculated by FEMS and produces an error report that shows all items with differences which is also sent back to the Budget Finance Manager. The Assistant Budget Finance Manager looks in TRAINS to ensure the depreciation documents from the FEMS interface to TRAINS are accepted. Then they go through a depreciation reconciliation process that uses the previous month's TARTS file, current month's TARTS file, equipment number change file, equipment disposal file, FEMS depreciation by unit file, and TRAINS depreciation amounts from COGNOS. This identifies depreciation by equipment number between TRAINS and FEMS. This also identifies units disposed, unit number changes, and units where the FEMS and TRAINS depreciation amounts do not match. The Assistant Budget Finance Manager (or Budget Finance Manager) verifies the items were indeed put into service on the dates listed and recalculates the adjustment made by FEMS to verify that amount. Any further adjustments needed are determined by the Assistant Budget Finance Manager (or Budget Finance Manager), who prepares the adjusting JV for TRAINS every month, which are reviewed and signed by the Transportation Financial Consultant or the Accounting and Reporting Manager of the Accounting and Financial Services (AFS) division. The Transportation Financial Consultant completes any JV necessary for AFRS adjustments, which are reviewed by the Accounting & Reporting Manager or Assistant Manager and then releases the JV in TRAINS (from the adjusted original summary total from FEMS) which is picked up in the nightly upload to AFRS.

### **How Transactions are Recorded in AFRS:**

The Transportation Financial Consultant (Beth De Vault) updates the fund equity amounts in TRAINS and AFRS using the various inventory system reports and the monthly TARTS reports to create an Excel workbook that compares the current quarters asset reporting to the previous quarter's asset reporting and on a quarterly basis through electronic journal vouchers that are entered separately in TRAINS and AFRS. TRAINS

## State of Washington

automatically records all expenditures in AFRS as transportation expenditures. These are recorded in AFRS via nightly upload. At the end of each quarter, the Transportation Financial Consultant (Beth De Vault) prepares a JV to adjust the transportation expenditure balance for the amounts that should be recorded as TEF. Then, the Accounting and Reporting unit performs monthly TRAINS/AFRS fund and GL reconciliations to ensure transactions are properly reported within AFRS. **(Key Control #4 - AFRS: Valuation - Manual)**.

One of the following staff members in the Accounting and Reporting section reviews the electronic journal voucher workbooks and releases the journal vouchers: The Accounting and Reporting Manager, or the Accounting & Reporting Assistant Manager. The person writing the JV cannot be the reviewer/releaser.

The purpose of the above procedures is to ensure the data that is entered into TARTS to be picked up by TRAINS on a daily interface is accurate and complete so that when TRAINS and AFRS interface on a nightly basis the information update transferred to AFRS is accurate and complete.

### Key Controls are as Follows:

**Key Control 1 - Automated Software Calculation - Valuation:** Deprecation is automatically calculated for new additions once listed in FEMS and its initial value, expected salvage value at service life end and service life are entered.

**Key Control 2 - Valuation:** Each month, the Budget Finance Manager reviews new entries in FEMS to ensure newly added assets are recorded at their cost. The Budget Finance Manager reconciles monthly depreciation between FEMS and TRAINS to ensure that both systems match.

**Key Control 3 - Existence:** A physical inventory is performed every other year to ensure that recorded assets actually exist.

**Key Control 4 - Valuation:** The Accounting and Reporting unit performs monthly TRAINS/AFRS fund and GL reconciliations to ensure transactions are properly reported within AFRS.

### Noted Weaknesses are as Follows:

None

### I.3.PRQ - Depreciable Assets (Net of Depreciation)

*Procedure Step:* Key Control #1 (Automated)

*Prepared By:* NJH, 8/26/2024

*Reviewed By:* RKM, 8/27/2024

# State of Washington

## Purpose/Conclusion:

**Purpose:** To confirm whether depreciation is automatically calculated for new additions once listed in FEMS and its initial value, expected salvage value at service life end and service life are entered for **Key Control #1 for TEF - TRAINS/FEMS** in order to assess control risk.

**Conclusion:**

Based on our test results, we concluded that the automated control **was** in place. General controls related to the automated control **were not** tested, therefore, we assess control risk at MAX.

Based on our understanding, related general IT controls **were** in place and adequately designed to ensure that the control operated consistently during the audit period. However, we did not test the operating effectiveness of general IT controls.

Our understanding and control risk assessment, which incorporates these conclusions, is documented at [\[Controls - TEF - TRAINS/FEMS\]](#).

We noted **no** material weaknesses or significant deficiencies in internal controls.

## Testing Strategy:

The following procedures are **required** for all automated key controls for financial and single audits:

### **STEP 1: Understand Automated Key Control**

Gain an understanding of the automated key control. The understanding can either be documented in the control system step or could be documented here in this step. Auditors should consider the following aspects of the automated control when gaining an understanding:

#### **Software Calculation:**

Is there written documentation of the calculation, and/or the source rates and factors used in the calculation?

*We would expect written documentation that defines the calculation and is an official, approved source for the formulas, rates and factors. This may be an approved policy or could be system documentation.*

What formulas are used to make the calculation?

What values or factors are used to make the calculation? For example:

- Rate tables used by the calculation

- Profile fields (i.e., applicable transaction types)

- Programmed/set formulas and/or values

- Constraints (i.e., effective date, minimums/maximums, etc.)

# State of Washington

How is the calculation triggered or initiated?

How is the calculation recorded in the accounting system (or used in an end result)?

## **STEP 2: Confirm and Test Automated Key Control**

Confirm and test the automated control. To test the automated control, consider the following procedures:

### **Software Calculation:**

Re-perform the calculation for selected transactions.

*Auditors would NOT normally use sampling for automated controls. Instead, auditors should judgmentally select one instance of each significant variation of the calculation. If the number of potential variations is large, auditors would judgmentally select based on risk factors (for example, the most common scenarios, or scenarios associated with identified risks, or scenarios that are not addressed by the entity's testing procedures).*

*In some cases, it may be possible for the auditor to reperform the calculation for the entire population.*

If any rate tables or values were updated during the period, view the current values (by observing the rate table or values in an admin menu or from a printed system report) and compare to approved sources.

*If no updates were made or there are only a few values, this risk could be addressed by re-performing the calculation. However, if source rate tables or values are large or complex, it may be more efficient to test these values directly than to recalculate a larger number of transactions.*

Consider the use of analytical procedures such as trends or descriptive statistics on the population (like average, minimum and maximum values, or a graph of values across the population) and follow up on any unexpected values or trends. *Analytical procedures would normally also count as a substantive test.*

## **STEP 3: Understand General IT Controls**

Gain an understanding of the general IT controls that support the continued proper operation of the automated control. Identify key general IT controls and note any control weaknesses. Auditors should consider the following aspects of general IT controls when gaining an understanding:

### **Software Calculation:**

Inquire if the entity has experienced any errors or irregularities with the calculation. Also how often changes are made to the calculation, and how many changes (if any) were made during the year.

How can the software calculation (formulas, rates/values, settings/configurations) be changed or customized?

*Software calculations will usually have one or more administrative menus that allow the government to modify rate tables or other*

## State of Washington

*calculation values, or to configure the calculation or apply settings.*

*In other cases, software calculation formulas and/or values may be hard-coded into the system and require programmers to make the changes. If the government has access to source code, then it needs internal procedures for program changes. If the program is controlled by vendors, we would expect program change procedures and expectations to be included in the contract.*

What are the procedures to authorize and make program changes or configuration/setting changes to the software calculation?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

*If utilizing a test environment, there should be controls to ensure that the live environment is updated and is consistent with the live production environment. As management is responsible for the accuracy of their automated controls (i.e., in the live environment), we would expect there to be a procedure to confirm each key automated control once it is in the live environment. This could be manually re-performing the calculation, reviewing reports against known expectations, etc.*

How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change programming, but they may be responsible for patch management, master table data, and/or configurations.*

### **STEP 4: Confirm Key General IT Controls**

Confirm your understanding of key general IT controls to determine whether they have been placed in operation (*whether the entity has actually implemented key controls*).

# State of Washington

## **STEP 5: Test Key General IT Controls**

Document whether general IT controls will be tested. Option 1 would result in control risk at MAX for the automated control. Either option 2 or 3 is necessary in order to set control risk at LOW. If general IT controls are tested, consider the following procedures:

### **Software Calculation:**

If program changes or setting/configuration changes are logged, review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the calculation may also provide this evidence if the re-performance tests address all states of the calculation during the period.

If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

## **STEP 6: Final Control Risk**

Evaluate the results and document a final control risk assessment in the control system step. Consider whether any deficiencies identified with either the automated control or related general IT controls represent material weaknesses or significant deficiencies.

*Note: general IT control deficiencies do not necessarily mean the automated control is not properly functioning. General IT control deficiencies would normally be considered a significant deficiency or material weakness only if it caused an issue with the compliance requirement or assertion.*

### **Recommendation Review Requirement**

IT Security related information is considered category 3 data protected by Public Request Exemption RCW 42.56.420. Issues related to IT Security require the following special handling:

[Instructions](#) are located in Team IT Audit's System's Sharepoint page.

Details of IT Security related issues should NOT be included in any emails or helpdesks.

Exit, ML and Findings should be separately communicated in an IT Security Results Document.

Findings will be referenced, but not included in the audit report.

All IT security-related recommendations must be reviewed by [Team IT Audit](#).

Template language for common IT related recommendations can be found in [ARS Part 5 Chapter 8](#).

### **PUBLIC REQUEST EXEMPTION**

Some IT related information is protected by Public Request Exemption RCW 42.56.420 for cyber security purposes. The details documented

# State of Washington

in the record of work and support workpapers may qualify for this exemption. If so, auditors must include this statement in the record of work done and any related workpapers: **"This record contains information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited "**.

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

## **Information Technology Planning Guide**

Auditors may contact [Team IT Audit](#) with any testing strategy or control assessment questions or to request assistance from an IT Specialist.

**Software Calculation:** A **software calculation control** exists when the value of a transaction is determined by a software application. This process can be a key control when the entity relies on the system to generate calculations correctly to determine the amount of transactions (i.e., summarizing/account code allocation to post to general ledger, calculate student, utility, other charges, etc.).

**Automated Interfaces:** An interface is a process that moves information from one computer application to another. The interface can occur internally between systems maintained by a single agency, or between systems maintained by different agencies or private companies. The interface can also occur between modules within the same computer application.

The data transferred might be a file consisting of one or more records processed at a later time (batch), or it can be a real-time update. Risk associated with interfaces increases as the number of transactions or the number of other services and systems supported by the interfaced data increases.

Poor design or inadequate oversight can affect the transfer of transaction data among the systems. Interface controls are automated and/or manual processes designed to ensure transmission and processing of information is complete and accurate.

## **Manual vs. Automated Interfaces**

A "manual interface" is the transfer of data from one system or module to another system or module, initiated and controlled by a user. An example of a manual interface is when customer accounts are downloaded from a utility billing system to be used to perform meter readings. When complete, the file with meter readings may be uploaded and posted to the customer accounts.

## State of Washington

An “automated interface” is the transfer of data from one system or module to another system or module that happens automatically based on a schedule, or other predefined criteria. A common example of an automated interface is the payroll module of a system. Typically, a payroll batch is created in the payroll module. Once approved, the batch is automatically sent by the system to the general ledger or other applicable modules, such as accounts payable.

Entities should have reconciliation controls between their various applications regardless of the method used for interfacing.

*Auditors should have determined whether system interfaces are automated as part of the Key Software Applications workpaper. **If not**, ask the following question to determine whether the system interface is manual or automated.*

*Is the data transferred from one system/module to another system/module by a user using an uploading and posting technique? For example, data is pulled from one system into a text file or other format, that is then uploaded into a different system or module by posting or in an upload feature of the module. If the answer to this question is yes, the interface would be considered “manual” since it is initiated and controlled by manually rather than through an automated process.*

**Edit Checks:** An **edit check** is a programmed routine designed to check input data or processing results for accuracy, compliance, or reasonableness. Types of edit checks include:

Range Checks: ensure that numeric values fall within specified ranges, minimums and/or maximums. For example, ensuring that a capital asset can only be entered as a positive amount, or a purchase order can only be submitted without secondary approval for less than a certain threshold.

Consistency Checks: verify that related data fields are consistent with each other. For example, ensuring that a patient’s age matches their date of birth.

Format Checks: validate data formats (for example, dates as MM/DD/YYYY or phone numbers as ###-###-####).

Logical Checks: assess logical relationships between data fields. For instance, verifying that total debits equals total credits in a journal entry.

Duplicate Checks: identify duplicate records or entries. For example, preventing the same invoice from being entered twice.

Cross-Field Checks: compare data across different fields. For instance, ensuring that the start date of a project is before the end date.

Required Field Checks: ensure that mandatory fields are filled out. For instance, making sure that a patient’s name and date of birth are provided.

Referential Integrity Checks: validate relationships between data tables. For example, confirming that a vendor number exists in the vendor master file as an active entity.

Outlier Checks: detect extreme or unexpected values. For instance, flagging water meter reading values that are extreme outliers for the customer type or account history.

Pattern Checks: look for specific patterns in data. For example, verifying that email addresses follow a valid format.

Edit checks may result in automatic rejection of a transaction, inability to proceed with a transaction, trigger for additional processing or review, or

## State of Washington

may simply result in a warning message to the user.

Edit checks may be identified as a key control when they are sufficiently relevant (ie: addressing the risk), precise (ie: able to catch all errors, rather than just being only reasonableness or limit check), and sufficiently strong (ie: prevent invalid transactions, rather than just generating a warning messages). Auditors may identify an individual edit or a group of edit checks together as a key control.

**Computer Generated Reports:** A **computer-generated report** is a report that is created by a computer program. The computer program, also referred to as a report generator or tool, takes data from a data source, such as a database, and displays it in a specified format. The process to generate a report often includes performing calculations on the data, such as summarizing, classifying, etc., before displaying, or can display the calculations on the report.

There are two types of computer-generated reports, pre-programmed and ad-hoc or customized reports.

- Pre-programmed or canned reports are pre-defined reports where criteria and specifications are hard coded in the system. A canned report may allow limited parameters, (month/year, for example), but in general the information that will be displayed is pre-determined.

- Ad-hoc or customized reports allow the user to drill down and customize what information is displayed on the report based on some allowed criteria, such as account codes, dollar amounts minimum, etc).

In contrast, a **manual report** is one that is created outside the system using data exports or is created ad hoc by a user. An example of a manual report is one that is created by copying data from a data source and pasting the data in an Excel spreadsheet or Word document or Powerpoint presentation where it is then processed further. With manual reports, each time a report is created, the data could be incorrect due to user error, such as not copying all relevant data, or processing errors. Therefore, these types of reports should be understood and tested similar to manual controls.

**Electronic Approvals:** Electronic approvals, electronic signatures and digital signatures are technically different, although often these terms are used interchangeably by entities.

Auditors should have determined whether the electronic approval is an automated control as part of the overall understanding of controls. For automated control purposes, an electronic approval is a software system functionality that:

- Permits a user to approve transaction(s) within the software system

- The system automatically documents, or logs, the data approved by the user and any subsequent manipulation

- The acceptance or rejection of the transaction by the approver will trigger an additional software system process, such as posting of a transaction.

E-mail, scanned-in pictures of signatures, or font-changed signatures, etc. may be part of a control activity but are generally not considered an automated control and are not covered by this testing strategy.

# State of Washington

## Electronic Signature vs Digital Signature

An “**electronic signature**” can look like a handwritten signature that has been scanned and then pasted into an electronic document. The reliability of this type of approval is variable. Recommend gaining an understanding of the process used to store and affix the signature to the document and then discuss the process with Team IT Audit before placing reliance on this control.

A “**digital signature**” is a legal signature with a formal certification process that documents who approved the document and ensures the document is not modified after certification. Reliability of this process is very high but has significant technical features. Recommend brainstorm with Team IT Audit before placing reliance on this control.

## **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

**Statements on Auditing Standards [AU-C 315](#) Understanding the Entity and Its Environment and Assessing the Risks of Material Misstatement** - paragraphs .A106-.A109 describe general and application controls and how they relate to audit risks

**Statements on Auditing Standards [AU-C 330](#) Performing Audit Procedures in Response to Assessed Risks and Evaluating the Audit Evidence Obtained** - paragraphs .10b and .A33-.A34 describe requirements and guidance for testing indirect controls in conjunction with tests of controls, that is, testing key general controls in conjunction with a test of a key automated control

Record of Work Done.

**This record contains information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited.**

**Key Control #1 (Automated Software Calculation - Valuation):** Deprecation is automatically calculated for new additions once listed in FEMS and its initial value, expected salvage value at service life end and service life are entered.

## **STEP 1: Understand Automated Key Control**

The understanding for this system is documented above in the [[Controls - TEF - TRAINS/FEMS](#)] step.

## **STEP 2: Confirm and Test Automated Key Control:**

We confirmed the key automated control as follows, to determine whether the software calculation correctly valued each transaction:

We obtained a copy of an example of the FEMS interface [[FEMS Unit Category Example](#)] for where the user manually inputs the necessary parameters pertaining to the specific TEF asset. We also obtained a copy of the depreciation parameter's [[FEMS Depreciation Parameters](#)] which gives the user an understanding of the necessary input fields required in FEMS such as the term, salvage %, and the type of asset. Additionally,

## State of Washington

the user relies on outside authoritative literature for the service life input into FEMS from guidance listed in SAAM (Addendum to Schedule A, Subsection [30.50.10.b](#)).

To confirm the automated control we re-performed the depreciation calculation for asset number 10A04303 (2023 Ford Mach E purchased on 12/19/2023). See re-calculation at [[TEF Automated Key Control #1 Testing](#)]. Asset information was provided by Charleen Emmons, Budget & Financial Manager, on 6/14/24 after a request for a random new asset addition for FY24. Note that because DOT selected the asset for us to evaluate and we did not randomly select it ourselves it could be subject to some level of bias risk for this control. However, given the longstanding integrity and professionalism of the DOT staff we don't consider this an issue. Recalculations were made to confirm monthly depreciation amount and LTD depreciation. The correct useful life was determined based off of "TEF Schedule of Useful Lives" which is submitted to OFM (See: [[TEF Schedule of Useful Lives Fiscal Year 2024 \(PBC\)](#)] ). Salvage value, salvage value %, and LTD Depreciation were supplied by the file *01C08003 Unit Accounting Frame from FEMS.png* provided by Charleen Emmons. Recalculation matched FEMS amount with the only difference due to rounding.  
**No issues noted.**

### **STEP 3: Understand General IT Controls**

#### FEMS General IT Controls:

We met with the following DOT staff on 5/29/24 to gain an understanding of general IT controls of the FEMS system:

Charleen Emmons - TEF Budget and Finance Manager

Dan Butler - TEF Database Administrator

Jesse Daniels - WSDOT Audit Liaison

FEMS is the system that automatically calculates depreciation for the Transportation Equipment Fund (TEF). The automatic depreciation calculation uses the service life (term), expected salvage value (entered as a percentage in FEMS), and unit cost.

There have not been any changes to the depreciation calculation since the system was purchased. The actual calculation itself is set by the system and was purchased with the system already having the depreciation calculations. Charleen and Dan have never experienced an error in the depreciation calculations. The system uses the parameters [[FEMS Depreciation Parameters](#)] for a unit category to calculate depreciation. The only way the depreciation could be wrong would be if the parameters were wrong, which are manually entered into the system.

A unit is an item purchased and entered into the system, such as a truck. Each unit is assigned to a unit category [[FEMS Unit Category Example](#)], through a "tech spec". The unit category is already in the system, along with the unit information used to automatically calculate depreciation. The unit category is set up through a process that goes through headquarters. Charleen is usually the person who will create or request a new unit category with the unit information and parameters, then it is reviewed by Asset Management. Access is limited to set up a new unit category. There is a memorandum that is sent out if there is a new unit category in the system. When a unit is assigned a unit category through the tech spec, it is never actually added to the category until Dan or Charleen review and accept it to the category. Regions can view the unit category their unit was assigned to through the tech spec, which contains the parameters, but they cannot change it or the parameters. If the region feels the tech spec was incorrect, they have to request to headquarters to change the tech spec. Changing the tech spec would give the item a new

## State of Washington

unit category, which would change the depreciation parameters for that unit. The actual parameters, such as salvage percentage or service life, would not be changed for that unit category if the tech spec was changed, the item would just be given a different unit category.

On certain occasions, it could be identified that parameters, such as life cycle or salvage value, need to be changed. Access is limited to change parameters, but Charleen or someone else with access at headquarters could change those parameters for the unit category. **There is an access list and a process for changing parameters (Key General IT Control).** For depreciation to be changed, the parameters for a unit category would have to be changed, the actual calculation itself could not be changed. The calculation and the parameters used in the calculation are set by the system and have never been changed. The only way a unit could depreciate wrong would be if the wrong unit category was assigned during the tech spec, and that is a manual process, so the system could not depreciate the unit category incorrectly. Betterments may cause depreciation of a unit to change. Betterments are added to a unit and it increases the value of the unit. As documented above in the understanding of TEF, new entries into FEMS are reviewed monthly to ensure that the information, unit category, and entry is accurate.

### **STEP 4: Confirm Key General IT Control:**

**Key General IT Control:** There is an access list and a process for changing parameters.

To confirm this general IT control, we met with Dan Butler, TEF Database Admin, and Charleen Emmons, TEFS Budget and Finance Manager, to observe a walkthrough of the FEMS system access. Dan shared with us that on the FEMS interface front end that there are different frame groups that certain users have access to. He shared his screen and showed us the highest level of access, which is a role called "HQ System Admin". We were able to view that there were seven users currently at DOT who have access at this level. Three of these are IT related non-users (Python script user and IT database/network group). The other few were Dan, Charleen, & each of their respective managers. Dan showed us how by accessing the "Role Maintenance" frame group (which only the HQ System Admin have access to) he is able to make changes to assigned roles and which roles/groups have what permissions. There are three permissions we saw within this frame; "Read, Update, & Full Access". Dan noted that each role or group of staff has certain permissions assigned to the necessary fields that could be modified on the FEMS Main Menu page as it relates to an asset. He verified this by logging into a "fake" account with TEF technician level parameters and showed how all of the input fields on a particular asset were grayed out / un-editable. ***No issues noted.***

We inquired with Dan about bad actors who might already have access as the HQ System Admin role. He noted here that there is nothing in place from another HQ System Admin from removing another HQ System Admin other than keeping the actual quantity of users with that role to a minimum. Dan stated that this role is not merely given based on position within TEF but rather on the actual duties they are responsible for performing, even if on occasion. During our meeting, Dan navigated to a section within role maintenance called the "Table Column Audit" section. This allows HQ System Admin to turn on logged traces of what changes were made to certain parameter fields within FEMS. This data is stored and backed up on a server. This has not been in place until this meeting when Dan turned them all on, stating that it would be a good security and accountability check to have in place and was unsure as to why it was not turned on or used. ***No issues noted.***

### **STEP 5: Test Key General IT Controls:**

## State of Washington

Not applicable - we are not planning to rely on automated controls and therefore do not need to test general controls; control risk will be assessed at MAX.

### I.3.PRG - Depreciable Assets (Net of Depreciation)

*Procedure Step:* Key Control #2 (Manual)

*Prepared By:* NJH, 6/20/2024

*Reviewed By:* SHW, 7/2/2024

Purpose/Conclusion:

**Purpose:**

To confirm whether the Budget Finance Manager reviews new entries in FEMS to ensure newly added assets are recorded at their cost and reconciles monthly depreciation between FEMS and TRAINS (key control #1 for TEF - TRAINS/FEMS) in order to assess control risk.

**Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation.*

## State of Washington

*Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency.*

***All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.***

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

## State of Washington

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

**Key Control #2 (Valuation):** Each month, the Budget Finance Manager reviews new entries in FEMS to ensure newly added assets are recorded at their cost. The Budget Finance Manager reconciles monthly depreciation between FEMS and TRAINS to ensure that both systems match.

The understanding for this system is documented above in the [\[Controls - TEF - TRAINS/FEMS\]](#) step.

# State of Washington

## **1. Confirmation of Key Manual Control:**

Charleen Emmons, TEFS Budget and Finance Manager, provided us with the FEMS/TRAINS Monthly Depreciation Comparison for April 2024. This report is taken from the TRAINS Access data workbook that provides depreciation amounts from both FEMS and TRAINS. That data is entered into a pivot table which compares any differences that arise for depreciation between TRAINS and FEMS. If amounts match between systems, the difference will show zero or 0.01 (due to rounding). Any amounts greater are reviewed by Charleen. We reviewed the data from the TRAINS Access data workbook and found that it had tabs for previous month and current month TARTS data, units changed, sold/disposed units, and unit depreciation from TRAINS. This information flowed accurately to the FEMS & TRAINS Monthly Depreciation file where TRAINS and FEMS depreciation were compared. There were 4 instances where differences were shown. Per the comments in the file, each instance was due to either TRAINS only being sent partial depreciation or "Research - part of sold". The total difference for the month was \$1,170. A JV will be used to increase depreciation expense in TRAINS for the partial amounts that were missed. We found that depreciation recorded in FEMS was reconciled to TRAINS data and differences were adjusted correctly. *No issues noted.*

We reviewed invoice 3PU413 for unit 01C08003. We found that the initial purchase price for the unit was \$62,844 from Bud Clary Ford Hyundai, which matched to FEMS as well as the acquisition date of 12/19/23. We found that the unit was recorded in FEMS accurately based on historical value and additions. *No issues noted.*

### **Noted Weaknesses are as follows:**

**None**

## **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

## **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

### **I.3.PR.G - Depreciable Assets (Net of Depreciation)**

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

**Key Control #3 (Existence):** A physical inventory is performed every other year to ensure that recorded assets actually exist.

The understanding for this system is documented above in the Controls - TEF - TRAINS/FEMS step.

### **1. Confirmation of Key Manual Control:**

We received and reviewed the physical inventory of assets performed every two years (each biennium). The last physical inventory was completed during FY2024. DOT TEF assets are divided among 9 different regions/programs as follows:

Northwest Region (NWR) - completed 6/25/24

North Central Region (NCR) - completed 6/25/24

Olympic Region (OR) - completed 6/21/24

Southwest Region (SWR) - 6/28/24

South Central Region (SCR) - completed 6/4/24

Eastern Region (ER) - completed 6/26/24

Materials Laboratory Region (MatLab) - completed 6/24/24

# State of Washington

GeoMetrix Region - (GS) - completed 2/22/24  
Printing Services Region (RP) - completed 2/21/24

Charleen Emmons, TEF Budget and Finance Manager, provided us with the portion of the TEF Operation Manual pertaining to Inventories (Chapter 12). The manual states that inventory lists are to be created by HQ TEF and will be provided electronically to each region/program prior to the due date for completion of the inventory. Once the physical inventory has been performed, the inventory control officer for each region/program will send a letter of inventory completion to the TEF fleet administrator.

We received the inventory completion letters from all nine regions/programs from Charleen Emmons. We reviewed the letters provided and noted inventories were stated as being completed and signed by the region's Inventory Control Officer. We determined Department biannual inventory and supervisory review of inventory processes and results provides assurance of existence of depreciable assets. ***No issues noted.***

Purpose/Conclusion:

## **Purpose:**

# State of Washington

To gain an understanding of internal controls.

## **Conclusion:**

We gained an understanding of internal controls as documented in the record of work done.

Testing Strategy:

## **The following procedures are required for all material systems:**

1. List the financial statement balance(s) and relevant assertion(s) addressed by the understanding.
2. Gain an understanding of the internal control process, identify how transactions are recorded in AFRS, identify key controls over relevant assertion(s), and note any control weaknesses.
  - In gaining an understanding of controls, consider the overall understanding of State-Level control elements as documented in the "State-Level Controls" step as they relate to this particular system.
  - Identify controls systems covering all relevant assertions for all significant classes of transactions.
  - Standards require the auditor to gain an understanding of the significant accounting system(s) that contain key controls over significant classes of transactions included in the line item.
  - Control systems identified in this step must match the Material Account Matrix and have a separate control understanding documented.
  - Talk with the ACFR Specialist or AIC if you identify different systems than the ones anticipated in the Material Account Matrix.

For each material system, auditors must document:

A brief outline of the transaction flow from beginning to end.

An expanded description of key controls.

Business processes relevant to financial reporting of the relevant assertion for the material balance. Processes should encompass automated and manual procedures by which transactions or events are identified or initiated, authorized as needed, recorded, processed and corrected as needed.

Original accounting records and how records are rolled-up to intermediary ledgers and transferred to the general ledger (AFRS) or financial statements.

Detailed descriptions of key controls. Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

The following is information to **consider** when identifying key controls and transaction flow.

## State of Washington

"Key controls" refer to the few controls that together provide reasonable assurance that material misstatements will be prevented or detected and corrected. This is contrasted with ancillary or supporting controls, which – although helpful and recommended – would provide less than reasonable assurance by themselves.

The focus of the write-up is on the key controls. Key controls should be specifically identified (as "key controls") in the write-up. This can be done in whatever way the auditor prefers, so long as it is obvious. Details that the auditor should document regarding key controls may include:

- Who or what initiates the control
- When (or how often) is the control applied
- Who performs the control
- As needed, the experience, knowledge and attitude of the person applying the control
- Detailed description of the control process or activity. For example, if the control is a review: what exactly is reviewed, what is the reviewer looking at or for and what are the reviewer's criteria?
- How the key control is documented or evidenced
- If not obvious from the description, how the control prevents or timely detects and corrects misstatements
- Any exceptions or alternative processing to the normal process
- What happens when misstatements or issues are identified by the control

The "transaction flow" refers to the process by which transactions are initiated, authorized, recorded, processed and reported (as applicable). Outlining the transaction flow gives context to key controls, especially how transactions become subject to controls in the first place. If a control inherently ensures that all applicable transactions are included (ex: bank reconciliation where the assertion is existence), the auditor may decide to just start the write-up with the initiation of the control procedure and go from there.

Elements of the transaction flow are defined informally as follows:

- Initiation:* How are transactions initiated?
- Authorization:* How are transactions and accounting record maintenance authorized?
- Recording:* How are transactions or balances identified and recorded in financial accounting systems?
- Processing:* How are the transactions or balances processed after they are recorded (if at all)? Processing may be manual or automated and may occur at a subsidiary system level or at the general ledger level.
- Reporting:* How are records translated into the financial statements? This part of the transaction flow extends the understanding to the actual financial statements that the audit is opining on. Since we already document an understanding of the financial reporting process in general, it is usually enough to simply reference this overall understanding. However, if there are important steps unique to the covered balances, it may be more appropriate to mention them here.

# State of Washington

Although transaction flow is a good way to think about understanding and documenting a control system, auditors should not worry too much about documenting “each element, in order” because often elements may be combined, not noticeable, not applicable or occur in a different order.

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits](#) Planning Guide**

Record of Work Done:

## **Material Balance and Assertions**

Internal controls in the TRAINS/CAFM address the following balance:

Depreciable Assets (Net of Depreciation)

For the following assertions:

Existence - The furnishings, equipment and capitalized costs have been disposed, replaced or otherwise impaired.

Valuation - The amount reported for this line item does not represent actual capitalized costs of furnishings and equipment constructed, purchased, or donated as of the report date.

Valuation - Newly added furnishings and equipment are not stated at historical or estimated historical cost.

Valuation - Depreciation may be incorrectly calculated because the wrong asset class code or useful life is entered into the system.

Significant Accounting Systems:

**Computer Aided Facilities Management System (CAFM)** - WSDOT’s system of record for the inventory of all owned and leased buildings and capitalized improvements. CAFM automatically calculates straight-line depreciation based on the asset's cost and useful life.

**Transportation Reporting and Accounting and Information System (TRAINS)** - TRAINS is used to post expenditures using Payment Vouchers or Journal Vouchers. TRAINS does not allow the creator to review and approve their own work. All additions,

## State of Washington

regardless of categorization, get recorded in TRAINS as "transportation expenditures" and then have to be broken out through a reconciling JV. See "*How Transactions are Recorded in AFRS*" section below.

### Other Systems (Not Significant Systems):

**Transportation Assets Reporting and Tracking System (TARTS)** – Text file showing value and life-to-date depreciation from capital asset inventory systems.

We met with the following staff on 5/29/24 to gain an understanding of controls for the capitalization of buildings/structures:

Jesse Daniels - WSDOT Audit Liaison

Krystle Mize - Capital Facilities Budget and Financial Manager

Stephanie Alexander-Butters - Capital Facilities Assistant Program Manager

Suzi Freelund - AFS Accounting and Reporting Manager

There are currently 618 capitalized structures with a total capital cost of \$364,345,156. As with all capitalized assets at WSDOT outside of Infrastructure Assets, which use the [GASB 34](#) Modified Approach, the depreciation method is straight-line depreciation. Depreciation amounts are based on the useful life schedule and commodity codes as listed in [SAAM 30.50.10](#). The facilities on the report have a commodity code of 0535, 0550, 5410 or 0655.

Facilities with a 0535 Commodity Codes are Public Restroom and have a useful life of 35 years.

Facilities with a 0550 Commodity Code are buildings and have a useful life of 50 years.

Facilities with a 5410 Commodity Code are prefabricated or portable structures and have a useful life of 50 years.

Facilities with a 0655 Commodity Code are improvements other than buildings and have a useful life of 25 years.

Buildings, building improvements, and leasehold improvements with a cost of \$100,000 or greater are considered as fixed assets. The cost of the improvements can be considerably less than that amount, it is the total value of the structure that needs to be more than \$100,000 (per [SAAM 30.20.20](#)). If the building improvements capitalized are less than 10% of the total value of the building, the improvement will not be depreciated separately. If the improvement increases the value of the building or if there is an increase in the probable life of the building, that is reviewed by the Budget Analyst to determine if there is need to change the depreciation. If any of those occur, then CAFM will be updated.

### Capitalization of Buildings/Structures

When buildings or other structures that are not intended to be part of the non-depreciable infrastructure of WSDOT are proposed, a work order is developed by the Capital Facilities management. Once the work order is complete (construction completed and structure in use), the Capital Facilities team will review the work order for completeness and approval for capitalization (**Key Control #1 - Existence**). Quarterly, they provide a list of completed work orders to the Capital Facilities Budget and Financial Manager's team, where they will check to ensure all information and detail for the work is provided. When there is enough information, they can determine whether something needs to be

## State of Washington

capitalized. A Capitalization Form is filled out and submitted to the Facilities Inventory Specialist for entering data into CAFM for capitalization and depreciation. CAFM is WSDOT's computerized system of record for used by the facilities office to inventory all WSDOT owned and leased buildings and associated capitalized improvements. The useful life is based on the OFM commodity code list ([SAAM 30.50.20](#)). CAFM automatically calculates straight-line depreciation based on the asset's cost and useful life (**Key Control #2 - Automated: Valuation**).

After the depreciation amounts calculated in CAFM are reviewed and reconciled by the Transportation Financial Consultant, Beth De Vul, the report is then reviewed by the Accounting and Reporting Manager, Suzi Freeland, who performs a final review for accuracy and reasonableness. Beth reviews the CAFM listing to ensure that assets recorded are properly valued and depreciated correctly. Suzi Freeland or Beth De Vul then pulls the data from CAFM to TARTS to perform a reconciliation of CAFM vs. TARTS to verify that the historical cost and accumulated depreciation from CAFM agree with data pulled to TARTS (**Key Control #3 - Valuation**). TARTS pulls data from all inventory systems, including CAFM, so a review between TARTS and TRAINS can be done for all inventory systems by Beth using a TARTS vs. TRAINS reconciliation.

### **How Transactions are Recorded in AFRS:**

Depreciation is given to the Transportation Financial Consultant (Beth De Vul) in the form of several reports. Capital Facilities provides a report for capitalized structures from CAFM. The Transportation Financial Consultant uses the Capital Facilities report and on a quarterly basis enters the depreciation amounts into TRAINS, then creates TRAINS and AFRS journal vouchers to record the increase or decrease in asset balances and depreciation in both financial systems. The Accounting and Reporting Manager reviews the documentation and calculated amounts then releases the journal vouchers in the system they were recorded in. TRAINS automatically records all expenditures in AFRS as transportation expenditures. These are recorded in AFRS via nightly upload. At the end of each quarter, the Transportation Financial Consultant (Beth De Vul) prepares a JV to adjust the transportation expenditure balance for the amounts that should be recorded as buildings. Then, the Accounting and Reporting unit performs monthly TRAINS/AFRS fund and GL reconciliations to ensure transactions are properly reported within AFRS (**Key Control #4 - Valuation**).

### **Key Controls are as Follows:**

**Key Control 1 - Existence:** When buildings or other structures that are not intended to be part of the non-depreciable infrastructure of WSDOT are proposed, a work order is developed by the Capital Facilities management. Once the work order is complete (construction completed and structure in use), the Capital Facilities team will review the work order for completeness and approval for capitalization and input into CAFM.

**Key Control 2 - Automated - Valuation:** CAFM system automatically calculates straight-line depreciation based on the asset's cost and useful life.

**Key Control 3 - Valuation:** The Financial Consultant at WSDOT's headquarters' Accounting and Finance Division prepares the Inventory Systems vs. TARTS Analysis to verify the Capital Facilities historical cost and accumulated depreciation from Facility Inventory Division (CAFM) agrees with the data shown in TARTS.

## State of Washington

**Key Control 4 - Valuation:** The Accounting and Reporting unit performs monthly TRAINS/AFRS fund and GL reconciliations to ensure transactions are properly reported within AFRS.

### Noted Weaknesses are as Follows:

None

### I.3.PRG - Depreciable Assets (Net of Depreciation)

*Procedure Step:* Key Control #1 (Manual)

*Reviewed By:* RKM, 8/28/2024

Purpose/Conclusion:

#### **Purpose:**

To confirm whether buildings or other structures that are not intended to be part of the non-depreciable infrastructure of WSDOT are proposed, a work order is developed by the Capital Facilities management. Once the work order is complete (construction completed and structure in use), the Capital Facilities team will review the work order for completeness and approval for capitalization and input into CAFM for **Key Control #1 for Buildings - TRAINS/CAFM** in order to assess control risk.

#### **Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented*

## State of Washington

*key controls).*

*A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency.*

***All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.***

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

## State of Washington

*If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

# State of Washington

Record of Work Done:

**Key Control #1 (Existence):** When buildings or other structures that are not intended to be part of the non-depreciable infrastructure of WSDOT are proposed, a work order is developed by the Capital Facilities management. Once the work order is complete (construction completed and structure in use), the Capital Facilities team will review the work order for completeness and approval for capitalization and input into CAFM.

The understanding for this system is documented above in the [\[Controls - Buildings - TRAINS/CAFM\]](#) step.

## **1. Confirmation of Key Manual Control:**

To confirm this key control, we received a walkthrough on 7/17/24 with Krystle Mize (Capital Facilities Financial Manager), Stephanie Alexander-Butters (Capital Facilities Assistant Program Manager), and Elena Fehr (Facilities Inventory Specialist) as well as inspected relevant documents that we acquired on 6/11/24 from Jesse Daniels, Audit Liaison, on behalf of Krystle Mize. We chose to evaluate the capital asset "Dayton Ave Annex Building" which we inquired about and documented additional ROWD pertaining to another key control at [\[Key Control #2 \(Automated\)\]](#). We inspected the document *Project Capitalization Form* to determine if the asset was listed to be eventually input into CAFM as well as the relevant costs making up that asset. The Dayton Annex Building is comprised of two identifiable costs shown on this sheet, \$1,799,132 from work order #00932 and \$15,390 from work order #PO1100 for a total asset cost of \$1,814,522. From this inspection we inquired about the two relevant work orders during our walkthrough to confirm the work order exists for this asset. Stephanie Butters shared with us a live view of the original #00932 work order, but had us note that there are 52 work orders with that number to include various additions and project changes. She explained that this project comes out of a certain fund within DOT fund management and all updates/changes are ran through that fund until they reach the budgeted funding amount. The additional \$15,390 was a change order later in the construction process, on 4/11/23, beyond the budgeted amount for the fund, so it came out of DOT facilities operating change fund, hence the different work order PO1100 which she shared with us during our walkthrough. Krystle pulled up a copy of the original contract work details by the contractor showing a breakdown of all of the costs that make up the Dayton Ave site overall (which included the Dayton Annex Building). On this sheet we could identify the majority of the original costs as well as the addition for the Annex Building. After confirming the necessary work orders existed and the proper amounts matched what was on the capitalization form, we had Elena Fehr show us a live view of the CAFM system for the Dayton Annex Building with a cost basis of \$1,814,522, showing no variances. From our walkthrough and inspection of documents we can confirm that the Annex Building exists and that the key control is in place and operating effectively. ***No issues noted.***

## **Noted Weaknesses are as follows:**

None

## **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be

## State of Washington

effective to reduce detection risk to an acceptable level.

### **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

### **I.3.PR.G - Depreciable Assets (Net of Depreciation)**

*Procedure Step:* Key Control #2 (Automated)

*Prepared By:* NJH, 8/28/2024

*Reviewed By:* RKM, 8/28/2024

#### **Purpose/Conclusion:**

**Purpose:** To determine whether CAFM system automatically calculates straight-line depreciation based on the asset's cost and useful life (**Key Control #2 - Buildings - TRAINS/CAFM**) was in place and operating effectively and to consider related general IT controls in order to assess control risk.

#### **Conclusion:**

Based on our understanding and test results, we concluded that the automated control **was** in place and operating effectively. However, we identified an error in a manual process that caused a misstatement in the automated depreciation calculation. See: [\[E: WSDOT Depreciable Assets Manual Input Error\]](#).

Based on our understanding, related general IT controls **were** in place and adequately designed to ensure that the control operated consistently during the audit period. However, we did not test the operating effectiveness of general IT controls.

Our understanding and control risk assessment, which incorporates these conclusions, is documented at [\[Controls - Buildings - TRAINS/CAFM\]](#).

We noted **the following** weaknesses or deficiencies in internal controls:

**The manual error of not properly updating the "date acquired" field and/or the "date placed in service" field in CAFM caused an incorrect depreciation calculation.**

#### **Testing Strategy:**

# State of Washington

The following procedures are **required** for all automated key controls for financial and single audits:

## **STEP 1: Understand Automated Key Control**

Gain an understanding of the automated key control. The understanding can either be documented in the control system step or could be documented here in this step. Auditors should consider the following aspects of the automated control when gaining an understanding:

### **Software Calculation:**

Is there written documentation of the calculation, and/or the source rates and factors used in the calculation?

*We would expect written documentation that defines the calculation and is an official, approved source for the formulas, rates and factors. This may be an approved policy or could be system documentation.*

What formulas are used to make the calculation?

What values or factors are used to make the calculation? For example:

- Rate tables used by the calculation

- Profile fields (i.e., applicable transaction types)

- Programmed/set formulas and/or values

- Constraints (i.e., effective date, minimums/maximums, etc.)

How is the calculation triggered or initiated?

How is the calculation recorded in the accounting system (or used in an end result)?

## **STEP 2: Confirm and Test Automated Key Control**

Confirm and test the automated control. To test the automated control, consider the following procedures:

### **Software Calculation:**

Re-perform the calculation for selected transactions.

*Auditors would NOT normally use sampling for automated controls. Instead, auditors should judgmentally select one instance of each significant variation of the calculation. If the number of potential variations is large, auditors would judgmentally select based on risk factors (for example, the most common scenarios, or scenarios associated with identified risks, or scenarios that are not addressed by the entity's testing procedures).*

*In some cases, it may be possible for the auditor to reperform the calculation for the entire population.*

If any rate tables or values were updated during the period, view the current values (by observing the rate table or values in an admin menu or from a printed system report) and compare to approved sources.

## State of Washington

*If no updates were made or there are only a few values, this risk could be addressed by re-performing the calculation. However, if source rate tables or values are large or complex, it may be more efficient to test these values directly than to recalculate a larger number of transactions.*

Consider the use of analytical procedures such as trends or descriptive statistics on the population (like average, minimum and maximum values, or a graph of values across the population) and follow up on any unexpected values or trends. *Analytical procedures would normally also count as a substantive test.*

### **STEP 3: Understand General IT Controls**

Gain an understanding of the general IT controls that support the continued proper operation of the automated control. Identify key general IT controls and note any control weaknesses. Auditors should consider the following aspects of general IT controls when gaining an understanding:

#### **Software Calculation:**

Inquire if the entity has experienced any errors or irregularities with the calculation. Also how often changes are made to the calculation, and how many changes (if any) were made during the year.

How can the software calculation (formulas, rates/values, settings/configurations) be changed or customized?

*Software calculations will usually have one or more administrative menus that allow the government to modify rate tables or other calculation values, or to configure the calculation or apply settings.*

*In other cases, software calculation formulas and/or values may be hard-coded into the system and require programmers to make the changes. If the government has access to source code, then it needs internal procedures for program changes. If the program is controlled by vendors, we would expect program change procedures and expectations to be included in the contract.*

What are the procedures to authorize and make program changes or configuration/setting changes to the software calculation?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

*If utilizing a test environment, there should be controls to ensure that the live environment is updated and is consistent with the live production environment. As management is responsible for the accuracy of their automated controls (i.e., in the live environment), we would expect there to be a procedure to confirm each key automated control once it is in the live environment. This could be manually re-performing the calculation, reviewing reports against known expectations, etc.*

# State of Washington

How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change programming, but they may be responsible for patch management, master table data, and/or configurations.*

## **STEP 4: Confirm Key General IT Controls**

Confirm your understanding of key general IT controls to determine whether they have been placed in operation (*whether the entity has actually implemented key controls*).

## **STEP 5: Test Key General IT Controls**

Document whether general IT controls will be tested. Option 1 would result in control risk at MAX for the automated control. Either option 2 or 3 is necessary in order to set control risk at LOW. If general IT controls are tested, consider the following procedures:

### **Software Calculation:**

If program changes or setting/configuration changes are logged, review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the calculation may also provide this evidence if the re-performance tests address all states of the calculation during the period.

If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

# State of Washington

## **STEP 6: Final Control Risk**

Evaluate the results and document a final control risk assessment in the control system step. Consider whether any deficiencies identified with either the automated control or related general IT controls represent material weaknesses or significant deficiencies.

*Note: general IT control deficiencies do not necessarily mean the automated control is not properly functioning. General IT control deficiencies would normally be considered a significant deficiency or material weakness only if it caused an issue with the compliance requirement or assertion.*

## **Recommendation Review Requirement**

IT Security related information is considered category 3 data protected by Public Request Exemption RCW 42.56.420. Issues related to IT Security require the following special handling:

[Instructions](#) are located in Team IT Audit's System's Sharepoint page.

Details of IT Security related issues should NOT be included in any emails or helpdesks.

Exit, ML and Findings should be separately communicated in an IT Security Results Document.

Findings will be referenced, but not included in the audit report.

All IT security-related recommendations must be reviewed by [Team IT Audit](#).

Template language for common IT related recommendations can be found in [ARS Part 5 Chapter 8](#).

## **PUBLIC REQUEST EXEMPTION**

Some IT related information is protected by Public Request Exemption RCW 42.56.420 for cyber security purposes. The details documented in the record of work and support workpapers may qualify for this exemption. If so, auditors must include this statement in the record of work done and any related workpapers: **"This record contains information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited "**.

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Information Technology](#) Planning Guide**

Auditors may contact [Team IT Audit](#) with any testing strategy or control assessment questions or to request assistance from an IT Specialist.

**Software Calculation:** A **software calculation control** exists when the value of a transaction is determined by a software application. This

## State of Washington

process can be a key control when the entity relies on the system to generate calculations correctly to determine the amount of transactions (i.e., summarizing/account code allocation to post to general ledger, calculate student, utility, other charges, etc.).

**Automated Interfaces:** An interface is a process that moves information from one computer application to another. The interface can occur internally between systems maintained by a single agency, or between systems maintained by different agencies or private companies. The interface can also occur between modules within the same computer application.

The data transferred might be a file consisting of one or more records processed at a later time (batch), or it can be a real-time update. Risk associated with interfaces increases as the number of transactions or the number of other services and systems supported by the interfaced data increases.

Poor design or inadequate oversight can affect the transfer of transaction data among the systems. Interface controls are automated and/or manual processes designed to ensure transmission and processing of information is complete and accurate.

### Manual vs. Automated Interfaces

A "manual interface" is the transfer of data from one system or module to another system or module, initiated and controlled by a user. An example of a manual interface is when customer accounts are downloaded from a utility billing system to be used to perform meter readings. When complete, the file with meter readings may be uploaded and posted to the customer accounts.

An "automated interface" is the transfer of data from one system or module to another system or module that happens automatically based on a schedule, or other predefined criteria. A common example of an automated interface is the payroll module of a system. Typically, a payroll batch is created in the payroll module. Once approved, the batch is automatically sent by the system to the general ledger or other applicable modules, such as accounts payable.

Entities should have reconciliation controls between their various applications regardless of the method used for interfacing.

*Auditors should have determined whether system interfaces are automated as part of the Key Software Applications workpaper. **If not**, ask the following question to determine whether the system interface is manual or automated.*

*Is the data transferred from one system/module to another system/module by a user using an uploading and posting technique? For example, data is pulled from one system into a text file or other format, that is then uploaded into a different system or module by posting or in an upload feature of the module. If the answer to this question is yes, the interface would be considered "manual" since it is initiated and controlled by manually rather than through an automated process.*

**Edit Checks:** An **edit check** is a programmed routine designed to check input data or processing results for accuracy, compliance, or reasonableness. Types of edit checks include:

## State of Washington

Range Checks: ensure that numeric values fall within specified ranges, minimums and/or maximums. For example, ensuring that a capital asset can only be entered as a positive amount, or a purchase order can only be submitted without secondary approval for less than a certain threshold.

Consistency Checks: verify that related data fields are consistent with each other. For example, ensuring that a patient's age matches their date of birth.

Format Checks: validate data formats (for example, dates as MM/DD/YYYY or phone numbers as ###-###-####).

Logical Checks: assess logical relationships between data fields. For instance, verifying that total debits equals total credits in a journal entry.

Duplicate Checks: identify duplicate records or entries. For example, preventing the same invoice from being entered twice.

Cross-Field Checks: compare data across different fields. For instance, ensuring that the start date of a project is before the end date.

Required Field Checks: ensure that mandatory fields are filled out. For instance, making sure that a patient's name and date of birth are provided.

Referential Integrity Checks: validate relationships between data tables. For example, confirming that a vendor number exists in the vendor master file as an active entity.

Outlier Checks: detect extreme or unexpected values. For instance, flagging water meter reading values that are extreme outliers for the customer type or account history.

Pattern Checks: look for specific patterns in data. For example, verifying that email addresses follow a valid format.

Edit checks may result in automatic rejection of a transaction, inability to proceed with a transaction, trigger for additional processing or review, or may simply result in a warning message to the user.

Edit checks may be identified as a key control when they are sufficiently relevant (ie: addressing the risk), precise (ie: able to catch all errors, rather than just being only reasonableness or limit check), and sufficiently strong (ie: prevent invalid transactions, rather than just generating a warning messages). Auditors may identify an individual edit or a group of edit checks together as a key control.

**Computer Generated Reports:** A **computer-generated report** is a report that is created by a computer program. The computer program, also referred to as a report generator or tool, takes data from a data source, such as a database, and displays it in a specified format. The process to generate a report often includes performing calculations on the data, such as summarizing, classifying, etc., before displaying, or can display the calculations on the report.

There are two types of computer-generated reports, pre-programmed and ad-hoc or customized reports.

Pre-programmed or canned reports are pre-defined reports where criteria and specifications are hard coded in the system. A canned report may allow limited parameters, (month/year, for example), but in general the information that will be displayed is pre-determined.

Ad-hoc or customized reports allow the user to drill down and customize what information is displayed on the report based on some allowed criteria, such as account codes, dollar amounts minimum, etc).

## State of Washington

In contrast, a **manual report** is one that is created outside the system using data exports or is created ad hoc by a user. An example of a manual report is one that is created by copying data from a data source and pasting the data in an Excel spreadsheet or Word document or Powerpoint presentation where it is then processed further. With manual reports, each time a report is created, the data could be incorrect due to user error, such as not copying all relevant data, or processing errors. Therefore, these types of reports should be understood and tested similar to manual controls.

**Electronic Approvals:** Electronic approvals, electronic signatures and digital signatures are technically different, although often these terms are used interchangeably by entities.

Auditors should have determined whether the electronic approval is an automated control as part of the overall understanding of controls. For automated control purposes, an electronic approval is a software system functionality that:

- Permits a user to approve transaction(s) within the software system

- The system automatically documents, or logs, the data approved by the user and any subsequent manipulation

- The acceptance or rejection of the transaction by the approver will trigger an additional software system process, such as posting of a transaction.

E-mail, scanned-in pictures of signatures, or font-changed signatures, etc. may be part of a control activity but are generally not considered an automated control and are not covered by this testing strategy.

### Electronic Signature vs Digital Signature

An "**electronic signature**" can look like a handwritten signature that has been scanned and then pasted into an electronic document. The reliability of this type of approval is variable. Recommend gaining an understanding of the process used to store and affix the signature to the document and then discuss the process with Team IT Audit before placing reliance on this control.

A "**digital signature**" is a legal signature with a formal certification process that documents who approved the document and ensures the document is not modified after certification. Reliability of this process is very high but has significant technical features. Recommend brainstorm with Team IT Audit before placing reliance on this control.

### **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

**Statements on Auditing Standards [AU-C 315](#) Understanding the Entity and Its Environment and Assessing the Risks of Material Misstatement** - paragraphs .A106-.A109 describe general and application controls and how they relate to audit risks

**Statements on Auditing Standards [AU-C 330](#) Performing Audit Procedures in Response to Assessed Risks and Evaluating the**

# State of Washington

**Audit Evidence Obtained** - paragraphs .10b and .A33-.A34 describe requirements and guidance for testing indirect controls in conjunction with tests of controls, that is, testing key general controls in conjunction with a test of a key automated control

Record of Work Done:

**This record contains information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited.**

**Key Control #2 (Valuation):** CAFM system automatically calculates straight-line depreciation based on the asset's cost and useful life.

**STEP 1: Understand Automated Key Control:**

The understanding for this system is documented above in the [\[Controls - Buildings - TRAINS/CAFM\]](#) step.

**STEP 2: Confirm and Test Automated Key Control:**

On 6/11/24 we received an email correspondence from Jesse Daniels, Audit Liaison, forwarded on behalf of Krystle Mize, DOT Budget & Financial Manager, that noted the following attestation: "We did not add a **new** FY24 asset that meet the threshold for capitalization so we cannot provide an example of depreciation calculated for a new FY24 asset, supporting documentation making up the asset's cost or the capitalization form." We determined that the next most useful confirmation of this key control would be to obtain an understating of the process of a new asset placed in service (PIS) for FY23 as that is the most recent year with capital additions/improvements that met the capitalization threshold. **No issues noted.**

Krystle Mize provided us with a copy of several relevant documents on 6/13/24 pertaining to the FY23 addition of a capital asset "Dayton Ave Annex – 1017BM07" where she noted that there were two additions during this project for the main building & annex building. These documents include:

1017BM07 – 2024-06-10: *This is the form submitted from Facilities Inventory Specialist (Elena) for the annex building depreciation.*

Dayton Capitalization: *Capitalization form submitted to Facilities Inventory Specialist (Elena) by Budget & Financial Manager*

v3 Project Capitalization Form: *Supporting documents for calculations.*

Pay App #38: *Supporting documents for calculations. Amounts that tie to the Annex Building are lines referenced "Exterior Shed Building" on page 12 & 13. Additionally, on page 19, please see "PCCO # 57 COP161 – Annex Motor Operated Doors"*

To confirm this automated control we preformed analytical procedures to re-calculate the CAFM depreciation of this asset at [\[SAO CAFM Recalculation - Dayton Annex\]](#) based on the supporting documents provided to us as well as our knowledge from a CAFM IT walkthrough on 6/5/24. We chose to evaluate the annex building which was placed in service on 11/18/21. We determined that the asset's useful life of 50yrs (600mo.) was classified correctly by referencing [SAAM 30.50.20](#) with code 0550 referenced in the spreadsheet. **No issues noted.**

We performed two different calculations to confirm this control on the sheet titled "SAO Calc". The first was to determine if the stated/calculated

## State of Washington

number of depreciation periods elapsed matched with our recalculation by backing into the depreciation periods using the life and depreciation per period. Our second calculation was a figure check for the cost, A/D, current value, and monthly depreciation compared to our recalculated figures. From these two calculations we noted two mathematical issues that arose: the first being a slight \$25 difference in the monthly depreciation amount (FEMS was about \$25 more than it should have been) and the second issue being a \$14,877 difference in total A/D which we calculated to be about 5 months of missing depreciation.

We met with Krystle & Elena on 6/27/24 to address these issues and try to gain a better understanding of what had happened to cause these errors. Elena noted that she had forgot to change the actual depreciation start date in another database table. Elena made that change and then sent us back a revised copy of the CAFM calculation table and we were able to run the same tests described above, see "DOT Corrected" sheet. The corrected error shows a total difference of \$123 in A/D which we can attribute to rounding over time and is determined to be insignificant. The other corrected error was the monthly depreciation to the correct amount \$3,024. We inquired with Elena about how this amount was changed (manual or automatic) and determined that the straight line calculation is an automated, un-editable parameter in CAFM. She stated that the system uses a logical formula based on the date acquired and date placed in service to determine the monthly depreciation amount. In the uncorrected date acquired field, the CAFM system calculated monthly depreciation for 595 months instead of the full 600 months. Once the date acquired field was updated and corrected, the CAFM system automatically calculated the correct monthly depreciation of \$3,024.

**The manual error of not properly updating the "date acquired" field and/or the "date placed in service" field in CAFM will be addressed as a verbal issue. See: [E: WSDOT\_Depreciable Assets Manual Input Error].**

### **STEP 3: Understand General IT Controls:**

The understanding of the general IT Controls is documented below from our inquiry about the CAFM system with Richard Daniels, GISP - DOT Technology Services Division, where he explained the following:

The CAFM system consists of thick clients known as Archibus and Smart Client that are currently only used for Admin tasks, a modern Web application known as WebCentral, and the shared SQL Database known as CAFM. Throughout the history of CAFM at WSDOT multiple web applications have been used against the CAFM database, those included CSMM, FM Studio, Infrastructure.Net, and now WebCentral. The web application is a configured commercial off the shelf (COTS) product. The code base is Vendor supported and human readable. The code consists of view files and java and JavaScript compiled coded that run under a TomCat web server environment. WSDOT maintains a complete database side environment with Development, Quality Assurance, and Production SQL Servers. On the web application side WSDOT has a Development, QA and Production project environment as well. All code or system level data changes are tested in the DEV and QA environments before being promoted to production.

Code changes within the application are done at the Vendors internal testing site then provide to WSDOT via SFTP for loading into our Development and QA environment on ARCHIBUS (wsdot.loc) (<http://hqpolymappcmms1p.wsdot.loc:8084/archibus/>) for final testing and acceptance. Accepted code changes are moved to the production server using a managed repliweb process that copies 'changed' files to the

## State of Washington

production server. This enables support staff to move code without directly accessing the production server. Server support and one Vendor support person have remote login permissions on the production application server. **In practice, only Richard Daniels and Elena Fehr, Facilities Inventory Specialist, and Brian Branners from Facilities, have permissions to edit code on the DEV/QA web server (Key General IT Control).**

Database structure changes are done using internal tools contained within the WebCentral and SmartClient application. This is made possible by the presence of a 'Fields' and 'Tables' table in the database that when used together, provide the definition of all tables and views contained within the database. When the "Rebuild" table structure command is issued from the WebCentral or SmartClient application the specified table will be rebuilt from scratch based on the table definition, data within the table is retained and copied into the newly created table (i.e., the old table is backed up prior to executing the drop and create SQL statements required by the "Rebuild" command).

Separate from the database structure within the SQL database itself are stored procedures, triggers, and SQL Agent Jobs. The stored procedures are used in four main roles, (1) populated drop downs within the application, (2) provide formatted data for reports, and (3) support ETL interfaces, and (4) triggered on demand to execute a specific calculation (e.g., issue work orders request based on preventive maintenance schedules). The SQL Agent jobs execute stored procedures at a give date time to support interfaces and internal. Anyone with update or DBA level access to the database could make changes to the data, executed these procedures, or alter a table structure; however, on the (re)deployment of the database structure from SmartClient, any database structure changes made directly within SQL would be reverted. To prevent data loss the Production data is backup daily and retained for over 6 months.

In the Production SQL database the only individuals who could change the data directly (vs. with DevOps) are the web application special user (account that talks between the web application and the database), WSDOT SQL Database Administrators, and CAFM App support team members. The list would include members of Data Based Administrators of the TSD Data Resource Management Office and Richard Daniels and Hazim Mohaisen from the TSD Solutions Development & Modernization Team and Elena Fehr, Brian Branners from Facilities. Permissions in Production for the database structured and stored procedures are strict (view only). This was done to force users to use the built in methods provided by WebCentral and SmartClient to deploy database structure changes.

### **STEP 4: Confirm Key General IT Controls:**

**Key General IT Control: In practice, only Richard Daniels, and Elena Fehr, Facilities Inventory Specialist, and Brian Branners from Facilities, have permissions to edit code on the DEV/QA web server.**

To confirm the general IT control met with Richard Daniels, GISP - DOT Technology Services Division, on 7/9/24 to observe a walkthrough and inquire of the control. Richard shared his screen and walked us through the login process for Web Central, where the Archibus application is which is used by the CAFM Database Server. He showed what happens when a user not authorized by the system tries to login, which results in an error pop up saying the password or user name is wrong. He shared with us that the user name can specialized (for certain development teams) or simply just the DOT 8 digit user ID that employees have. For passwords, Richard shared that these are not the same passwords used in admin in

## State of Washington

the active directory, but are specially created passwords. Richard informed us that all user permissions and parameter's for granting access are done at the DOT Network level. Once into the Archibus system, Richard showed us the user access list to CAFM & Archibus. Only 14 people have access at all (consisting of IT, Facilities staff, & vendor personnel) and only 6 have the highest level of admin capabilities (for creating and removing users). Of these 6, there are 2 IT personnel and 4 facilities personnel. Richard explained the following order of necessary requirements in order to access or make changes in the CAFM system front end DEV environment:

1. Obtain a DOT Credential to use the DOT Intranet
2. Obtain/know the web server hosting alias
3. Have an Archibus/Web Central Account (that meets password requirements)
4. The account has to have certain "edit/modify" permissions only granted by super-user admin in order to make changes.

For back end DEV and SQL Database changes, all access levels and permissions are granted/created by TES STAR Team or the Network Admin, both of which are separate divisions under DOT's Technology Service Department (TSD). Richard walked us through virtually logging into the SQL DEV Database for CAFM. Richard noted that every year the IT team will pull a list from CAFM database of users and validate users with current DOT email's to ensure that anyone who has access (at any level) to make changes to the CAFM system are current employees at DOT. This ensures that terminated or old employees do not still have access to the system. *No issues noted.*

### **STEP 5: Test Key General IT Controls:**

Not applicable - we are not planning to rely on automated controls and therefore do not need to test general controls; control risk will be assessed at MAX.

### **I.3.PR.G - Depreciable Assets (Net of Depreciation)**

*Procedure Step:* Key Control #3 (Manual)

*Prepared By:* NJH, 7/1/2024

*Reviewed By:* RKM, 7/5/2024

Purpose/Conclusion:
---------------------

### **Purpose:**

To confirm whether The Financial Consultant at WSDOT's headquarters' Accounting and Finance Division prepares the Inventory Systems vs. TARTS Analysis to verify the Capital Facilities Historical cost and Accumulated Depreciation from Facility Inventory Division (CAFM) agrees with the data shown in TARTS for **Key Control #3 for Buildings - TRAINS/CAFM** in order to assess control risk.

# State of Washington

## **Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

## Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*

## State of Washington

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency.*

***All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.***

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

# State of Washington

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

**Key Control #3 (Valuation):** The Financial Consultant at WSDOT's headquarters' Accounting and Finance Division prepares the Inventory Systems vs. TARTS Analysis to verify the Capital Facilities Historical cost and Accumulated Depreciation from Facility Inventory Division (CAFM) agrees with the data shown in TARTS.

The understanding for this system is documented above in the [[Controls - Buildings - TRAINS/CAFM](#)] step.

### **1. Confirmation of Key Manual Control:**

We received a copy of the April 2024 Inventory Systems vs. TARTS Analysis on from Jesse Daniels, Audit Liaison, on behalf of Suzi Freelund, Accounting & Reporting Manager. The spreadsheet shows a query for the amount (historical cost) and depreciation (accumulated depreciation) for the current month sorted by the respective inventory system used by capital assets. A pivot table is created based on the data and sorted by the 9 different distinct inventory systems which are as follows:

- Facilities
- Facilities/MC Facilities
- FEMS
- IRIS
- MC
- Remedy
- Terminals
- Vessels
- WAIMS

A "TARTS Variance" section is set up adjacent to the pivot table to analyze the comparison between the calculated pivot table sums and what is

## State of Washington

shown on an external TART report. By analyzing the excel formula used for the "Facilities" system, "`=389352955-GETPIVOTDATA("Sum of Amount",$J$1,"Inventory System","Facilities")`" we were able to understand that the TARTS figures are manually hard keyed into each formula from each external TARTS report which is referenced/documentated adjacent to each cell. Any discrepancies & variances are usually noted by the editor of the spreadsheet. ***No issues noted.***

Additionally, we noted that the total for the "Facilities" and "MC Facilities" systems (we omitting other line items not a part of Capital Facilities), the total cost was \$389,359,553.00 and the total A/D was \$162,258,073.50. The total manually entered TARTS amounts showed \$389,352,955 in costs and \$162,251,575 in A/D. Therefore, the noted variances in the spreadsheet for these systems were \$6,598 and \$6,498 respectively. The editor noted in the spreadsheet that there is a regular permanent difference of these amounts between Facilities & MC Facilities. ***No issues noted.***

We were able to confirm that the Inventory Systems vs. TARTS Analysis verified the Capital Facilities Historical cost and Accumulated Depreciation from Facility Inventory Division (CAFM) and that it agrees with the data shown in TARTS. ***No issues noted.***

### **Noted Weaknesses are as follows:**

**None**

### **2. Preliminary Control Risk Assessment**

MAX - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

### **I.3.PR.G - Depreciable Assets (Net of Depreciation)**

*Procedure Step:* Key Control #4 - TRAINS/AFRS (Manual)

*Prepared By:* NJH, 7/11/2024

*Reviewed By:* RKM, 10/14/2024

## State of Washington

Purpose/Conclusion:

**Purpose:**

To confirm whether the Accounting and Reporting unit performs monthly TRAINS/AFRS fund and GL reconciliations to ensure transactions are properly reported within AFRS for **Key Control #4 for TEF - TRAINS/FEMS and Buildings - TRAINS/CAFM** in order to assess control risk.

**Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

**Key Control #1 (Valuation):** The Accounting and Reporting unit performs monthly TRAINS/AFRS fund and GL reconciliations to ensure transactions are properly reported within AFRS.

The understanding for this control/system is documented in the "Controls - TEF - TRAINS/FEMS" and "Controls - Buildings - TRAINS/CAFM" steps as this control pertains to these DOT systems regarding depreciable assets.

An updated understanding of all systems was gained through a control confirmation walkthrough meeting with Suzi Freelund, Accounting & Reporting Manager, on 7/9/24. During this meeting we learned that Suzi (in place currently for Beth De Vaul) and her team do the general system wide vs. TARTS report reconciliations while each respective asset system manager for TEF (Charleen Emmons), Buildings (Krystle Mize) , and WSF (Eric Bozarth) do their own separate monthly reconciliations with TARTS Reports vs. TRAINS before Suzi & the accounting/reporting team do their reconciliation.

### **1. Confirmation of Key Manual Control:**

To confirm this key control, we observed a walkthrough from Suzi Freelund, Accounting & Reporting Manager, on 7/9/24 for the Month of April 2024 as well as inspected a copy of the *Inventory Systems vs. TARTS Report* for the month of April. From our understanding of the document and the walkthrough, we were able to identify that Suzi pulls the GL/Fund data in TRAINS (which uploads to AFRS every night) at the end of each month and reconciles these amounts to the pulled TARTS reports from each system. From here she will inspect any variances in total cost and

## State of Washington

total accumulated depreciation based on the nine different internal asset systems in TRAINS. There were two variances she went through for the "Facilities" and "MC Facilities" systems identified in April which she noted are "always offset" due to accounting differences that exist between facility assets and minor capital assets. The total cost was \$389,359,553.00 and the total A/D was \$162,258,073.50 for both systems. The total TARTS amounts showed \$389,352,955 in costs and \$162,251,575 in A/D. Therefore, the noted trivial variances in the spreadsheet for these systems were \$6,598 and \$6,498 respectively that she addressed. ***No issues noted.***

Suzi had us note here that this is a completely separate process than the quarterly reconciliation process done by Beth De Vul who enters the depreciation amounts into TRAINS, then creates TRAINS and AFRS journal vouchers to record the increase or decrease in asset balances and depreciation in both financial systems.

During our walkthrough Suzi also pulled up a copy of a TRAINS reconciliation spreadsheet used to reconcile TARTS reports amounts and TRAINS amounts for Minor Capitalization projects (MC) and Remedy projects (IT Assets). Suzi explained that this sheet helps her identify any variances or discrepancies, and that if a variance or issue is found, she will send the information over to the specified region where the variance took place. Note here that Minor Capital and IT Assets are not included in the scope of our audit but does provide additional context as to the control environment regarding DOT assets. ***No issues noted.***

### **Noted Weaknesses are as follows:**

**None**

### **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

### **I.3.PR.G - Depreciable Assets (Net of Depreciation)**

*Procedure Step:* Controls - WSF - TRAINS

*Prepared By:* NJH, 6/20/2024

*Reviewed By:* RKM, 10/14/2024

# State of Washington

Purpose/Conclusion:

**Purpose:**

To gain an understanding of internal controls.

**Conclusion:**

We gained an understanding of internal controls as documented in the record of work done.

Testing Strategy:

**The following procedures are required for all material systems:**

1. List the financial statement balance(s) and relevant assertion(s) addressed by the understanding.
2. Gain an understanding of the internal control process, identify how transactions are recorded in AFRS, identify key controls over relevant assertion(s), and note any control weaknesses.
  - In gaining an understanding of controls, consider the overall understanding of State-Level control elements as documented in the "State-Level Controls" step as they relate to this particular system.
  - Identify controls systems covering all relevant assertions for all significant classes of transactions.
  - Standards require the auditor to gain an understanding of the significant accounting system(s) that contain key controls over significant classes of transactions included in the line item.
  - Control systems identified in this step must match the Material Account Matrix and have a separate control understanding documented.
  - Talk with the ACFR Specialist or AIC if you identify different systems than the ones anticipated in the Material Account Matrix.

For each material system, auditors must document:

A brief outline of the transaction flow from beginning to end.

An expanded description of key controls.

Business processes relevant to financial reporting of the relevant assertion for the material balance. Processes should encompass automated and manual procedures by which transactions or events are identified or initiated, authorized as needed, recorded, processed and corrected as needed.

Original accounting records and how records are rolled-up to intermediary ledgers and transferred to the general ledger (AFRS) or financial statements.

Detailed descriptions of key controls. Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a significant

## State of Washington

deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

The following is information to **consider** when identifying key controls and transaction flow.

“Key controls” refer to the few controls that together provide reasonable assurance that material misstatements will be prevented or detected and corrected. This is contrasted with ancillary or supporting controls, which – although helpful and recommended – would provide less than reasonable assurance by themselves.

The focus of the write-up is on the key controls. Key controls should be specifically identified (as “key controls”) in the write-up. This can be done in whatever way the auditor prefers, so long as it is obvious. Details that the auditor should document regarding key controls may include:

- Who or what initiates the control
- When (or how often) is the control applied
- Who performs the control
- As needed, the experience, knowledge and attitude of the person applying the control
- Detailed description of the control process or activity. For example, if the control is a review: what exactly is reviewed, what is the reviewer looking at or for and what are the reviewer’s criteria?
- How the key control is documented or evidenced
- If not obvious from the description, how the control prevents or timely detects and corrects misstatements
- Any exceptions or alternative processing to the normal process
- What happens when misstatements or issues are identified by the control

The “transaction flow” refers to the process by which transactions are initiated, authorized, recorded, processed and reported (as applicable). Outlining the transaction flow gives context to key controls, especially how transactions become subject to controls in the first place. If a control inherently ensures that all applicable transactions are included (ex: bank reconciliation where the assertion is existence), the auditor may decide to just start the write-up with the initiation of the control procedure and go from there.

Elements of the transaction flow are defined informally as follows:

- Initiation:* How are transactions initiated?
- Authorization:* How are transactions and accounting record maintenance authorized?
- Recording:* How are transactions or balances identified and recorded in financial accounting systems?
- Processing:* How are the transactions or balances processed after they are recorded (if at all)? Processing may be manual or automated and may occur at a subsidiary system level or at the general ledger level.

# State of Washington

*Reporting:* How are records translated into the financial statements? This part of the transaction flow extends the understanding to the actual financial statements that the audit is opining on. Since we already document an understanding of the financial reporting process in general, it is usually enough to simply reference this overall understanding. However, if there are important steps unique to the covered balances, it may be more appropriate to mention them here.

Although transaction flow is a good way to think about understanding and documenting a control system, auditors should not worry too much about documenting “each element, in order” because often elements may be combined, not noticeable, not applicable or occur in a different order.

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits](#) Planning Guide**

Record of Work Done:

## **Material Balance and Assertions**

Internal controls in the TRAINS system address the following balance:

Depreciable Assets (Net of Depreciation)

For the following assertions:

Existence - The furnishings, equipment and capitalized costs have been disposed, replaced or otherwise impaired.

Valuation - The amount reported for this line item does not represent actual capitalized costs of furnishings and equipment constructed, purchased, or donated as of the report date.

Valuation - Newly added furnishings and equipment are not stated at historical or estimated historical cost.

Valuation - Depreciation may be incorrectly calculated because the wrong asset class code or useful life is entered into the system.

Significant Accounting System:

# State of Washington

**Transportation Reporting and Accounting and Information System (TRAINS)** - TRAINS is used to post expenditures using Payment Vouchers or Journal Vouchers. TRAINS does not allow the creator to review and approve their own work.

## Other Systems (Not Significant Systems):

**Transportation Assets Reporting and Tracking System (TARTS)** - Text file from FEMS, showing value and life-to-date depreciation from capital asset inventory systems.

**COGNOS Datamart and Financial Information Retrieval System (FIRS)** - Read only systems used to access WSDOT accounting system expenditures in the capitalization process.

## **Purchase and Capitalization of Transportation Equipment:**

We met with the following staff on 5/13/24 to discuss the purchase and capitalization controls related to ferries:

Eric Bozarth - WSF Capital Accountant

Lewis Bequette - Controller at WSF

Beth De Vault - AFS Transportation Financial Consultant

Suzi Freelund - Accounting and Reporting Manager

Loretta Sexton - Expenditures manager at WSF

Jesse Daniels - WSDOT Audit Liaison

Washington State Ferries (WSF) only tracks the vessels, equipment attached to the vessels, and the ferry terminals; the smaller equipment such as power equipment or vehicles are included in the Transportation Equipment Fund (TEF). They use an excel spreadsheet to track the equipment and calculate depreciation. The spreadsheet includes cost, acquisition date, useful life, remaining life, and monthly and accumulated depreciation calculations. Assets are added to the spreadsheet using data from the COGNOS report showing all capital expenses for the quarter.

## Additions

Quarterly, WSF will update the Excel spreadsheet for vessels, terminals, and make updates to the construction in progress (CIP) excel spreadsheet. The WSF Capital Accountant (Eric Bozarth) will run a COGNOS report for all capital expenses for the quarter and reach out to the vessels and terminals business groups to obtain a list of new CIP work orders. The vessel and terminal business groups will also leave notes for completed projects, useful life, and when it was completed. The information in the Excel spreadsheet for CIP is updated for the new quarter, so the beginning balance equals the previous quarter's ending balance. Once the file is updated the WSF Capital Accountant adds in the COGNOS data, which will contain any additions and their amounts from the quarter. The WSF Capital Accountant will work with the vessels or terminals business groups to determine which projects are complete and should be added to the vessel asset spreadsheet, and which costs should be added to construction in progress (**Key Control #1 - Existence**).

## Deletions

Deletions of vessels and terminals are rare, due their long expected useful life. There are three vessels awaiting sale and are off of the WSF books

## State of Washington

and noted in the disclosures for FY23.

### Depreciation Calculation

The monthly depreciation calculation is tracked in the WSF Vessels Fixed Asset spreadsheet and is based on the useful life and data provided by the ferries and vessels business groups (useful life, cost, and project complete date). The monthly depreciation is added to the accumulated depreciation, which is recorded via journal entry **(Key Control #2 - Valuation)**.

### **How Transactions are Recorded in AFRS:**

At the end of the quarter Beth De Vul, Transportation Financial Consultant, uses the WSF Vessels Spreadsheet and WSF Terminals Spreadsheet and creates the "Department of Transportation Fixed Asset Detail Report (HWY-RAI06060A)". This report is compared to the WSF report maintained by Eric Bozarth. Changes from the WSF Fixed Assets Excel spreadsheet and construction in progress that occurred in the quarter are recorded by Beth through a JV into TRAINS and AFRS **(Key Control #3 - Valuation)**.

### **Key Controls are as Follows:**

**Key Control 1 - Valuation:** WSF tracks depreciation in the WSF Vessels Fixed Assets Excel spreadsheet based on cost and useful life for each vessel.

**Key Control 2 - Existence/Valuation:** Each quarter, the Transportation Financial Consultant creates the "Department of Transportation Fixed Asset Detail Report". This report is compared to the WSF report maintained by the WSF Capital Accountant, changes (additions/reductions) and construction in progress that occurred in the quarter are recorded by the Financial Consultant through a JV into TRAINS and AFRS.

### **Noted Weaknesses are as Follows:**

None

### I.3.PRG - Depreciable Assets (Net of Depreciation)

*Procedure Step:* Key Control #1 (Manual)

*Prepared By:* NJH, 7/2/2024

*Reviewed By:* RKM, 7/5/2024

# State of Washington

Purpose/Conclusion:

**Purpose:**

To confirm whether WSF tracks depreciation in the WSF Vessels Fixed Assets Excel spreadsheet based on cost and useful life for each vessel for **Key Control #1 for Ferries - TRAINS/FEMS** in order to assess control risk.

**Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. *When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent

## State of Washington

material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency.*

***All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.***

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. *Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. *Controls are not related to a "significant risk" identified in the audit plan.*

## State of Washington

*C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*

*D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

**Key Control #1 (Valuation):** WSF tracks depreciation in the WSF Vessels Fixed Assets Excel spreadsheet based on cost and useful life for each vessel.

The understanding for this system is documented above in the "Controls - WSF - Trains" step.

### **1. Confirmation of Key Manual Control:**

To confirm the key control, we obtained a copy of the WSF Vessels Fixed Assets spreadsheet [[WSF Vessels Fixed Assets Excel spreadsheet \(PBC\)](#)] from Jesse Daniels, Audit Liaison, on behalf of Lewis Bequette, WSF Controller. Upon reviewing the spreadsheet, we noted the spreadsheet includes vessel details including name of vessel, addition and related work orders, acquisition date, and cost. We recalculated the monthly depreciation for WO 00-4173 for the Tillikum asset "Renovation" and found that it matched the depreciation expense recorded for that month as well as tied to the total accumulated depreciation up to April '24. The spreadsheet also has columns for Accumulated Depreciation (March), Depreciation & Accumulated Depreciation (April), and Annual Deprecation. We noted the March accumulated + April monthly matched the April accumulated depreciation as expected. We were able to confirm WSF is using their Fixed Asset Reporting Excel spreadsheet to track depreciation and cost for each vessel. *No issues noted.*

**Noted Weaknesses are as follows:**

# State of Washington

None

## **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

## **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

### **I.3.PR.G - Depreciable Assets (Net of Depreciation)**

*Procedure Step:* Key Control #2 (Manual)

*Prepared By:* NJH, 7/12/2024

*Reviewed By:* SHW, 7/25/2024

Purpose/Conclusion:

#### **Purpose:**

To confirm whether Each quarter, the Transportation Financial Consultant creates the "Department of Transportation Fixed Asset Detail Report". This report is compared to the WSF report maintained by the WSF Capital Accountant, changes (additions/reductions) and construction in progress that occurred in the quarter are recorded by the Financial Consultant through a JV into TRAINS and AFRS (**Key Control #2 for Ferries - TRAINS**) in order to assess control risk.

#### **Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

## State of Washington

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. ## **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

## **I.3.PR.G - Depreciable Assets (Net of Depreciation)**

# State of Washington

*Procedure Step:* Risk Assessment

*Prepared By:* NJH, 8/28/2024

*Reviewed By:* RKM, 8/28/2024

Purpose/Conclusion:

**Purpose / Conclusion:**

To assess inherent risk, control risk, and the risk of material misstatement in order to design an initial testing strategy for each assertion.

Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

**STEP 1: Inherent Risk (IR)**

Assess inherent risk for each relevant assertion. This assessment is based on understanding of the entity and the nature of the account balance or class of transactions.

*Inherent risk is the susceptibility of an assertion to material misstatement. It is our assessment of "total threat", which includes both "natural risk" and identified risk indicators, without any regard to any potential control activities. As inherent risk is fully independent of control risk, any understanding of controls cannot be used to increase/decrease the assessment of inherent risk. Consider the following factors as your basis for this assessment:*

*General Considerations*

*Does the balance include transactions that are difficult to audit or involve complex accounting issues?*

*Were there significant misstatements identified in previous audits or prior-period adjustments in the account balance or transaction class? If so, analyzing the cause of prior period misstatements will help in analyzing inherent risk.*

*Are there any inherent risk factors at the entity or industry level, such as changes in regulation or accounting rules, unique transactions or accounting practices, use of information technology, etc that affect the balance?*

*Inherent Risk due to Error*

*How large are the transactions making up the balance? If the balance has only a few large transactions, even a single error may mean a significant misstatement.*

*Have there been changes in the transactions making up the balance that may increase risk? For example, significantly different composition, nature or volume of transactions may inherently disrupt established controls.*

## State of Washington

*Are financial events originated or identified by accounting personnel or non-accounting personnel? This consideration is mainly for the completeness assertion.*

*Does the process to account for transactions involve judgment or estimation, complex calculations, numerous steps or significant manual steps?*

*Do transactions have widely varying attributes that need to be manually identified? For example, grant loans that are accounted for in one of several ways depending on the terms of the agreement.*

*Inherent Risk due to Fraudulent Reporting (intentional misstatements)*

*Are there substantial pressures or motivations to misstate the balance?*

*Inherent Risk due to Misappropriation*

*Is the account balance or transaction class susceptible to sizable misappropriation?*

*Inherent Risk due to Non-Compliance*

*Are there any laws, contracts or grant agreements affecting the balance? If so, would non-compliance lead to sizable misstatements?*

*Are compliance requirements complex, hard to understand, subject to judgment or otherwise difficult to comply with?*

*Are there any motivations or pressures to not comply?*

### **STEP 2: Control Risk (CR)**

Assess control risk by system and assertion. This assessment should be based on the results of the control understanding, confirmation, and (if setting control risk to LOW) testing. If applicable, auditors will evaluate any control deficiencies and determine whether those deficiencies, individually or in combination, are significant deficiencies or material weaknesses.

*Control risk is the risk that material misstatements would not be prevented or detected timely by the system of internal control. Control risk could be thought of as the "vulnerability" of an entity to misstatements. Control risk exists independently of the inherent risk (the level of vulnerability exists independent of the level of threat).*

*Control risk is MAX in both of the following situations: (1) controls aren't tested or (2) controls are problematic and cannot be relied upon. In order to set control risk to LOW, the auditor must test that controls operated effectively throughout the period.*

*A material weakness exists when the design or operation of controls results in a reasonable possibility a material misstatement will not be prevented or detected and corrected in a timely manner. A significant deficiency is less severe than a material weakness, yet important enough to merit the attention of the governing body. **All potential material weaknesses and significant deficiencies should be discussed with the AIC, since they must be reported as findings.***

### **STEP 3: Risk of Material Misstatement (RMM)**

Assess the risk of material misstatement for each relevant assertion for each significant line item. The risk of material misstatement (RMM) is a combination of the auditor's separate assessment of inherent and control risk.

## State of Washington

*In practice, the RMM is the amount of substantive evidence that's needed, and the only way to reduce the amount of needed substantive evidence (equal to the inherent risk) is to test controls. As such, when control risk is MAX, the RMM must always equal the inherent risk (IR).*

*When controls are tested & can be relied upon (are determined to be effective) it is a matter of professional judgment how much the RMM should be set lower than inherent risk (1 or 2 steps).*

*Auditors should assess RMM by assertion, if different. For example, if RMM is assessed at MOD for the existence assertion, but LOW for the rights & obligations assertion, then document "MOD – existence and LOW – rights & obligations".*

### **STEP 4: Design Substantive Testing**

Design a substantive testing strategy that addresses the relevant assertion (identified risk) in the portion of the line item that relates to that risk.

*Planning identifies where to audit (significant balances, classes of transactions & disclosures) what to audit for (relevant assertions), and how much to audit (RMM). The quantity and quality of evidence obtained by substantive tests needs to match the level of risk. The higher the risk of material misstatement, the greater evidence needed. "Greater evidence" could either be greater quantity of evidence, greater quality of evidence, or some combination of greater quality and quantity.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6210](#) – Planning Financial Statement Audits**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits](#) Planning Guide**

Record of Work Done:

### **(1) Inherent Risk (IR):**

Based on our understanding of the line item, we assessed inherent risk as follows for each relevant assertion and significant class of transactions:

Existence - High

Valuation - High

# State of Washington

## **(2) Control Risk (CR):**

We assessed control risk as follows for each system and relevant assertion:

**TEF - TRAINS/FEMS: (Valuation/Existence)**

**Buildings - TRAINS/CAFM: (Valuation/Existence)**

**WSF - TRAINS: (Valuation/Existence)**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

## **(3) Risk of Material Misstatement (RMM):**

We considered both inherent and control risk and assessed the risk of material misstatement as follows for each relevant assertion and significant class of transactions:

Existence - High

Valuation - High

## **(4) Testing Strategy:**

We designed our substantive testing strategy based on our assessment of the risk of material misstatement. We plan to perform the following tests:

### **TEF:**

(Existence) - We will select a sample of TEF equipment and verify existence by reviewing photos/recent work orders.

(Valuation) - Verify a sample of monthly TRAINS/AFRS Depreciation Reconciliations are completed to ensure balances are valued correctly.

(Valuation) - Recalculate a sample of asset depreciation amounts to confirm FEMS is automatically populating an accurate amount based on inventory value, LTD amount, salvage value, and useful life remaining of assets.

### **Buildings:**

(Existence) - We will select a sample of capital assets and verify existence by reviewing photos/recent work orders.

(Valuation) - Recalculate a sample of asset depreciation amounts to confirm CAFM is automatically populating an accurate amount based on inventory value, LTD amount, salvage value, and useful life remaining of assets.

# State of Washington

## WSF:

- (Existence) - Select all vessels from the asset listing to determine whether they exist by viewing VesselWatch which records ferry location and activity.
- (Valuation) - Recalculate accumulated depreciation & net book value for all WSF Vessels from the asset listing. Additionally, we will compare the useful life code against the relevant SAAM commodity code to ensure useful life is appropriate for vessels used in the calculation.

We anticipate that these tests will provide sufficient appropriate audit evidence to address the assessed risk of material misstatement for relevant assertions in significant classes of transactions.

## I.3.PRG - Depreciable Assets (Net of Depreciation)

*Procedure Step:* Substantive Test - TEF (TRAINS/FEMS)  
*Prepared By:* NJH, 10/17/2024  
*Reviewed By:* CJG, 12/5/2024

Purpose/Conclusion.*
----------------------

### **Purpose - Existence:**

To determine whether reported capital assets represent real assets, as of the end of the period.

### **Conclusion:**

We determined that the TEF assets currently exist and represents real asset obligations as of the reporting date. *No issues noted.*

### **Purpose - Valuation:**

To determine whether capital assets are reported at properly valued and calculated amounts.

### **Conclusion:**

We determined the monthly reconciliations to be accurate and performed timely and that FEMS is automatically populating an accurate amount based on inventory value, LTD amount, salvage value, and useful life remaining of assets. *No issues noted.*

# State of Washington

## Testing Strategy:

### Valuation:

The following is a list of **considerations** for testing the valuation assertion for capital and infrastructure assets. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

### Incorrect Depreciation Calculations

Perform an analytical review of depreciation expense by type of asset for reasonableness.

Re-calculate depreciation expense for a sample of assets or in conjunction with a test of automated controls (if depreciation is automatically calculated by the system). Consider testing the inputs used for the calculation to determine whether they are reasonable and in line with any applicable policies; i.e. useful life, salvage value, etc. Alternatively, test calculations, extensions and footing of subsidiary records if records are maintained on spreadsheets.

Evaluate capital asset policies for componentization or grouping of assets to determine if it has been consistently followed and will result in a rational method of depreciation. See BARS [3.3.10.150](#) for guidance.

Evaluate estimated useful life and scrap value factors for reasonableness. This test could be done in general (on the government's accounting policies), for selected asset classes or for selected or sampled asset records.

*If testing selected high risk assets, auditors should consider assets that are nearly or fully depreciated (see BARS [3.3.10.130](#)), assets with unusually high or low useful lives for their type, and assets with unusually high scrap values.*

Compare estimated useful lives for assets with replacement schedules / policies and capital budgets.

*We would expect that assets on a regular replacement schedule (such as equipment, vehicles, road surfacing, etc) or that are included for replacement in the capital budget would have estimated useful lives that match the government's replacement plans for the asset.*

Consider whether the date placed in service for assets is reasonable given when the asset begins being used or is substantially complete as this will have an effect on when depreciation begins. See information in BARS [3.3.10.90](#) about when to move a project out of CIP.

### Impairment

Check that the measurement method used for write-offs is in accordance with GAAP (GASB 42.12-15). Review or recalculate the portion of historical cost that should be written off for impaired capital assets. *Note: auditor would normally use the same measurement method used by the government unless it the auditor finds it inappropriate for the circumstances or unallowable under GAAP.*

### Incorrect Historical Cost of Assets

# State of Washington

Trace recorded cost to supporting documentation. *Note: This test would normally be limited to recent additions, since documentation for historical assets has likely passed the records retention period.*

Evaluate the reasonableness of any estimates of the historical cost of capital assets.

Evaluate the reasonableness and support for any estimates of the acquisition value (per GASB 72) of donated capital assets.

## **Conversion to GAAP**

For governments converting to GAAP reporting, examine valuation method for retroactively reported infrastructure assets and verify that the valuation method used is one of the methods prescribed by the County Road Advisory Board.

## **Modified Approach**

Check that infrastructure is being depreciated unless the modified approach is used. If the modified approach is used, verify that the government has met criteria of GASB 34 par 23-26.

## **Allocation**

On the government-wide statement of activities, review allocation of depreciation for capital assets for governmental funds. Depreciation expense will be reported as a component of the direct expense shown in the statement of activities. Request spreadsheet for allocation.

Existence:

The following is a list of **considerations** for testing the existence assertion for capital and infrastructure assets. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

## **Nonexistent Assets**

Review capital asset records to determine whether records meet minimum requirements of BARS [3.3.9.40](#) to positively identify and adequately describe the asset. If asset records are not sufficient, follow up on how the entity is able to identify and track reported assets and consider further audit procedures.

Scan the capital asset list for unusual or unexpected assets or patterns.

*For example: asset descriptions that appear insufficient to identify the asset, asset descriptions that seem strange, assets with a historical cost that doesn't appear to meet the capital asset threshold, assets that are past the end of their service life, assets or asset types that don't appear to belong (based on auditor's understanding of entity activities and area of operation), assets or asset types that the auditor doesn't recognize, attributes that appear unreasonable (historical cost, useful life or scrap value), assets that appear connected to actions noted in planning procedures (impairment, replacement, sale or surplus, transfer), etc.*

## State of Washington

Test sampled assets or selected high-risk assets from accounting records for existence by observing them or reviewing documentation.

*Observation for aboveground infrastructure such as roads, bridges or buildings may be by [google maps](#). Documentation for underground assets may consist of maps, system plans approved by regulatory agencies or permits, etc.*

Review the government's records of the latest physical inventory for any identification and follow-up on missing assets or any types of assets or locations that were not covered. Note: review of a government's physical inventory is considered a control test. However, it may be done as a risk assessment procedure to help direct substantive testing, and follow-up on results may result in some substantive evidence.

Trace assets from accounting records to assets listed on the government's insurance policy records. Note: if a complete comparison or reconciliation is made, this test would also provide evidence for the completeness assertion.

Trace assets from accounting records to operational records (ex: Public Works Department typically tracks assets for maintenance or regulatory reporting purposes). Note: if a complete comparison or reconciliation is made, this test would also provide evidence for the completeness assertion.

For land and buildings, trace parcels and historical cost per the land subsidiary schedules to the County's land (GIS) records to verify ownership. Note: this test also provides evidence for the rights & obligations assertion and - if a complete list is obtained from the County - for the completeness assertion as well.

Compare reported public project completed or in process during the period to the L&I [prevailing wage reporting database](#). Note: since reporting is done by contractors, it would be considered a third-party verification of project existence. We would expect capitalized costs (which include costs incurred by the government as well as contractors) to exceed the contractor's reported costs for most projects. This test also provides evidence for the completeness assertion if traced from the L&I database.

### **Cut-off**

Review supporting documentation to verify dates of any transfers, annexations or donations.

See the Expenditures | Existence step for testing strategies on cut-off for capitalized expenditures.

### **Detail Roll-Up**

If manual journal entries are required to update the GL, agree figures per the GL to subsidiary schedules or systems.

Search for manual journal entries that debit (increase) capital or infrastructure assets. Consider testing if any risk indicators are noted.

Reconcile (or review the government's reconciliation) capital expenditures for governmental funds to increases in capital assets. The only anticipated reconciling item would be equipment that is below the capitalization threshold.

Reconcile (or review the government's reconciliation) increases in capital assets to capital purchases and sales per the statement of cash flows for proprietary funds. The only anticipated reconciling item would be donated or contributed assets.

# State of Washington

**Over/Invalid Capitalization** - See classification step for testing strategies on improper capitalization upon construction or acquisition, or when determining whether an expense is a maintenance or repair expense or a capitalized improvement.

## **Unrecorded Disposals or Impairments**

Scan capital asset records for fully depreciated assets and inquire as to the status (disposed, no longer in use, etc.) to ensure all retirements and disposals have been recorded. Evaluate appropriate accounting for any fully depreciated assets remaining in service in accordance with [BARS 3.3.10.130](#).

Identify significant disposals, impairments (due to obsolescence or damage) or contributions per review of minutes and trace to asset records to verify these events were accounted for.

Request a list of insurance claims made during the audit period to identify possible impairments or removed assets, then trace to subsidiary records to verify that the event was properly accounted for.

Identify annexations (through minutes, inquiry or OFM's central annexation tracking system) and trace to supporting documents showing the transfer of assets. Note: this test would also provide evidence for the completeness and rights & obligations assertions.

## **Joint Ventures**

Evaluate involvement in undivided interests, joint ventures, jointly governed organizations, and component units (identified as part of the perm file and Reporting Entity step) for assets that may have been jointly acquired, constructed or used (see [BARS 3.3.10.20](#)).

See the Rights & Obligations step for additional testing strategies related to capital assets being transferred between governments or created as part of joint projects.

Guidance/Criteria:
--------------------

### **Existence:**

#### **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

## **BARS [3.3.9](#) Capital Asset Management System Requirements**

GAAP criteria for reporting capital assets

[GASB Codification Section 1400](#) Reporting Capital Assets

[GASB Comprehensive Implementation Guide Chapter 7](#) Basic Financial Statements and Management's Discussion and Analysis, sections 7.9-7.21

### **Valuation:**

# State of Washington

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

2012 GAAFR page 451 describes generally accepted estimation methods for when the historical cost of an asset is unknown. NOTE: The County Road Advisory Board (CRAB) worked with local governments to develop several methods for valuing historical infrastructure assets when GASB 34 was implemented.

## **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

**BARS [3.3.9](#) Capital Asset Management System Requirements**

**BARS [3.3.10](#) Capital Asset Accounting** - guidance on determining ownership of capital assets.

**BARS [3.9.2](#) Property Transfers**

GAAP criteria for reporting capital assets

**[GASB Codification Section 1400](#) Reporting Capital Assets**

**[GASB Comprehensive Implementation Guide Chapter 7](#) Basic Financial Statements and Mangement's Discussion and Analysis, sections 7.9-7.21**

Record of Work Done.:

### **Substantive tests performed to meet the Existence assertion:**

(Existence) - We will select a sample of TEF equipment and verify existence by reviewing photos/recent work orders.

We used the FS Sampling Spreadsheet to select a sample of TEF equipment for testing using the random number generator. Using a tolerable misstatement of 7.5%, assurance at high, we determined a sample size of 39 randomly selected TEF items. Charleen Emmons, Fleet Operations Budget and Finance Manager, provided us with images on 08/08/24 of each selected TEF asset selected for testing. We were able to review each photo to confirm that the asset currently exists and represents real asset obligations as of the reporting date. See testing at [[TEF Testing \(Existence & Valuation\)](#)]. *No issues noted.*

### **Substantive tests performed to meet the two Valuation assertions:**

(Valuation) - Verify a sample of monthly TRAINS/AFRS Depreciation Reconciliations are completed to ensure balances are valued correctly.

## State of Washington

We used the FS Sampling Spreadsheet for Populations of 365 or less to test FEMS to TRAINS reconciliations for TEFS equipment. Using a tolerable misstatement of 7.5% and setting assurance at High, we determined a sample size of 5 monthly reconciliations. Charleen Emmons, Fleet Operations Budget and Finance Manager, provided us with the reconciliations and the JVs to correct the variances between the two systems. We found the reconciliations to be accurate and performed timely. We confirmed ACFR tie out and population completeness by comparing the PBC report to the *TRAINS Trial Balance Report A613B dated 8/29/24* for funds 997 & 410 with variances below the floor. See testing at [\[TEF Testing \(Existence & Valuation\)\]](#). ***No issues noted.***

(Valuation) - Recalculate a sample of asset depreciation amounts to confirm FEMS is automatically populating an accurate amount based on inventory value, LTD amount, salvage value, and useful life remaining of assets.

We used the FS Sampling Spreadsheet to select a sample of TEF equipment for testing using the random number generator. Using a tolerable misstatement of 7.5%, assurance at high, we determined a sample size of 39 randomly selected TEF items. Charleen Emmons, Fleet Operations Budget and Finance Manager, provided us with an export from the TARTS system, detailing all TEF Capital Assets, as of 6/30/2024. We recalculated asset depreciation amounts to confirm FEMS is automatically populating an accurate amount based on inventory value, LTD amount, salvage value, and useful life remaining of assets. We noted differences below the floor. Additionally, we confirmed ACFR tie out and population completeness by comparing the PBC report to the *TRAINS Trial Balance Report A613B dated 8/29/24* for funds 997 & 410 with variances below the floor. See testing at [\[TEF Testing \(Existence & Valuation\)\]](#). ***No issues noted.***

### I.3.PRG - Depreciable Assets (Net of Depreciation)

***Procedure Step:*** Substantive Test - Buildings (TRAINS/CAFM)

***Prepared By:*** NJH, 10/17/2024

***Reviewed By:*** CJG, 12/5/2024

Purpose/Conclusion:
---------------------

**Purpose - Existence:**

To determine whether reported capital assets represent real assets, as of the end of the period.

**Conclusion:**

We determined that the capital facility assets currently exist and represents real asset obligations as of the reporting date. ***No issues noted.***

# State of Washington

## **Purpose - Valuation:**

To determine whether capital assets are reported at properly valued and calculated amounts.

## **Conclusion:**

We determined the CAFM is automatically populating an accurate amount based on inventory value, LTD amount, salvage value, and useful life remaining of assets withx noted differences below the floor. ***No issues noted.***

## Testing Strategy:

The following is a list of **considerations** for testing the valuation assertion for capital and infrastructure assets. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

### **Incorrect Depreciation Calculations**

Perform an analytical review of depreciation expense by type of asset for reasonableness.

Re-calculate depreciation expense for a sample of assets or in conjunction with a test of automated controls (if depreciation is automatically calculated by the system). Consider testing the inputs used for the calculation to determine whether they are reasonable and in line with any applicable policies; i.e. useful life, salvage value, etc. Alternatively, test calculations, extensions and footing of subsidiary records if records are maintained on spreadsheets.

Evaluate capital asset policies for componentization or grouping of assets to determine if it has been consistently followed and will result in a rational method of depreciation. See BARS [3.3.10.150](#) for guidance.

Evaluate estimated useful life and scrap value factors for reasonableness. This test could be done in general (on the government's accounting policies), for selected asset classes or for selected or sampled asset records.

*If testing selected high risk assets, auditors should consider assets that are nearly or fully depreciated (see BARS [3.3.10.130](#)), assets with unusually high or low useful lives for their type, and assets with unusually high scrap values.*

Compare estimated useful lives for assets with replacement schedules / policies and capital budgets.

*We would expect that assets on a regular replacement schedule (such as equipment, vehicles, road surfacing, etc) or that are included for replacement in the capital budget would have estimated useful lives that match the government's replacement plans for the asset.*

Consider whether the date placed in service for assets is reasonable given when the asset begins being used or is substantially complete as this will have an effect on when depreciation begins. See information in BARS [3.3.10.90](#) about when to move a project out of CIP.

# State of Washington

## **Impairment**

Check that the measurement method used for write-offs is in accordance with GAAP (GASB 42.12-15). Review or recalculate the portion of historical cost that should be written off for impaired capital assets. *Note: auditor would normally use the same measurement method used by the government unless it the auditor finds it inappropriate for the circumstances or unallowable under GAAP.*

## **Incorrect Historical Cost of Assets**

Trace recorded cost to supporting documentation. *Note: This test would normally be limited to recent additions, since documentation for historical assets has likely passed the records retention period.*

Evaluate the reasonableness of any estimates of the historical cost of capital assets.

Evaluate the reasonableness and support for any estimates of the acquisition value (per GASB 72) of donated capital assets.

## **Conversion to GAAP**

For governments converting to GAAP reporting, examine valuation method for retroactively reported infrastructure assets and verify that the valuation method used is one of the methods prescribed by the County Road Advisory Board.

## **Modified Approach**

Check that infrastructure is being depreciated unless the modified approach is used. If the modified approach is used, verify that the government has met criteria of GASB 34 par 23-26.

## **Allocation**

On the government-wide statement of activities, review allocation of depreciation for capital assets for governmental funds. Depreciation expense will be reported as a component of the direct expense shown in the statement of activities. Request spreadsheet for allocation.

Guidance/Criteria:
--------------------

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

2012 GAAFR page 451 describes generally accepted estimation methods for when the historical cost of an asset is unknown. NOTE: The County Road Advisory Board (CRAB) worked with local governments to develop several methods for valuing historical infrastructure assets when GASB 34 was implemented.

## **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

# State of Washington

## **BARS [3.3.9](#) Capital Asset Management System Requirements**

**BARS [3.3.10](#) Capital Asset Accounting** - guidance on determining ownership of capital assets.

## **BARS [3.9.2](#) Property Transfers**

GAAP criteria for reporting capital assets

**[GASB Codification Section 1400](#) Reporting Capital Assets**

**[GASB Comprehensive Implementation Guide Chapter 7](#) Basic Financial Statements and Mangement's Discussion and Analysis, sections 7.9-7.21**

Record of Work Done.

### **Substantive tests performed to meet the Existence assertion:**

(Existence) - We well make a selection of capital assets and verify existence by reviewing photos/recent work orders.

We used the FS Sampling Spreadsheet to select a sample of Capital Facilities assets for testing using the random number generator. Using a tolerable misstatement of 7.5%, assurance at high, we determined a sample size of 38 randomly selected Facility assets. Krystle Mize, Capital Facilities Financial Manager, provided us with images on 08/12/24 of each selected facilities asset selected for testing. We were able to review each photo to confirm that the asset currently exists and represents a real asset obligation as of the reporting date. See testing at [[Buildings Testing \(Existence & Valuation\)](#)]. ***No issues noted.***

### **Substantive tests performed to meet the Valuation assertion:**

(Valuation) - Recalculate selection of asset depreciation amounts to confirm CAFM is automatically populating an accurate amount based on inventory value, LTD amount, salvage value, and useful life remaining of assets.

We used the FS Sampling Spreadsheet to select a sample of TEF equipment for testing using the random number generator. Using a tolerable misstatement of 7.5%, assurance at high, we determined a sample size of 38 randomly selected Facility assets. Elena Fehr, IT Data Management - Facilities, provided us with an export from the TARTS system on 8/8/24, detailing all capital facility assets, as of 6/30/2024. We recalculated asset accumulated depreciation and monthly depreciation amounts to confirm CAFM is automatically populating an accurate amount based on inventory value, LTD amount, salvage value, and useful life remaining of assets. We noted differences below the floor. Additionally, we confirmed ACFR tie out and population completeness by comparing the PBC report to the *TRAINS Trial Balance Report A613B dated 8/29/24* for funds 997 & 410 with varainces below the floor. See testing at [[Buildings Testing \(Existence & Valuation\)](#)]. ***No issues noted.***

Based on our recalculation misstatement found during control work, we chose to discuss all variances presented during testing with agency. The agency noted that the CAFM system was not recording any cents/decimal values over the years, creating cumulative rounding variances for both

## State of Washington

the monthly depreciation and accumulated depreciated amounts. Additionally, there were 5 assets by which the agency noted that they will need to investigate further as to why the monthly depreciation amounts appear to be off from our recalculations as there was no immediate explanation. All of the rounding variances noted were corrected and adjusted in an additional TARTS report dated for 7/30/24 after year-end which is outside the scope of our testing. We analyzed both the updated depreciation amounts and the original testing amounts and have noted that the variances from both recalculations are below the floor and neither variances represent a significant misstatement. ***No issues noted.***

### I.3.PRG - Depreciable Assets (Net of Depreciation)

*Procedure Step:* Substantive Test - WSF (TRAINS/FEMS)

*Prepared By:* NJH, 10/17/2024

*Reviewed By:* CJG, 12/5/2024

#### Purpose/Conclusion:

##### **Purpose - Existence:**

To determine whether reported capital assets represent real assets, as of the end of the period.

##### **Conclusion:**

We determined that the reported capital assets represent real assets, as of the end of the period. ***No issues noted.***

To determine whether capital assets are reported at properly valued and calculated amounts.

##### **Conclusion:**

We determined that the capital assets are reported at properly valued and calculated amounts. ***No issues noted.***

#### Testing Strategy:

The following is a list of **considerations** for testing the valuation assertion for capital and infrastructure assets. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

### **Incorrect Depreciation Calculations**

## State of Washington

Perform an analytical review of depreciation expense by type of asset for reasonableness.

Re-calculate depreciation expense for a sample of assets or in conjunction with a test of automated controls (if depreciation is automatically calculated by the system). Consider testing the inputs used for the calculation to determine whether they are reasonable and in line with any applicable policies; i.e. useful life, salvage value, etc. Alternatively, test calculations, extensions and footing of subsidiary records if records are maintained on spreadsheets.

Evaluate capital asset policies for componentization or grouping of assets to determine if it has been consistently followed and will result in a rational method of depreciation. See BARS [3.3.10.150](#) for guidance.

Evaluate estimated useful life and scrap value factors for reasonableness. This test could be done in general (on the government's accounting policies), for selected asset classes or for selected or sampled asset records.

*If testing selected high risk assets, auditors should consider assets that are nearly or fully depreciated (see BARS [3.3.10.130](#)), assets with unusually high or low useful lives for their type, and assets with unusually high scrap values.*

Compare estimated useful lives for assets with replacement schedules / policies and capital budgets.

*We would expect that assets on a regular replacement schedule (such as equipment, vehicles, road surfacing, etc) or that are included for replacement in the capital budget would have estimated useful lives that match the government's replacement plans for the asset.*

Consider whether the date placed in service for assets is reasonable given when the asset begins being used or is substantially complete as this will have an effect on when depreciation begins. See information in BARS [3.3.10.90](#) about when to move a project out of CIP.

### **Impairment**

Check that the measurement method used for write-offs is in accordance with GAAP (GASB 42.12-15). Review or recalculate the portion of historical cost that should be written off for impaired capital assets. *Note: auditor would normally use the same measurement method used by the government unless it the auditor finds it inappropriate for the circumstances or unallowable under GAAP.*

### **Incorrect Historical Cost of Assets**

Trace recorded cost to supporting documentation. *Note: This test would normally be limited to recent additions, since documentation for historical assets has likely passed the records retention period.*

Evaluate the reasonableness of any estimates of the historical cost of capital assets.

Evaluate the reasonableness and support for any estimates of the acquisition value (per GASB 72) of donated capital assets.

### **Conversion to GAAP**

For governments converting to GAAP reporting, examine valuation method for retroactively reported infrastructure assets and verify that the

# State of Washington

valuation method used is one of the methods prescribed by the County Road Advisory Board.

## Modified Approach

Check that infrastructure is being depreciated unless the modified approach is used. If the modified approach is used, verify that the government has met criteria of GASB 34 par 23-26.

## Allocation

On the government-wide statement of activities, review allocation of depreciation for capital assets for governmental funds. Depreciation expense will be reported as a component of the direct expense shown in the statement of activities. Request spreadsheet for allocation.

Existence:

The following is a list of **considerations** for testing the existence assertion for capital and infrastructure assets. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

## Nonexistent Assets

Review capital asset records to determine whether records meet minimum requirements of BARS [3.3.9.40](#) to positively identify and adequately describe the asset. If asset records are not sufficient, follow up on how the entity is able to identify and track reported assets and consider further audit procedures.

Scan the capital asset list for unusual or unexpected assets or patterns.

*For example: asset descriptions that appear insufficient to identify the asset, asset descriptions that seem strange, assets with a historical cost that doesn't appear to meet the capital asset threshold, assets that are past the end of their service life, assets or asset types that don't appear to belong (based on auditor's understanding of entity activities and area of operation), assets or asset types that the auditor doesn't recognize, attributes that appear unreasonable (historical cost, useful life or scrap value), assets that appear connected to actions noted in planning procedures (impairment, replacement, sale or surplus, transfer), etc.*

Test sampled assets or selected high-risk assets from accounting records for existence by observing them or reviewing documentation.

*Observation for aboveground infrastructure such as roads, bridges or buildings may be by [google maps](#). Documentation for underground assets may consist of maps, system plans approved by regulatory agencies or permits, etc.*

Review the government's records of the latest physical inventory for any identification and follow-up on missing assets or any types of assets or locations that were not covered. Note: review of a government's physical inventory is considered a control test. However, it

## State of Washington

may be done as a risk assessment procedure to help direct substantive testing, and follow-up on results may result in some substantive evidence.

Trace assets from accounting records to assets listed on the government's insurance policy records. Note: if a complete comparison or reconciliation is made, this test would also provide evidence for the completeness assertion.

Trace assets from accounting records to operational records (ex: Public Works Department typically tracks assets for maintenance or regulatory reporting purposes). Note: if a complete comparison or reconciliation is made, this test would also provide evidence for the completeness assertion.

For land and buildings, trace parcels and historical cost per the land subsidiary schedules to the County's land (GIS) records to verify ownership. Note: this test also provides evidence for the rights & obligations assertion and - if a complete list is obtained from the County - for the completeness assertion as well.

Compare reported public project completed or in process during the period to the L&I [prevailing wage reporting database](#). Note: since reporting is done by contractors, it would be considered a third-party verification of project existence. We would expect capitalized costs (which include costs incurred by the government as well as contractors) to exceed the contractor's reported costs for most projects. This test also provides evidence for the completeness assertion if traced from the L&I database.

### **Cut-off**

Review supporting documentation to verify dates of any transfers, annexations or donations.

See the Expenditures | Existence step for testing strategies on cut-off for capitalized expenditures.

### **Detail Roll-Up**

If manual journal entries are required to update the GL, agree figures per the GL to subsidiary schedules or systems.

Search for manual journal entries that debit (increase) capital or infrastructure assets. Consider testing if any risk indicators are noted.

Reconcile (or review the government's reconciliation) capital expenditures for governmental funds to increases in capital assets. The only anticipated reconciling item would be equipment that is below the capitalization threshold.

Reconcile (or review the government's reconciliation) increases in capital assets to capital purchases and sales per the statement of cash flows for proprietary funds. The only anticipated reconciling item would be donated or contributed assets.

**Over/Invalid Capitalization** - See classification step for testing strategies on improper capitalization upon construction or acquisition, or when determining whether an expense is a maintenance or repair expense or a capitalized improvement.

### **Unrecorded Disposals or Impairments**

Scan capital asset records for fully depreciated assets and inquire as to the status (disposed, no longer in use, etc.) to ensure all retirements and disposals have been recorded. Evaluate appropriate accounting for any fully depreciated assets remaining in service in accordance with [BARS 3.3.10.130](#).

## State of Washington

Identify significant disposals, impairments (due to obsolescence or damage) or contributions per review of minutes and trace to asset records to verify these events were accounted for.

Request a list of insurance claims made during the audit period to identify possible impairments or removed assets, then trace to subsidiary records to verify that the event was properly accounted for.

Identify annexations (through minutes, inquiry or OFM's central annexation tracking system) and trace to supporting documents showing the transfer of assets. Note: this test would also provide evidence for the completeness and rights & obligations assertions.

### Joint Ventures

Evaluate involvement in undivided interests, joint ventures, jointly governed organizations, and component units (identified as part of the perm file and Reporting Entity step) for assets that may have been jointly acquired, constructed or used (see [BARS 3.3.10.20](#)).

See the Rights & Obligations step for additional testing strategies related to capital assets being transferred between governments or created as part of joint projects.

Guidance/Criteria:

**[GASB Comprehensive Implementation Guide Chapter 7](#) Basic Financial Statements and Mangement's Discussion and Analysis, sections 7.9-7.21**

Record of Work Done.

#### **Substantive tests performed to meet the Existence assertion:**

(Existence) - Select all vessels from the asset listing to determine whether they exist by viewing VesselWatch which records ferry location and activity.

We selected ferry vessels from the WSF capital asset listing as of June 30, 2024 prepared by Eric Bozarth. We reviewed the asset dollar amount and asset type within the listing to determine whether the vessel was properly capitalized. We verified existence at <https://www.wsdot.com/ferries/vesselwatch/> as of 6/30/2024. See testing at [[WSF Testing \(Existence & Valuation\)](#)]. We noted all ferries existed as of fiscal year end. *No issues noted.*

#### **Substantive tests performed to meet the Valuation assertion:**

(Valuation) - Recalculate accumulated depreciation & net book value for all WSF Vessels from the asset listing. Additionally, we will compare the useful life code against the relevant SAAM commodity code to ensure useful life is appropriate for vessels used in the calculation.

We selected all vessel assets with \$661,051,569 in NBV, representing 100% of all WSF vessel assets. We tested for the net book value (arrived at by recalculating the accumulated depreciation) and the proper classification of the SAAM useful life to ensure the depreciation calculation was correct. We noted all assets were properly capitalized. We recalculated the net of depreciation amounts noting differences due to support not being provided for additions/disposals that occurred before 2019. Misstatement is below the floor individually and in aggregate. There were 31 instances where our recalculated "Asset Net of Depreciation" value did not match theirs. It was determined that these variances were caused by changes to the asset value that were not reported in the documentation we received. All of these additions/disposals took place before 2019 and there is no record to show evidence. Additionally, we confirmed ACFR tie out and population completeness by comparing the PBC report to the

# State of Washington

*TRAINS Trial Balance Report A613B dated 8/29/24 for funds 997 & 410 with variances below the floor. See testing at [[WSF Testing \(Existence & Valuation\)](#)]. The total variance was below the floor. **No issues noted.***

## I.4.PRG - Pensions - Long-Term Liabilities, Deferred Inflows, Deferred Outflows, Net Pension Asset

*Procedure Step:* Summary & Conclusion

*Prepared By:* MRF, 11/14/2024

*Reviewed By:* RKM, 11/21/2024

Purpose/Conclusion:

**Purpose:**

To evaluate risk assessments and the sufficiency and appropriateness of evidence obtained based on results of substantive work.

**Conclusion:**

We determined that **no** modifications were necessary to inherent risk, control risk, or the risk of material misstatement as assessed in planning.

We also determined that evidence obtained was sufficient and appropriate in response to the risk of material misstatement.

Testing Strategy:

Auditors are **required** to evaluate conclusions for substantive testing as follows:

*Auditors may wish to use the optional Lead Sheet available in the Store to summarize testing related to each balance and assertion.*

**1.** Determine whether the results of substantive testing indicate a need to modify the inherent risk assessment (IR), control risk assessment (CR), risk of material misstatement (RMM) or other aspects of planning (such as material balances or assertions). If so, document changes and consider the need for additional testing.

*If the results of substantive testing indicate a need to change control risk, auditors should also update the [Permanent File](#) by either correcting the documentation or by adding an update section describing changes to the top of the record of work done. For all changes to IR, CR, or RMM the [Material Balances](#) spreadsheet should be updated.*

## State of Washington

*More significant changes to other aspects of planning (such as material balances or assertions) should be referenced in this step and documented in detail in the [Changes to FS Audit Plan](#) step.*

2. Evaluate whether the quality and quantity of evidence obtained is sufficient and appropriate in response to the risk of material misstatement. In making this determination, auditors should evaluate:

### Information to be used as audit evidence:

- Does evidence relate to the population, period of time and risk (assertion and “what could go wrong” from the Material Balance Spreadsheet)? If there are any gaps or uncertainties in the logical connection between the evidence and conclusions, is there a documented consideration and explanation?
- Are the sources of information sufficiently reliable and appropriate for the risk (whether internal to the government, external, or auditor developed)? If key information is not from a sufficiently reliable source (for example, inquiry), then is it corroborated by information that is?
- Are there any concerns about accuracy, completeness, authenticity, or bias in information? If so, did the auditor perform sufficient procedures to confirm reliability of that information?
- Is information precise enough to catch if misstatements exceeded the tolerable level?
- Is information detailed enough to conclude on whether or not there were misstatements?
- Was there any information that appeared contradictory or inconsistent? If so, was there a documented response to the inconsistencies or doubts about the reliability of evidence?

### Results:

- How much misstatement was identified by testing, and the likelihood and magnitude of further potential misstatement?
- How did misstatements occur and how often might they occur again in the population?
- Were misstatements caused by control deficiencies or circumvention of controls?
  - If control deficiencies, is there a need to re-evaluate our understanding of controls in the [Permanent File](#) folder or assessment of control risk?
  - If circumvention, the [Management Override of Controls](#) step should address or reference this area. Auditors should also consider whether a fraud risk has been identified.
  - Did tests identify a different level or type of risk than the planned audit response was designed to address?
  - If likely misstatements are identified, are further procedures necessary to improve the precision of our estimate?

*To support the overall evaluation of audit risk and provide a basis for concluding on the overall sufficiency and appropriateness of evidence in the [FS Summary & Report](#) step, auditors should conclude in each area whether the auditor continues to believe that the tests performed and quality and quantity of evidence obtained are commensurate with RMM for all relevant risks (the “what could go wrong”, in the [Material Balances](#) spreadsheet).*

## State of Washington

If the auditor determines that evidence is not sufficient or appropriate, additional substantive testing should be done. If sufficient, appropriate evidence is not available for audit, the AIC should discuss the effect on our audit report with the AAM and AM.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6310](#) – Determining the Nature, Timing and Extent of Substantive Testing**

**SAO Audit Policy [3210](#) – Audit Evidence**

Record of Work Done:

Based on test results, we re-evaluated risk assessments, procedures, evidence obtained and conclusions as follows:

### **(1) Do the results of substantive tests indicate a need to modify our risk assessment (IR, CR and RMM)?**

The results of substantive tests do not indicate a need to modify our risk assessment.

### **(2) Was the quality and quantity of evidence obtained sufficient and appropriate?**

The quality and quantity of evidence obtained was sufficient and appropriate.

### **I.4.PRQ - Pensions - Long-Term Liabilities, Deferred Inflows, Deferred Outflows, Net Pension Asset**

*Procedure Step:* Understanding of Line Item

*Prepared By:* BM2, 5/20/2024

*Reviewed By:* RKM, 7/5/2024

Purpose/Conclusion:

### **Purpose / Conclusion:**

To gain an understanding of the line item and confirm the scope of testing as documented in the Significant Account Matrix.

# State of Washington

## Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

### **STEP 1: Prior Audit Exceptions**

Document any exceptions noted during the prior audit. Follow-up to determine how the agency has responded to or corrected the issue, unless this work is anticipated as part of the testing strategy.

### **STEP 2: Analyze Composition and Changes of Line Item**

Include link to the line item leadsheet. This will be completed at the end of the audit. Leadsheet analysis should be documented in this spreadsheet.

Inquire with agency staff about the activities and transactions that make up the balance and any changes to those activities or transactions in relation to the prior year.

Determine relevant classes of transactions or account balances within the line item to analyze (such as agencies, funds, programs, departments, accounts, and/or objects), and use AFRS to create trends of those elements. This step should not include any specific dollar amounts associate with the line item.

Evaluate trends to identify:

(1) What classes of transactions or account balances are primary to the identified risk. Auditors should specifically consider what elements are primary to the line item (comprising a large percentage of the line item), and which elements the identified risk would apply to, and which elements might be most susceptible to the identified risk (having a high risk of non-trivial misstatement for a relevant assertion, considering likelihood and impact of potential for misstatement).

(2) What changes are primary to the identified risk, if applicable. Auditors should specifically consider whether the overall change to the line item from the prior year was significant, what elements were the primary drivers of overall change, whether any elements changed significantly from the prior year, and which changes (if any) might relate to the identified risk.

(3) Any unusual or unexpected elements, amounts, or changes that may indicate a risk, whether the one identified in planning or a new one that may need to be considered for a change to the plan.

**Consider** other procedures to gain an understanding of the line item, such as review of key policy documents, review of program information or reports, inquiry of staff, budget information, or other analytical procedures.

### **STEP 3: Update Significant Account Matrix**

Based on your understanding of the line item, update the Significant Account Matrix with final conclusions on the agencies covered, account

## State of Washington

description, significant accounting systems, and risk (what could go wrong and relevant assertions). The account description should reflect the significant transaction streams or account balances relevant to the risk.

*The description of agencies, significant accounting systems, and what could go wrong in the Significant Account Matrix constitute the overall scope of substantive testing.*

*A transaction stream is significant based on the potential for misstatement. This is often due in part to its size (ie: comprising a large percentage of the total line item), but is ultimately a judgment about the susceptibility to the identified risk (for example, when the risk is understatement a small or omitted account may hold the most potential for the largest misstatement).*

*Significant accounting system(s) are those that contain key controls over significant classes of transactions included in the line item. Control systems identified in this step must match the Significant Account Matrix and have a separate control understanding documented.*

*Talk with the AIC if you identify any changes to the Significant Account Matrix.*

Guidance/Criteria.:

Record of Work Done.:

### **(1) Prior Audit Exceptions:**

None.

### **(2) Composition & Change Analysis:**

Line Item Leadsheet: [[Line Item Lead Sheet](#)].

### **Balance Composition**

The Governmental Accounting Standards Board (GASB) issued GASB Statement No. 68, *Accounting and Financial Reporting for Pensions*, which revises and establishes new financial reporting for most governments that provide their employees with pension benefits. GASB Statement No. 68 is effective for financial statements for fiscal years beginning after June 30, 2014. Prior to implementing GASB 68, employers participating in an agent plan recognized annual pension cost under a funding approach. Pension expenses were derived from a measure of an annual required contribution to the plan. Pension liabilities resulted from the difference between contributions required and contributions made.

With the implementation of GASB 68, employers are now required to recognize a liability as employees earn their pension benefits. Employers participating in agent plans will recognize their specific pension amounts which include net pension liability, deferred outflows of resources, deferred inflows of resources, and pension expense.

Washington State defined benefit plans are defined as either:

Single-employer - those in which pension benefits are provided to the employees of only one employer.

# State of Washington

Cost-sharing, multiple-employer (cost-sharing) - those in which the pension obligations to the employees of more than one employer are pooled and pension plan assets can be used to pay the benefits of the employees of any employer that provides pensions through the pension plan.

We obtained the various retirement systems and plans in which the State of Washington employees participate by reviewing the prior year 2023 ACFR Note 15: Retirement Plans and from the 2023 Participating Employers Financial Information (PEFI) report. We summarized pension plans included in the line item and key attributes for each plan at [[Pension & OPEB Plans](#)].

## Changes

We inquired with Kennesy Cavanah, Statewide Accountant, on May 13, 2024 about any significant updates or changes to the pension balances reported for ACFR. She noted that legislature passed House Bill 1336 in 2023 that directly affects the Volunteer Fire Fighters and Reserve Officers' Relief and Pension Plan (VFF). Legislature split the plan to comply with federal requirements set by the Internal Revenue Service. See [Washington State Legislature](#). Although the plans are separate, they are still overseen by the Board of Volunteer Firefighters (BVFF) and exist in the volunteer firefighters' and reserve officers' system as in prior years. The plan was separated into the following:

- A new plan to include only reserve law enforcement officers

- The existing plan to include only volunteer firefighters and emergency medical technicians (EMTs).

We also noted that in FY23, the Office of the State Actuary changed the Higher Education's Supplemental Retirement Plans (SRP) valuation date from June 30th to January 1st. Kennesy confirmed that the SRP valuation date will continue to be January 1 in FY24 and future years. We confirmed the valuation date of January 1 would still meet requirements set by the Governmental Accounting Standards Board (GASB) statement No. 68, *Accounting and Financial Reporting for Pensions*. Specifically GASB 68 states "If a valuation is not performed as of the measurement date, the total pension liability is required to be based on update procedures to roll forward amounts from an earlier actuarial valuation (performed as of a date no more than 30 months and 1 day prior to the employer's most recent year-end)." ***No issues noted.***

## **(3) Updates to Significant Account Matrix:**

We identified no updates to the Significant Account Matrix based on our understanding of the line item.

## **I.4.PR.G - Pensions - Long-Term Liabilities, Deferred Inflows, Deferred Outflows, Net Pension Asset**

*Procedure Step:* Controls - Allocation of Pension Amounts

*Prepared By:* BM2, 5/28/2024

*Reviewed By:* RKM, 7/5/2024

# State of Washington

Purpose/Conclusion:

**Purpose:**

To gain an understanding of internal controls.

**Conclusion:**

We gained an understanding of internal controls as documented in the record of work done.

Testing Strategy:

**The following procedures are required for all material systems:**

1. List the financial statement balance(s) and relevant assertion(s) addressed by the understanding.
2. Gain an understanding of the internal control process, identify how transactions are recorded in AFRS, identify key controls over relevant assertion(s), and note any control weaknesses.
  - In gaining an understanding of controls, consider the overall understanding of State-Level control elements as documented in the "State-Level Controls" step as they relate to this particular system.
  - Identify controls systems covering all relevant assertions for all significant classes of transactions.
  - Standards require the auditor to gain an understanding of the significant accounting system(s) that contain key controls over significant classes of transactions included in the line item.
  - Control systems identified in this step must match the Material Account Matrix and have a separate control understanding documented.
  - Talk with the ACFR Specialist or AIC if you identify different systems than the ones anticipated in the Material Account Matrix.

For each material system, auditors must document:

A brief outline of the transaction flow from beginning to end.

An expanded description of key controls.

Business processes relevant to financial reporting of the relevant assertion for the material balance. Processes should encompass automated and manual procedures by which transactions or events are identified or initiated, authorized as needed, recorded, processed and corrected as needed.

Original accounting records and how records are rolled-up to intermediary ledgers and transferred to the general ledger (AFRS) or financial statements.

Detailed descriptions of key controls. Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

## State of Washington

The following is information to **consider** when identifying key controls and transaction flow.

"Key controls" refer to the few controls that together provide reasonable assurance that material misstatements will be prevented or detected and corrected. This is contrasted with ancillary or supporting controls, which – although helpful and recommended – would provide less than reasonable assurance by themselves.

The focus of the write-up is on the key controls. Key controls should be specifically identified (as "key controls") in the write-up. This can be done in whatever way the auditor prefers, so long as it is obvious. Details that the auditor should document regarding key controls may include:

- Who or what initiates the control
- When (or how often) is the control applied
- Who performs the control
- As needed, the experience, knowledge and attitude of the person applying the control
- Detailed description of the control process or activity. For example, if the control is a review: what exactly is reviewed, what is the reviewer looking at or for and what are the reviewer's criteria?
- How the key control is documented or evidenced
- If not obvious from the description, how the control prevents or timely detects and corrects misstatements
- Any exceptions or alternative processing to the normal process
- What happens when misstatements or issues are identified by the control

The "transaction flow" refers to the process by which transactions are initiated, authorized, recorded, processed and reported (as applicable). Outlining the transaction flow gives context to key controls, especially how transactions become subject to controls in the first place. If a control inherently ensures that all applicable transactions are included (ex: bank reconciliation where the assertion is existence), the auditor may decide to just start the write-up with the initiation of the control procedure and go from there.

Elements of the transaction flow are defined informally as follows:

- Initiation:* How are transactions initiated?
- Authorization:* How are transactions and accounting record maintenance authorized?
- Recording:* How are transactions or balances identified and recorded in financial accounting systems?
- Processing:* How are the transactions or balances processed after they are recorded (if at all)? Processing may be manual or automated and may occur at a subsidiary system level or at the general ledger level.
- Reporting:* How are records translated into the financial statements? This part of the transaction flow extends the understanding to the actual financial statements that the audit is opining on. Since we already document an understanding of the financial reporting process in general,

## State of Washington

it is usually enough to simply reference this overall understanding. However, if there are important steps unique to the covered balances, it may be more appropriate to mention them here.

Although transaction flow is a good way to think about understanding and documenting a control system, auditors should not worry too much about documenting "each element, in order" because often elements may be combined, not noticeable, not applicable or occur in a different order.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits](#) Planning Guide**

Record of Work Done:

Internal controls in the manual pension calculations address the following balance(s):

Statement of Net Position - Government Wide	Statement of Net Position - Proprietary Funds	Various financial statements
Deferred Outflows of Resources (Pension)	Deferred Outflows of Resources (Pension)	Deferred Outflows on Pensions
Restricted Net Pension Asset	Restricted Net Pension Asset	Restricted Net Pension Asset
Long-Term Liabilities Due in More than One Year (Net Pension Liability)	Net Pension Liability (Noncurrent)	Net Pension Liability (Noncurrent)
Deferred Inflows of Resources (Pension)	Deferred Inflows of Resources (Pension)	Deferred Inflows of Resources (Pension)

# State of Washington

For the following assertions:

## **Valuation**

There is a risk that balances (e.g. deferred outflows of resources, deferred inflows of resources, pension assets, pension liabilities) related to pension have not been measured in accordance with GASB Statement No. 68.

There is a risk the actuary uses inappropriate assumptions or actuarial methods that are not in conformity with GASB Statement No. 68 and the Actuarial Standards of Practice, causing errors in the computation of pension balances.

There is a risk the amounts included in the schedule of employer allocations and schedule of pension amounts prepared by the plan specific to the employer, including the employer amount used in the allocation percentage (that is, the numerator of the calculation), are not accurate.

There is a risk the employer-specific deferred inflows and outflows of resources (including contributions made after the measurement date, changes in proportion, and differences between the employer's actual contributions and its proportionate share of total employer contributions) have not been properly measured in accordance with GASB Statement No. 68.

There is a risk that employer's proportionate share of the pension amounts (e.g. deferred outflows of resources, deferred inflows of resources, pension assets, pension liabilities, pension expense) is not consistent with the manner in which the employer's contributions are made to the plan.

## **Completeness**

Census data reported by the employer to the plan is not accurate and complete

## **Classification**

There is a risk that the allocation between funds is not representative of the agencies included in that roll-up fund

## **General Risk (Reliance on Specialist)**

There is a risk the plan auditor's report and accompanying schedule of employer allocations and schedule of pension amounts are not adequate or appropriate for the employer auditor's purposes (for example, opinion modification, opinion on the schedule as a whole and not the individual elements, employer or employer auditor, or both, not named in the report as a specified user).

There is a risk the plan auditor engaged to report on the schedule of employer allocations and schedule of pension amounts does not have the necessary competence and objectivity for the employer auditor's purposes.

## **Gain an Understanding of Internal Controls**

We met with Kenney Cavanah, Statewide Accountant, on May 13, 2024 to gain an understanding of controls related to pension balances reported for the ACFR.

# State of Washington

## DATA VALIDATION

The FY2024 ACFR utilizes the FY2023 Department of Retirement System (DRS) Participating Employer Financial Information (PEFI) report in determining pension amounts for DRS administered Cost sharing Multiple-Employer, Defined Benefit Plans (Plan 1&2 types)/Hybrid Benefit Plans (Plan 3 types). The Office of the State Actuary certifies the DRS schedule of collective pension amounts that is included within the PEFI. The PEFI schedules are also audited by an independent auditor, Uhy. We perform a review of UHY workpapers to determine if we can place reliance on their work in the ACFR. As part of our review, we consider UHY's work performed specifically on the PEFI. For FY23 (FY23 PEFI is used to prepare FY23 statements), we noted the following: "Based on the auditors planning, work performed over census data, and substantive procedures, we determined sufficient procedures were performed to address risks. We noted conclusions made at the workpaper level agreed with the auditors' opinions. We determined sufficient procedures were performed over census data, the allocation basis, and allocation percentages. We determined we can rely on the auditors work over the PEFI." See prior year work in S1Washington-FS23, J.4 "Work of Other Audits - DRS." ***No issues noted.***

Employer contribution transmittals DRS received and processed within the fiscal year ended June 30, 2023, are used as the basis for determining each employer's proportionate share of the collective pension amounts reported in the Schedule of Employer and Non-employer Allocations for all plans - except LEOFF Plan 1, which is fully funded and no further employer contributions have been required since June 2000. OFM conducts comparisons of DRS data to HRMS data to verify the PEFI report's contribution data for completeness and accuracy.

The Human Resource Management System (HRMS) does not contain detailed employer contribution data for Higher Education and Department of Transportation (DOT). Kennesy Cavanah, Statewide Accountant, informed us that Higher education entities and DOT report summary information. Therefore, it is necessary to have these agencies provide the breakdown by plan. Differences between DRS and AFRS data causes differences in JV workbook totals; therefore, OFM sends query results to the entities requiring allocation information by plan and a reconciliation of DRS and AFRS amounts with variances explained. Higher Ed and DOT perform their own testing to verify accuracy of DRS data and certify amounts to OFM. The calculations are not final until after the Higher Education disclosures are submitted and certified. After OFM approves the contribution data from Higher Education and DOT, their data then can be included in the employer contribution totals used in the DRS allocation percentage for each plan and provided the allocation for governmental funds as a whole and each proprietary roll-up fund **(Key Control 1 - Completeness and Valuation)**.

OFM conducts a "high-level" comparison of total employer contributions by plan from DRS to HRMS. It is expected that variances will be identified in the high-level comparison due to the cash vs. accrual queries and plan management fees recorded in HRMS, but not included in DRS amounts. OFM staff perform analytical tests on employer contribution amounts in HRMS by reconciling detailed data to DRS system reports. Specifically, they reconcile the following:

- agency employer contribution amounts in HRMS to DRS employer contributions
- DRS employer contributions summary to the DRS employer contribution on the DRS e-services reports
- DRS employer contributions summary and e-services report to the DRS Schedule of Employer Allocations

# State of Washington

In August of 2023 the FY2023 DRS data was available to OFM. The FY2023 data is used for the FY2024 ACFR. Kennesy Cavanah, Statewide Accountant, performed the comparison noted above in preparation of the FY2024 ACFR **(Key Control 2 - Completeness and Valuation)**.

## **ALLOCATION OF AMOUNTS**

The allocation process does not begin until OFM receives the Higher Education institutions completed disclosures that give their pensions amounts. Kennesy said these disclosures are completed and available typically around September and OFM has no issues completing the allocation process within the ACFR JV submission timeline. OFM has created separate JV reconciliation workbooks for each plan, however, the methodology is essentially the same for all plan types. Kennesy informed us that the FY2024 allocation process will be the same allocation process that was done in the FY2023 ACFR. We will remain aware of any significant changes throughout the completion of this audit.

The allocation of DRS plan pension amounts for the state is prepared using the following steps:

- Total balances per plan are obtained from the DRS PEFI's Schedule of Collective Pension Amounts (includes net pension liability/asset, components of deferred inflows/outflows, and pension expense/income)

- The total employer contributions for the plan is obtained from DRS disclosure form (validated by OFM, see data validation above)

- The State's proportionate share of pension amounts are obtained from DRS PEFI's Schedule of Employer and Nonemployer Allocations

- OFM determines the state's proportionate share of all pension amounts for each plan (collective pension amounts and contribution disclosure amounts multiplied by the State's proportionate share), this is summarized in each plan's workbook in the "Schedule of Pension Amounts" tab

## **How Transactions are Recorded in AFRS:**

### Journal Entries:

AFRS pension balances are calculated with OFM spreadsheets that are created for each plan type. Kennesy Cavanah, Statewide Accountant, prepares the OFM spreadsheets using the DRS PEFI figures and employer contributions to calculate and record pension balances for each plan type by roll-up fund **(Key Control #3 - Completeness, Valuation, Classification)**.

For reporting in the ACFR, the state's total proportionate share of pension amounts is further allocated by a group of sort codes (rollup fund, agency, and statement code). To prepare the allocation of pension amounts for ACFR reporting, Kennesy performs the following:

- OFM obtains detailed employer contribution information from HRMS, DOT, and Higher Eds (validated by OFM, see data validation above)

- Employer contribution reports pulled from HRMS/received by DOT and Higher Eds include the agency, fund, retirement plan, and employer contributions.

- OFM uses the ACFR database in Access to assign agencies to their appropriate rollup fund, fund type, and statement code. This is done by merging the employer contribution reports and D53 agency function table in Access.

- When a new agency is created, OFM will update the tables in the ACFR Database to assign the appropriate rollup fund, and function

- OFM groups employer contributions (from the ACFR database report) by rollup fund, fund type, and statement code in each plan's spreadsheet tab "Allocation Rollup-Function"

## State of Washington

The sum for each rollup fund group is divided by the total employer contributions to determine the rollup fund allocation percentage. OFM allocates the state's proportionate share of all pension amounts by rollup fund allocation percentage (State proportionate share x rollup fund allocation percentage) in the "Schedule of Pension Amounts" tab.

The calculated pension expense, deferred outflows, deferred inflows, net pension liabilities and assets for each plan are summarized in the "JV Summary" tab by rollup fund/function. Kennessy uses calculated amounts from the "JV Summary" tab to prepare journal entries to record all components of the pension balances. The JV's are reviewed and approved by Sara Rupe, Deputy Statewide Accounting Director, and then reviewed/released by another statewide accountant separate from the pension reconciliation process.

Kennessy also runs an Enterprise Report, summarizing the GL balances for all plans after the JVs are posted to ensure amounts are accurate. Since JVs are not posted until year end, we reviewed the prior year's enterprise report and confirmed JV amounts recorded in AFRS are accurate.

### Key Controls are as Follows:

**Key Control #1 (Manual)** - Higher Ed and DOT certify to OFM that they have verified, in all material aspects, the employer amounts (employer contributions) used in the DRS allocation percentage for each plan and provided the allocation for governmental funds as a whole and each proprietary roll-up fund (**Completeness, Valuation**).

**Key Control #2 (Manual)** - OFM performs a reconciliation of agency employer contribution amounts in HRMS to DRS employer contributions, DRS employer contributions summary to the DRS employer contribution on the DRS e services reports, and DRS employer contributions summary and e-services report to the DRS Schedule of Employer Allocations (**Completeness, Valuation**).

**Key Control #3 (Manual)** - Kennessy Cavanah, Statewide Accountant, prepares the OFM spreadsheets using the DRS PEFI figures and employer contributions to calculate and record pension balances for each plan type by roll-up fund (**Completeness, Valuation, Classification**).

### Noted Weaknesses are as Follows:

None.

### I.4.PR.G - Pensions - Long-Term Liabilities, Deferred Inflows, Deferred Outflows, Net Pension Asset

*Procedure Step:* Key Control 1 (Manual)

*Prepared By:* BM2, 5/23/2024

*Reviewed By:* RKM, 7/5/2024

# State of Washington

Purpose/Conclusion:

**Purpose:**

To confirm if Higher Ed and DOT certify to OFM that they have verified, in all material aspects, the employer amounts (employer contributions) used in the DRS allocation percentage for each plan and provided the allocation for governmental funds as a whole and each proprietary roll-up fund (**key control 1 for Allocation of Pension Amounts**) in order to assess control risk.

**Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent

## State of Washington

material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency.*

***All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.***

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. *Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. *Controls are not related to a "significant risk" identified in the audit plan.*

## State of Washington

*C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*

*D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

**Key Control 1 (Valuation and Completeness):** Higher Ed and DOT certify to OFM that they have verified, in all material aspects, the employer amounts (employer contributions) used in the DRS allocation percentage for each plan and provided the allocation for governmental funds as a whole and each proprietary roll-up fund.

The understanding for this system is documented above in the "Controls - Allocation of Pension Amounts" step.

### **1. Confirmation of Key Manual Control:**

We obtained the Department of Transportation (DOT) certified spreadsheet that will be used for the FY2024 ACFR from Kennesy Cavanah, Statewide Accountant, on May 22, 2024. The file was titled "DOT\_FY23."

We reviewed the spreadsheet and noted the FY2023 data was on the "Summary" tab, which is the information used for the FY2024 ACFR. On the "Summary" tab we confirmed the department entered all required information into the yellow highlighted cells as directed. This process is the same for Higher education employer contribution data.

There was a .6% variance of \$(394,553) and DOT explained the variance is due to a difference in cash vs accrual methods and Agency 410 & 411 not being in the HRMS total. Kennesy confirmed that these variances happen with DOT year to year and their explanation is valid given the variance size. We also noted that the HRMS vs AFRS and HRMS vs DRS amounts accounted for the total variance of DOT. On the bottom of the

## State of Washington

spreadsheet, OFM had the statement "By submitting this spreadsheet, the Department of Transportation certifies to OFM that they have verified, in all material aspects, the FY2023 employer amounts (employer contributions) used in the DRS allocation percentage for each plan and provided the allocation for governmental funds as a whole and each proprietary roll-up fund". ***No issues noted.***

### **Noted Weaknesses are as follows:**

None.

### **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

### **I.4.PRG - Pensions - Long-Term Liabilities, Deferred Inflows, Deferred Outflows, Net Pension Asset**

*Procedure Step:* Key Control 2 (Manual)

*Prepared By:* BM2, 5/22/2024

*Reviewed By:* RKM, 7/5/2024

Purpose/Conclusion.\*

#### **Purpose:**

To confirm OFM performs a reconciliation of agency employer contribution amounts in HRMS to DRS employer contributions, DRS employer contributions summary to the DRS employer contribution on the DRS e services reports, and DRS employer contributions summary and e-services report to the DRS Schedule of Employer Allocations (**key control 2 for Allocation of Pension Amounts**) in order to assess control risk.

#### **Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

# State of Washington

## SAO Audit Policy [2310](#) - Reporting Identified Audit Issues

## SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk

Record of Work Done:

**Key Control 2 (Valuation and Completeness):** OFM performs a reconciliation of agency employer contribution amounts in HRMS to DRS employer contributions, DRS employer contributions summary to the DRS employer contribution on the DRS e services reports, and DRS employer contributions summary and e-services report to the DRS Schedule of Employer Allocations.

The understanding for this system is documented above in the "Controls - Allocation of Pension Amounts" step.

### **1. Confirmation of Key Manual Control:**

We obtained the DRS to HRMS comparison spreadsheet that will be used for the FY2024 ACFR from Kennesy Cavanah, Statewide Accountant, on May 21, 2024. The file was titled "DRS\_vs\_HRMS\_Data\_Comparison\_2024"

We noted that OFM compared \$ and % differences between FY2024 HRMS and DRS data for employer contributions. The spreadsheet included any difference between the two data sets as well as any follow up procedures for variances. OFM determined they would only follow up on any significant variances (+/- \$10,000 and +/-5%).

We reviewed the data comparison and identified one agency that met the criteria for follow up, Student Achievement Council. The agency had a difference of \$(62,242.23) and -6.89%. Based on Kennesy's review of the identified variance, she confirmed that "the majority of the difference is due to the TIAA-CREF amount in HRMS, but not in DRS." The explanation is reasonable and we confirmed this agrees with prior year ACFR workpapers. We noted that no other agencies had any differences near the 10% threshold and all agencies (other than DOT or HigherEd) that had a +/- \$10,000 differences had explanations to not follow up for being a low percentage. The overall total difference for the DRS to HRMS comparison was **(\$107,898.47), .97%** of the total DRS employer contributions. **No issues noted.**

### **Noted Weaknesses are as follows:**

None.

### **2. Preliminary Control Risk Assessment**

## State of Washington

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

#### **I.4.PRG - Pensions - Long-Term Liabilities, Deferred Inflows, Deferred Outflows, Net Pension Asset**

*Procedure Step:* Key Control 3 (Manual)

*Prepared By:* BM2, 5/21/2024

*Reviewed By:* RKM, 7/5/2024

Purpose/Conclusion:

#### **Purpose:**

To confirm OFM prepares spreadsheets to calculate and record pension balances for each plan type (**key control 3 for Allocation of Pension Amounts**) in order to assess control risk.

#### **Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency.*

***All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.***

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

## State of Washington

*If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

**Key Control 3 (Valuation, Completeness, and Classification):** Kennesy Cavanah, Statewide Accountant, prepares the OFM spreadsheets using the DRS PEFI figures and employer contributions to calculate and record pension balances for each plan type by roll-up fund.

# State of Washington

The understanding for this system is documented above in the "Controls - Allocation of Pension Amounts" step.

## **1. Confirmation of Key Manual Control:**

We obtained OFM's pension balance calculation workbook related to PERS 1 for ACFR fiscal year 2023 (titled "PERS1\_JV\_Worksheet\_and\_Reconciliation") from Kennesy Cavanah, Statewide Accountant, on May 13, 2024. Since the fiscal year 2024 pension amounts and workbooks are not expected to be completed until after phase 2 close (September 2024) and no significant changes were made with the allocation process, we determined review of the prior year workbooks would provide sufficient coverage to confirm the control.

We identified the following key tabs used in calculating pension balances for PERS 1:

- Pension Disclosure Form (FY22 and FY21) - This is a summary of covered payroll, employer contributions, member contributions, and state contributions for each plan. The total employer contributions are used in calculations on the schedule of pension amounts.

- Allocation Rollup-Function (FY22 and FY21) - To determine allocations by fund and agency functions. This is used to calculate the pension amounts for ACFR reporting and changes in proportion for FY2023.

- DRS Allocation (FY22 and FY21) - To determine the state's proportionate share for the plan based on PEFI.

- Schedule of Pension Amounts (FY22 and FY21) - Calculation of pension amounts based on state's proportionate share (obtained from PEFI) and further by rollup/agency function allocation percentage.

- JV Summary - Summarizes JV entry using T accounts for the total state pension amounts. The entry is made based on these amounts.

- Rollup Function Summary tabs for each (999 700A, 999 700B, 999 700C, etc.) - Summarizes JV entry using T accounts for each rollup fund/agency function. Breaks them out separately for review and detail purposes.

To confirm that OFM calculated pension amounts accurately and recorded them properly, we reviewed the

"PERS1\_JV\_Worksheet\_and\_Reconciliation" and verified figures used in the calculation were accurate and supported.

- FY22 State Proportionate Share - OFM used 42.181026% as the allocation percentage for the State of Washington in their calculations. We vouched the allocation percentage to DRS' PEFI for 2022. The state's allocation percentage for PERS 1 was .453420% and 41.727606% for UAAL (Total of 42.181026%).

- Collective pension amounts - OFM used collective pension amounts from DRS' PEFI for 2022 to determine the state's proportionate share. We vouched the net pension liability (\$2,784,367,000) from the "Schedule of Pension Amounts" tab to PEFI, along with the deferred inflow/outflow components and pension expense. All amounts used in calculation tied to source documents (PEFI) without exception.

- State's Share of Net Pension Liability - OFM calculated the State's proportionate share of net pension liability for PERS 1 to be \$1,174,474,568 (\$2.8 billion \* 42.18%). Calculation appears accurate. We traced this amount to the notes to the financial statements (Note 15, Retirement Plans) for FY23 with no exception.

We selected one rollup fund/agency function allocation to trace from calculation to entry, rollup fund 999 and agency function 700A.

The allocation percentage for the selected rollup fund/agency function was 7.16% based on employer contributions of \$18.4 million divided by total employer contributions of \$257.8 million. Calculation appears accurate.

# State of Washington

The ending net pension liability was \$84,036,610 ( $\$2,784,367,000 * 42.181026\% * 7.16\%$ )

The ending net pension liability per the JV summary agreed to the amount calculated in the "Schedule of Pension Amounts" tab. We reviewed JVOFM036 to ensure the entry was accurate, all amounts agreed to the t account from the JV summary and calculations. JVOFM036 was prepared by Kenesey Cavanah, Statewide Accountant, on April 27, 2023 and reviewed and approved by Sara Rupe, Deputy Statewide Accounting Director, on May 1, 2024. ***No issues noted.***

## Noted Weaknesses are as follows:

None.

## **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

## **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

## **I.4.PR.G - Pensions - Long-Term Liabilities, Deferred Inflows, Deferred Outflows, Net Pension Asset**

*Procedure Step:* Risk Assessment

*Prepared By:* BM2, 8/13/2024

*Reviewed By:* RKM, 8/22/2024

Purpose/Conclusion.\*

### **Purpose / Conclusion:**

To assess inherent risk, control risk, and the risk of material misstatement in order to design an initial testing strategy for each assertion.

Testing Strategy.\*

Auditors are **required** to perform the following procedures for each line item:

# State of Washington

## **STEP 1: Inherent Risk (IR)**

Assess inherent risk for each relevant assertion. This assessment is based on understanding of the entity and the nature of the account balance or class of transactions.

*Inherent risk is the susceptibility of an assertion to material misstatement. It is our assessment of "total threat", which includes both "natural risk" and identified risk indicators, without any regard to any potential control activities. As inherent risk is fully independent of control risk, any understanding of controls cannot be used to increase/decrease the assessment of inherent risk. Consider the following factors as your basis for this assessment:*

### *General Considerations*

*Does the balance include transactions that are difficult to audit or involve complex accounting issues?*

*Were there significant misstatements identified in previous audits or prior-period adjustments in the account balance or transaction class? If so, analyzing the cause of prior period misstatements will help in analyzing inherent risk.*

*Are there any inherent risk factors at the entity or industry level, such as changes in regulation or accounting rules, unique transactions or accounting practices, use of information technology, etc that affect the balance?*

### *Inherent Risk due to Error*

*How large are the transactions making up the balance? If the balance has only a few large transactions, even a single error may mean a significant misstatement.*

*Have there been changes in the transactions making up the balance that may increase risk? For example, significantly different composition, nature or volume of transactions may inherently disrupt established controls.*

*Are financial events originated or identified by accounting personnel or non-accounting personnel? This consideration is mainly for the completeness assertion.*

*Does the process to account for transactions involve judgment or estimation, complex calculations, numerous steps or significant manual steps?*

*Do transactions have widely varying attributes that need to be manually identified? For example, grant loans that are accounted for in one of several ways depending on the terms of the agreement.*

### *Inherent Risk due to Fraudulent Reporting (intentional misstatements)*

*Are there substantial pressures or motivations to misstate the balance?*

### *Inherent Risk due to Misappropriation*

*Is the account balance or transaction class susceptible to sizable misappropriation?*

### *Inherent Risk due to Non-Compliance*

*Are there any laws, contracts or grant agreements affecting the balance? If so, would non-compliance lead to sizable misstatements?*

*Are compliance requirements complex, hard to understand, subject to judgment or otherwise difficult to comply with?*

*Are there any motivations or pressures to not comply?*

# State of Washington

## **STEP 2: Control Risk (CR)**

Assess control risk by system and assertion. This assessment should be based on the results of the control understanding, confirmation, and (if setting control risk to LOW) testing. If applicable, auditors will evaluate any control deficiencies and determine whether those deficiencies, individually or in combination, are significant deficiencies or material weaknesses.

*Control risk is the risk that material misstatements would not be prevented or detected timely by the system of internal control. Control risk could be thought of as the "vulnerability" of an entity to misstatements. Control risk exists independently of the inherent risk (the level of vulnerability exists independent of the level of threat).*

*Control risk is MAX in both of the following situations: (1) controls aren't tested or (2) controls are problematic and cannot be relied upon. In order to set control risk to LOW, the auditor must test that controls operated effectively throughout the period.*

*A material weakness exists when the design or operation of controls results in a reasonable possibility a material misstatement will not be prevented or detected and corrected in a timely manner. A significant deficiency is less severe than a material weakness, yet important enough to merit the attention of the governing body. **All potential material weaknesses and significant deficiencies should be discussed with the AIC, since they must be reported as findings.***

## **STEP 3: Risk of Material Misstatement (RMM)**

Assess the risk of material misstatement for each relevant assertion for each significant line item. The risk of material misstatement (RMM) is a combination of the auditor's separate assessment of inherent and control risk.

*In practice, the RMM is the amount of substantive evidence that's needed, and the only way to reduce the amount of needed substantive evidence (equal to the inherent risk) is to test controls. As such, when control risk is MAX, the RMM must always equal the inherent risk (IR).*

*When controls are tested & can be relied upon (are determined to be effective) it is a matter of professional judgment how much the RMM should be set lower than inherent risk (1 or 2 steps).*

*Auditors should assess RMM by assertion, if different. For example, if RMM is assessed at MOD for the existence assertion, but LOW for the rights & obligations assertion, then document "MOD – existence and LOW – rights & obligations".*

## **STEP 4: Design Substantive Testing**

Design a substantive testing strategy that addresses the relevant assertion (identified risk) in the portion of the line item that relates to that risk.

*Planning identifies where to audit (significant balances, classes of transactions & disclosures) what to audit for (relevant assertions), and how much to audit (RMM). The quantity and quality of evidence obtained by substantive tests needs to match the level of risk. The higher the risk*

## State of Washington

*of material misstatement, the greater evidence needed. "Greater evidence" could either be greater quantity of evidence, greater quality of evidence, or some combination of greater quality and quantity.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6210](#) – Planning Financial Statement Audits**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits](#) Planning Guide**

Record of Work Done:

### **(1) Inherent Risk (IR):**

Based on our understanding of the line item, we assessed inherent risk as follows for each relevant assertion and significant class of transactions:

**Completeness - High**

**Valuation - High**

**Classification - High**

### **(2) Control Risk (CR):**

We assessed control risk as follows for each system and relevant assertion:

#### **GASB Allocation of Pension Amounts**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **(3) Risk of Material Misstatement (RMM):**

We considered both inherent and control risk and assessed the risk of material misstatement as follows for each relevant assertion and significant class of transactions:

**Completeness - High**

# State of Washington

**Valuation - High**

**Classification - High**

## **(4) Testing Strategy:**

We designed our substantive testing strategy based on our assessment of the risk of material misstatement. We plan to perform the following tests:

### **Substantive Test: DRS Administered Pension Plans**

Step 1: Determine the type of pension plans the employer participates in. See full list of state plans identified at [[Pension & OPEB Plans](#)].

Step 2: Use the applicable GASB 68 Testing Spreadsheet to re-recalculate the reported pension balances from the PEFI report

Step 3: Special Funding Situation: Ensure employers are recognizing pension expense and an equal amount of revenue for their share of contributions to the LEOFF 2 plan, made on their behalf by the state

Step 4: Test allocation of pension amounts to funds and activities (as applicable)

Step 5: Review Required Supplementary Information (RSI)

Step 6: Review note disclosures for accuracy and completeness

We will follow the testing strategy for GASB 68 at [[Substantive Test: DRS Administered Pension Plans](#)]

### **Substantive Test: Supplemental Retirement Plans**

Step 1: Tie Financial Statement Amounts to Actuary Report

Step 2: Review note disclosures for accuracy and completeness

Step 3: Review Required Supplementary Information

We will follow the testing strategy for GASB 68 at [[Substantive Test: Supplemental Retirement Plans](#)].

### **Rely on the work of a Specialist**

We will follow the testing strategy in order to rely on the work of a specialist for GASB 68 [[Rely on Specialist \(DRS Plans\)](#)] and [[Rely on Specialist \(SRP\)](#)].

We anticipate that these tests will provide sufficient appropriate audit evidence to address the assessed risk of material misstatement for relevant assertions in significant classes of transactions.

## **I.4.PRG - Pensions - Long-Term Liabilities, Deferred Inflows, Deferred Outflows, Net Pension Asset**

*Procedure Step:* Substantive Test: DRS Administered Pension Plans

# State of Washington

*Prepared By:* MRF, 11/14/2024

*Reviewed By:* RKM, 11/21/2024

Purpose/Conclusion:

**Purpose:**

To confirm pension balances and disclosures are correctly reported.

**Conclusion:**

We determined:

- Pension balances are correctly valued and classified
- Pension disclosures are accurate and complete
- Pension RSI schedules are accurate and complete

**No issues noted**

Testing Strategy:

Before auditing this area auditors should obtain an appropriate understanding:

Review [BARS Manual part 3.4.2](#) BARS GAAP Manual – Accounting – Liabilities – Pensions

Consider the following additional steps:

Accounting/Auditing self-study training

[GASB 68 Pensions - Year 2](#)

[Pension and OPEB Reporting from the Auditors' and Actuaries' Experience](#)

Scan the DRS Employer [website](#) for GASB 68 resources

Participating Employer Financial Information (PEFI)

eServices Contribution Reconciliation

*As detailed in the Guidance/Criteria tab of this audit step:*

*Additional rely on specialist procedures and management representations are not required.*

*Some employers report to DRS under more than one employer ID number, these employers should combine all PEFI amounts for financial statement reporting; our workpaper has this factored in (there is no additional adjustment necessary)*

*Volunteer Fire Fighters and Reserve Officers Retirement System (VFFRPF) if applicable is expected to be immaterial. If disclosed in the notes and reported as a net pension asset consider tying amounts to client supporting documentation.*

To determine whether pensions were properly reported, auditors are **required** to perform the following procedures:

# State of Washington

## **STEP 1 for all plans: Determine the type of pension plan(s) in which the employer participated in FY2023**

**Defined Contribution plans:** The following information should be disclosed in notes to the financial statements about each defined contribution pension plan to which the **employer contributes** to the plan. If only employees contribute, then the employer is not a participant and no disclosures are required.

Name of pension plan, identification of the public employee retirement system or other administrative entity, and that it is a defined contribution pension plan

Brief description of benefit terms (including any terms related to vesting and forfeitures and the policy related to the use of forfeited amounts) and authority under which benefit terms are established or may be amended

Contribution (or crediting) rates (in dollars or as a percentage of salary) for employees, employer, and any non-employer contributing entities, and the authority under which those rates are established or may be amended

Amount of pension expense recognized by the employer in the reporting period

Amount of forfeitures reflected in pension expense recognized by the employer in the reporting period

Amount of the employer's liability outstanding at the end of the period, if any.

There are no pension liabilities (except for any outstanding payable due for contributions) or deferred outflows/inflows to report. *No further work is necessary for Defined Contribution plans.*

### **Defined Benefit plans:**

Single-employer plans:

Governmental & Proprietary Governments

The cities of Seattle, Spokane and Tacoma have their own pension plans in addition to participation in the closed LEOFF 1 plan. A number of cities, counties and some fire districts have obligations remaining from police and firefighter plans in existence before state plans were established (sometimes referred to as "pre-LEOFF 1" plans). These are closed plans with no active members. Auditors should check for existence of these plans and expect such a plan for any governments who receive Fire Insurance Premium tax (BARS 336.06.91), which are listed as an Appendix in the Pension / OPEB planning guide. Contact a Pension / OPEB Subject Matter Expert if a government is receiving this funding but does not have a plan or to alert the specialist to any previously unidentified single-employer plans.

Proprietary Only

4-year and community colleges report a Supplemental Retirement Plan, that pension is covered by its own testing strategy.

If other single employer plans are identified where the government administers its own defined benefit pension plan, contact the Pension/OPEB Subject Matter Experts.

Non-governmental defined benefit pension plans – Some local governments may provide pensions to their employees through a cost-sharing, multiple-employer defined benefit pension plan that is not a state or local governmental pension plan. For example, a union sponsored plan.

## State of Washington

Participating employers do not report a pension liability, deferred outflows or deferred inflows in their financial statements. Pension expense is equal to the employer's required contributions to the plan. See the BARS manual for note disclosure and RSI requirements.

*Continue with the testing strategy to review reporting and disclosure requirements for Defined Benefit plans.*

### STEP 2: Obtain GASB 68 Workpaper and employer contributions

Obtain the appropriate GASB 68 workpaper from the TeamStore which is based off 1) the year-end of the government and 2) the measurement date of the relied upon actuary report.

*The earliest measurement date that can be used by an employer is 12 months earlier than the reporting date.*

Earliest Available Valuation Date	Earliest Available Measurement Date Employer Can Use	Employer Reporting Date
6/30/2019	6/30/2020	6/30/2021
6/30/2020	6/30/2021	8/31/2021
6/30/2020	6/30/2021	12/31/2021

*Therefore, local governments with a reporting date of 6/30/21 can use **either** the 6/30/20 **or** 6/30/21 schedules for their year-end balances. Due to timing of the publication of the PEFI reports most local governments with a 6/30/21 year end elected to use the 6/30/20 report. Local governments with a reporting date of 12/31/21 should use the 6/30/21 schedules for their year-end balances.*

On the INPUT tab, follow the instructions to enter the Organization ID Number (obtained from the 20XX\_PEFI tab) and Employer's FYE.

Request from the client pension contributions subsequent to the measurement date up through the employer's reporting date, and enter on INPUT tab.

*Contribution amounts should be actual employer contributions, on the accrual basis, to each plan. For PERS 1 (and TERS 1) this includes PERS 2/3 and PSERS 2 "Plan 1 UAAL" contributions (and TERS 2/3 and SERS). Plan 1 UAAL contributions are Plan 1 contributions, not Plan 2 contributions. Employers should have supporting documentation obtained from the DRS eServices contributions system to support all contribution amounts.*

All state pension plans tested by this procedure are identified on the GAAP-Summary tab.

### STEP 3: Compare expected pensions amounts to reported

## State of Washington

Use the GAAP-Summary tab to compare reported amounts per client to expected for the following financial statement amounts:

Net Pension Asset/Liability

*No expected current portion/due within one year for net pension liabilities as those amounts are paid with plan assets.*

Deferred Outflows/Inflows

Pension Expense (a component of payroll expense)

*Employers should have supporting documentation of their calculations for audit. If amounts per auditor calculations do not agree to employer amounts, use the individual plan summary tabs to research and identify errors. The individual plan tabs are the same tool provided to local governments in the BARS Manual.*

*In addition to the collective deferred outflows and deferred inflows reported in the PEFI for each plan, employers must also recognize their own employer-specific DO/DI. Test the mathematical accuracy of the following:*

*Employer contributions made subsequent to the measurement date of the net pension liability/(asset), but before the end of the employer's fiscal year – recognized as a deferred outflow.*

*Change in Proportionate Share – The net effect of changes in the allocation percentage between years - recognized as of the beginning of the period. A table to calculate the change in proportionate share is included on each plan tab in the attached spreadsheet. An additional table to calculate amortization of current and prior year changes in proportionate share is also included on each plan spreadsheet.*

If net pension assets exist, see BARS [3.4.2.63](#) for how **restricted net position** should be reported and disclosed. Recalculating restricted net position is not required, however auditors will need to confirm what method was applied (and disclosed). If no restricted net position was reported then should calculate the error using SAO's preferred method.

### **Step 4: Special Funding Situation: Ensure employers are recognizing pension expense and an equal amount of revenue for their share of contributions to the LEOFF 2 plan, made on their behalf by the state**

LEOFF plans 1 and 2 include a special funding situation in which the State has a legal obligation to make contributions directly to the plans.

Although the State makes the contributions, individual employers are required to recognize pension expense and an equal amount of revenue for their share of these contributions.

LEOFF 1 is fully funded and there have been no contributions since 2000. No further action (other than note disclosure) is currently necessary.

LEOFF 2 – The total amount contributed by the State appears at the end of the LEOFF 2 Employer Allocation Schedule in the PEFI. Note that allocation percentages have not been calculated for individual employers and each individual employer must calculate their own share of the State's total contributions.

Formula: See the "SpecFndg" tab in the attached spreadsheet. This spreadsheet explains the calculation of the special funding amount, the required journal entry, and note disclosures.

# State of Washington

Verify that employers have recorded this transaction.

## **STEP 5: Test allocation of pension amounts to funds and activities (as applicable)**

For GAAP statements that include multiple opinion units, pension liabilities/(assets), deferred outflows and deferred inflows should be allocated between governmental and business-type activities in the government-wide statement of net position, allocated to appropriate activities in the government-wide statement of activities, and reported in the specific proprietary or fiduciary funds they are directly related to and expected to be paid from.

Auditors should evaluate allocations for reasonableness by:

- Understanding and evaluating the reasonableness of the allocation methodology. We expect the methodology to be consistent from year to year.

- Testing the mathematical accuracy of formulas used and tracing amounts to the financial statements.

- SAO recommends the effect of changes in allocation percentages from year to year be expensed in the current year. However, employers may amortize these changes over the remaining service life of the plan if they choose.

## **STEP 6: Review Required Supplementary Information (RSI)**

Inquire with management about the methods of preparing the schedules, including:

- Whether it is measured and presented in accordance with GAAP

- Whether methods of measurement or presentation have been changed from those used in the prior period and the reasons for any such changes.

- Whether there were any significant assumptions or interpretations underlying the measurement or presentation of the information.

Verify that RSI is included with all and only the required elements

*See the BARS Manual for [State sponsored pension plans](#) (PERS, PSERS, LEOFF).*

Read the schedule for consistency with inquiry and knowledge obtained during the audit.

Foot and cross-foot schedules and tie key figures reported in the schedule to the financial statements, notes and underlying accounting records.

*Note that the Schedule of Proportionate Share of the Net Pension Liability is dated as of the measurement date of the plans (e.g. 6/30 for*

## State of Washington

*state sponsored plans) and the Schedule of Employer Contributions is dated as of the employer's reporting date (e.g. 12/31 for most local governments). When these two dates are different, we expect the amount reported for covered payroll to be different on the two schedules. "Covered payroll" is the payroll on which contributions to a pension plan are based. For PERS 1 (and TERS 1), covered payroll includes not only the payroll related to active plan 1 employees, but also the payroll from PERS 2/3 and PSERS (or TERS 2/3 and SERS) because these plans determine plan 1 UAAL contributions. "Contributions" are actual employer contributions into the plans. For plan 1's, this includes plan 2 contributions that fund the plan 1 UAAL's.*

Consider additional work as necessary to address any risks noted.

### **STEP 7: Review note disclosures for accuracy and completeness**

Compare disclosures to the BARS manual template notes for state sponsored plans.

*Local governments may, but are not required to, use this sample note disclosure. The sample note meets the minimum disclosure requirements of GASB 68 and local governments may include additional information as considered necessary for a fair and accurate presentation. The attached spreadsheet includes sample DO/DI and amortization tables for the notes on each plan spreadsheet.*

Foot and cross-foot schedules and tie key figures reported in the notes to the financial statements, PEFI report, underlying accounting records, and other sources, as necessary.

If net pension assets exist the notes should disclose the method used to calculate restricted net position. All significant accounting policies require disclosure (either under note 1 or along with the pension note).

Guidance/Criteria:
--------------------

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

For assistance contact Pension/OPEB subject matter experts.

### **Pension and OPEB Planning Guide**

### **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

## State of Washington

**AICPA Audit Guide for State and Local Governments – [Chapter 13](#) Defined Benefit Pension Plans**

### **GASB Codification sections P20–P24**

Record of Work Done:

#### **STEP 1 for all plans: Determine the type of pension plan(s) in which the employer participates**

The significant retirement plans administered by DRS that are subject to audit are listed here [[Pension & OPEB Plans](#)].

#### **STEP 2: Use GASB 68 Testing Spreadsheet to re-calculate reported pension balances from the Participating Employer Financial Information (PEFI) report. (Completeness)**

We used the auditor pension tool to test the mathematical accuracy of the calculation of the net pension liability (and/or asset), deferred outflows and deferred inflows amounts reported by the employer for each plan using the Schedules of Collective Pension Amounts in the PEFI.

The teamstore workpaper recalculates each employer's proportionate share of pension balances for state-sponsored plans using PEFI data, however, does not calculate amounts for the total state. We made the following modifications to the pension confirmation workbook available in the teamstore:

In all PEFI tabs (source: Data provided by DRS directly to SAO), we summarized employer contributions by plan for ONLY state of washington. We obtained State of Washington figures for employer contributions and allocation percentage (from the applicable PEFI) and included the information in PEFI tabs. For 2023 PEFI, this included:

PERS1	N/A	State of Washington - Employer Allocations	2,197,031.60	0.322414%	State of Washington
PERS1	N/A	State of Washington - Plan 1 UAAL	288,539,875.15	42.343117%	State of Washington
PERS23	N/A	State of Washington - Employer Allocations	449,409,550.99	51.114528%	State of Washington
PSERS	N/A	State of Washington - Employer Allocations	33,198,299.77	65.933914%	State of Washington
TRS1	N/A	State of Washington - Employer Allocations	109,560.56	0.020299%	State of Washington
TRS1	N/A	State of Washington - Plan 1 UAAL	7,687,443.72	1.424334%	State of Washington

## State of Washington

TRS23	N/A	State of Washington - Employer Allocations	9,633,439.82	1.423660%	State of Washington
LEOFF2	N/A	State of Washington - Employer Allocations	1,634,912.94	0.724320%	State of Washington

We assigned an ORG ID of N/A for the total State of Washington PEFI amounts to allow for formulas to calculate by using the ORG ID N/A in the input tab.

Calculation changes made for employers related to special funding contributions are not applicable to State of Washington, see Step 4 below. We removed the special funding calculation from the "GAAP-Summary" tab.

We hid SERS calculations from "GAAP-Summary" and SERS tabs as the State of Washington made no contributions to this plan and therefore had no allocation of liabilities.

**See** [[Pension confirmation \(GASB 68\) – DRS plans 12-31-23](#)].

### STEP 3: Compare expected pensions amounts to reported (Valuation)

We used the GAAP-Summary tab from modified Team Store Workpaper to compare reported amounts per client to expected for the following financial statement amounts:

Net Pension Asset/Liability

*No expected current portion/due within one year for net pension liabilities as those amounts are paid with plan assets. **No issues noted***

Deferred Outflows/Inflows **No issues noted**

Pension Expense (a component of payroll expense). **No issues noted.**

In addition to the collective deferred outflows and deferred inflows reported in the PEFI for each plan, employers must also recognize their own employer-specific DO/DI. We tested the mathematical accuracy of the following:

*Employer contributions made subsequent to the measurement date of the net pension liability/(asset), but before the end of the employer's fiscal year – recognized as a deferred outflow. **No issues noted***

*Change in Proportionate Share – The net effect of changes in the allocation percentage between years - recognized as of the beginning of the period. A table to calculate the change in proportionate share is included on each plan tab in the attached spreadsheet. An additional table to calculate amortization of current and prior year changes in proportionate share is also included on each plan spreadsheet. **No issues noted***

**Step 4: Special Funding Situation: Ensure employers are recognizing pension expense and an equal amount of revenue for their share of contributions to the LEOFF 2 plan, made on their behalf by the state.**

## State of Washington

For the State ACFR, the special funding contribution to the LEOFF 2 plan made by the state for the benefit of other municipalities (outside of its own employer contributions for agencies that participate in the plan) is entirely an expense of the state. Adjustments to the special funding tab removes the calculation of other municipalities' proportionate share of the state's special funding contribution, i.e. the special funding is 100% state expense. See the "SpecFndg" tab in [[Pension confirmation \(GASB 68\) – DRS plans 12-31-23](#)] spreadsheet.

### **STEP 5: Test allocation of pension amounts to funds and activities (as applicable)**

For GAAP statements that include multiple opinion units, pension liabilities/(assets), deferred outflows and deferred inflows should be allocated between governmental and business-type activities in the government-wide statement of net position, allocated to appropriate activities in the government-wide statement of activities, and reported in the specific proprietary or fiduciary funds they are directly related to and expected to be paid from.

Auditors should evaluate allocations for reasonableness by:

- Understanding and evaluating the reasonableness of the allocation methodology. We expect the methodology to be consistent from year to year.

- Testing the mathematical accuracy of formulas used and tracing amounts to the financial statements.

We reviewed the OFM workbooks for each of the plans, and the specific fund tabs. We reviewed the T-accounts used to calculate the deferred inflows and outflows, and noted the adjustments complied with GASB 68 standards.

We confirmed that the total allocated for all funds within a pension plan, was equal to the amount allocated to the pension plan as a whole with the state's proportionate share. As we traced fund allocations we reviewed the fund function to determine if the agencies reporting to that fund are reasonable based on the agency type.

We recalculated the allocation among opinion units here [[Line Item Lead Sheet](#)]. I.4.1 tab "Fund Breakdown" Using OFM workbooks to recalculate the total pension asset (liability) for each fund based on DRS total amount, and OFM calculated allocation. This amount is tested in I.4.6 [[Pension confirmation \(GASB 68\) – DRS plans 12-31-23](#)]. We determined we can rely on the allocation percentages. Each pension plan gets reported in different funds. OFM performs a calculation based on contributions to each fund, and determines a percentage for each fund of the total plan contributions.

The "fund" tab of OFM's workbook has the following actions for each fund code in each pension plan:

- Reverse the prior year deferred outflows. Deferred Outflows of PY are recognized in the current period as a decrease by crediting the PY recorded amount.

- Reverse the prior year's deferred inflows. Deferred inflows of PY are recognized in the current period as an decrease by debiting the PY recorded amount.

- Include the current year's pension expense. This is the pension expense as allocated by the FY23 Proportional Share

- Include the current year's deferred inflows (if any). Again, total balance is tracked and reported by DRS, and OFM allocates to the funds with the proportional share, then fund share percentages.

- Include deferred outflows, all contributions made to the plan after the measurement date close (end of previous fiscal year)

# State of Washington

On the "AFRS Balance to Rollup Fund" tab, we compared the OFM reported total as traced in testing (Fund Breakdown tab), to the amount reported in AFRS (ACFR Queries tab). All variances noted were below the floor, and we will not carry them to the AOM. **No issues noted.**

## **STEP 6: Review Required Supplementary Information (RSI)**

See [2024 ACFR RSI - Pension Plans]. Work is documented here [RSI: Pension Plan Information].

## **STEP 7: Review note disclosures for accuracy and completeness**

See [Note 15: Retirement Plans]. Work is documented here [Note 15: Retirement Plans].

### I.4.PRG - Pensions - Long-Term Liabilities, Deferred Inflows, Deferred Outflows, Net Pension Asset

*Procedure Step:* Substantive Test: Supplemental Retirement Plans

*Prepared By:* MRF, 11/14/2024

*Reviewed By:* RKM, 11/21/2024

Purpose/Conclusion:

#### **Purpose:**

To confirm that the Higher Education Supplemental Retirement Plan pension balances and disclosures are correctly reported.

#### **Conclusion:**

We determined state pension plan:

Balances are correctly valued and classified/allocated correctly

Disclosures are accurate and complete

RSI schedules are accurate and complete

Testing Strategy:

### **Step 1: Tie Financial Statement Amounts to Actuary Report**

**a) Tie the following financial statement figures to the actuary report:**

# State of Washington

## **Net Pension Liability Pension Expense Deferred Inflows Deferred Outflows**

*The financial statement pension balances will include non-SRP activity — to test only the portion of the balance related to the SRP, auditors should document what GL accounts they're testing (or by testing to the related journal entry).*

*Pension expense is not discretely presented on the change statement as it is a component of employee benefits. Typically, the colleges should be making monthly benefit payments and contributions to the plan – these amounts are recorded throughout the year as pension expense. The remaining expected pension expense is posted at year-end using information from the actuary report.*

### **b) Recalculate the current/noncurrent portion of the Net Pension Liability:**

*SRP benefit funds are currently restricted from paying SRP benefits and are not expected to pay benefits until approximately 2035. Until this time, SRP benefit payments are paid by the colleges on a pay-as-you-go basis, meaning employers pay these benefits as they occur. As a result, colleges should report a current portion due. The current portion is required by GASB 34, ¶31.*

### **Step 2: Review note disclosures for accuracy and completeness**

#### **Trace key figures in the notes to the actuary report (or roll-forward)**

*Document work or use tick-marks to demonstrate note figures tie to actuary report. Expected note tables include:*

*Development of the Net Pension Liability*

*Sensitivity of the Net Pension Liability to Changes in the Discount Rate*

*Deferred Resources*

*5-year recognition (and thereafter) table of DO/DI*

*Employees Covered by the Benefit Terms (only updated by OSA for the new valuation, not the roll-forward). Using prior year data for this disclosure is a trivial error.*

### **Step 3: Review Required Supplementary Information**

Inquire with management about the methods of preparing the schedules, including:

Whether it is measured and presented in accordance with GAAP

Whether methods of measurement or presentation have been changed from those used in the prior period and the reasons for any such changes.

# State of Washington

Whether there were any significant assumptions or interpretations underlying the measurement or presentation of the information.

Verify that RSI is included with all and only the required elements

## **RSI – Schedule of Changes in the Net Pension Liability and Related Ratios**

**Confirm key figures in the RSI to the actuary report**

## **RSI – Schedule of Employer Contributions**

**Confirm key figures in the RSI to the actuary report and accounting records**

Guidance/Criteria.:

Record of Work Done.:

### **Step 1: Tie Financial Statement Amounts to Actuary Report**

We obtained the 2024 Higher Education Supplemental Retirement Plan information in the workbook *2024 GASB Results - Final*, which was accompanied by the SRP.Actuarial.Certification.Letter [[SRP.Actuarial.Certification.Letter](#)]. This information was provided to OFM, and forwarded to SAO via email. The 2024 report was not posted on the OSA website as of 11/08/2024. See actuary report here [[2024 GASB Results - Final - From OSA](#)]

We reviewed the spreadsheet created by OFM to determine whether the OSA 2023 Actuarial Valuation change from June 30th to January 1st for Higher Education SRPs will affect the State's ability to remain within GASB 68 Net Pension Liability reporting compliance. We determined that the valuation date will not affect the State's ability to remain within compliance of GASB 68 reporting requirement of having a Net Pension Liability valuation within 30 months and 1 day of the fiscal year-end. See here [[HigherEdSup\\_Proposed\\_Val\\_Measure\\_Report\\_Dates](#)]. No issues noted.

a) Tied the following financial statement figures to the actuary report [[SRP Confirmations to Actuary Report](#)] :

- Net Pension Liability
- Pension Expense
- Deferred Inflows
- Deferred Outflows

## State of Washington

The allocation methodology among functions and funds for the SRP pension line amounts are similar to the DRS administered plans as described in [\[Controls - Allocation of Pension Amounts\]](#) except specifically for employer contributions, based upon fund type, to the HE SRP and allocated proportionately to the roll-up funds. We recalculated the allocated amounts [\[Line Item Lead Sheet\]](#) (Fund Breakdown tab) and tied the post-allocated amounts of the SRP amounts to the financial statements at [\[Line Item Lead Sheet\]](#) (AFRS Balance to Rollup Fund tab) with no exceptions.  
**No issues noted.**

### **Step 2: Review Note Disclosures for Accuracy and Completeness**

See [\[Note 15: Retirement Plans\]](#).

### **Step 3: Review Required Supplementary Information**

See [\[2024 ACFR RSI - Pension Plans\]](#).

### **I.4.PR.G - Pensions - Long-Term Liabilities, Deferred Inflows, Deferred Outflows, Net Pension Asset**

*Procedure Step:* Rely on Specialist (DRS Plans)  
*Prepared By:* BM2, 10/24/2024  
*Reviewed By:* RKM, 11/21/2024

Purpose/Conclusion:

#### **Purpose:**

To determine if we can rely on the work of Office of the State Actuary to provide audit evidence for liabilities for DRS sponsored pension plans.

#### **Conclusion:**

We determined that we **can** rely on the work of the specialist.

Testing Strategy:

To determine whether the audit can rely on the work of the outside specialist and whether the specialist's work supports the financial statements, the following procedures are **required** to be performed:

## State of Washington

Auditor should check with their supervisor whenever they determine that the use of a specialist may be necessary.

*A specialist is an individual or organization possessing expertise in a field other than accounting or auditing (for example, information technology specialists, engineers and actuaries). Specialists may be contracted or employed by entity management to assist them in performing their responsibilities (management's specialist) or contracted or employed by our Office (auditor's specialist).*

*This step does not need to be completed when consulting with attorney general assistants, LGS, TAS, LISA, STAT, DSI or "Subject Matter Experts" designated on the intranet. Contact TAS for assistance if needed to determine whether someone would be considered a specialist or not.*

Assess the specialist's competence, capability and objectivity as it relates to the work that we intend to rely on for the audit.

*Competence refers to the specialist's relevant qualifications and experience. In assessing competence, auditors should consider:*

*The education, professional certifications or licenses of the specialist in his or her field, as appropriate.*

*The reputation and standing of the specialist.*

*The specialist's experience in the type of work under consideration.*

*Our Office's experience in using the specialist's work, if applicable.*

*Capability refers to effect of any access, resource or other limitations on the specialist's work. In assessing capability, auditors should consider:*

*Timing of the specialists work*

*Any significant limitations on the specialist's access to needed information or people*

*Any significant limitations on the time the specialist was able to devote to the work*

*Our Office's experience in using the specialist's work, if applicable.*

*Objectivity refers to the possible effects of any bias, conflicts of interest or undue influence on the specialist's judgment. If the specialist's objectivity is impaired, the auditor may not rely on the work of the specialist. In assessing objectivity, auditors should consider:*

*Any pressures or incentives on either specialists or management to misstate*

## State of Washington

*Threats to objectivity of the specialist (including self-interest, advocacy, familiarity, self-review or intimidation threats) and any safeguards in place (segregation of duties, lines of reporting, professional standards, formality and consistency of methods and assumptions, retrospective reviews, etc)*

*Our Office's experience in using the specialist's work, if applicable.*

*Auditors should contact TAS if the auditor has any concerns with assessing the competence, capabilities or objectivity of specialists.*

Obtain an understanding of the work and conclusions of the specialist. This understanding should include the following elements:

- Objectives and scope of the specialist's work
- Intended use of the specialist's work to support the audit objective
- Specialist procedures and conclusions
- Assumptions and methods used by the specialist

*The objectives and scope of the specialists work and intended use of the specialist's work to support our audit objective should have already been included in the audit plan or else will need to be documented as a change to the audit plan.*

Evaluate the work and conclusions of the specialist. This evaluation should include the following elements as applicable:

Relevance and reasonableness of the specialist's methods and assumptions

*The appropriateness and reasonableness of methods and assumptions used and their application are the responsibility of the specialist. However, if the auditor concludes that the specialist's findings are unreasonable in the circumstances, the auditor should apply alternative procedures, which may include obtaining the opinion of another specialist.*

*Auditors should specifically consider whether methods and assumptions changed from the preceding period and the reasons for such changes, if applicable.*

Appropriate tests of source data provided by the entity to the specialist.

*If any data used by the specialist was provided by the entity, the auditor should consider the risk that incomplete or inaccurate data may materially affect the specialist's conclusions. This risk may be affected by the auditor's assessment of overall COSO elements and control risk for the related system.*

*For example: when relying on work of an actuary for self-insurance liabilities, auditors would normally verify the completeness and accuracy of claims information provided to the actuary against claims information per the pool's system. This can be done by*

## State of Washington

*comparing the total claim payments per pool's records to total claims paid shown on the actuary reports (in aggregate or on annual basis) – the figures may not match exactly but should be very close.*

Relevance and reasonableness of the specialist's conclusions.

Verifying that the specialist's conclusions are reflected in the financial statements

Add an additional representation to the rep letter if the specialist used was employed or contracted by management (rather than SAO). See the List of Additional Representations located in the Auditor Reference Guide here: [Representation Letter Resource.docx](#)

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [3230](#) - Using the Work of Specialists**

Record of Work Done:

### **Assessment of Competence, Capabilities and Objectivity of Specialist**

We assessed the competence, capabilities and objectivity of the specialist, specifically considering factors described in the testing strategy.

#### **1. Competence**

Two individuals certified the 2023 Participating Employer Financial Information (PEFI) report [[2023 PEFI Actuarial Certification Letter](#)]:

*Matthew M. Smith, FCA, EA, MAAA, State Actuary (Signatory on Actuarial Valuation, DRS ACFR and PEFI Actuarial Certification Letter)*

Matt has been with the Office of the State Actuary for 22 years (November 2002)

Matthew M. Smith is a Fellow of the Conference of Consulting Actuaries (FCA) since 2005, an Enrolled Actuary (EA) since 1999, and a member of the American Academy of Actuaries (MAAA) since 1999.

Matt is Washington's third State Actuary and serves as executive head of OSA. As the State Actuary, Matt oversees the annual actuarial valuations of 14 public retirement plans. He directs the actuarial services for the state's prepaid tuition program, certain medical programs, and the Long-Term Services and Supports Trust Program. OSA also provides staff and assistance to the Select Committee on Pension Policy (SCPP), a 20-member statutory committee. The SCPP studies issues and policies affecting the Washington State Retirement Systems and makes recommendations to the Legislature. Matt directs research and policy staff in support of the SCPP.

*Michael T. Harbour, ASA, MAAA, Actuary (Prepared Actuarial Estimate)*

Michael has been with the Office of the State Actuary for 17 years (2007)

## State of Washington

He is an associate of the Society of Actuaries (ASA) since 2017 and a member of the American Academy of Actuaries (MAAA) since 2017

We verified their credentials by reviewing the [actuarial directory](#) (hosted by both SOA and AAA) and verified their standings as members of both organizations. We noted that they were both compliant with SOA Continuing Professional Development requirements. ***No issues noted.***

### 2. Capability

Capability relates to the ability of the specialist to exercise their competence. The Office of the State Actuary works exclusively on the funding and benefit issues of Washington State's Retirement System. There were no limitations on the specialist's access to needed information or people and time the specialist was able to devote to the work. They have worked closely with State agencies in the past. Based on our Office's past experiences, we determined they are capable of performing their actuarial duties. We have been able to rely on their work in the past without issues. We believe they continue to be capable and we can rely on their reports.

Based on review of the report criteria, completeness of the information through reconciliation of systems and census data noted in [[Key Control 2 \(Manual\)](#)], as well as lack of pressure or incentive for specialists to misstate, we determined we can rely on the capabilities of the specialist to perform the work. ***No issues noted.***

### 3. Objectivity

The Office of the State Actuary is an independent and non-partisan agency of the Washington State Legislature and works primarily on the funding and benefit issues of the state's public retirement systems. The Office was created in 1977 and its duties are set forth in RCW [44.44](#) and [41.24.320](#). The role of the Office as currently defined is to:

- Prepare actuarial valuations of all DRS plans, including studies required by law.
- Provide fiscal notes/all pension legislation.
- Advise Legislature/Governor on pension issues.
- Staff the Select Committee on Pension Policy.
- Provide actuarial assistance to: Department of Retirement Systems & LEOFF 2 Retirement Board, committee on advanced tuition payment, long term services and supports trust commission, and Employment Security Department related to the family and medical leave program.

We noted no evidence to indicate pressures or incentives on specialists to misstate. Threats to objectivity of the specialist or lack of safeguards were not noted. There was no indication that information was withheld from the specialist by the DRS or related entities. Based on their independence, we determined we can rely on the objectivity of the specialist. ***No issues noted.***

### **Understanding of Specialist's Work and Conclusions**

We gained an understanding of the specialist's procedures and conclusions, including the methods and assumptions used, and noted the following:

# State of Washington

## **1. Objectives and scope of the specialist's work**

The primary purpose of the information provided by the OSA, is to satisfy the actuarial reporting requirements of GASB. Actuarial valuations of the plans are used by the Office of the State Actuary (OSA) in determining the funded status and funding progress of the plans. The State Actuary's Office performs all actuarial services for the State sponsored plans, including all studies required by law. This includes conducting valuations of the separate systems. The valuations are presented in the Actuarial Valuations Report available on the State Actuary's website: [Office of the State Actuary](#). The report is located in Valuations under the Pension Funding menu on the site's home page.

For further detail of the specialist's work, see the 2023 ACFR Actuarial Certification Letter at [\[2023 ACFR Actuarial Certification Letter\]](#) and the 2023 PEFI Certification Letter here at [\[2023 PEFI Actuarial Certification Letter\]](#). *No issues noted.*

## **2. Intended use of the specialist's work to support the audit objective**

OSA calculates the total pension liability for each plan. OSA also calculates the amortization schedules for the deferred inflows and outflows, and the pension expense that are recorded in the Schedules of Collective Pension Amounts. We will review the actuarial valuation to ensure that assumptions and methodologies were reasonable for calculation of pension balances.

## **3. Specialist procedures and conclusions**

OSA receives member and beneficiaries information from the Department of Retirement Systems (DRS). Assets and financial information are provided by the Washington State Investment Board (WSIB) and DRS. Employer contribution transmittals DRS received and processed within the fiscal year ended June 30, 2023, are used as the basis for determining each employer's proportionate share of the collective pension amounts reported in the Schedule of Employer and Non-employer Allocations for all plans. LEOFF Plan 1 is fully funded and no further employer contributions have been required since June 2000. The latest Actuarial Valuation was performed as of August 2024, which is within 30 months and 1 day prior to DRS' year-end/measurement date, June 30, 2023, as required by GASB 68. See [\[2023 DRS Plans Actuarial Valuation\]](#). *No issues noted.*

## **4. Assumptions and methods used by the specialist**

To calculate the contribution rates necessary to pre-fund the plan's benefits, an actuary uses an actuarial cost method, asset valuation method, funding policy economic assumptions, and demographic assumptions. The Entry Age Normal (EAN) cost method is used to report the plans' funded status. The annual cost of benefits under EAN is comprised of two components: normal cost, plus amortization of the unfunded liability. The normal cost is most commonly determined on an individual basis, from a member's age at plan entry, and is designed to be a level percentage of pay throughout a member's career. Comparing the EAN liabilities to the actuarial value of assets on the valuation date provides an appropriate measure of a plan's funded status and is acceptable according to current Governmental Accounting Standards Board (GASB) Statements 67 and 68.

The plan's assets were used to calculate contribution rates, unfunded liabilities, and the plan's funded status. Because the market value of assets

## State of Washington

can be volatile from one year to the next, an asset valuation method is generally used to adjust the market value of assets and smooth the effects of short-term volatility. The adjusted assets are called the actuarial value of assets, or valuation assets. In the valuation process, assumptions are required for four economic variables; expected investment rate of return, inflation, general salary growth and membership growth. Economic assumptions affect expectations regarding the accumulation of assets and the growth of projected pension benefits. The Pension Funding Council (PFC) adopts economic assumptions for all plans/systems except LEOFF 2. The LEOFF 2 Board adopts economic assumptions for LEOFF 2. All economic assumptions are then subject to revision by the Legislature. Demographic assumptions include, but are not limited to, rates of retirement, probability of termination, rates at which members become disabled, turnover rates, mortality rates.

In the State Actuary's opinion, all methods, assumptions, and calculations are reasonable and are in conformity with generally accepted actuarial principles and standards of practice as of the date of the June 30, 2023 Actuarial Report (dated August 2024). All methods and assumptions can be found on the [State Actuary's Website](#). In addition, in the State Actuary's opinion, the PEFI disclosures were prepared in accordance with GASB Statement 68. **See Actuarial Certification Letter for the PEFI at [2023 PEFI Actuarial Certification Letter]**. NOTE: The valuations were used to determine the criteria Actuaries used in their assumptions for the PEFI and ACFR. The amounts reviewed for State ACFR items came from the PEFI for multi-employer plans and from the ACFR for single employer plans. *No issues noted.*

Changes for the 2023 valuation include:

- No changes to economic or demographic assumptions since the prior valuation.

- Adjustments to methods for calculating UAAL contribution rates in PERS 1 and TRS 1 to reflect the delay between the measurement date of calculated Plan 1 rates and when the rates are collected.

- Adjustments to OSA's model to reflect past inflation experience when modeling future COLAs for current annuitants in all plans except PERS 1 and TRS 1

### **Evaluation of Specialist's Work**

#### **1. Relevance and Reasonableness of the Specialist's Methods and Assumptions**

We reviewed the methods and assumptions used in determining the total pension liability to ensure they are in accordance with GASB Statement No. 68 and Actuarial Standards of Practice. We noted that 12 of 16 DRS plans [[Pension & OPEB Plans](#)] are cost sharing multiple employer defined benefit plans. Key actuarial requirements under [GASB Statement No. 68](#) (for cost-sharing multiple employer defined benefit plans, paragraphs 48-71) include:

- Paragraph 60: Pension liability should be determined by an actuarial valuation as of the measurement date or the use of update procedures to roll forward to the measurement date amounts from an actuarial valuation as of a date no more than 30 months and 1 day earlier than the employer's most recent fiscal year end.

- Paragraph 60: For accounting and financial reporting purposes, an actuarial valuation of the pension liability should be performed at least biennially.

- Paragraph 61: Unless otherwise specified by the Statement, the selection of all assumptions used in determining the pension liability and related measures should be made in conformity with Actuarial Standards of Practice issued by the Actuarial Standards Board.

## State of Washington

Paragraph 62: Projected benefit payments should include all benefits to be provided to current active and inactive employees through the pension plan in accordance with the benefit terms and any additional legal agreements to provide benefits that are in force at the measurement date.

Paragraph 62: Projected benefit payments should include the effects of automatic postemployment benefit changes, including automatic COLAs

Paragraph 64: The discount rate should be the single rate that reflects:

The long-term expected rate of return on pension plan investments that are expected to be used to finance the payment of benefits, to the extent that (1) the pension plan's fiduciary net position is projected (in conformity with [paragraphs 65–67](#)) to be sufficient to make projected benefit payments (determined in conformity with [paragraphs 62](#) and [63](#)) and (2) pension plan assets are expected to be invested using a strategy to achieve that return

A yield or index rate for 20-year, tax-exempt general obligation municipal bonds with an average rating of AA/Aa or higher (or equivalent quality on another rating scale), to the extent that the conditions in (a) are not met.

Paragraph 70: The entry age actuarial cost method should be used to attribute the actuarial present value of projected benefit payments of each employee to periods in conformity with the following:

Attribution should be made on an individual employee-by-employee basis.

Each employee's service costs should be level as a percentage of that employee's projected pay. For purposes of this calculation, if an employee does not have projected pay, the projected inflation rate should be used in place of the projected rate of change in salary.

The beginning of the attribution period should be the first period in which the employee's service accrues pensions under the benefit terms, notwithstanding vesting or other similar terms.

The service costs of all pensions should be attributed through all assumed exit ages, through retirement. In pension plans in which the benefit terms include a DROP, for purposes of this Statement, the date of entry into the DROP should be considered to be the employee's retirement date.

Each employee's service costs should be determined based on the same benefit terms reflected in that employee's actuarial present value of projected benefit payments.

We reviewed the Washington State 2023 Actuarial Valuation Report and determined that the specialist's methods and assumptions are relevant and reasonable. Methods and assumptions used by OSA are in accordance with key actuarial requirements from GASB 68. We also noted in the State Actuary's opinion, all methods, assumptions, and calculations are reasonable and are in conformity with generally accepted actuarial principles and standards of practice as of the date of the June 30, 2023 Actuarial Report (dated August 2024). ***No issues noted.***

### **2. Appropriate tests of source data provided by the entity to the specialist**

Office of the State Actuary obtains audited member and beneficiary data from the Department of Retirement Systems (DRS). DRS contracts with Uhy LLP to audit the PEFI and ACFR. As part of the PEFI audit, Uhy reviews employer contributions that allocation percentages are based on. As part of the ACFR audit, Uhy LLP reviews active and inactive membership (headcount and census data). Uhy LLP provided an unmodified opinion

## State of Washington

for both ACFR and PEFI. We perform a CPA review of Uhy LLP's audit of DRS' ACFR and PEFI. We reviewed audit workpapers related to June 30, 2023 DRS ACFR and PEFI as part of the prior year ACFR audit, S1Washington-FS23 in folder J.4. We noted the following:

### *PEFI Census Data testing:*

*UHY performed targeted sampling at each employer through utilization of comprehensive data analysis for the full population of the employer payroll records. Application of the analysis and sampling is detailed below.*

*Eligibility Analysis: The full population of each employer's payroll file was cross referenced against DRS census in order to identify those who were excluded from the census. A dollar value threshold for fiscal year wages was established for sampling purposes through which eligibility and participation would have been likely. Employees with wages over this threshold were selected to assess whether their exclusion from participation, as well as census, was appropriate. A sample of up to 10 employees was selected from the group that was flagged through their analysis.*

*Date of Birth Analysis: The full population of each employer's payroll file was cross referenced against the employer's comprehensive employee information report. The date of birth for every employee in the employer's fiscal year 2022 payroll was tested against the census allowing for full coverage of the population. For all instances in which the date of birth per the employee information report did not match the census, each was selected for testing. The auditor obtained official government issued IDs or official tax and employment forms in order to determine the correct date of birth.*

*Service Credit Calculation: The full population of each employer's payroll file was cross referenced against DRS census to identify all individuals on both the payroll and census. Based on key employment dates (hire, leave, termination), the auditor calculated the estimated months of service credit. For instances in which the estimated service credit did not agree within 12 months, a sample up to 10 employees was selected for detailed testing. For each selection, the auditor obtained detailed employment records and incorporated service credit earned from prior employment.*

*Compensation Analysis: The full population of each employer's fiscal year 2022 payroll file were summed by employee, with consideration for the eligibility of wages when the data was available. Employee wages were matched against the census and the differences were stratified by amount. A sample of up to 10 employees was selected with selections focused on instances in which the wages, per the employer's payroll records, differed from the census by more than \$5,000. For each selection, the auditor obtained employee paystubs including a detailed breakdown of the wages to assess eligibility. Additionally, wages from prior employment were obtained to aid in reconciling to the census.*

*The auditor noted that based on their audit procedures they have concluded that there was no significant impact on the actuarial valuation or net pension liability of the Washington State Department of Retirement Systems resulting from the census data testing. Their audit provided reasonable assurance that the financial statements are free from material misstatement.*

### *PEFI Contribution testing:*

*Confirmations*

## State of Washington

*The auditors determined confirmations were the most effective method of testing contributions and obtaining adequate coverage. 25 contribution confirmations were sent, and all were received. We reviewed the control confirmation log at 7500.00. We also reviewed the results of the confirmations (confirmation reconciliation). No significant exceptions were noted. We noted contribution confirmations were recalculated. The auditors noted recalculation of allocations tied within an immaterial variance (\$28,946 or .00015%).*

*Analytical Procedures (7006.01)*

*We reviewed a substantive contribution analytical. Employer and employee contributions were considered in the analytical. Recalculated contributions were within expectations. Reconciliation of Contributions Reported on the PEFI to the DRS ACFR (7003 and 7004). We reviewed the reconciliation of PEFI contributions to the DRS ACFR. We noted amounts tied without exception*

OSA also checks the data for reasonableness based on the purpose of their valuation. ***No issues noted.***

### **3. Relevance and reasonableness of the specialist's conclusions**

We reviewed the 2023 DRS ACFR and the 2023 PEFI Actuarial Valuation Certification letters for valuation dates of June 30, 2023. **See: [2023 PEFI Actuarial Certification Letter] & [2023 ACFR Actuarial Certification Letter]. *No issues noted.***

#### 2023 ACFR (DRS)

OSA performed the most recent actuarial valuation in 2023 with a valuation date of June 30, 2022. The total pension liability was calculated as of the valuation date and projected to the measurement date of June 30, 2023. Plan liabilities were rolled forward from June 30, 2022, to June 30, 2023, reflecting each plan's normal cost (using the Entry Age cost method), assumed interest, and actual benefit payments. GASB 67 requires an "asset sufficiency test" to determine whether (or how long) OSA can use the long-term expected rate of return on assets to measure the present value of accrued plan liabilities for accounting purposes. See the entire documented actuarial valuation process for the 2023 ACFR at [2023 ACFR Actuarial Certification Letter]. ***No issues noted.***

#### 2023 PEFI (2023)

OSA prepared the following information for inclusion in the 2023 Participating Employer Financial Information (PEFI):

Schedules of Collective Pension Amounts, Fiscal Year 2023  
Amortization Schedules and Pension Expense under Note 2

We believe the data, methods, and assumptions used in the actuary's valuation process/procedure are reasonable and appropriate. Based on our review, we determined that the specialist's conclusions are relevant and reasonable. ***No issues noted.***

### **4. Verifying that the specialist's conclusions are reflected in the financial statements**

See substantive tests performed at [Substantive Test: DRS Administered Pension Plans].

## State of Washington

### 5. If the specialist used was employed or contracted by management, add an additional representation to the Management Representation Letter related to the work of the specialist.

We added a representation related to the use of an actuary, see [\[Concluding\]](#).

#### I.4.PRG - Pensions - Long-Term Liabilities, Deferred Inflows, Deferred Outflows, Net Pension Asset

*Procedure Step:* Rely on Specialist (SRP)

*Prepared By:* MRF, 11/18/2024

*Reviewed By:* RKM, 11/21/2024

Purpose/Conclusion:

#### **Purpose:**

To determine if we can rely on the work of Office of the State Actuary to provide audit evidence for Supplementary Retirement Plan (SRP) actuariality determined values.

#### **Conclusion:**

We determined that we **can** rely on the work of the specialist.

Testing Strategy:

To determine whether the audit can rely on the work of the outside specialist and whether the specialist's work supports the financial statements, the following procedures are **required** to be performed:

Auditor should check with their supervisor whenever they determine that the use of a specialist may be necessary.

*A specialist is an individual or organization possessing expertise in a field other than accounting or auditing (for example, information technology specialists, engineers and actuaries). Specialists may be contracted or employed by entity management to assist them in performing their responsibilities (management's specialist) or contracted or employed by our Office (auditor's specialist).*

*This step does not need to be completed when consulting with attorney general assistants, LGS, TAS, LISA, STAT, DSI or "Subject Matter*

## State of Washington

*Experts” designated on the intranet. Contact TAS for assistance if needed to determine whether someone would be considered a specialist or not.*

Assess the specialist’s competence, capability and objectivity as it relates to the work that we intend to rely on for the audit.  
*Competence refers to the specialist’s relevant qualifications and experience. In assessing competence, auditors should consider:*

*The education, professional certifications or licenses of the specialist in his or her field, as appropriate.*

*The reputation and standing of the specialist.*

*The specialist’s experience in the type of work under consideration.*

*Our Office’s experience in using the specialist’s work, if applicable.*

*Capability refers to effect of any access, resource or other limitations on the specialist’s work. In assessing capability, auditors should consider:*

*Timing of the specialists work*

*Any significant limitations on the specialist’s access to needed information or people*

*Any significant limitations on the time the specialist was able to devote to the work*

*Our Office’s experience in using the specialist’s work, if applicable.*

*Objectivity refers to the possible effects of any bias, conflicts of interest or undue influence on the specialist’s judgment. If the specialist’s objectivity is impaired, the auditor may not rely on the work of the specialist. In assessing objectivity, auditors should consider:*

*Any pressures or incentives on either specialists or management to misstate*

*Threats to objectivity of the specialist (including self-interest, advocacy, familiarity, self-review or intimidation threats) and any safeguards in place (segregation of duties, lines of reporting, professional standards, formality and consistency of methods and assumptions, retrospective reviews, etc)*

*Our Office’s experience in using the specialist’s work, if applicable.*

*Auditors should contact TAS if the auditor has any concerns with assessing the competence, capabilities or objectivity of specialists.*

Obtain an understanding of the work and conclusions of the specialist. This understanding should include the following elements:

- Objectives and scope of the specialist’s work

## State of Washington

- Intended use of the specialist's work to support the audit objective
- Specialist procedures and conclusions
- Assumptions and methods used by the specialist

*The objectives and scope of the specialists work and intended use of the specialist's work to support our audit objective should have already been included in the audit plan or else will need to be documented as a change to the audit plan.*

Evaluate the work and conclusions of the specialist. This evaluation should include the following elements as applicable:

Relevance and reasonableness of the specialist's methods and assumptions

*The appropriateness and reasonableness of methods and assumptions used and their application are the responsibility of the specialist. However, if the auditor concludes that the specialist's findings are unreasonable in the circumstances, the auditor should apply alternative procedures, which may include obtaining the opinion of another specialist.*

*Auditors should specifically consider whether methods and assumptions changed from the preceding period and the reasons for such changes, if applicable.*

Appropriate tests of source data provided by the entity to the specialist.

*If any data used by the specialist was provided by the entity, the auditor should consider the risk that incomplete or inaccurate data may materially affect the specialist's conclusions. This risk may be affected by the auditor's assessment of overall COSO elements and control risk for the related system.*

*For example: when relying on work of an actuary for self-insurance liabilities, auditors would normally verify the completeness and accuracy of claims information provided to the actuary against claims information per the pool's system. This can be done by comparing the total claim payments per pool's records to total claims paid shown on the actuary reports (in aggregate or on annual basis) – the figures may not match exactly but should be very close.*

Relevance and reasonableness of the specialist's conclusions.

Verifying that the specialist's conclusions are reflected in the financial statements

Add an additional representation to the rep letter if the specialist used was employed or contracted by management (rather than SAO). See the List of Additional Representations located in the Auditor Reference Guide here: [Representation Letter Resource.docx](#)

# State of Washington

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

### **SAO Audit Policy [3230](#) - Using the Work of Specialists**

Record of Work Done:

## **Assessment of Competence, Capabilities and Objectivity of Specialist**

We assessed the competence, capabilities and objectivity of the specialist, specifically considering factors described in the testing strategy.

### **1. Competence**

Two individuals certified the 2024 Supplemental Retirement Plan Valuation for Higher Education: Lisa Won, Deputy State Actuary, and Michael Harbour, Actuary, certified the 2024 Actuarial Valuation report.

Lisa Won, ASA, FCA, and MAAA - Deputy State Actuary. Lisa has been with OSA since 2007 and has been Deputy State Actuary since 2016. She received an undergraduate degree in Actuarial Science from the University of Waterloo in Ontario Canada. Lisa is an associate of the Society of Actuaries (ASA), a Fellow of the Conference of Consulting Actuaries (FCA), and a member of the American Academy of Actuaries (MAAA). To become an FCA, the candidate must be engaged in actuarial work as a consultant, in government, as an insurance employee or as an Enrolled Agent. One prerequisite has the candidate obtaining six years of actuarial experience and hold the ASA, ACAS, EA, MAAA or MSPA designation. As the Deputy State Actuary, Lisa oversees the annual actuarial valuations of 14 public retirement plans. OSA also provides staff and assistance to the Select Committee on Pension Policy (SCPP), a 20-member statutory committee. The SCPP studies issues and policies affecting the Washington State Retirement Systems and makes recommendations to the Legislature. Lisa contributes direction for research and policy staff in support of the SCPP. **No issues noted.**

*Michael Harbour, ASA, MAAA- Actuarial Analyst (Prepared Actuarial Estimate)*-Michael has been with OSA since 2007. He is an associate of the Society of Actuaries (ASA) and a member of the American Academy of Actuaries (MAAA). **No issues noted.**

We verified that Lisa Won's and Michael Harbour's credentials were in good standing with the American Academy of Actuaries at [actuary.org](http://actuary.org), and Conference of Consulting Actuaries at [ccactuaries.org](http://ccactuaries.org).

SAO has worked with Lisa and Michael as actuaries in the past. Our office has always had a good experience using the specialist's work for the GASB 68 Census Data Examination that we performed for the Department of Retirement Systems in prior years. Based on the qualification,

# State of Washington

experience, and credentials of the individual noted above, we determined that we can rely on the competence of the specialists. ***No issues noted.***

## **2. Capability**

Capability relates to the ability of the specialist to exercise their competence. The Office of the State Actuary works exclusively on the funding and benefit issues of Washington State's Retirement System. They have worked closely with State agencies in the past. Based on our Office's past experiences, we determined they are capable of performing their actuarial duties. We have been able to rely on their work in the past without issues. We believe they continue to be capable and we can rely on their reports.

Based on review of the report criteria, completeness of the information, as well as lack of pressure or incentive for specialists to misstate, we determined we can rely on the capabilities of the specialist to perform the work. ***No issues noted.***

## **3. Objectivity**

The Office of the State Actuary is an independent and non-partisan agency of the Washington State Legislature and works primarily on the funding and benefit issues of the state's public retirement systems. The Office was created in 1977 and its duties are set forth in Chapters 44.44 and 41.24 RCW. The role of the Office as currently defined is to:

- Prepare actuarial valuations of the plans.
- Provide fiscal notes/all pension legislation.
- Advise Legislature/Governor on pension issues.
- Staff the Select Committee on Pension Policy.
- Provide actuarial assistance to: Department of Retirement Systems & LEOFF 2 Retirement Board

For Higher Education SRP, per RCW 28B.10.423:

Each institution of higher education that is responsible for payment of supplemental amounts shall contract with the state actuary for an actuarial valuation of their supplemental benefit plan. Each institutional shall also contract with the state actuary for actuarial experience study of the mortality, service, compensation, and other experience of the annuity or retirement income plans and into the financial condition of each system. Upon completion of the valuation or experience study, the state actuary shall provide copies of the study to the institution of higher education and to the select committee on pension policy and the pension funding council.

We noted no evidence to indicate pressures or incentives on specialists to misstate. Threats to objectivity of the specialist or lack of safeguards were not noted. There was no indication that information was withheld from the specialist by the DRS or related entities. Based on their independence from DRS, we determined we can rely on the objectivity of the specialist. ***No issues noted.***

## **Understanding of Specialist's Work and Conclusions**

# State of Washington

We gained an understanding of the specialist's procedures and conclusions, including the methods and assumptions used, and noted the following:

**1. Objectives and scope of the specialist's work** (2024 Higher Education SRP Actuarial Valuation letter [[SRP.Actuarial.Certification.Letter](#)])

The primary purpose of the valuation is to provide information to the higher education institutions in order to meet the financial reporting requirements under GASB Statement No. 67/68 for the fiscal year ending June 30, 2024.

**2. Intended use of the specialist's work to support the audit objective**

OSA calculates the total pension liability for participating entity. OSA also calculates the amortization schedules of the deferred inflows and outflows, and the pension expense that are recorded in the Schedules of Collective Pension Amounts. These are used by OFM to value the Higher Education SRP for the participating entities.

**3. Specialist procedures and conclusions**

OSA relies on participant data provided by entities and retirement plan vendors to perform the valuation. An update to the plan participant data file was provided as of January 1, 2024. OSA checked the data for reasonableness as appropriate based on the purpose of the valuation. An audit of the participant data was not performed. They relied on all the information provided as complete and accurate. In their opinion, this information is adequate and substantially complete for the purposes of the valuation.

**4. Assumptions and methods used by the specialist**

The assumptions used in the valuation, including total salary growth and the demographic assumptions, were developed in the 2023 Economic Experience Study report. OSA considered input from TIAA, a Retirement Plan vendor, to help us set the economic assumptions related to the Assumed Income. OSA determined the discount rate based upon the 2021 Economic Experience Study for the Washington State retirement plans and based on the results of the GASB 67/68 crossover test. In their opinion, all methods, assumptions, and calculations are reasonable and are in conformity with generally accepted actuarial principles and standards of practice as of the date of the letter.

To calculate the contribution rates necessary to pre-fund the plan's benefits, an actuary uses an actuarial cost method, asset valuation method, economic assumptions, and demographic assumptions. The Entry Age Normal (EAN) cost method is used to report the plans' funded status. The annual cost of benefits under EAN is comprised of two components: normal cost, plus amortization of the unfunded liability. The normal cost is most commonly determined on an individual basis, from a member's age at plan entry, and is designed to be a level percentage of pay throughout a member's career. Comparing the EAN liabilities to the actuarial value of assets on the valuation date provides an appropriate measure of a plan's funded status and is acceptable according to current Governmental Accounting Standards Board (GASB) Statements 67 and 68.

Assumptions from the previous year are generally the same.

We noted rate of return for plan assets returned to the standard 7.0%, as the discount rate to measure the Total Pension Liability (TPL).

# State of Washington

The plan's assets were used to calculate contribution rates, unfunded liabilities, and the plan's funded status. Because the market value of assets can be volatile from one year to the next, an asset valuation method is generally used to adjust the market value of assets and smooth the effects of short-term volatility. The adjusted assets are called the actuarial value of assets, or valuation assets.

In the valuation process, assumptions are required for four economic variables; expected investment rate of return, inflation, general salary growth and membership growth. Economic assumptions affect expectations regarding the accumulation of assets and the growth of projected pension benefits. The Pension Funding Council (PFC) adopts economic assumptions for the plan. All economic assumptions are then subject to revision by the Legislature.

Demographic assumptions include, but are not limited to, rates of retirement, probability of termination, rates at which members become disabled, turnover rates, mortality rates.

In the State Actuary's opinion, all methods, assumptions, and calculations are reasonable and are in conformity with generally accepted actuarial principles and standards of practice as of the date of the June 30, 2024 Actuarial Valuation Report (dated October 2024). All methods and assumptions can be found on the State Actuary's Website, see OSA Assumptions. ***No issues noted.***

## **Evaluation of Specialist's Work**

### **1. Relevance and reasonableness of the specialist's methods and assumptions.**

We reviewed the methods and assumptions used in determining the total pension liability are in accordance with GASB Statement No. 67/68 and Actuarial Standards of Practice and are the same as those used by the plan. These seem appropriate based upon our review. In the State Actuary's opinion, all methods, assumptions, and calculations are reasonable and are in conformity with generally accepted actuarial principles and standards of practice as of the date of the June 30, 2024 Actuarial Valuation Report (dated October 2024). We reviewed the Washington State 2024 Actuarial Valuation Report and determined that the specialist's methods and assumptions are relevant and reasonable. ***No issues noted.***

### **2. Appropriate tests of source data provided by the entity to the specialist.**

We obtained OFM's JV Workbooks by entity for the SRP, amortization schedules, and corresponding JV's from Kenney Cavanah, Statewide Accountant.

The Washington State Investment Board, the Office of Financial Management, and the Department of Retirement Systems provided financial and asset information as of June 30, 2024. OSA checked the participant data and assets for reasonableness as appropriate based on the purpose of the valuation. They relied on the information provided as complete and accurate. In their opinion, this information was adequate and substantially complete for the purposes of the valuation.

In order to ensure a reasonable valuation, OSA developed eligibility criteria to determine which actives (or members currently on leave) should be

## State of Washington

included in the SRP valuation. The criteria relies on the calculated First Contribution Date, the institution's SRP closure date (Plan Closure Date), and the employee's date of hire. Starting with the census files provided to us by the institutions, we relied on the following rules to determine who should be included or excluded from the valuation.

1. An active employee must be participating in the Higher Education Retirement Plan (HERP) to be eligible for a SRP benefit.
2. If an active employee has a First Contribution Date that occurs prior to the Plan Closure Date, they are included on the valuation file.
3. If an active employee has a First Contribution Date that occurs on or after the Plan Closure Date, they are included on the valuation file only if their date of hire is before the Plan Closure Date.
4. All other active employees were excluded from the valuation file. They were either reported with a date of hire and First Contribution Date that occurred on or after the Plan Closure Date or they were reported with no HERP contribution information.

### **3. Relevance and reasonableness of the specialist's conclusions.**

We reviewed the Actuarial Certification Letter along with the reports. We believe the data, methods, and assumptions used in the actuary's valuation process/procedure are reasonable and appropriate. Based on our review, we determined that the specialist's conclusions are relevant and reasonable.

### **4. Verifying that the specialist's conclusions are reflected in the financial statements.**

We verified that the specialist's conclusions are reflected in the financial statements here: [\[Substantive Test: Supplemental Retirement Plans\]](#). We tied the amounts recorded in AFRS to the financial statements in our review presentation and disclosure work here [\[Proprietary Fund Financial Statements\]](#).

### **5. If the specialist used was employed or contracted by management, add an additional representation to the Management Representation Letter related to the work of the specialist.**

We added a representation related to the use of an actuary, see [\[FS Letter of Representation\]](#).

### **I.5.PR.G - OPEB - Liability (Current & Noncurrent), Deferred Inflows, Deferred Outflows**

*Procedure Step:* Summary & Conclusion

*Prepared By:* BM2, 11/21/2024

*Reviewed By:* RKM, 11/29/2024

Purpose/Conclusion:
---------------------

# State of Washington

## **Purpose:**

To evaluate risk assessments and the sufficiency and appropriateness of evidence obtained based on results of substantive work.

## **Conclusion:**

We determined that **no** modifications were necessary to inherent risk, control risk, or the risk of material misstatement as assessed in planning.

We also determined that evidence obtained was sufficient and appropriate in response to the risk of material misstatement.

Testing Strategy:

Auditors are **required** to evaluate conclusions for substantive testing as follows:

*Auditors may wish to use the optional Lead Sheet available in the Store to summarize testing related to each balance and assertion.*

**1.** Determine whether the results of substantive testing indicate a need to modify the inherent risk assessment (IR), control risk assessment (CR), risk of material misstatement (RMM) or other aspects of planning (such as material balances or assertions). If so, document changes and consider the need for additional testing.

*If the results of substantive testing indicate a need to change control risk, auditors should also update the **Permanent File** by either correcting the documentation or by adding an update section describing changes to the top of the record of work done. For all changes to IR, CR, or RMM the **Material Balances** spreadsheet should be updated.*

*More significant changes to other aspects of planning (such as material balances or assertions) should be referenced in this step and documented in detail in the **Changes to FS Audit Plan** step.*

**2.** Evaluate whether the quality and quantity of evidence obtained is sufficient and appropriate in response to the risk of material misstatement. In making this determination, auditors should evaluate:

### **Information to be used as audit evidence:**

Does evidence relate to the population, period of time and risk (assertion and “what could go wrong” from the Material Balance Spreadsheet)? If there are any gaps or uncertainties in the logical connection between the evidence and conclusions, is there a documented consideration and explanation?

Are the sources of information sufficiently reliable and appropriate for the risk (whether internal to the government, external, or auditor developed)? If key information is not from a sufficiently reliable source (for example, inquiry), then is it corroborated by information that is?

## State of Washington

Are there any concerns about accuracy, completeness, authenticity, or bias in information? If so, did the auditor perform sufficient procedures to confirm reliability of that information?

Is information precise enough to catch if misstatements exceeded the tolerable level?

Is information detailed enough to conclude on whether or not there were misstatements?

Was there any information that appeared contradictory or inconsistent? If so, was there a documented response to the inconsistencies or doubts about the reliability of evidence?

### Results:

How much misstatement was identified by testing, and the likelihood and magnitude of further potential misstatement?

How did misstatements occur and how often might they occur again in the population?

Were misstatements caused by control deficiencies or circumvention of controls?

If control deficiencies, is there a need to re-evaluate our understanding of controls in the [Permanent File](#) folder or assessment of control risk?

If circumvention, the [Management Override of Controls](#) step should address or reference this area. Auditors should also consider whether a fraud risk has been identified.

Did tests identify a different level or type of risk than the planned audit response was designed to address?

If likely misstatements are identified, are further procedures necessary to improve the precision of our estimate?

*To support the overall evaluation of audit risk and provide a basis for concluding on the overall sufficiency and appropriateness of evidence in the [FS Summary & Report](#) step, auditors should conclude in each area whether the auditor continues to believe that the tests performed and quality and quantity of evidence obtained are commensurate with RMM for all relevant risks (the "what could go wrong", in the [Material Balances](#) spreadsheet).*

If the auditor determines that evidence is not sufficient or appropriate, additional substantive testing should be done. If sufficient, appropriate evidence is not available for audit, the AIC should discuss the effect on our audit report with the AAM and AM.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6310](#) – Determining the Nature, Timing and Extent of Substantive Testing**

**SAO Audit Policy [3210](#) – Audit Evidence**

# State of Washington

## Record of Work Done:

Based on test results, we re-evaluated risk assessments, procedures, evidence obtained and conclusions as follows:

### **(1) Do the results of substantive tests indicate a need to modify our risk assessment (IR, CR and RMM)?**

The results of substantive tests do not indicate a need to modify our risk assessment.

### **(2) Was the quality and quantity of evidence obtained sufficient and appropriate?**

The quality and quantity of evidence obtained was sufficient and appropriate.

## **I.5.PR.G - OPEB - Liability (Current & Noncurrent), Deferred Inflows, Deferred Outflows**

*Procedure Step:* Understanding of Line Item

*Prepared By:* BM2, 5/22/2024

*Reviewed By:* RKM, 7/5/2024

## Purpose/Conclusion:

### **Purpose / Conclusion:**

To gain an understanding of the line item and confirm the scope of testing as documented in the Significant Account Matrix.

## Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

### **STEP 1: Prior Audit Exceptions**

Document any exceptions noted during the prior audit. Follow-up to determine how the agency has responded to or corrected the issue, unless this work is anticipated as part of the testing strategy.

### **STEP 2: Analyze Composition and Changes of Line Item**

## State of Washington

Include link to the line item leadsheet. This will be completed at the end of the audit. Leadsheet analysis should be documented in this spreadsheet.

Inquire with agency staff about the activities and transactions that make up the balance and any changes to those activities or transactions in relation to the prior year.

Determine relevant classes of transactions or account balances within the line item to analyze (such as agencies, funds, programs, departments, accounts, and/or objects), and use AFRS to create trends of those elements. This step should not include any specific dollar amounts associate with the line item.

Evaluate trends to identify:

- (1) What classes of transactions or account balances are primary to the identified risk. Auditors should specifically consider what elements are primary to the line item (comprising a large percentage of the line item), and which elements the identified risk would apply to, and which elements might be most susceptible to the identified risk (having a high risk of non-trivial misstatement for a relevant assertion, considering likelihood and impact of potential for misstatement).
- (2) What changes are primary to the identified risk, if applicable. Auditors should specifically consider whether the overall change to the line item from the prior year was significant, what elements were the primary drivers of overall change, whether any elements changed significantly from the prior year, and which changes (if any) might relate to the identified risk.
- (3) Any unusual or unexpected elements, amounts, or changes that may indicate a risk, whether the one identified in planning or a new one that may need to be considered for a change to the plan.

**Consider** other procedures to gain an understanding of the line item, such as review of key policy documents, review of program information or reports, inquiry of staff, budget information, or other analytical procedures.

### **STEP 3: Update Significant Account Matrix**

Based on your understanding of the line item, update the Significant Account Matrix with final conclusions on the agencies covered, account description, significant accounting systems, and risk (what could go wrong and relevant assertions). The account description should reflect the significant transaction streams or account balances relevant to the risk.

*The description of agencies, significant accounting systems, and what could go wrong in the Significant Account Matrix constitute the overall scope of substantive testing.*

*A transaction stream is significant based on the potential for misstatement. This is often due in part to its size (ie: comprising a large percentage of the total line item), but is ultimately a judgment about the susceptibility to the identified risk (for example, when the risk is understatement a small or omitted account may hold the most potential for the largest misstatement).*

*Significant accounting system(s) are those that contain key controls over significant classes of transactions included in the line item. Control systems identified in this step must match the Significant Account Matrix and have a separate control understanding documented.*

*Talk with the AIC if you identify any changes to the Significant Account Matrix.*

# State of Washington

Guidance/Criteria:

Record of Work Done:

**(1) Prior Audit Exceptions:**

No prior year exceptions.

**(2) Composition & Change Analysis:**

Line Item Leadsheet: [\[Line Item Lead Sheet\]](#).

In addition to pension benefits reviewed at [\[Pensions - Long-Term Liabilities, Deferred Inflows, Deferred Outflows, Net Pension Asset\]](#), the State's Health Care Authority (HCA), administers a single employer defined benefit Other Post Employment Benefits (OPEB) plan. Per Office of the State Actuary (OSA), "OPEB are benefits provided to eligible retired employees (and their spouses) beyond those provided by their pension plans. Such benefits include medical, prescription drug, life, dental, vision, disability, and long-term care insurance. PEBB was created within the Washington State Health Care Authority (HCA) to administer all these benefits for public employees, retirees, and their families. PEBB employers provide monetary assistance, or subsidies, for medical, prescription drug, dental and vision insurance." See [\[ \]](#) for understanding of Public Employees' Benefit Board (PEBB) including the state index rate, retiree benefits, and other plan information.

The Governmental Accounting Standards Board (GASB) issued GASB Statement No. 75, *Accounting and Financial Reporting for Postemployment Benefits Other than Pensions*, in June 2015 which establishes standards for recognizing and measuring liabilities, deferred outflows of resources, deferred inflows of resources, and expense/expenditures for OPEB. GASB 75 requires employers to disclose key financial measures for the plan, including the Total OPEB Liability (TOL), OPEB expense, and benefit payments (or employer contributions). The statement requires more extensive disclosures and supplementary information than the prior reporting requirements. GASB 75 became effective for employer fiscal years beginning after June 15, 2017, and requires employers to disclose key plan measures relative to their plan members, including the Total OPEB Liability (TOL) and OPEB Expense.

For ACFR, balances reported on individual statements and opinion units are percentages of state-wide OPEB balances (deferred outflows, short-term liability, long-term liability, and deferred inflows as determined by OSA's actuarial valuations). State-wide balances are audited in S1FinancialManagement-FS24. Agencies do not report OPEB balances in AFRS, OFM prepares manual AFRS journal vouchers to record balances for all agencies by opinion unit and statement.

We met with Kenesey Cavanah, Statewide Accountant, on May 13, 2024 to inquire of any significant changes to the balance and she did not identify any. She noted there are a couple new agencies for fiscal year 2024 that will be included in the allocation calculations, but that is a common occurrence from year to year.

# State of Washington

## **(3) Updates to Significant Account Matrix:**

We identified no updates to the Significant Account Matrix based on our understanding of the line item.

## **I.5.PR.G - OPEB - Liability (Current & Noncurrent), Deferred Inflows, Deferred Outflows**

*Procedure Step:* Controls - Allocation of OPEB Amounts

*Prepared By:* BM2, 7/2/2024

*Reviewed By:* RKM, 7/5/2024

Purpose/Conclusion:

### **Purpose:**

To gain an understanding of internal controls.

### **Conclusion:**

We gained an understanding of internal controls as documented in the record of work done.

Testing Strategy:

### **The following procedures are required for all material systems:**

1. List the financial statement balance(s) and relevant assertion(s) addressed by the understanding.
2. Gain an understanding of the internal control process, identify how transactions are recorded in AFRS, identify key controls over relevant assertion(s), and note any control weaknesses.
  - In gaining an understanding of controls, consider the overall understanding of State-Level control elements as documented in the "State-Level Controls" step as they relate to this particular system.
  - Identify controls systems covering all relevant assertions for all significant classes of transactions.
  - Standards require the auditor to gain an understanding of the significant accounting system(s) that contain key controls over significant classes of transactions included in the line item.
  - Control systems identified in this step must match the Material Account Matrix and have a separate control understanding documented.

## State of Washington

Talk with the ACFR Specialist or AIC if you identify different systems than the ones anticipated in the Material Account Matrix.

For each material system, auditors must document:

- A brief outline of the transaction flow from beginning to end.

- An expanded description of key controls.

- Business processes relevant to financial reporting of the relevant assertion for the material balance. Processes should encompass automated and manual procedures by which transactions or events are identified or initiated, authorized as needed, recorded, processed and corrected as needed.

- Original accounting records and how records are rolled-up to intermediary ledgers and transferred to the general ledger (AFRS) or financial statements.

- Detailed descriptions of key controls. Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

The following is information to **consider** when identifying key controls and transaction flow.

“Key controls” refer to the few controls that together provide reasonable assurance that material misstatements will be prevented or detected and corrected. This is contrasted with ancillary or supporting controls, which – although helpful and recommended – would provide less than reasonable assurance by themselves.

The focus of the write-up is on the key controls. Key controls should be specifically identified (as “key controls”) in the write-up. This can be done in whatever way the auditor prefers, so long as it is obvious. Details that the auditor should document regarding key controls may include:

- Who or what initiates the control

- When (or how often) is the control applied

- Who performs the control

- As needed, the experience, knowledge and attitude of the person applying the control

- Detailed description of the control process or activity. For example, if the control is a review: what exactly is reviewed, what is the reviewer looking at or for and what are the reviewer’s criteria?

- How the key control is documented or evidenced

- If not obvious from the description, how the control prevents or timely detects and corrects misstatements

- Any exceptions or alternative processing to the normal process

- What happens when misstatements or issues are identified by the control

## State of Washington

The “transaction flow” refers to the process by which transactions are initiated, authorized, recorded, processed and reported (as applicable). Outlining the transaction flow gives context to key controls, especially how transactions become subject to controls in the first place. If a control inherently ensures that all applicable transactions are included (ex: bank reconciliation where the assertion is existence), the auditor may decide to just start the write-up with the initiation of the control procedure and go from there.

Elements of the transaction flow are defined informally as follows:

*Initiation:* How are transactions initiated?

*Authorization:* How are transactions and accounting record maintenance authorized?

*Recording:* How are transactions or balances identified and recorded in financial accounting systems?

*Processing:* How are the transactions or balances processed after they are recorded (if at all)? Processing may be manual or automated and may occur at a subsidiary system level or at the general ledger level.

*Reporting:* How are records translated into the financial statements? This part of the transaction flow extends the understanding to the actual financial statements that the audit is opining on. Since we already document an understanding of the financial reporting process in general, it is usually enough to simply reference this overall understanding. However, if there are important steps unique to the covered balances, it may be more appropriate to mention them here.

Although transaction flow is a good way to think about understanding and documenting a control system, auditors should not worry too much about documenting “each element, in order” because often elements may be combined, not noticeable, not applicable or occur in a different order.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits](#) Planning Guide**

Record of Work Done:

### **Material Balance(s) and Assertions**

Internal controls in the GASB Allocation of OPEB Amounts address the following balance(s):

## State of Washington

Statement of Net Position - Government Wide	Statement of Net Position – Proprietary Funds	Various financial statements
Deferred Outflows of Resources (OPEB)	Deferred Outflows of Resources (OPEB)	Deferred Outflows of Resources (OPEB)
Long Term Liabilities Due within One Year (Other Post Employment Benefits Obligations)	Other Long Term Liabilities - Noncurrent (Other Post Employment Benefits)	Total OPEB Liability (Current)
Long Term Liabilities Due in More Than One Year (Other Post Employment Benefits Obligations)	Total OPEB Liability (Current)	Total OPEB Liability (Noncurrent)
Deferred Inflows of Resources (OPEB)	Deferred Inflows of Resources (OPEB)	Deferred Inflows of Resources (OPEB)

For the following assertions:

### **Completeness -**

Members are inappropriately excluded from, or included in, the census data

### **Valuation**

Census data does not reconcile to (agree with) the employer's payroll and personnel records or is not properly accumulated (maintained) for active and inactive members, causing errors in the computation of deferred outflows, total OPEB liability, and/or deferred inflows

The actuary uses incomplete (missing) or incorrect census data, causing errors in the computation of total deferred outflows, total OPEB liability, and/or deferred inflows

The actuary uses inappropriate assumptions or actuarial methods that are not in conformity with GASB Statement No. 75

Deferred outflows of resources and deferred inflows of resources and OPEB expense are not properly calculated and reported in accordance with GASB Statement No. 75

### **Classification**

There is a risk that the allocation between funds is not representative of the agencies included in that roll-up fund

### **Gain an Understanding of Internal Controls**

We met with Kennesy Cavanah, Statewide Accountant, on May 13, 2024 to gain an understanding over Other Post-Employment Benefits (OPEB) balances reported in the State of Washington financial statements on May 13, 2024. We used prior year work to gain our understanding of controls because OPEB data was not expected to be complete until August. We confirmed with Kennesy that the control process from the prior

# State of Washington

year will remain the same.

## Actuarial Valuation

The Office of the State Actuary (OSA), with assistance from the Health Care Authority's actuaries (Milliman), determines all OPEB balances at the State level in their annual Actuarial Valuation. Key plan details and assumptions were as follows:

Non-qualifying trust: The Washington State plan was pay-as-you-go with a substantive plan (terms understood by employers and plan members without a formalized contract or plan document).

Discount rate: The discount rate was equal to the 20-year Municipal Bond Index. The rate used for the current measurement date, June 30, 2023, was 3.65%.

Valuation: Estimates were based on Entry Age Normal actuarial cost method.

Amortization: Changes in actuary assumptions were based on the average expected remaining service lives of all active and inactive members (nine years)

## OPEB Schedules

The Statewide Accountant prepares the following schedules to report allocation of OPEB liabilities and OPEB balances by selected state agencies and in total:

Schedule of OPEB State Agency Allocations - Lists headcount and allocation percentage (agency headcount divided by total state headcount) for each agency. Based on census data as of measurement date.

Schedule of OPEB Amounts by Agency - Allocates state balances from OSA Actuarial valuation based on agency allocation percentage. This includes Total OPEB liability, deferred outflows, deferred inflows, and OPEB expense components

Notes to OPEB Schedules - Describes the plan, participants, allocation method, actuarial assumptions.

SAO performs a separate engagement with the above OPEB Schedules. We reviewed TeamMate audit file [S1FinancialManagements-FS23] for audit procedures and results over testing census data, review of actuary assumptions, and recalculation of schedules. All balances reported in OPEB Schedules were identified as significant and audit procedures included reviewing actuary assumptions (by performing the rely on specialists steps), reviewing census data accuracy, and recalculating OPEB Schedule balances. The audit resulted in 2 exit items related to benefits eligibility at one agency and a missing note disclosure. The OFM Statewide Accountant reviews the results of the OPEB Schedule audit and census data testing to ensure the completeness and accuracy of the allocation percentages used to prepare OPEB calculations (**Key Control #1: Manual - Completeness and Valuation**).

## Allocation of OPEB Amounts

OFM Statewide Accountant uses the audited OPEB balances by state agency and further allocates each agency's liability by expenses reported in sub-object BD (Health, Life & Disability Insurance) to ensure OPEB balances are properly reported in the appropriate statement and opinion unit (**Key Control #2: Manual - Valuation, Classification**). Sub-object BD was used because of the following:

## State of Washington

The Schedule of Other Post-Employment Benefits State Agency Allocations was based on an agency's number of active employees receiving health and life benefits administered by the Public Employees Benefit Board (PEBB), Benefits were allocated on the same basis as payroll (active employees), and The employer medical contribution (EMC) was expensed through sub-object BD. The EMC was the monthly amount paid by state agencies based on the number of employees eligible to receive benefits (including employees that waived coverage). The monthly rate for plan year 2024 was \$680, based on 85% of an average of UMP's bid rate. Each state agency transferred money to the Health Care Authority (HCA) after each payroll cycle (10th and 25th), the administrator of PEBB and state employee benefits. The OFM Statewide Accountant noted some state agencies have additional expenses run through sub-object BD for additional benefits. Additional benefits were typically for life insurance or other similar insurances that were significantly paid for by the employee. The OFM Statewide Accountant noted no additional benefits that were expected to skew the allocation of benefits.

The OFM Statewide Accountant modifies the audited OPEB schedules in OFM's Excel workbook 'OPEB\_JV\_Worksheets\_2023' to determine balances reported for ACFR. Kennesy prepared a procedures document that gives a step by step of the workbook to update amounts, formulas, and allocation processes. We used the 2023 workpapers for gaining our understanding of the 2024 controls and process due to timing. OPEB workbooks were prepared in August/September. See below for the following steps:

Step #1: Obtain final version of audited OPEB schedules (Schedule of Other Post-Employment Benefits State Agency Allocations).

Step #2: Export the prior year ACFR database balances for sub-object BD totaled by agency, fund, and table sort codes by index match. See tab "21\_ACFR\_Data" in OFM's Excel workbook. The prior year BD expenses were used to match the measurement date (one year lag).

Step #3: Split agency allocation percentages from the Schedule of Other Post-Employment Benefits State Agency Allocations by fund and opinion unit based on sub-object BD totals. See tabs "21\_BD% Allocation by Agency" and "19 % charged by Rollup & Function" in OFM's Excel workbook. Agencies that reported under multiple funds were highlighted in a separate color to help preparers and reviewers ensure allocations were accurately split.

Step #4: Allocations were aggregated by opinion unit and summarized in a pivot table by rollup fund, posting agency, and total. The total for the opinion unit was multiplied by the total OPEB line item balance. See tab "22 Schedule of OPEB amounts" for allocation of all audited OPEB line items in OFM's Excel workbook.

### **How transactions are recorded in AFRS:**

Kennesy Cavanah, OFM Statewide Accountant, prepares a year-end journal voucher to record the long-term liabilities balance using the actuary report and allocation schedule calculations. The calculations from OPEB\_JV\_Worksheets\_2023 Excel workbook was the support used for all OPEB JV's in AFRS. Another Statewide Accountant performs a detailed review over the OPEB excel workbook to ensure journal vouchers were supported by audited OPEB schedule amounts, accurately allocated to respective agencies and reporting funds, and accurately adjusted balances to ensure opinion units recorded state-wide balances and amounts in compliance with reporting requirements under GASB 75 (**Key Control #3: Manual - Valuation, Classification, and Completeness**). Kennesy will also verify the JV was properly posted to AFRS by running an Enterprise Reporting report and tracing amounts from the OPEB calculations to AFRS.

# State of Washington

## Key Controls are as Follows:

**Key Control #1 (Manual - Completeness and Valuation)** - The OFM Statewide Accountant reviews the results of the OPEB Schedule audit and census data testing to ensure the completeness and accuracy of the allocation percentages used to prepare OPEB calculations.

**Key Control #2 (Manual - Valuation, Classification)** - OFM allocates each agency's liability by expenses reported in sub-object BD (Health, Life & Disability Insurance) to ensure OPEB balances are properly reported in the appropriate statement and opinion unit.

**Key Control #3 (Manual - Valuation, Classification, and Completeness)** - Kennessy Cavanah, OFM Statewide Accountant, prepares a year-end journal voucher to record the long-term liabilities balance using the actuary report and allocation schedule calculations. Another Statewide Accountant performs a detailed review over the OPEB excel workbook to ensure journal vouchers were supported by audited OPEB schedule amounts, accurately allocated to respective agencies and reporting funds, and accurately adjusted balances to ensure opinion units recorded state-wide balances and amounts in compliance with reporting requirements under GASB 75.

## Noted Weaknesses are as Follows:

**None.**

## I.5.PR.G - OPEB - Liability (Current & Noncurrent), Deferred Inflows, Deferred Outflows

*Procedure Step:* Key Control 1 (Manual)

*Prepared By:* BM2, 10/17/2024

*Reviewed By:* RKM, 11/5/2024

Purpose/Conclusion.*
----------------------

### **Purpose:**

To confirm the OFM Statewide Accountant reviews the results of the OPEB Schedule audit and census data testing to ensure the completeness and accuracy of the allocation percentages used to prepare OPEB calculations (key control 1 for Allocation of OPEB Amounts) in order to assess control risk.

### **Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

# State of Washington

## Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified*

## State of Washington

*issue represents a material weakness or significant deficiency.*

***All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.***

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

# State of Washington

## SAO Audit Policy [2310](#) - Reporting Identified Audit Issues

## SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk

Record of Work Done:

**Key Control 1 (Completeness and Valuation):** The OFM Statewide Accountant reviews the results of the OPEB Schedule audit and census data testing to ensure the completeness and accuracy of the allocation percentages used to prepare OPEB calculations.

The understanding for this system is documented above in the "Controls - Allocation of OPEB Amounts" step.

### **1. Confirmation of Key Manual Control:**

We reviewed OFM's ACFR OPEB calculation workbook, "OPEB\_Worksheets\_2024", prepared by Kenney (Statewide Accountant), and noted the allocation amounts and supporting OSA/Milliman figures tied to our recalculation workbook from S1FinancialManagement-FS24. Kenney used SAO's audit to confirm allocation percentages for OPEB balances were complete and accurate. Within OFM's workbook, Kenney compared allocation percentages used in prior calculations to the current allocation percentages and made necessary changes to include new agencies/remove disbanded agencies and summarize Community and Technical college data for rollup in ACFR. We compared the updated allocation percentages to data in the OPEB audit (S1FinancialManagement-FS24) and confirmed OFM's source data for ACFR calculations agreed to the audited OPEB schedules.

We performed a review of the SAO Statewide OPEB Schedules Audit (S1FinancialManagement-FS24) to determine if OFM using the allocation data was reasonable. We reviewed underlying census data and actuary work of OSA and Milliman as part of S1FinancialManagement-FS24 and noted the following:

Census Data - FY24 is a roll forward year, therefore, census data and the underlying assumptions are not updated. We reviewed S1FinancialManagement-FS23 for results of census data testing, applicable to FY24 OPEB balances and noted the following: We reported 1 exit item in relation to census data testing as part of the audit. One agency had 9 employees that did not meet our expectations and were included in the census data when they shouldn't have or vice versa. The effect was isolated to the one agency and did not impact any OPEB balances.

Actuary Work - We reviewed the rely on work of specialist performed in S1FinancialManagement-FS24 over Milliman and OSA. We noted no exceptions and that we determined we could rely on the work of Milliman and OSA in relation to the OPEB schedules.

Based on substantive testing performed in S1FinancialManagement-FS23 and FS24, we determined the population used for ACFR reporting were

# State of Washington

complete and estimates were valued accurately. *No issues noted.*

## Noted Weaknesses are as follows:

None.

## **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

## **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

## **I.5.PR.G - OPEB - Liability (Current & Noncurrent), Deferred Inflows, Deferred Outflows**

*Procedure Step:* Key Control 2 (Manual)

*Prepared By:* BM2, 10/24/2024

*Reviewed By:* RKM, 11/5/2024

Purpose/Conclusion.\*

### **Purpose:**

To confirm OFM allocates each agency's liability by expenses reported in sub-object BD (Health, Life & Disability Insurance) to ensure OPEB balances are properly reported in the appropriate statement and opinion unit (key control 2 for Allocation of OPEB Amounts) in order to assess control risk.

### **Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls, however, we did note the following:

OFM's review of the OPEB allocation calculation was insufficient to ensure that the calculation was performed correctly. This resulted in various misstatements across opinion units. **See issue:** [V: OFM Allocation of OPEB Amounts (Part of ML)]. **See AOM:** [Aggregation of Misstatements (GAAP)].

## State of Washington

### Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

# State of Washington

## SAO Audit Policy [2310](#) - Reporting Identified Audit Issues

## SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk

Record of Work Done:

**Key Control 2 (Valuation and Classification):** OFM allocates each agency's liability by expenses reported in sub-object BD (Health, Life & Disability Insurance) to ensure OPEB balances are properly reported in the appropriate statement and opinion unit.

The understanding for this system is documented above in the "Controls - Allocation of OPEB Amounts" step.

### **1. Confirmation of Key Manual Control:**

We obtained OFM's prepared allocation calculation workbook, "OPEB\_Worksheets\_2024\_.xlsx" from Kennesy Cavanah, Statewide Accountant. OFM uses BD expenses by rollup fund and posting agency to further allocate whole agency allocation percentages based on function and fund. The BD expense therefore helps to define the classification and allocation of OPEB benefits within each agency's overall allocation percentage. Rollup funds determine the appropriate opinion unit to report OPEB balances.

We noted all FYE 2024 expenses for subobject BD were exported and agency percentages were allocated across funds and statements by the amounts reported in sub-object BD. We confirmed OFM used all FYE 2024 BD expenses by running an independent query from the ACFR database. See [[OPEB Adjusted Allocation Recalculation](#)], tabs 'SAO ACFR Query BD\_FY24' for the documented SQL code and results. We noted SAO's total BD expenses for FYE 2023 (measurement date) was \$1,768,133,876.14. OFM included beginning balances in their exported data of BD expenses and totalled \$3,177,144,950.35.

We recalculated the adjusted allocation percentages based on agency head counts and expenses coded to sub-object 'BD', excluding beginning balances to remain consistent with calculations in previous years. See [[OPEB Adjusted Allocation Recalculation](#)], tab 'Mod Allocation % Comparison.' Our calculated allocation percentages varied from OFM's as a result of their calculation erroneously including beginning balances of the BD expense account. The differences in allocation percentage caused issues in the valuation of OPEB balances among opinion units and incorrect deferred inflows/outflows at a statewide level. See issue at [[V: OFM Allocation of OPEB Amounts \(Part of ML\)](#)].

### **Noted Weaknesses are as follows:**

OFM's review of the OPEB allocation calculation was insufficient to ensure that the calculation was performed correctly. **See issue in conclusion above.**

# State of Washington

## **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

## **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

### **I.5.PR.G - OPEB - Liability (Current & Noncurrent), Deferred Inflows, Deferred Outflows**

*Procedure Step:* Key Control 3 (Manual)

*Prepared By:* BM2, 10/25/2024

*Reviewed By:* RKM, 11/5/2024

Purpose/Conclusion.:

#### **Purpose:**

To confirm OFM Statewide Accountant, prepares a year-end journal voucher to record the long-term liabilities balance using the actuary report and allocation schedule calculations (key control 3 for Allocation of OPEB Amounts) in order to assess control risk.

#### **Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls, however, we did note the following:

OFM's review of the OPEB allocation calculation was insufficient to ensure that the calculation was performed correctly. This resulted in various misstatements across opinion units. **See issue:** [V: OFM Allocation of OPEB Amounts (Part of ML)].

Testing Strategy.:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

Guidance/Criteria:
--------------------

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

# State of Washington

Record of Work Done:

**Key Control 3 (Valuation, Classification, and Completeness):** Kennesy Cavanah, OFM Statewide Accountant, prepares a year-end journal voucher to record the long-term liabilities balance using the actuary report and allocation schedule calculations. Another Statewide Accountant performs a detailed review over the OPEB excel workbook to ensure journal vouchers were supported by audited OPEB schedule amounts, accurately allocated to respective agencies and reporting funds, and accurately adjusted balances to ensure opinion units recorded state-wide balances and amounts in compliance with reporting requirements under GASB 75.

The understanding for this system is documented above in the "Controls - Allocation of OPEB Amounts" step.

## **1. Confirmation of Key Manual Control:**

We obtained OFM's JV to record OPEB balances as of June 30, 2024, JVOFM89. We reviewed OFM's JV workbook (JVOFM089\_OPEB\_DO\_DI\_Exp\_TOPEBL.xlsx) which included the JV, links to OFM's supporting calculation workbooks, and indication of review (emails from reviewer, notes and signature and date).

We reviewed OFM's allocation calculation workbook "OPEB\_Worksheets\_2024" that was used to determine OPEB balances by rollup fund. We agreed the JV to the supporting workbook's tab "JV Summary" with no exceptions.

We noted Kennesy Cavanah, Statewide Accountant, prepared the entry on 8/20/2024. Anna Quichocho, Financial Reporting Manager, reviewed and approved the entry on 8/23/2024. During our review of the calculation workbook (see key control 2), we identified errors in the calculation of allocation percentages. We noted this as a weakness.

## **Noted Weaknesses are as follows:**

OFM's review of the OPEB allocation calculation was insufficient to ensure that the calculation was performed correctly. **See issue in conclusion above.**

## **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

## **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

# State of Washington

## I.5.PR.G - OPEB - Liability (Current & Noncurrent), Deferred Inflows, Deferred Outflows

*Procedure Step:* Risk Assessment

*Prepared By:* BM2, 10/14/2024

*Reviewed By:* RKM, 10/23/2024

Purpose/Conclusion:

### **Purpose / Conclusion:**

To assess inherent risk, control risk, and the risk of material misstatement in order to design an initial testing strategy for each assertion.

Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

### **STEP 1: Inherent Risk (IR)**

Assess inherent risk for each relevant assertion. This assessment is based on understanding of the entity and the nature of the account balance or class of transactions.

*Inherent risk is the susceptibility of an assertion to material misstatement. It is our assessment of "total threat", which includes both "natural risk" and identified risk indicators, without any regard to any potential control activities. As inherent risk is fully independent of control risk, any understanding of controls cannot be used to increase/decrease the assessment of inherent risk. Consider the following factors as your basis for this assessment:*

#### *General Considerations*

*Does the balance include transactions that are difficult to audit or involve complex accounting issues?*

*Were there significant misstatements identified in previous audits or prior-period adjustments in the account balance or transaction class? If so, analyzing the cause of prior period misstatements will help in analyzing inherent risk.*

*Are there any inherent risk factors at the entity or industry level, such as changes in regulation or accounting rules, unique transactions or accounting practices, use of information technology, etc that affect the balance?*

#### *Inherent Risk due to Error*

*How large are the transactions making up the balance? If the balance has only a few large transactions, even a single error may mean a significant misstatement.*

## State of Washington

*Have there been changes in the transactions making up the balance that may increase risk? For example, significantly different composition, nature or volume of transactions may inherently disrupt established controls.*

*Are financial events originated or identified by accounting personnel or non-accounting personnel? This consideration is mainly for the completeness assertion.*

*Does the process to account for transactions involve judgment or estimation, complex calculations, numerous steps or significant manual steps?*

*Do transactions have widely varying attributes that need to be manually identified? For example, grant loans that are accounted for in one of several ways depending on the terms of the agreement.*

*Inherent Risk due to Fraudulent Reporting (intentional misstatements)*

*Are there substantial pressures or motivations to misstate the balance?*

*Inherent Risk due to Misappropriation*

*Is the account balance or transaction class susceptible to sizable misappropriation?*

*Inherent Risk due to Non-Compliance*

*Are there any laws, contracts or grant agreements affecting the balance? If so, would non-compliance lead to sizable misstatements?*

*Are compliance requirements complex, hard to understand, subject to judgment or otherwise difficult to comply with?*

*Are there any motivations or pressures to not comply?*

### **STEP 2: Control Risk (CR)**

Assess control risk by system and assertion. This assessment should be based on the results of the control understanding, confirmation, and (if setting control risk to LOW) testing. If applicable, auditors will evaluate any control deficiencies and determine whether those deficiencies, individually or in combination, are significant deficiencies or material weaknesses.

*Control risk is the risk that material misstatements would not be prevented or detected timely by the system of internal control. Control risk could be thought of as the "vulnerability" of an entity to misstatements. Control risk exists independently of the inherent risk (the level of vulnerability exists independent of the level of threat).*

*Control risk is MAX in both of the following situations: (1) controls aren't tested or (2) controls are problematic and cannot be relied upon. In order to set control risk to LOW, the auditor must test that controls operated effectively throughout the period.*

*A material weakness exists when the design or operation of controls results in a reasonable possibility a material misstatement will not be prevented or detected and corrected in a timely manner. A significant deficiency is less severe than a material weakness, yet important enough to merit the attention of the governing body. **All potential material weaknesses and significant deficiencies should be discussed with the AIC, since they must be reported as findings.***

### **STEP 3: Risk of Material Misstatement (RMM)**

## State of Washington

Assess the risk of material misstatement for each relevant assertion for each significant line item. The risk of material misstatement (RMM) is a combination of the auditor's separate assessment of inherent and control risk.

*In practice, the RMM is the amount of substantive evidence that's needed, and the only way to reduce the amount of needed substantive evidence (equal to the inherent risk) is to test controls. As such, when control risk is MAX, the RMM must always equal the inherent risk (IR).*

*When controls are tested & can be relied upon (are determined to be effective) it is a matter of professional judgment how much the RMM should be set lower than inherent risk (1 or 2 steps).*

*Auditors should assess RMM by assertion, if different. For example, if RMM is assessed at MOD for the existence assertion, but LOW for the rights & obligations assertion, then document "MOD – existence and LOW – rights & obligations".*

### **STEP 4: Design Substantive Testing**

Design a substantive testing strategy that addresses the relevant assertion (identified risk) in the portion of the line item that relates to that risk.

*Planning identifies where to audit (significant balances, classes of transactions & disclosures) what to audit for (relevant assertions), and how much to audit (RMM). The quantity and quality of evidence obtained by substantive tests needs to match the level of risk. The higher the risk of material misstatement, the greater evidence needed. "Greater evidence" could either be greater quantity of evidence, greater quality of evidence, or some combination of greater quality and quantity.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6210](#) – Planning Financial Statement Audits**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits Planning Guide](#)**

Record of Work Done:

### **(1) Inherent Risk (IR):**

Based on our understanding of the line item, we assessed inherent risk as follows for each relevant assertion and significant class of transactions:

# State of Washington

**Completeness - High**

**Valuation - High**

**Classification - High**

## **(2) Control Risk (CR):**

We assessed control risk as follows for each system and relevant assertion:

### **GASB Allocation of OPEB Amounts - Completeness, Valuation, Classification**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

## **(3) Risk of Material Misstatement (RMM):**

We considered both inherent and control risk and assessed the risk of material misstatement as follows for each relevant assertion and significant class of transactions:

**Completeness - HIGH**

**Valuation - HIGH**

**Classification - HIGH**

## **(4) Testing Strategy:**

We designed our substantive testing strategy based on our assessment of the risk of material misstatement. We plan to perform the following tests:

To address the following risks:

**Completeness** - Members are inappropriately excluded from, or included in, the census data

**Valuation** - Census data does not reconcile to (agree with) the employer's payroll and personnel records or is not properly accumulated (maintained) for active and inactive members, causing errors in the computation of deferred outflows, total OPEB liability, and/or deferred inflows; The actuary uses incomplete (missing) or incorrect census data, causing errors in the computation of total deferred outflows, total OPEB liability, and/or deferred inflows; The actuary uses inappropriate assumptions or actuarial methods that are not in conformity with GASB Statement No. 75

**We will rely on the SAO audit S1FinancialManagement-FS24 for the accuracy of census data**

As part of S1FinancialManagement-FS24, we perform a review of census data to verify the head count figures representing active members in the OPEB plan are accurate, complete, and agree to agency records. We also verify that OFM's calculation of OPEB

## State of Washington

amounts are based on the same head count data used by HCA's actuaries. We will reference this work and ensure that head count figures used in OFM's OPEB balance calculations agree.

**We will rely on the SAO audit S1FinancialManagement-FS24 for the review of the actuarial valuation**

As part of S1FinancialManagement-FS24, we perform a review and rely on specialists, OSA (prepares the OPEB actuarial valuation) and Milliman (determines estimates related to OPEB, transactions subsequent to the measurement date). We will reference this work and ensure that figures used in OFM's OPEB balance calculations for ACFR agree.

To address the following risks:

**Valuation** - Deferred outflows of resources and deferred inflows of resources and OPEB expense are not properly calculated and reported in accordance with GASB Statement No. 75

**Classification** - There is a risk that the allocation between funds is not representative of the agencies included in that roll-up fund

**We will re-perform OFM's OPEB balance calculations to determine if deferred inflows, outflows, total OPEB liability, and all OPEB components are properly valued and classified in accordance with GASB 75/GAAP:**

- STEP 1: Review OPEB audit (S1FinancialManagement-FS24) to ensure we can rely on allocation percentages based on head counts. Obtain head count data to determine allocation percentages for ACFR purposes. Review and adjust head count data for cash basis agencies to ensure amounts were appropriately recorded for GAAP statements.
- STEP 2: Re-calculate adjusted allocation percentages based on sub-object BD (represents actual employer medical contribution expenditures). Obtain BD expenditures from ACFR database. Add rollup fund and reporting fields to the data to determine ACFR allocation percentages.
- STEP 3: Calculate OPEB Balances by Roll-Up Fund and Posting Agency. Allocate statewide OPEB balances from the actuarial valuation performed by OSA. Verify total from calculations agree to OSA actuarial valuation.
- STEP 4: Tie out recalculated OPEB balances by roll-up fund and agency to AFRS data. Verify the financial statement balances agree to AFRS data and SAO's recalculation work.

We anticipate that these tests will provide sufficient appropriate audit evidence to address the assessed risk of material misstatement for relevant assertions in significant classes of transactions.

### I.5.PR.G - OPEB - Liability (Current & Noncurrent), Deferred Inflows, Deferred Outflows

<i>Procedure Step:</i>	Substantive Test
<i>Prepared By:</i>	BM2, 10/22/2024
<i>Reviewed By:</i>	RKM, 11/18/2024

# State of Washington

## Purpose/Conclusion:

### **Purpose:**

To determine the following:

- whether all non-current liabilities as of the end of the period were reported.
- whether non-current liabilities were reported at properly valued or calculated amounts.
- whether financial statements properly classify non-current liabilities in conformity with generally accepted accounting principles (GAAP).

### **Conclusion:**

We determined the following:

- all non-current liabilities as of the end of the period were reported.
- non-current liabilities were **not** reported at properly valued or calculated amounts. See issue at [V: OFM Allocation of OPEB Amounts (Part of ML)].
- financial statements properly classify non-current liabilities in conformity with generally accepted accounting principles (GAAP).

## Testing Strategy:

### **Completeness**

The following is a list of **considerations** for testing the completeness assertion for non-current liabilities. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

### **Long-Term Debt**

Review minutes or legislative proceedings and enactments, and inquire whether all debt bearing the name of the reporting entity or any of its component entities is identified and is properly disclosed in the financial statements and notes.

Confirm publicly-issued bonds by searching EMMA and/or the Washington State Department of Commerce sites.

*State agencies and local governments are required to report all bond issuances (including anticipation notes and privately placed debt) to Dept of Commerce per RCW 39.44.210. Bond underwriters and dealers are required by the SEC per 17 CFR 240.15c2-12 to report information on bond issuances to EMMA. Issuers are further required to post continuing disclosure requirements to EMMA. Dept of Commerce's Bond Clearinghouse can be accessed at: <https://fortress.wa.gov/com/buc/BondFormSearch.aspx> EMMA can be accessed at: <http://emma.msrb.org/Default.aspx>. NOTE: these sources may not be complete if issuers have not done required reporting.*

Confirm amounts outstanding with lenders or fiscal agents using blind confirmations. *Note: this test also evidences existence.*

Scan check register for vendors that may represent a lending institution or lessee and determine if payments made were for long term debt or capital leases.

# State of Washington

Review documentation for operating leases to determine if these should have been accrued as capital leases. *Note: this test also addresses the valuation assertion.*

Review contracts or inquire as to the existence of any guarantees or commitments related to the issuance of debt of other organizations.

Verify debt balances to source amortization schedules from authorizing resolutions or ordinances, agreements or issuance documents and verify all early retirements. *Note: this test only provides evidence about completeness of previously reported debt.*

**Net OPEB Obligations (for entities that have implemented GASB 45)** - Auditors should use the OPEB Audit Plan workpaper available in the Store for auditing OPEB liabilities.

**Pollution Remediation Obligations (for entities that have implemented GASB 49)** - Auditors should use the Pollution Liability Audit Plan workpaper available in the Store for auditing pollution remediation liabilities.

## **Classification**

The following is a list of **considerations** for testing the classification assertion for non-current liabilities. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

Review source documents to verify that non-current liabilities are obligations of the reporting fund, rather than some other fund.

Review journal entries that re-classify non-current debt.

To verify whether general obligation debt should be reported (in whole or in part) as a liability of a proprietary fund, review documentation and transactions for support of the intent and ability to pay general obligation debt from proprietary funds.

Trace amounts due in within one year per debt-repayment schedules to check that it was properly shown as a current liability. Note that lines of credit and demand debt (debt that is payable at any time upon demand of the holder) should be classified as a current liability.

## **Valuation**

The following is a list of considerations for testing the valuation assertion for non-current liabilities. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

Recalculate or review entity calculation of capital lease liabilities

Recalculate or review entity calculation of estimated long-term liabilities

Recalculate or review entity calculation of imputed interest on non-interest-bearing notes or other liabilities.

Recalculate or review entity calculation of accrued termination benefits (see GASB 47 for requirements)

Recalculate or review entity calculation of compensated absences liability (see GASB 16 for requirements). If reviewing the entity's calculation, compare the formulas used against the entity's policy; for instance, if an auditee pays 25% for accumulated sick leave

## State of Washington

upon retirement but not if the employee leaves for other reasons, we would expect the formula to incorporate projections of the proportion of employees continue employment until retirement.

Recalculate or review entity calculation of landfill closure and post-closure costs (see GASB 18 for requirements). If reviewing the entity's calculation, evaluate the formula for reasonableness; for instance, cost elements should include facilities and equipment, capping and post-closure monitoring. Verify there is an annual reevaluation of the costs by reviewing their documents supporting that the yearly cost estimate has been updated.

**Net OPEB Obligations (for entities that have implemented GASB 75)** - Auditors should use the GASB 75 OPEB Balances Baseline Testing and the corresponding GASB 75 Testing Strategy workpaper available in the Store for auditing OPEB liabilities.

**Pollution Remediation Obligations (for entities that have implemented GASB 49)** - Auditors should use the Pollution Liability Testing Strategy workpaper available in the Store for auditing pollution remediation liabilities.

Guidance/Criteria.:

**Add the Guidance/Criteria for each relevant assertion from the TeamStore. You may also include other resources that you used for testing.**

Record of Work Done.:

**Substantive tests performed to meet the Completeness assertion:**

**Identified Risk(s):** Members are inappropriately excluded from, or included in, the census data

We will rely on the SAO audit S1FinancialManagement-FS24 for the accuracy of census data. As part of S1FinancialManagement-FS24 we:  
performed a review of census data to verify the head count figures representing active members in the OPEB plan are accurate, complete, and agree to agency records  
verified that OFM's calculation of OPEB amounts are based on the same head count data used by HCA's actuaries

We will reference this work and ensure that head count figures used in OFM's OPEB balance calculations agree. Based on our review of testing procedures and results of the OPEB schedule audit, we determined we could place reliance on the procedures performed as part of SAO audit S1FinancialManagement-FS24. We determined the quality and quantity of evidence obtained was sufficient and appropriate to address ACFR risks.

**Testing Results**

We relied on SAO's audit S1FinancialManagement-FS24 for testing the completeness of head count related census data (for allocation purposes and data used by actuaries). We reviewed the following to address completeness risks:

# State of Washington

## Completeness of Census Data

We reviewed the S1FinancialManagement-FS24 issues and noted none impacted the completeness of census data. We determined the census data was complete and members were appropriately included in the census data.

## Completeness of Data Used in the Calculation of OPEB Balances

We reviewed procedures related to the work of specialists (OSA and Milliman, located in C.2). No exceptions were noted. We determined we could rely on the work performed by OSA and Milliman.

*No issues noted.*

## **Substantive tests performed to meet the Valuation assertion:**

**Identified Risk(s):** Census data does not reconcile to (agree with) the employer's payroll and personnel records, or is not properly accumulated for active and inactive members, causing errors in the computation of deferred outflows, total OPEB liability, and/or deferred inflows; The actuary uses incomplete (missing) or incorrect census data, causing errors in the computation of total deferred outflows, total OPEB liability, and/or deferred inflows; The actuary uses inappropriate assumptions or actuarial methods that are not in conformity with GASB Statement No. 75

We relied on the SAO audit S1FinancialManagement-FS24 for the accuracy of census data and actuarial valuation. As part of S1FinancialManagement-FS24 we:

- performed a review of census data to verify the head count figures representing active members in the OPEB plan are accurate, complete, and agree to agency records
- verified that OFM's calculation of OPEB amounts are based on the same head count data used by HCA's actuaries
- performed a review and relied on specialists, OSA (prepares the OPEB actuarial valuation) and Milliman (determines estimates related to OPEB, transactions subsequent to the measurement date).

## Testing Results

We reviewed OFM's OPEB balance calculations for ACFR, from "OPEB\_Worksheets\_2024\_.xlsx", to agree headcount and allocation percentages to audited schedules. Allocation percentages used in reporting ACFR related OPEB balances tied to S1FinancialManagement-FS24 without exception. Based on our review of testing procedures and results of the OPEB schedule audit, we determined we could place reliance on the procedures performed as part of SAO audit S1FinancialManagement-FS24. We determined the quality and quantity of evidence obtained was sufficient and appropriate to address ACFR risks. The allocation percentages used in ACFR reporting were based on complete and accurate census data (See C.1.2 in S1FinancialManagement-FS24) and actuary's assumption were appropriate based on our review of specialists, in conformity with GASB 75 (See C.2 in S1FinancialManagement-FS24).

*No issues noted.*

**Identified Risk(s):** Deferred outflows of resources and deferred inflows of resources and OPEB expense are not properly calculated and

# State of Washington

reported in accordance with GASB Statement No. 75

We re-performed OFM's OPEB balance calculations to determine if deferred inflows, outflows, total OPEB liability, and all OPEB components are properly valued and classified in accordance with GASB 75/GAAP.

## Testing Results

STEP 1: Review OPEB audit (S1FinancialManagement-FS24) to ensure we can rely on allocation percentages based on head counts. Obtain head count data to determine allocation percentages for ACFR purposes. Review and adjust head count data for cash basis agencies to ensure amounts were appropriately recorded for GAAP statements.

See details of review above. We confirmed allocation percentages used in ACFR reporting agree to the audited OPEB schedules. For measurement date (6/30/2023) this included 134,978 active and eligible employees. *No issues noted.*

STEP 2: Re-calculate adjusted allocation percentages based on sub-object BD (represents actual employer medical contribution expenditures). Obtain BD expenditures from ACFR database. Add rollup fund and reporting fields to the data to determine ACFR allocation percentages.

See [\[OPEB Adjusted Allocation Recalculation\]](#). We performed the following:

Obtained the FYE 06/30/2024 BD expenses from the ACFR database. See tab 'SAO ACFR Query BD\_FY24.'

We added reporting fields to the BD data through power query. We used OFM's tables that summarized financial statement reporting fields. We tied the tables to SAAM Chapter 75 to ensure the accuracy of the financial statement mapping. See [\[OPEB Power Query Process\]](#) for the steps we took to assign the appropriate reporting fields. See tab 'BD with Reporting Fields FY24.' for the results.

We summarized the BD expense report by agency, roll-up fund, and posting agency. See tab '23 BD Allocation %.' We used conditional formatting to identify agencies that reported in multiple funds. We manually calculated the percent of BD expenses reported by roll-up fund and posting agency for each agency. We ensured the accuracy of the BD reporting percentages tied to the number of listed agencies used for head-count allocations. We noted all agencies (state agencies and component units) were included. We identified the following component units that would have to be removed for ACFR reporting: 106 Washington Economic Development Finance Authority - FMZ 700A, 148 Washington State Housing Finance Commission - FMZ 700A, 599 Washington Health Care Facilities Authority - FMZ 700D

We used a power query to match the agency number as reported on our BD expense data to the allocation percent reported in the audited WA state-wide OPEB report (S1FinancialManagement-FS24, Schedule 1). We multiplied the BD allocation by the agency allocation to determine the adjusted allocation percentage. See tab 'Modified Allocation %.'

We summarized the adjusted allocation percentage by roll-up fund and posting agency and compared our calculation of the adjusted allocation percentages with OFM's adjusted allocation percentages. **We noted several differences between OFM's calculation and SAO's calculated adjusted percentages. OFM included the beginning balance of expenses coded to subobject BD in their calculation of allocations. This error caused variances in allocation percentages by rollup fund. OFM's modified allocated percentages used for reporting OPEB to ACFR are incorrect. This resulted in small percentage differences by opinion unit, which**

## State of Washington

caused reported amounts to differ. See tab 'Mod Allocation % Comparison.' See issue at [\[V: OFM Allocation of OPEB Amounts \(Part of ML\)\]](#). We determined the misstatement effect as part of step 4 below.

STEP 3: Calculate OPEB Balances by Roll-Up Fund and Posting Agency. Allocate statewide OPEB balances from the actuarial valuation performed by OSA. Verify total from calculations agree to OSA actuarial valuation.

See [\[OPEB Balances by Adjusted Allocation and Rollup Fund\]](#). We performed the following:

We used our recalculation of the modified allocation percentages from the Adjusted Allocation recalculation workbook [\[OPEB Adjusted Allocation Recalculation\]](#) to recalculate total OPEB balances. We carried forward the "Mod Allocation % Comparison" tab (calculated above) and the 2016-2023 head counts from the State of Washington's OPEB Schedules to use in our workbook.

We aggregated adjusted percentage allocations for fiscal years 2016-2023 in tab 'Modified Allocation % Fund&Func' and inquired about any changes or new reporting in rollup fund/posting agencies with Kennesy Cavanah, OFM Statewide Accountant.

Next, we calculated change in agency proportionate share deferred outflows and inflows for FY24. See tab 'FY 2024 DO-DI Determination.' For determining allocation of OPEB balances within a government, GASB 75 prescribed OPEB allocation methodologies must be consistent with pension allocations. We calculated the change in agency proportionate share based on the methodology used for pensions as prescribed by GASB 68, 74, and 85. We used audited OPEB amounts from S1FinancialManagement-FS24 and OSA report amounts to allocate based on the adjusted allocation % for rollup fund/posting agency.

Once change in agency proportionate share was determined, we calculated amortization schedules and balance of deferred outflows and inflows as of 06/30/2024. We noted OFM and our calculations used a nine year amortization period which was the actuarial determined average expected remaining service life of all active and inactive members (as prescribed by GASB 75). See tab 'DO-DI Amort Sched.'

We calculated all reported OPEB balances (including all elements of deferred outflows and inflows) by roll-up fund and posting agency. See tab 'OPEB Balances by Rollup Fund.' Note, we calculated the OPEB liability by short-term and long-term amounts. Short-term OPEB liabilities totaled the transactions subsequent to the measurement date. Long term OPEB liabilities were calculated as total OPEB liability less the short term liability.

STEP 4: Tie out recalculated OPEB balances by roll-up fund and agency to AFRS data. Verify the financial statement balances agree to AFRS data and SAO's recalculation work.

See [\[AFRS Tie Out to OPEB Recalculation\]](#). We performed the following:

We used our calculation of OPEB balances by roll-up fund and posting agency from the steps above, tab 'OPEB Balances by Rollup Fund.' We aggregated OPEB balances by roll-up fund using a pivot table in tab 'Pivot - Balances by Rollup Fund.' We identified the amounts allocated for cash basis component units that would need to be adjusted since they are not included in AFRS (worksheet adjustments). Those amounts are posted in rollup fund FMZ for the following agencies:

106 - Washington Economic Development Finance Authority

148 - Washington State Housing Finance Commission

## State of Washington

599 - Washington Health Care Facilities Authority

We ran a query for all OPEB balances in the ACFR database. See tab 'AFRS GL Query 2024.' We compared OPEB amounts by roll-up fund in tab 'AFRS Balance to OPEB Sched.' We tied out balances by general ledger accounts to ensure our calculations by roll-up fund were correct. We also tied out significant balances as documented in the leadsheet to ensure our re-calculation tied to the reported balances. We identified variances due to OFM using incorrect allocation percentages by rollup fund for ACFR reporting. This resulted in variances at the opinion unit level for all balances identified in the leadsheet. We determined 6 balances across opinion units were misstated by amounts above their applicable floor. See issue at [V: OFM Allocation of OPEB Amounts (Part of ML)]. This included the following:

Statement of Net Position (Government Wide) - Business-Type Activities:

Long Term Liabilities Due in More Than One Year (Other Post Employment Benefits Obligations) was overstated by \$7.05 million

Deferred Inflows of Resources (OPEB) was understated by \$8.63 million

Statement of Net Position (Proprietary Funds) - Health Insurance:

Other Long Term Liabilities - Noncurrent (Other Post Employment Benefits) was overstated by \$155 thousand.

Statement of Net Position (Proprietary Funds) - Higher Education Student Services:

Other Long Term Liabilities - Noncurrent (Other Post Employment Benefits) was overstated by \$8.75 million

Deferred Outflows of Resources (OPEB) was overstated by \$946 thousand

Deferred Inflows of Resources (OPEB) was understated by \$7.00 million

### **Substantive tests performed to meet the Classification assertion:**

**Identified Risk(s):** There is a risk that the allocation between funds is not representative of the agencies included in that roll-up fund

We re-performed OFM's OPEB balance calculations to determine if deferred inflows, outflows, total OPEB liability, and all OPEB components are properly valued and classified in accordance with GASB 75/GAAP.

### **Testing Results**

See testing results above for steps performed (steps 1 through 4). Amounts appeared to be reported properly as short and long term (in conformity with GAAP), however, our testing identified variances in reporting at the opinion unit level as a result of inaccurate allocations for rollup funds. We identified 6 balances across opinion units that were misstated. OPEB balances were not representative of the rollup funds and agencies included. See issue at [V: OFM Allocation of OPEB Amounts (Part of ML)].

### **I.6.PRG - Long & Short Term Liabilities: Bonds**

*Procedure Step:* Summary & Conclusion

# State of Washington

*Prepared By:* JAG, 10/1/2024  
*Reviewed By:* RKM, 11/23/2024

## Purpose/Conclusion:

### **Purpose:**

To evaluate risk assessments and the sufficiency and appropriateness of evidence obtained based on results of substantive work.

### **Conclusion:**

We determined that **no** modifications were necessary to inherent risk, control risk, or the risk of material misstatement as assessed in planning.

We also determined that evidence obtained was sufficient and appropriate in response to the risk of material misstatement.

## Testing Strategy:

Auditors are **required** to evaluate conclusions for substantive testing as follows:

*Auditors may wish to use the optional Lead Sheet available in the Store to summarize testing related to each balance and assertion.*

**1.** Determine whether the results of substantive testing indicate a need to modify the inherent risk assessment (IR), control risk assessment (CR), risk of material misstatement (RMM) or other aspects of planning (such as material balances or assertions). If so, document changes and consider the need for additional testing.

*If the results of substantive testing indicate a need to change control risk, auditors should also update the **Permanent File** by either correcting the documentation or by adding an update section describing changes to the top of the record of work done. For all changes to IR, CR, or RMM the **Material Balances** spreadsheet should be updated.*

*More significant changes to other aspects of planning (such as material balances or assertions) should be referenced in this step and documented in detail in the **Changes to FS Audit Plan** step.*

**2.** Evaluate whether the quality and quantity of evidence obtained is sufficient and appropriate in response to the risk of material misstatement. In making this determination, auditors should evaluate:

Information to be used as audit evidence:

## State of Washington

- Does evidence relate to the population, period of time and risk (assertion and “what could go wrong” from the Material Balance Spreadsheet)? If there are any gaps or uncertainties in the logical connection between the evidence and conclusions, is there a documented consideration and explanation?
- Are the sources of information sufficiently reliable and appropriate for the risk (whether internal to the government, external, or auditor developed)? If key information is not from a sufficiently reliable source (for example, inquiry), then is it corroborated by information that is?
- Are there any concerns about accuracy, completeness, authenticity, or bias in information? If so, did the auditor perform sufficient procedures to confirm reliability of that information?
- Is information precise enough to catch if misstatements exceeded the tolerable level?
- Is information detailed enough to conclude on whether or not there were misstatements?
- Was there any information that appeared contradictory or inconsistent? If so, was there a documented response to the inconsistencies or doubts about the reliability of evidence?

### Results:

- How much misstatement was identified by testing, and the likelihood and magnitude of further potential misstatement?
- How did misstatements occur and how often might they occur again in the population?
- Were misstatements caused by control deficiencies or circumvention of controls?
  - If control deficiencies, is there a need to re-evaluate our understanding of controls in the [Permanent File](#) folder or assessment of control risk?
  - If circumvention, the [Management Override of Controls](#) step should address or reference this area. Auditors should also consider whether a fraud risk has been identified.
- Did tests identify a different level or type of risk than the planned audit response was designed to address?
- If likely misstatements are identified, are further procedures necessary to improve the precision of our estimate?

*To support the overall evaluation of audit risk and provide a basis for concluding on the overall sufficiency and appropriateness of evidence in the [FS Summary & Report](#) step, auditors should conclude in each area whether the auditor continues to believe that the tests performed and quality and quantity of evidence obtained are commensurate with RMM for all relevant risks (the “what could go wrong”, in the [Material Balances](#) spreadsheet).*

If the auditor determines that evidence is not sufficient or appropriate, additional substantive testing should be done. If sufficient, appropriate evidence is not available for audit, the AIC should discuss the effect on our audit report with the AAM and AM.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

# State of Washington

## SAO Audit Policy [6310](#) – Determining the Nature, Timing and Extent of Substantive Testing

## SAO Audit Policy [3210](#) – Audit Evidence

Record of Work Done:

Based on test results, we re-evaluated risk assessments, procedures, evidence obtained and conclusions as follows:

### **(1) Do the results of substantive tests indicate a need to modify our risk assessment (IR, CR and RMM)?**

We determined the results of substantive tests do not indicate a need to modify our risk assessment (IR, CR and RMM).

### **(2) Was the quality and quantity of evidence obtained sufficient and appropriate?**

We determined the quality and quantity of evidence obtained was sufficient and appropriate.

### **I.6.PRG - Long & Short Term Liabilities: Bonds**

*Procedure Step:* Understanding of Line Item

*Prepared By:* JAG, 5/3/2024

*Reviewed By:* RKM, 6/18/2024

Purpose/Conclusion:

### **Purpose / Conclusion:**

To gain an understanding of the line item and confirm the scope of testing as documented in the Significant Account Matrix.

### **Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

# State of Washington

## **STEP 1: Prior Audit Exceptions**

Document any exceptions noted during the prior audit. Follow-up to determine how the agency has responded to or corrected the issue, unless this work is anticipated as part of the testing strategy.

## **STEP 2: Analyze Composition and Changes of Line Item**

Include link to the line item leadsheet. This will be completed at the end of the audit. Leadsheet analysis should be documented in this spreadsheet.

Inquire with agency staff about the activities and transactions that make up the balance and any changes to those activities or transactions in relation to the prior year.

Determine relevant classes of transactions or account balances within the line item to analyze (such as agencies, funds, programs, departments, accounts, and/or objects), and use AFRS to create trends of those elements. This step should not include any specific dollar amounts associated with the line item.

Evaluate trends to identify:

- (1) What classes of transactions or account balances are primary to the identified risk. Auditors should specifically consider what elements are primary to the line item (comprising a large percentage of the line item), and which elements the identified risk would apply to, and which elements might be most susceptible to the identified risk (having a high risk of non-trivial misstatement for a relevant assertion, considering likelihood and impact of potential for misstatement).
- (2) What changes are primary to the identified risk, if applicable. Auditors should specifically consider whether the overall change to the line item from the prior year was significant, what elements were the primary drivers of overall change, whether any elements changed significantly from the prior year, and which changes (if any) might relate to the identified risk.
- (3) Any unusual or unexpected elements, amounts, or changes that may indicate a risk, whether the one identified in planning or a new one that may need to be considered for a change to the plan.

**Consider** other procedures to gain an understanding of the line item, such as review of key policy documents, review of program information or reports, inquiry of staff, budget information, or other analytical procedures.

## **STEP 3: Update Significant Account Matrix**

Based on your understanding of the line item, update the Significant Account Matrix with final conclusions on the agencies covered, account description, significant accounting systems, and risk (what could go wrong and relevant assertions). The account description should reflect the significant transaction streams or account balances relevant to the risk.

*The description of agencies, significant accounting systems, and what could go wrong in the Significant Account Matrix constitute the overall scope of substantive testing.*

*A transaction stream is significant based on the potential for misstatement. This is often due in part to its size (ie: comprising a large*

## State of Washington

*percentage of the total line item), but is ultimately a judgment about the susceptibility to the identified risk (for example, when the risk is understatement a small or omitted account may hold the most potential for the largest misstatement).*

*Significant accounting system(s) are those that contain key controls over significant classes of transactions included in the line item. Control systems identified in this step must match the Significant Account Matrix and have a separate control understanding documented.*

*Talk with the AIC if you identify any changes to the Significant Account Matrix.*

Guidance/Criteria:

Record of Work Done:

### **(1) Prior Audit Exceptions:**

We did not identify any prior audit exceptions.

### **(2) Composition & Change Analysis:**

Line Item Lead Sheet: [\[Line Item Lead Sheet\]](#)

### **Governmental Activities - Long Term Liabilities Due Within One Year (Bonds)**

### **Governmental Activities - Long Term Liabilities Due in More Than One Year (Bonds)**

The Office of the State Treasurer (TRE) manages the state's debt as one of their core functions. The State issues debt via bond sales to finance some of the state's major capital and transportation projects and issues certificates of participation (COPs) to finance real estate and equipment for state agencies and local governments.

### **Composition of the Line Item and Planned Audit Coverage:**

The following GL account balances roll up into the line item: \*Note: GL Codes listed in [SAAM 75.40.20](#)

Long-term Liabilities Due Within One Year (Bonds):

**GL 5161 - General Obligation (GO) Bonds Payable**

**GL 5162 - Revenue Bonds Payable**

**GL 5164 - Zero-Coupon (GO) Rate Bonds Payable**

**GL 5169 - Other Bonds Payable**

The bolded GL accounts (GLs 5161, 5162, 5164, 5169) have been selected for audit, providing 100% coverage of the line item.

## State of Washington

Long-term Liabilities Due in More than One Year (Bonds):

GL 5212 - Accreted Interest Payable

**GL 5261 - General Obligation Bonds Payable**

**GL 5262 - Revenue Bonds Payable**

GL 5264 - Zero-Coupon GO Bonds Payable

GL 5269 - Other Bonds Payable

GL 5273 - COP Notes Payable

GL 5297 - Fees Payable

GL 5299 - Other Obligations

The bolded GL accounts (GLs 5261, 5262) have been selected for audit, providing 98.14% coverage of the line item. TRE shows a balance in GLs 5212, 5264, and 5297, but their inclusion does not significantly change the audit coverage, so it is omitted to prevent over-auditing.

### **(3) Updates to Significant Account Matrix:**

No changes required.

### **I.6.PRQ - Long & Short Term Liabilities: Bonds**

*Procedure Step:* Controls - TM\$

*Prepared By:* JAG, 4/29/2024

*Reviewed By:* RKM, 8/12/2024

Purpose/Conclusion:

#### **Purpose:**

To gain an understanding of internal controls.

#### **Conclusion:**

We gained an understanding of internal controls as documented in the record of work done.

Testing Strategy:

**The following procedures are required for all material systems:**

## State of Washington

1. List the financial statement balance(s) and relevant assertion(s) addressed by the understanding.
2. Gain an understanding of the internal control process, identify how transactions are recorded in AFRS, identify key controls over relevant assertion(s), and note any control weaknesses.
  - In gaining an understanding of controls, consider the overall understanding of State-Level control elements as documented in the "State-Level Controls" step as they relate to this particular system.
  - Identify controls systems covering all relevant assertions for all significant classes of transactions.
  - Standards require the auditor to gain an understanding of the significant accounting system(s) that contain key controls over significant classes of transactions included in the line item.
  - Control systems identified in this step must match the Material Account Matrix and have a separate control understanding documented.
  - Talk with the ACFR Specialist or AIC if you identify different systems than the ones anticipated in the Material Account Matrix.

For each material system, auditors must document:

- A brief outline of the transaction flow from beginning to end.

- An expanded description of key controls.

- Business processes relevant to financial reporting of the relevant assertion for the material balance. Processes should encompass automated and manual procedures by which transactions or events are identified or initiated, authorized as needed, recorded, processed and corrected as needed.

- Original accounting records and how records are rolled-up to intermediary ledgers and transferred to the general ledger (AFRS) or financial statements.

- Detailed descriptions of key controls. Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

The following is information to **consider** when identifying key controls and transaction flow.

"Key controls" refer to the few controls that together provide reasonable assurance that material misstatements will be prevented or detected and corrected. This is contrasted with ancillary or supporting controls, which – although helpful and recommended – would provide less than reasonable assurance by themselves.

The focus of the write-up is on the key controls. Key controls should be specifically identified (as "key controls") in the write-up. This can be done in whatever way the auditor prefers, so long as it is obvious. Details that the auditor should document regarding key controls may include:

- Who or what initiates the control

## State of Washington

When (or how often) is the control applied

Who performs the control

As needed, the experience, knowledge and attitude of the person applying the control

Detailed description of the control process or activity. For example, if the control is a review: what exactly is reviewed, what is the reviewer looking at or for and what are the reviewer's criteria?

How the key control is documented or evidenced

If not obvious from the description, how the control prevents or timely detects and corrects misstatements

Any exceptions or alternative processing to the normal process

What happens when misstatements or issues are identified by the control

The "transaction flow" refers to the process by which transactions are initiated, authorized, recorded, processed and reported (as applicable). Outlining the transaction flow gives context to key controls, especially how transactions become subject to controls in the first place. If a control inherently ensures that all applicable transactions are included (ex: bank reconciliation where the assertion is existence), the auditor may decide to just start the write-up with the initiation of the control procedure and go from there.

Elements of the transaction flow are defined informally as follows:

*Initiation:* How are transactions initiated?

*Authorization:* How are transactions and accounting record maintenance authorized?

*Recording:* How are transactions or balances identified and recorded in financial accounting systems?

*Processing:* How are the transactions or balances processed after they are recorded (if at all)? Processing may be manual or automated and may occur at a subsidiary system level or at the general ledger level.

*Reporting:* How are records translated into the financial statements? This part of the transaction flow extends the understanding to the actual financial statements that the audit is opining on. Since we already document an understanding of the financial reporting process in general, it is usually enough to simply reference this overall understanding. However, if there are important steps unique to the covered balances, it may be more appropriate to mention them here.

Although transaction flow is a good way to think about understanding and documenting a control system, auditors should not worry too much about documenting "each element, in order" because often elements may be combined, not noticeable, not applicable or occur in a different order.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

# State of Washington

## SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk

### [Financial Statement Audits](#) Planning Guide

Record of Work Done:

Internal controls in the Treasury Management System (TM\$) address the following balance(s):

**Governmental Activities - Long Term Liabilities Due Within One Year (Bonds)**

**Governmental Activities - Long Term Liabilities Due in More Than One Year (Bonds)**

For the following assertions:

**Completeness:** That all bonds payable amounts occurring during the period are not identified and recorded.

**Valuation:** Since bond payable balances are constantly changing due to new issuances and payment of principal and interest, there is a risk that bonds payable amounts are reported at incorrect amounts.

**Classification:** Amortization schedules calculating short and long term portions could be misstated or not updated resulting in bonds that are incorrectly classified between short and long term.

**Auditor's Note:** The ROWD references long-term liabilities due within one year and long-term liabilities due in more than one year. "Long-term liabilities due within one year" describes the balance on the State's financial statements representing the current portion of issued bonds and should not be labeled as a short-term liability. OFM does not use GL 5121 (Matured Bonds Payable) to record bond balances issued by TRE maturing in less than 1 year. SAAM lists all "GL 516X" accounts as "Short-term Bonds Payable," which includes GL accounts 5161, 5162, 5164, and 5169. When discussing the current portions of long-term liabilities with TRE staff, use the term "short-term bonds payable" to describe the current portion to avoid confusion.

### **Gain an Understanding of Internal Controls**

To update our understanding of internal controls, we conducted a Teams meeting on 4/25/24 with: Leslie Yonkers, Debt Financial Officer and Austin Goble, Bond Program Manager. TRE referred us to their "Debt and Credit Analysis" covering high level information regarding bonds here: [\[2024 Debt and Credit Analysis - For The Web - Final.pdf \(wa.gov\)\]](#). The report includes additional details about the types of bonds issued, credit ratings, other obligations, and borrowing costs. Unless otherwise noted, TRE uses the Treasury Management System (TM\$) as their accounting system over the line items.

### **Debt Issuance Processes:**

#### **Phase 1A - Bond Sale Process**

# State of Washington

## Non-COP (Certificate of Participation) Bonds:

TRE's debt management staff track the Legislative Session to determine which programs will require new debt issuance. Once the Session is over, Austin Goble, Bond Program Manager, prepares all the details to be input into TM\$ and Leslie Yonkers, Debt Financial Officer, along with Austin reviews bond details for accuracy. Austin then looks at the cash flow estimate for fund 057 (State Building Construction Account). The cash flow estimate reconciles new appropriations with agency funds appropriated and spent from fund 057 for maintenance and construction projects. For the three agencies that have individual authority to spend from a specific bond authorization (Department of Transportation, Department of Ecology, and Department of Commerce), Leslie asks the agencies to estimate their cash flow needs for the next six months. In addition, the Secretary of the Department of Transportation sends a letter requesting bond proceeds for its financial needs before a bond sale.

## COP Bonds:

State agencies and municipalities enter into COPs and because they do not benefit the state as a whole, they do not count towards the state's debt limit. COP bonds do not require legislative approval unless it is for constructing a building or a large service based project. COP bonds typically have a shorter maturity date. The financed project or leases determine the COP bond amount, which the bond staff enter into TM\$. COP bond sales follow the same process as other bond sales (described below) with exception to the approval process (described above).

## All Bonds:

The State sold the following bonds in fiscal year 2024:

- July 25 General Obligation Bonds (Taxable), 2024T
- July 25 MVFT/VRF General Obligation Bonds, 2024B
- July 25 Various Purpose General Obligations Bonds, 2024A
- October 26 Certificates of Participation, Series 2023C
- November 7 MVFT/VRF General Obligations Refunding Bonds, R-2024B
- November 7 Various Purpose General Obligation Refunding Bonds, R-2024A
- January 23 MVFT/VRF General Obligation Bonds, 2024D
- January 23 Various Purpose General Obligation Bonds, 2024C
- February 26 Certificates of Participation, 2024A
- March 26 MVFT/VRF General Obligation Refunding Bonds, R-2024C
- June 25 Certificates of Participation, 2024B
- June 25 Various Purpose General Obligation Refunding Bonds, R-2025A
- June 25 General Obligation Bonds (Taxable), 2025T
- June 25 MVFT/VRF General Obligation Bonds, 2025B
- June 25 Various Purpose General Obligation Bonds, 2025A

Austin works with the state's municipal advisors to determine a good time for bonds to enter the market. The State typically issues new money bonds on a semiannual basis. For 'advance' refundings, policy sets the savings threshold to a present value savings of at least five percent of the

## State of Washington

principal amount of the refunding debt issued. A 'current' refunding transaction requires a graduated present value savings depending on the years between call and final redemption, which varies between 1% and 5%. The State Finance Committee may, and regularly, grants the Treasurer the authority to enter the market without pre-approval for new money and refunding bond issuance, through a resolution, as provided by a 2010 amendment to [RCW 39.42](#). Public Law 115-97 eliminated the federal tax exemption for interest income earned on advance refunding bonds for any municipal bond issued after tax year 2017.

When a bond is ready to be issued, Leslie Yonkers inputs the agency request for bond proceeds into TM\$. Austin Goble reviews and adjusts as necessary prior to sending it to state's the bond counsel. Austin will compile the chapters, laws and TM\$ authorization numbers and forwards to the bond counsel to double check that the requests are within the bond authority. The bond counsel drafts a resolution for the State Finance Committee, who reviews applicable laws and regulations, IRS rules, and other legal aspects of the bond issuance for the state. At the same time, the municipal advisors or TRE, in cooperation with the municipal advisors, prepare all the preliminary numbers, such as level of debt service. Typically, TRE prepares preliminary work and the municipal advisors review. For refundings, the municipal advisors prepare preliminary work and TRE reviews.

### **Phase 1B - Preparation for Bond Issuance**

When the bond counsel finishes writing the resolution and the municipal advisors and TRE finalize the preliminary numbers, Austin reviews the resolution to ensure they followed all applicable rules and regulations. Austin uses DBC Finance, an external municipal finance sizing and structuring software, to recalculate the numbers and see if they agree with the municipal advisors' amounts.

The state's Disclosure Council prepares the "Preliminary Official Statement" (POS) in conjunction with the Deputy Treasurer, Jason Richter, Debt Management division. TRE requests input regarding the correctness and completeness of the document from various state agencies, who then certify their review in writing. Dawn Leopardo, Debt Program Analyst, prepares and Austin Goble confirms the debt summary tables for Appendix A. TRE's Assistant Attorney General, Municipal Advisors, Bond Counsel, Disclosure Counsel, Deputy Treasurer, Debt Management division, Austin, and Leslie each receive a copy of this POS to review for format and substance. When approved, Whitney Trumbly, Compliance Officer, ensures the POS is posted on TRE's website and was sent electronically to ImageMaster's MuniOS distribution platform. The POS serves as the prospectus for underwriters and investors.

#### Negotiated Bond Sales (infrequent, specialized sale)

Negotiated bond issues occur when a bond is specialized or has a unique feature that appeals to a very limited market (e.g. when triple pledge bonds are issued with which the general investing public is not familiar). For a bond sale using the negotiated method, instead of receiving bids from underwriters, TRE posts a request for qualifications and request for proposals to hire underwriters who will underwrite the bonds, creating a pool of candidates. TRE conducts most bond sales on a competitive basis unless there are unique circumstances that would require the sale to be executed via the negotiated sale method.

#### Competitive Bond Sales (more frequent) – Winner is Lowest True Interest Cost (TIC)

All bidders for a competitive sale are pre-registered with i-Deal Prospectus (and its sale platform, "Ipreo"). On the day of the competitive bond sale, Ipreo invites underwriters to submit bids. TRE announces the winner based on who has the lowest TIC. All of the bids and the TIC % are posted on TRE's website at: [\[Bond and COP Sale Results | Office of the Washington State Treasurer\]](#).

TRE holds bond sales semi-annually. The State Finance Committee approval of the sales are open to the public. If there are multiple series or bid

## State of Washington

groups, each bid series is scheduled 15 to 30 minutes apart from each other. Austin shares the incoming bids via Teams or Zoom for everyone to observe. Debt Management members, Bond Counsel, and Municipal Advisors attend the sale virtually. Ipreo displays the Bidder Name and the TIC computed by the system from lowest to highest. TRE staff and municipal advisors verify the TIC to ensure it is correct prior to awarding the apparent winning bidder (the one with the lowest TIC). Once staff and advisors confirm the calculations and compliance with bid parameters, TRE selects and notifies the bidder with the lowest cost. A 90 minute deadline for wiring the good faith deposit starts following notification sent to the underwriter via Ipreo. Leslie receives the winning bidder's contact information from the municipal advisor and emails them information for wiring the good faith deposit. Leslie periodically logs into the bank account to see if winners wired the deposit. Austin and the other municipal advisors can resize or adjust bonds to meet proceeds requirements and desired debt structure (e.g. level debt service).

Leslie prepares the A8 form to record the good faith deposit and Stephanie Richardson, COP Financial Analyst, reviews it. Once reviewed, the Deputy Treasurer of Debt Management, Bond Program Manager (Austin), and Disclosure Counsel prepare the bond sale "Final Official Statement." Whitney ensures it is printed and posted on TRE's website while the bond disclosure counsel sends an electronic copy to ImageMaster. The municipal advisors send the closing letter to the underwriter. TRE also posts final bond sale information to the [EMMA website](#), which is an additional measure of transparency above TRE's required level of public disclosure.

Leslie then prepares a spreadsheet to determine the allocation of the bond proceeds, the underwriter's discount, and the issuance costs to the different agencies/funds. Austin reviews the spreadsheet for accuracy and that it matches the municipal advisors' numbers and the closing memo. Leslie also uses the spreadsheet to track and reconcile prepared A8 forms and allocates the bond proceeds to the correct funds.

### **Phase 2 - Receipt of Bond Sale Proceeds**

The bond purchasers (underwriters) transfer bond proceeds, less the underwriter's discount, to TRE about two weeks after the sale. The wire must match the closing memo. Leslie prepares the A8 form in TM\$ to record the receipt of bond proceeds and allocate the net proceeds to the appropriate funds. TM\$ uploads these transactions to AFRS automatically. Leslie runs the Enterprise report afterward to ensure that cash was properly posted to the recipient funds on a monthly basis in TM\$ (**Key Control 1 - Valuation, Completeness, and Classification**). Dawn prepares tables for TM\$ based on final numbers provided by the municipal advisors. Austin reviews the tables for accuracy, uploads the data to the TM\$ database, and creates new bond payment amortization schedules. Dawn then verifies the data imported into TM\$ by Austin for accuracy and completeness against all originally prepared forms (**Key Control 2 - Valuation, Completeness, and Classification**).

### **Phase 3 - Bond Debt Service Payment**

US Bank, the Fiscal Agent, posts monthly payments due for the following month on its website. This amount includes interest and principal for all bonds issued. Leslie downloads this invoice (CSV file) to prepare for payment. The invoice details the scheduled payment for State of Washington Bonds, including refunded bonds being paid by an escrow bank. US Bank publishes the invoice approximately 15 days prior to the due date of the payments.

Leslie imports the CSV file from US Bank into TM\$ and runs a "TRE to US Bank" reconciliation report. She pays the amount stated on US Bank's invoice unless the reconciliation identifies significant variances between the two sources. Typically the reconciliation shows a difference of only a few cents (**Key Control 3 - Completeness and Valuation**). To fix significant variances, Leslie emails her contact at US Bank to reconcile with the bank. Austin would work with Leslie to ensure the fix correctly remedies the issue.

## State of Washington

Leslie forces TM\$ to automatically prepare four main types of JVs:

- JV for an ACH wire that pays US Bank from various debt service funds on the payment date.

- JV to transfer same day debt service through the general fund (done for: DES, OOSPI, UW, WSU, and DOT).

- JV to reimburse the general fund from agencies required to do so (see above bullet).

- JV for payments made on principle in addition to interest payments, which reduces the principle outstanding in fund 999 - general long term debt account.

Stephanie Richardson, COP Financial Analyst, reviews and approves the JVs and reviews the payment, and the Assistant or Deputy Treasurer approves the debt service payment. The Cash Management division receives approved forms and sets up a 2 day ACH file to send out the money. TRE maintains all of these transfer documents in PDF. TRE saves these PDFs for their full retention length (33 years).

### **How transactions are recorded in AFRS:**

Leslie prepares all of the monthly transactions in TM\$ (refunding, debt service payments, etc.) that are related to the calculation of the current bond payments which effects the long-term liabilities (due within one year) and long-term liabilities (due in more than one year). She prepares the batches in TM\$ for the reconciliation to AFRS and Stephanie reviews and approves them. This reconciliation to AFRS ensures that the amount in AFRS the long-term liabilities (due within one year) and long-term liabilities (due in more than one year) matches the amortization schedules in TM\$ for all bond issues. Once approved, TM\$ releases the batch and operations uploads them into AFRS as a part of end-of-day processing. Leslie receives the "In Process Report" (exception report) on the following day which she uses to ensure that all transactions posted properly in AFRS (**Key Control 4 - Completeness and Classification**). The exception report runs every morning and only provides exceptions if an error occurs. The exception report most commonly identifies miscoded items. Leslie and Stephanie, as needed, updates information in AFRS to resolve any exceptions.

### **Key controls are as follows:**

**Key Control 1** - The Debt Financial Officer prepares the A8 form in TM\$ to record the receipt of bond proceeds and allocate the net proceeds to the appropriate funds. TM\$ uploads these transactions to AFRS automatically at the end of the day. The Officer runs the Enterprise report afterward to ensure that cash was properly posted to the recipient funds monthly in TM\$ (**Valuation, Completeness, Classification**).

**Key Control 2** - The Debt Program Analyst prepares tables for TM\$ based on the final numbers report package prepared by the state's municipal advisors. The Bond Program Manager reviews the tables for accuracy, and updates TM\$, which creates new bond payment amortization schedules. The Analyst then verifies the data imported into TM\$ by the Program Manager for accuracy and completeness against all originally prepared forms (**Valuation, Completeness, and Classification**).

**Key Control 3** - To process monthly bond service payments, the Debt Financial Officer imports the CSV file from US Bank into TM\$ and runs a "TRE to US Bank" reconciliation report. The Officer pays the amount stated on US Bank's invoice unless the reconciliation identifies significant variances between the two sources. Typically the reconciliation shows a difference of only a few cents (**Completeness and Valuation**).

**Key Control 4** - The Debt Financial Officer prepares all of the monthly transactions in TM\$ (refunding, debt service payments, etc.) that are related to the calculation of the current bond payments which effects the the long-term liabilities (due within one year) and long-term liabilities (due in more than one year). The Officer prepares the batches in TM\$ for the reconciliation to AFRS and the COP Financial

## State of Washington

Analyst reviews and approves them. This reconciliation to AFRS ensures that the amount in AFRS the long-term liabilities (due within one year) and long-term liabilities (due in more than one year ) matches the amortization schedules in TM\$ for all bond issues. Once approved, TM\$ releases the batch and operations uploads them into AFRS as a part of end-of-day processing. The Officer receives the "In Process Report" (exception report) on the following day which she uses to ensure that all transactions posted properly in AFRS. The exception report runs every morning and only provides exceptions if an error occurs **(Completeness and Classification)**.

### Noted Weaknesses are as Follows:

None.

### I.6.PRG - Long & Short Term Liabilities: Bonds

*Procedure Step:* Key Control #1 - TM\$ (Manual)

*Prepared By:* JAG, 4/29/2024

*Reviewed By:* RKM, 6/18/2024

Purpose/Conclusion.

#### **Purpose:**

To confirm the process to record a bond sale and its associated receipt of funds (key control #1 for TM\$) in order to assess control risk.

#### **Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy.

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

## State of Washington

*A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency.*

***All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.***

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood*

## State of Washington

*of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

Guidance/Criteria.:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done.:

# State of Washington

## **Key Control 1 - (Valuation, Completeness, Classification)**

The Debt Financial Officer prepares the A8 form in TM\$ to record the receipt of bond proceeds and allocate the net proceeds to the appropriate funds. TM\$ uploads these transactions to AFRS automatically at the end of the day. The Officer runs the Enterprise report afterward to ensure that cash was properly posted to the recipient funds monthly in TM\$.

The understanding for this system is documented above in the "Controls - TM\$" step.

### **1. Confirmation of Key Manual Control:**

We reviewed a Cash Receipt (A8) for \$739,727,782.45 for VP GO Bonds (Taxable) Series 2024C, sold January 23, 2024. Leslie Yonkers, Debt Financial Officer, prepared and signed the A8 on 1/26/2024, Stephanie Richardson, COP Financial Analyst, approved/signed it on 1/30/2024, and validated in a batch process on 2/7/2024.

We reviewed the allocation spreadsheet "2024CD Allocation" prepared by Leslie Yonkers, Debt Financial Officer, for the 2024C bond proceeds accounting allocations and supporting information. **No issues Noted.**

We reviewed an AFRS report as of 4/17/24 that has two transactions that were posted to help clear up an unbalanced in-process reconciliation report. There was a difference of \$1,203.32 and \$319.38 between the OST and Agency. The AFRS report shows that the cash was properly posted and the unbalanced amount is cleared. **No issues noted.**

### **Noted Weaknesses are as follows:**

None

### **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **3. Control Risk at LOW - Test Key Manual Control:**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

## **I.6.PRГ - Long & Short Term Liabilities: Bonds**

*Procedure Step:* Key Control #2 - TM\$ (Manual)

*Prepared By:* JAG, 4/29/2024

*Reviewed By:* RKM, 6/18/2024

# State of Washington

Purpose/Conclusion:

**Purpose:**

To confirm the process to record a bond sale and its associated receipt of funds (key control #2 for TM\$) in order to assess control risk.

**Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.

Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.

When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent

## State of Washington

material weaknesses or significant deficiencies.

Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.

A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency.

**All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.**

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.

If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.

An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. **SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

### **Key Control 2 - (Valuation, Completeness, and Classification)**

The Debt Program Analyst prepares tables for TM\$ based on the final numbers report package prepared by the state's municipal advisors. The Bond Program Manager reviews the tables for accuracy, and updates TM\$, which creates new bond payment amortization schedules. The Analyst then verifies the data imported into TM\$ by the Program Manager for accuracy and completeness against all originally prepared forms.

The understanding for this system is documented above in the "Controls - TM\$" step.

### **1. Confirmation of Key Manual Control:**

#### **Good Faith Deposit**

We reviewed a Cash Receipt (A8) for \$739,727,782.45 for VP GO Bonds (Taxable) Series 2024C, sold January 23, 2024. Leslie Yonkers, Debt Financial Officer, prepared and signed the A8 on 1/26/2024, Stephanie Richardson, COP Financial Analyst, approved/signed it on 1/30/2024, and validated in a batch process on 2/7/2024.

We reviewed the "TM\$ Update Worksheet" tables and tied to all other forms concluding all amounts and dates are in agreement. **No issues noted.**

We reviewed the TM\$ Update - "Bond Review Form" report for a new issue that was updated for the 2024D Bond sale on 2/6/24, and was reviewed on 2/28/24. The person who updated TM\$ was Austin Goble, Bond Program Manager, and Dawn Leopardo, Debt Program Analyst, reviewed the update in TM\$. **No issues noted.**

# State of Washington

Guidance/Criteria:
--------------------

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

# State of Washington

Record of Work Done:

## **Key Control 3 - (Completeness and Valuation)**

To process monthly bond service payments, the Debt Financial Officer imports the CSV file from US Bank into TM\$ and runs a "TRE to US Bank" reconciliation report. The Officer pays the amount stated on US Bank's invoice unless the reconciliation identifies significant variances between the two sources. Typically the reconciliation shows a difference of only a few cents.

The understanding for this system is documented above in the "Controls - TM\$" step.

### **1. Confirmation of Key Manual Control:**

We reviewed the US Bank invoice dated 11/2/2023 for funds due 12/1/2023 and noted the following amounts:

Total principal due = \$36,515,351.80

Total interest due = \$56,058,109.77

Net amount due = \$92,573,461.57 (which totals the above figures)

We reviewed the December 2023 "Reconciliation Between Fiscal Agent and TRE Payments - All Records" report from TM\$ for the debt payment and noted the following amounts:

Fiscal Agent:

Total Debt Service: Principal = \$36,515,351.80

Total Debt Service: Interest = \$56,058,109.77

Total Debt Service = \$92,573,461.57

OST:

Total Debt Service: Principal = \$15,066,533.00

Total Debt Service: Interest = \$77,506,928.56

Total Debt Service = \$92,573,461.56

The reconciliation established that there was a \$0.01 difference in total debt service between the Fiscal Agent and OST. We reviewed the "DS Payment to US Bank" report prepared by Leslie Yonkers, Debt Financial Officer, reviewed by Stephanie Richardson, COP Financial Analyst, and signed and approved on 11/14/23. This report shows the Officer paid the amount stated on the US Bank invoice and shows TRE paid the extra penny. All of the supporting TM\$ report amounts and US Bank Invoice were in agreement of the reconciliation. **No issues noted.**

**Auditor's Note:** The way US Bank records zero coupon bond payments as principal and how TRE calculates the portion of payment as attributable to interest has resulted in differences with the principal or interest in prior audit periods.

# State of Washington

## Noted Weaknesses are as follows:

None

### **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. ### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

# State of Washington

Record of Work Done:

## **Key Control 4 - (Completeness and Classification)**

The Debt Financial Officer prepares all of the monthly transactions in TM\$ (refunding, debt service payments, etc.) that are related to the calculation of the current bond payments which effects the long-term liabilities (due within one year) and long-term liabilities (due in more than one year). The Officer prepares the batches in TM\$ for the reconciliation to AFRS and the COP Financial Analyst reviews and approves them. This reconciliation to AFRS ensures that the amount in AFRS the long-term liabilities (due within one year) and long-term liabilities (due in more than one year) matches the amortization schedules in TM\$ for all bond issues. Once approved, TM\$ releases the batch and operations uploads them into AFRS as a part of end-of-day processing. The Officer receives the "In Process Report" (exception report) on the following day which she uses to ensure that all transactions posted properly in AFRS. The exception report runs every morning and only provides exceptions if an error occurs.

The understanding for this system is documented above in the "Controls - TM\$" step.

### **1. Confirmation of Key Manual Control:**

We reviewed the reconciliation for the month of March 2024. The reconciliation includes the following balances from TM\$ and AFRS:

#### **TM\$:**

GO Bonds, GL 5161 and 5261:	\$21,710,305,000.00
Revenue Bonds, GL 5162 and 5262	\$335,538,970.67
Proprietary, Remaining proprietary debt matured in FY2016	\$ 0
Zero Coupon, GL 5164 & 5264	\$150,977,373.30
Other Bonds Payable, GL 5169 & 5269	\$ 0
Total	\$22,196,821,343.97

#### **AFRS:**

GO Bonds, GL 5161 & 5261:	\$21,710,305,000.00
Revenue Bonds, GL 5162 & 5262	\$334,349,066.67
Proprietary, Remaining proprietary debt matured in FY2016	\$ 0
Zero Coupon, GL 5164 & 5264	\$150,977,373.30
Other Bonds Payable, GL 5169 & 5269	\$ 0
Total	\$22,195,631,439.97

The variance is due to TIFIA prepayment made on 12/1/2023. TM\$ has not been updated yet because OST has not received an updated debt service schedule from the Federal Government.

# State of Washington

The reconciliation included the following notes:

GL 5269 includes bonds for the Dairy and Fruit Commissions in Fund 999. The two funds are not in AFRS and the totals will not roll up properly unless they are reported in Fund 999. All amounts recorded in TM\$ matched AFRS. **No issues noted.**

ACFR figures are reported in the MD&A. Proprietary debt is reported as Business-Type activity.

GARVEE Bonds are recorded in TM\$ as limited obligation bonds. In AFRS, the liability is posted in GL 5262 Revenue Bonds Payable.

We tied amounts from the reconciliation (above) to the "ACFR-Outstanding by Disclosure Code and Fiscal Year" report for each bond type. We also tied the "Bond Retirement and Interest" report (CAF002) from AFRS to the above excel reconciliation by GL without exception. **No issues noted.**

We reviewed the "Bond Retirement and Interest" report (GL01) from AFRS to identify any early bond retirements and JVs related to the adjustments. There were no adjustments required for this year, and there are no associated JVs. **No issues noted.**

## **Noted Weaknesses are as follows:**

None

## **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

*Procedure Step:* Risk Assessment

*Prepared By:* JAG, 5/6/2024

*Reviewed By:* RKM, 6/18/2024

Purpose/Conclusion:
---------------------

# State of Washington

## **Purpose / Conclusion:**

To assess inherent risk, control risk, and the risk of material misstatement in order to design an initial testing strategy for each assertion.

## Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

1. Assess inherent risk for each relevant assertion. This assessment is based on understanding of the entity and the nature of the account balance or class of transactions.

*Inherent risk is the susceptibility of an assertion to a material misstatement ("total threat", which includes both naturally inherent risk and risk indicators), assuming that there are no related controls. As inherent risk is fully independent of control risk, any understanding of controls cannot be used to increase/decrease the assessment of inherent risk. Consider the following factors as your basis for this assessment:*

### *General Considerations*

*Does the balance include transactions that are difficult to audit or involve complex accounting issues?*

*Were there significant misstatements identified in previous audits or prior-period adjustments in the account balance or transaction class? If so, analyzing the cause of prior period misstatements will help in analyzing inherent risk.*

*Are there any inherent risk factors at the entity or industry level, such as changes in regulation or accounting rules, unique transactions or accounting practices, use of information technology, etc that affect the balance?*

### *Inherent Risk due to Error*

*How large are the transactions making up the balance? If the balance has only a few large transactions, even a single error may mean a significant misstatement.*

*Have there been changes in the transactions making up the balance that may increase risk? For example, significantly different composition, nature or volume of transactions may inherently disrupt established controls.*

*Are financial events originated or identified by accounting personnel or non-accounting personnel? This consideration is mainly for the completeness assertion.*

*Does the process to account for transactions involve judgment or estimation, complex calculations, numerous steps or significant manual steps?*

*Do transactions have widely varying attributes that need to be manually identified? For example, grant loans that are accounted for in one of several ways depending on the terms of the agreement.*

### *Inherent Risk due to Fraudulent Reporting (intentional misstatements)*

## State of Washington

*Are there substantial pressures or motivations to misstate the balance?*

*Inherent Risk due to Misappropriation*

*· Is the account balance or transaction class susceptible to sizable misappropriation?*

*Inherent Risk due to Non-Compliance*

*Are there any laws, contracts or grant agreements affecting the balance? If so, would non-compliance lead to sizable misstatements?*

*Are compliance requirements complex, hard to understand, subject to judgment or otherwise difficult to comply with?*

*Are there any motivations or pressures to not comply?*

2. Assess control risk by system and assertion. This assessment should be based on the results of the control understanding, confirmation, and testing (if applicable). If applicable, auditors will evaluate any control deficiencies and determine whether those deficiencies, individually or in combination, are significant deficiencies or material weaknesses.

*Control risk is the risk that material misstatements would not be prevented or detected timely by the system of internal control. Control risk could be thought of as the "vulnerability" of an entity to misstatements. Control risk exists independently of the inherent risk (the level of vulnerability exists independent of the level of threat). Note: control risk and inherent risk must be assessed separately and cannot be combined.*

*In order to set control risk to LOW, general controls would also need to be tested to provide evidence of the consistent operation of automated controls or automated controls would need to be sampled or tested throughout the audit period. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*

*A material weakness exists when the design or operation of controls results in a reasonable possibility a material misstatement will not be prevented or detected and corrected in a timely manner. A significant deficiency is less severe than a material weakness, yet important enough to merit the attention of the governing body.*

***All potential material weaknesses and significant deficiencies should be discussed with the AIC, since they must be reported as findings.***

3. Assess the risk of material misstatement for each relevant assertion for each significant line item. The risk of material misstatement is a combination of the auditor's separate assessment of inherent and control risk.

In practice, the RMM is the amount of substantive evidence that's needed, and the only way to reduce the amount of needed substantive evidence (equal to the inherent risk) is to test controls. As such, when control risk is MAX, the RMM must always equal the inherent risk (IR).

## State of Washington

When controls are tested & can be relied upon (are determined to be effective) it is a matter of professional judgment how much the RMM should be set lower than inherent risk (1 or 2 steps).

*Auditors should assess RMM by assertion, if different. For example, if RMM is assessed at MOD for the existence assertion, but LOW for the rights & obligations assertion, then document "MOD – existence and LOW – rights & obligations".*

4. Design a substantive testing strategy that addresses the relevant assertion in all significant transaction streams included within the material line item.

*In addition to identifying what to audit (material balances) and what to audit for (relevant assertions), planning has also identified how much to audit (risk of material misstatement). The quantity and quality of evidence obtained by substantive tests needs to match the level of risk. The higher the risk of material misstatement, the greater evidence needed. "Greater evidence" could either be greater quantity of evidence, greater quality of evidence, or some combination of greater quality and quantity.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6210](#) – Planning Financial Statement Audits**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits](#) Planning Guide**

Record of Work Done:

### **(1) Inherent Risk (IR):**

Based on our understanding of the line item, we assessed inherent risk as follows for each relevant assertion and significant class of transactions:

**Completeness: High**

**Valuation: High**

**Classification: High**

# State of Washington

## **(2) Control Risk (CR):**

We assessed control risk as follows for each system and relevant assertion:

**TM\$ - Completeness - Max:** For the risk that all bond payable amounts occurring during the period are not identified and recorded, we noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

**TM\$ - Valuation - Max:** For the risk that Bonds Payable amounts are reported at incorrect amounts, we noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

**TM\$ - Classification - Max:** For the risk that Bonds are not correctly classified between short and long term, we noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

## **(3) Risk of Material Misstatement (RMM):**

We considered both inherent and control risk and assessed the risk of material misstatement as follows for each relevant assertion and significant class of transactions:

**TM\$ - Completeness - High**

**TM\$ - Valuation - High**

**TM\$ - Classification - High**

## **(4) Testing Strategy:**

Based on our assessment of the risk of material misstatement, we plan to perform the following tests:

### Valuation:

In order to determine if this line item is valued correctly, we will:

Reconcile the amounts recorded with the bond fiscal agent (U.S. Bank) to TM\$.

Review the year-end reconciliation completed by Leslie Yonkers, OST Debt Financial Officer.

Test the outstanding debt to ensure it is correctly recorded at year-end.

### Completeness:

In order to determine if this line item is complete, we will:

Confirm the balance at fiscal year-end to ensure bond sales were correctly recorded.

## State of Washington

Identify debt issued in FY24 and reconcile to AFRS to ensure all debt issued in FY24 was recorded. To do this, we will use the Electronic Municipal Market Access (EMMA) website which records all debt issued by state and local governments. It is funded and operated by the Municipal Securities Rulemaking Board and is designated by the U.S. Securities and Exchange Commission as the official source for municipal securities data and disclosures.

### Classification:

Reconcile the maturity dates with the bond fiscal agent (U.S. Bank) to TM\$.

Review the year-end reconciliation completed by Leslie Yonkers, OST Debt Financial Officer.

Test the outstanding debt to ensure amounts were properly classified between "Due Within One Year" and "Due in More Than One Year."

We anticipate that these tests will provide sufficient appropriate audit evidence to address the assessed risk of material misstatement for relevant assertions in significant classes of transactions.

### I.6.PRG - Long & Short Term Liabilities: Bonds

*Procedure Step:* Substantive Testing

*Prepared By:* JAG, 10/1/2024

*Reviewed By:* RKM, 10/17/2024

Purpose/Conclusion.
---------------------

### **Purpose:**

To determine whether all current & non-current liabilities as of the end of the period were reported (Completeness).

To determine whether current & non-current liabilities were reported at properly valued or calculated amounts (Valuation).

To determine whether financial statements properly classify current & non-current liabilities: bonds in conformity with generally accepted accounting principles (GAAP) (Classification).

### **Source:**

Leslie Yonkers, TRE Debt Financial Officer

### **Conclusion:**

We determined that all current & non-current liabilities as of the end of the period were reported (Completeness).

## State of Washington

We determined that current & non-current liabilities were reported at properly valued or calculated amounts (Valuation).  
We determined that financial statements properly classify current & non-current liabilities: bonds in conformity with GAAP (Classification).  
***No issues noted.***

### Testing Strategy:

The following is a list of **considerations** for testing the completeness assertion for current liabilities. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

For accruals resulting from normal operations (such as payroll or accounts payable), compare the accrued amount to prior years or to 1/12th of the total expenditure for the year to determine reasonableness. Follow-up as necessary to determine if all such expenditures were reported.

Inquire with AP clerks regarding invoices held, but not entered as of year-end (ie: due to pending litigation or disputes).

Obtain an attorney's letter or equivalent evidence regarding possible legal obligations of the entity. *Note: this test also gives evidence regarding rights & obligations.*

Review for compliance violations that would result in likely repayments. *Note: this test also gives evidence regarding rights & obligations.*

For governmental funds, compare current liabilities reported on the government-wide statements to those reported on the governmental funds balance sheet and verify that any differences are valid.

### Cut-off

Scan expenditure transactions recorded 1-3 months after fiscal year end to and test selected or sampled expenditures to determine if they were reported in the correct period.

-----  
The following is a list of **considerations** for testing the valuation assertion for current liabilities. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

*For current portions of long-term liabilities, see the valuation testing strategy for non-current liabilities. The same strategies can be applied to the entire liability, covering both current and non-current portions.*

Recalculate or review entity calculations of accruals (such as withholding taxes, accrued payroll, payroll taxes, accrued interest payable, etc).

-----  
The following is a list of **considerations** for testing the classification assertion for current liabilities. Results from planning procedures (inherent

## State of Washington

and control risk assessments) are the basis for the auditor's design of substantive tests.

Review supporting documentation to determine whether current liabilities are properly classified to the correct opinion unit.

Trace amounts due in within one year per debt-repayment schedules to check that it was properly shown as a current liability. Note that lines of credit and demand debt (debt that is payable at any time upon demand of the holder) should be classified as a current liability.

-----  
The following is a list of **considerations** for testing the rights and obligations assertion for current liabilities. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

Determine whether the entity had legal authority to incur the liability.

Determine whether selected accruals are the obligation of the entity through review of source documentation.

Obtain an attorney's letter or equivalent evidence regarding possible legal obligations of the entity. *Note: this test also gives evidence regarding completeness.*

Review for compliance violations that would result in likely repayments. *Note: this test also gives evidence regarding completeness.*

### **Liabilities related to Joint Ventures or Other Arrangements**

Review forming documents and agreements to verify liability for current obligations of the venture.

Guidance/Criteria.
--------------------

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**Certificate of Participation (COP) Confirmations** (*applies to state agencies, including community colleges and universities*) - listing of outstanding COP debt at fiscal year end obtained directly from the State Treasurer

### **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

**BARS 3.4.1 Leases** - includes accounting procedures applicable to municipal leases

**BARS 3.4.4 Refunding Debt**

# State of Washington

## **BARS [3.4.9](#) Risk Management Principles**

## **BARS [3.4.15](#) Legal and Other Contingencies**

### **ADDITIONAL BACKGROUND**

-----  
Auditors should consider the following background information and resources when performing work on this area.

#### **Expenditure & Liability Recognition under Modified Accrual (Governmental Funds)**

Discussion of when an expenditure and, if payment is deferred, the respective liability should be reported under the modified accrual basis of accounting is described in GASB Interpretation 6 paragraphs 9-12.

"Matured liabilities ... should be reported as governmental fund liabilities. Matured liabilities include:

- a. Liabilities that normally are due and payable in full when incurred
- b. The matured portion of general long-term indebtedness (the portion that has come due for payment).

... Governmental fund liabilities and expenditures that should be accrued include liabilities that, once incurred, normally are paid in a timely manner and in full from current financial resources-for example, salaries, professional services, supplies, utilities, and travel. To the extent not paid, such liabilities generally represent claims against current financial resources and should be reported as governmental fund liabilities."

**Certificate of Participation (COP) Confirmations** (*applies to state agencies, including community colleges and universities*) - listing of outstanding COP debt at fiscal year end obtained directly from the State Treasurer

### **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

-----

# State of Washington

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

### **Current & Non-Current (Government-wide and Proprietary Statements)**

GASB 34 paragraph 31 defines "current" versus "non-current" classification for liabilities:

"Governments are encouraged to present assets and liabilities in order of their relative liquidity. An asset's liquidity should be determined by how readily it is expected to be converted to cash and whether restrictions limit the government's ability to use the resources. A liability's liquidity is based on its maturity, or when cash is expected to be used to liquidate it. The liquidity of an asset or liability may be determined by assessing the average liquidity of the class of assets or liabilities to which it belongs, even though individual balances may be significantly more or less liquid than others in the same class and some items may have both current and long-term elements. Liabilities whose average maturities are greater than one year should be reported in two components—the amount due within one year and the amount due in more than one year..."

**Certificate of Participation (COP) Confirmations** *(applies to state agencies, including community colleges and universities)* - listing of outstanding COP debt at fiscal year end obtained directly from the State Treasurer

Record of Work Done.

### **Overview:**

We recorded our document request here [[Bond Testing Request](#)] which we used to obtain all documents required for testing.

### **Substantive tests performed to meet the Completeness assertion:**

#### **1. Identify debt issued in FY24 and reconcile to AFRS to ensure all debt issued in FY24 was recorded.**

We reviewed the Office of the State Treasurer website at [[Bond and COP Sale Results | Office of the Washington State Treasurer](#)] to determine what bonds were issued during FY 2024. The state exclusively uses EMMA's issuer page platform for all financial disclosures and official statements. We reviewed the official statements posted on the EMMA website and identified the bonds issued in FY 2024, see [[2024 Bond Testing](#)], tab "FY24 Bonds Issued". We obtained the bond closing memorandums, A8 cash receipts, and good faith deposit journal summaries for each bond sale from Leslie Yonkers, Debt Financial Officer. We tied the closing memorandums to the bond sales posted on the EMMA website and recalculated the net bond proceeds. We compared the recalculated net bond proceeds for each bond series to the total deposit on the A8 cash journal summaries. **No issues noted.**

We ran a query in the AFRS database for bond proceeds at [[2024 Bond Testing](#)], see tab "FY24 Bonds Issued," beginning on row 38. The query includes Income Statement Sort Codes ND (Bonds Issued) and NH (Issuance Premiums). We used the par values and the associated discount/premium amounts from the closing letters to recalculate bond proceeds as noted above. We then compared the calculated totals to the bond proceeds recorded in AFRS without exception. **No issues noted.**

#### **2. Confirm the balance at fiscal year-end to ensure bond sales were correctly recorded.**

We ran a query in the AFRS database at [[2024 Bond Testing](#)], see tab "ACFR Query", for the outstanding bond debt reported in the General Long-Term Obligations fund. We noted a total of \$20,752,338,224.13 after excluding accreted interest payable (\$213,445,282.76) and excluding fees payable (\$184,987.70). We added the portion moved to short term, excluding COP, in the amount of \$1,236,882,978.08 for a total of

## State of Washington

\$21,989,221,202.21 recorded in AFRS. We tied the total recorded in AFRS to the total bonds on the TM\$ report. We determined that the long term liabilities: due within one year and due in more than one year are properly recorded. **No issues noted.**

### **Substantive tests performed to meet the Valuation assertion:**

#### **1. Review the year-end reconciliation completed by Leslie Yonkers, TRE Debt Financial Officer.**

We obtained the 6/30/2024 TRE Bond reconciliation spreadsheet from Leslie and noted that a reconciliation was performed between the Treasury Management System and the bond fiscal agent, US Bank. Additionally, we re-performed the reconciliation [[2024 Bond Testing](#)] as noted below and found no variances between our reconciliation and the reconciliation performed by Leslie Yonkers. **No issues noted.**

#### **2. Test outstanding debt and reconcile the amounts recorded with the bond fiscal agent (U.S. Bank) to TM\$ to ensure it is correctly recorded at year end.**

We obtained and reviewed the outstanding bond debt report created by the Treasury Management System ("Loan Accounts List- for Outstanding Bonds - Series"). We also obtained the US Bank confirmation report that showed outstanding bonds and included defeased bonds, see [[2024 Bond Testing](#)], tab "USBank Confirmation." Defeased bonds are in escrow and are appropriately excluded from the TM\$ balance as they are no longer a liability of the State. We reviewed communication between Leslie Yonkers and US bank to determine there were no defeased bonds during FY24. Additionally, Leslie Yonkers provided us with a Zero Coupon bonds outstanding spreadsheet, see [[2024 Bond Testing](#)], tab "Zero Coupon Bonds." The spreadsheet provides a breakdown of the interest and principal for the zero coupon bonds. We tied the principal for the zero coupon bonds to the TM\$ outstanding column and the total debt service column amounts to the US Bank outstanding balances.

We re-performed the reconciliation between the outstanding bond debt report created by the Treasury Management System and the US Bank confirmation report at [[2024 Bond Testing](#)], see tab "Bond Confirmation." We tied the outstanding principal from the TM\$ report to the outstanding principal from the US Bank confirmation (less refunded bonds and the zero coupon bond difference). We tied the zero coupon bond differences between the TM\$ report and the US bank confirmation to the zero coupon bond interest. We noted a difference between the TM\$ report and the US Bank confirmation in the amount of (\$15,089,701). We determined this difference was related to the WASTIF13C- Toll Revenue Bond. We discussed this with Leslie Yonkers, TRE Debt Financial Officer, who stated that there is a variance for the TIFIA bonds because they are only authorized to issue \$300,000,000 and interest accrued before any debt service payments are made. US Bank and TRE record these differently. US Bank adds the accrued amounts to the principal and TRE adds it to the interest. We reviewed the "TIFIA - SR 520" spreadsheet, that has the calculated ending balance of loan amortization schedule and annual projected payments, and the "TIFIA OST and US Bank Variance FY2024" spreadsheet, used to verify US Bank's ending principal balance and TRE's ending principal balance since they differ. Both TIFIA spreadsheets were obtained from Leslie Yonkers and we noted that the accrued interest on the debt service schedule tied to the difference between the TM\$ report and the US Bank confirmation. **No issues noted.**

### **Substantive tests performed to meet the Classification assertion:**

#### **1. Reconcile the maturity dates with the bond fiscal agent (U.S. Bank) to TM\$.**

We obtained the 6/30/2024 TRE Bond reconciliation spreadsheet of the reclassification of long-term to short-term FY ending 6/30/24 from Leslie

# State of Washington

Yonkers, TRE Debt Financial Officer and noted that the reconciliation was performed between the Treasury Management System and the bond fiscal agent, US Bank. We noted that each bond within the reconciliation had matching maturity dates between TM\$ and US Bank. **No issues noted.**

## **2. Review the year-end reconciliation completed by Leslie Yonkers, TRE Debt Financial Officer.**

We obtained the 6/30/2024 TRE Bond reconciliation spreadsheet of the reclassification of long-term to short-term FY ending 6/30/24 from Leslie Yonkers, TRE Debt Financial Officer and noted that the reconciliation was performed between the Treasury Management System and the bond fiscal agent, US Bank. Additionally, we re-performed the reconciliation as noted below and found no variances between our reconciliation and the reconciliation performed by Leslie Yonkers. **No issues noted.**

## **3. Test the outstanding debt to ensure amounts were properly classified between "Due Within One Year" and "Due in More Than One Year."**

We obtained TM\$ reports "Debt Service Payments - for a Month Detail" for all fiscal months in which TRE plans to pay bonds in FY25 (due within the next fiscal year) from Leslie Yonkers, TRE Debt Financial Officer. Using the TM\$ reports, we identified and summed the debt service principal payments due by 06/30/2025 between general obligation bonds, revenue bonds, and zero coupon bonds for each month at [2024 Bond Testing], see tab "Classification." Using the US Bank confirmations report, see tab "USBank Confirmation, [2024 Bond Testing]" we calculated the total amounts outstanding for the three bond types. We reduced the US Bank confirmation total outstanding with the TM\$'s principal payments due by 6/30/2025 to come to a recalculation of the long-term debt portion - "Due in More Than One Year." We had to make additional adjustments for the recalculation of the revenue and zero coupon bonds. The revenue bonds required an adjustment of \$15,089,701, see at [2024 Bond Testing], for the accrued interest of the WASTIF13C- Toll Revenue Bond. The zero coupon bonds required an adjustment of \$336,286,603, see at [2024 Bond Testing], for the zero coupon bond interest contained within the US Bank confirmation report. We then compared both the principal payments due by 6/30/2025 ("Due Within One Year") and the recalculated long-term debt ("Due in More Than One Year") to the amounts reported on the AFRS database, see tab "ACFR Query," and noted no variances at [2024 Bond Testing], see tab "Classification." We determined FY24 bonds are correctly classified between "Due Within One Year" and "Due in More Than One Year." **No issues noted.**

## **I.7.PR.G - Paid Family & Medical Leave - Expenses**

*Procedure Step:* Summary & Conclusion

*Prepared By:* JLE, 10/4/2024

*Reviewed By:* RKM, 11/21/2024

# State of Washington

Purpose/Conclusion:

## **Purpose**

To evaluate risk assessments and the sufficiency and appropriateness of evidence obtained based on results of substantive work.

## **Conclusion**

We determined that **no modifications were necessary** to inherent risk, control risk, or the risk of material misstatement as assessed in planning.

We also determined that evidence obtained was sufficient and appropriate in response to the risk of material misstatement.

Testing Strategy:

Auditors are **required** to evaluate conclusions for substantive testing as follows:

*Auditors may wish to use the optional Lead Sheet available in the Store to summarize testing related to each balance and assertion.*

**1.** Determine whether the results of substantive testing indicate a need to modify the inherent risk assessment (IR), control risk assessment (CR), risk of material misstatement (RMM) or other aspects of planning (such as material balances or assertions). If so, document changes and consider the need for additional testing.

*If the results of substantive testing indicate a need to change control risk, auditors should also update the **Permanent File** by either correcting the documentation or by adding an update section describing changes to the top of the record of work done. For all changes to IR, CR, or RMM the **Material Balances** spreadsheet should be updated.*

*More significant changes to other aspects of planning (such as material balances or assertions) should be referenced in this step and documented in detail in the **Changes to FS Audit Plan** step.*

**2.** Evaluate whether the quality and quantity of evidence obtained is sufficient and appropriate in response to the risk of material misstatement. In making this determination, auditors should evaluate:

## **Information to be used as audit evidence:**

Does evidence relate to the population, period of time and risk (assertion and “what could go wrong” from the Material Balance Spreadsheet)? If there are any gaps or uncertainties in the logical connection between the evidence and conclusions, is there a documented consideration and explanation?

## State of Washington

- Are the sources of information sufficiently reliable and appropriate for the risk (whether internal to the government, external, or auditor developed)? If key information is not from a sufficiently reliable source (for example, inquiry), then is it corroborated by information that is?
- Are there any concerns about accuracy, completeness, authenticity, or bias in information? If so, did the auditor perform sufficient procedures to confirm reliability of that information?
- Is information precise enough to catch if misstatements exceeded the tolerable level?
- Is information detailed enough to conclude on whether or not there were misstatements?
- Was there any information that appeared contradictory or inconsistent? If so, was there a documented response to the inconsistencies or doubts about the reliability of evidence?

### Results:

- How much misstatement was identified by testing, and the likelihood and magnitude of further potential misstatement?
- How did misstatements occur and how often might they occur again in the population?
- Were misstatements caused by control deficiencies or circumvention of controls?
  - If control deficiencies, is there a need to re-evaluate our understanding of controls in the [Permanent File](#) folder or assessment of control risk?
  - If circumvention, the [Management Override of Controls](#) step should address or reference this area. Auditors should also consider whether a fraud risk has been identified.
  - Did tests identify a different level or type of risk than the planned audit response was designed to address?
  - If likely misstatements are identified, are further procedures necessary to improve the precision of our estimate?

*To support the overall evaluation of audit risk and provide a basis for concluding on the overall sufficiency and appropriateness of evidence in the [FS Summary & Report](#) step, auditors should conclude in each area whether the auditor continues to believe that the tests performed and quality and quantity of evidence obtained are commensurate with RMM for all relevant risks (the "what could go wrong", in the [Material Balances](#) spreadsheet).*

If the auditor determines that evidence is not sufficient or appropriate, additional substantive testing should be done. If sufficient, appropriate evidence is not available for audit, the AIC should discuss the effect on our audit report with the AAM and AM.

Guidance/Criteria:
--------------------

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6310](#) – Determining the Nature, Timing and Extent of Substantive Testing**

# State of Washington

## SAO Audit Policy [3210](#) – Audit Evidence

Record of Work Done:

Based on test results, we re-evaluated risk assessments, procedures, evidence obtained and conclusions as follows:

**(1) Do the results of substantive tests indicate a need to modify our risk assessment (IR, CR and RMM)?**

The results of substantive tests do not indicate a need to modify our risk assessment.

**(2) Was the quality and quantity of evidence obtained sufficient and appropriate?**

The quality and quantity of evidence obtained was sufficient and appropriate.

### I.7.PRГ - Paid Family & Medical Leave - Expenses

*Procedure Step:* Understanding of Line Item

*Prepared By:* JLE, 6/4/2024

*Reviewed By:* SHW, 7/10/2024

Purpose/Conclusion:

**Purpose / Conclusion**

To gain an understanding of the line item and confirm the scope of testing as documented in the Significant Account Matrix.

Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

**STEP 1: Prior Audit Exceptions**

Document any exceptions noted during the prior audit. Follow-up to determine how the agency has responded to or corrected the issue, unless this work is anticipated as part of the testing strategy.

**STEP 2: Analyze Composition and Changes of Line Item**

## State of Washington

Include link to the line item leadsheet. This will be completed at the end of the audit. Leadsheet analysis should be documented in this spreadsheet.

Inquire with agency staff about the activities and transactions that make up the balance and any changes to those activities or transactions in relation to the prior year.

Determine relevant classes of transactions or account balances within the line item to analyze (such as agencies, funds, programs, departments, accounts, and/or objects), and use AFRS to create trends of those elements. This step should not include any specific dollar amounts associate with the line item.

Evaluate trends to identify:

- (1) What classes of transactions or account balances are primary to the identified risk. Auditors should specifically consider what elements are primary to the line item (comprising a large percentage of the line item), and which elements the identified risk would apply to, and which elements might be most susceptible to the identified risk (having a high risk of non-trivial misstatement for a relevant assertion, considering likelihood and impact of potential for misstatement).
- (2) What changes are primary to the identified risk, if applicable. Auditors should specifically consider whether the overall change to the line item from the prior year was significant, what elements were the primary drivers of overall change, whether any elements changed significantly from the prior year, and which changes (if any) might relate to the identified risk.
- (3) Any unusual or unexpected elements, amounts, or changes that may indicate a risk, whether the one identified in planning or a new one that may need to be considered for a change to the plan.

**Consider** other procedures to gain an understanding of the line item, such as review of key policy documents, review of program information or reports, inquiry of staff, budget information, or other analytical procedures.

### **STEP 3: Update Significant Account Matrix**

Based on your understanding of the line item, update the Significant Account Matrix with final conclusions on the agencies covered, account description, significant accounting systems, and risk (what could go wrong and relevant assertions). The account description should reflect the significant transaction streams or account balances relevant to the risk.

*The description of agencies, significant accounting systems, and what could go wrong in the Significant Account Matrix constitute the overall scope of substantive testing.*

*A transaction stream is significant based on the potential for misstatement. This is often due in part to its size (ie: comprising a large percentage of the total line item), but is ultimately a judgment about the susceptibility to the identified risk (for example, when the risk is understatement a small or omitted account may hold the most potential for the largest misstatement).*

*Significant accounting system(s) are those that contain key controls over significant classes of transactions included in the line item. Control systems identified in this step must match the Significant Account Matrix and have a separate control understanding documented.*

*Talk with the AIC if you identify any changes to the Significant Account Matrix.*

# State of Washington

Guidance/Criteria:

Record of Work Done:

## **(1) Prior Audit Exceptions**

Paid Family & Medical Leave (PFML) was not tested in prior-year Annual Comprehensive Financial Report (ACFR) audits. In the FY22 Employment Security Department (ESD) accountability audit, we issued a finding relating to inadequate controls over the PFML program. Specifically, we found:

- ESD had not implemented controls to prevent claimants from receiving PFML benefits in the same claim week where they are receiving unemployment (UI) benefits, resulting in \$1M of improper PFML expenditures.

- ESD had not implemented processes or procedures to assess and collect PFML penalties or overpayments, as required by State law.

Per inquiry on 5/16/2024 with Eric West (ESD PFML Fraud Manager), John Mattes (ESD PFML Operations Manager), and Shalina Latiff (ESD PFML Program Manager), we found that while ESD has implemented controls to help detect double-payments made between the UI and PFML programs, the agency has not yet implemented preventative controls. Currently, the main preventative control is a question within the online weekly claim portal, which asks claimants whether they received UI benefits for the week. Additionally, ESD has not yet implemented processes or procedures to collect PFML-related penalties or overpayments.

**We reviewed the amount of double-payments made between the UI and PFML programs for FY23, noting that such payments are insignificant to the ACFR; as such, we will not include these double-payments in our testing strategy for PFML at the State-wide level.** These prior accountability audit exceptions will be followed up on in the FY23 accountability audit at TM file: *S1-EmploymentSecurity-AC23*.

## **(2) Composition & Change Analysis**

See Line Item Leadsheet at: [\[Line Item Lead Sheet\]](#).

ESD considers PFML expenditures to be direct payments to program claimants, as well as those ancillary costs necessary to implement and support the PFML program. We analyzed the expenditure amounts at the line item lead sheet and identified SubObject NA 'Direct Payments to Clients' as significant, comprising 95% of total FY23 balance expenditures.

We note that there was a 49% increase between FY22 and FY23 expenditures. Per ESD's [FY23 Actuarial Annual Report](#) for PFML (ref: page 7), we found that this change was primarily caused by both an increase in the average weekly benefit amount awarded, as well as in the number of claims submitted year-over-year.

## State of Washington

We analyzed the PFML Claims Dashboard located at: <https://esd.wa.gov/labormarketinfo/paidleave/claims-data>, noting the following:

The average weekly benefit amount increased from \$891 in FY22 to \$957 in FY23 (7.5% increase).

The number of family and medical claims submitted increased from 212,164 in FY22 to 245,795 in FY23 (16% increase).

There were 1,365,795 of compensated weeks paid in FY22, and 1,578,233 weeks compensated in FY23 (15.5% increase).

The number of individuals choosing to participate in elective PFML coverage increased from 1,079 to 1,235 from FY22 to FY23 (14.5% increase).

**Overall, we identified no unusual or unexpected elements that may indicate unidentified areas of risk for PFML expenditures.**

### Additional Background: Program Information

The PFML program is made up of two claimant categories: medical leave and family leave. Benefits are paid at a rate of up to 90% of a worker's average weekly pay.

Medical leave is provided for an individual's personal health condition (e.g., surgery, pregnancy, mental health, chronic conditions, or inpatient treatment); claimants may receive up to 12 weeks\* of leave per claim year\*\*.

Family leave is provided to assist with a relative's serious health condition, for bonding with newly born/adopted children, and for military family leave relating to deployments; up to 12 weeks\* of leave per claim year\*\*.

*\* If an individual has more than one qualifying event in the same claim year, they may receive up to 16 weeks of combined family/medical leave. If an individual experiences a condition in pregnancy which results in incapacity, they may receive up to 18 weeks of combined family/medical leave.*

*\*\* The claim year begins on the Sunday of the week in which a worker submits an initial application, and expires 52 weeks later.*

Leave does not have to be taken all at once; however, workers must claim a minimum of 8 consecutive hours of leave each week. Regardless of how a worker takes their leave, they must file a claim every week (including during the waiting week). Workers cannot take medical leave and family leave in the same week, nor can they collect unemployment or worker's compensation during the same week that they collect PFML benefits. Additionally, any employer-provided paid time off should be reported in the weekly claim, and will reduce PFML benefit payments for that week.

The waiting week is the first week in which a worker is approved to file a claim and use leave. Generally, workers are not paid for the waiting week period. Exceptions include parental bonding leave, medical leave taken during the postnatal period, and military exigency. A week is defined as Sunday through Saturday; as such, if a qualifying event occurs on a weekday, then the waiting week may be less than 7 days. During this waiting period, workers may use paid time off from employers without impacting their PFML benefits.

In order to qualify for the program, a worker must have worked a minimum of 820 hours in Washington State during their qualifying period. The qualifying period is normally defined as the first four of the last five completed calendar quarters, or, the last four completed calendar quarters immediately preceding the application for leave. The 820 hours can be counted for full-time, part-time, temporary, or seasonal work; additionally,

## State of Washington

the work hours can be counted in situations where an individual works multiple jobs for different employers, or when an individual switches employers.

Program exemptions include: federal employees, employees of tribally-owned businesses on tribal land, self-employed persons or independent contractors (unless they've opted-in for elective coverage), or workers covered by an employer's voluntary plan.

### **(3) Updates to Significant Account Matrix**

We updated the relevant accounting systems to include the OMAC Portal and Microsoft Dynamics.

### **I.7.PRG - Paid Family & Medical Leave - Expenses**

*Procedure Step:* Controls - OMAC Portal & Dynamics

*Prepared By:* JLE, 7/2/2024

*Reviewed By:* SHW, 11/4/2024

Purpose/Conclusion:

#### **Purpose**

To gain an understanding of internal controls within the OMAC Portal and Microsoft Dynamics systems used by ESD; relevant to the rights and obligations, valuation, and completeness assertions.

#### **Conclusion**

We gained an understanding of internal controls as documented in the record of work done.

We noted the following control weaknesses, which we **do not** consider to represent significant deficiencies or material weaknesses:

**Control Weakness 1** - PFML claim adjudicators have the ability to manually adjust/override system-calculated benefit amounts; there is no secondary review performed over such manual adjustments. **See issue at:** [E: ESD PFML Control Weaknesses].

**Control Weakness 2** - ESD has not implemented detective controls to identify multiple payments made to a single claimant between the PFML and workers' compensation benefit programs. **See issue at:** [E: ESD PFML Control Weaknesses].

Testing Strategy:

**The following procedures are required for all material systems:**

## State of Washington

1. List the financial statement balance(s) and relevant assertion(s) addressed by the understanding.
2. Gain an understanding of the internal control process, identify how transactions are recorded in AFRS, identify key controls over relevant assertion(s), and note any control weaknesses.
  - In gaining an understanding of controls, consider the overall understanding of State-Level control elements as documented in the "State-Level Controls" step as they relate to this particular system.
  - Identify controls systems covering all relevant assertions for all significant classes of transactions.
  - Standards require the auditor to gain an understanding of the significant accounting system(s) that contain key controls over significant classes of transactions included in the line item.
  - Control systems identified in this step must match the Material Account Matrix and have a separate control understanding documented.
  - Talk with the ACFR Specialist or AIC if you identify different systems than the ones anticipated in the Material Account Matrix.

For each material system, auditors must document:

- A brief outline of the transaction flow from beginning to end.

- An expanded description of key controls.

- Business processes relevant to financial reporting of the relevant assertion for the material balance. Processes should encompass automated and manual procedures by which transactions or events are identified or initiated, authorized as needed, recorded, processed and corrected as needed.

- Original accounting records and how records are rolled-up to intermediary ledgers and transferred to the general ledger (AFRS) or financial statements.

- Detailed descriptions of key controls. Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

The following is information to **consider** when identifying key controls and transaction flow.

"Key controls" refer to the few controls that together provide reasonable assurance that material misstatements will be prevented or detected and corrected. This is contrasted with ancillary or supporting controls, which – although helpful and recommended – would provide less than reasonable assurance by themselves.

The focus of the write-up is on the key controls. Key controls should be specifically identified (as "key controls") in the write-up. This can be done in whatever way the auditor prefers, so long as it is obvious. Details that the auditor should document regarding key controls may include:

## State of Washington

Who or what initiates the control

When (or how often) is the control applied

Who performs the control

As needed, the experience, knowledge and attitude of the person applying the control

Detailed description of the control process or activity. For example, if the control is a review: what exactly is reviewed, what is the reviewer looking at or for and what are the reviewer's criteria?

How the key control is documented or evidenced

If not obvious from the description, how the control prevents or timely detects and corrects misstatements

Any exceptions or alternative processing to the normal process

What happens when misstatements or issues are identified by the control

The "transaction flow" refers to the process by which transactions are initiated, authorized, recorded, processed and reported (as applicable). Outlining the transaction flow gives context to key controls, especially how transactions become subject to controls in the first place. If a control inherently ensures that all applicable transactions are included (ex: bank reconciliation where the assertion is existence), the auditor may decide to just start the write-up with the initiation of the control procedure and go from there.

Elements of the transaction flow are defined informally as follows:

*Initiation:* How are transactions initiated?

*Authorization:* How are transactions and accounting record maintenance authorized?

*Recording:* How are transactions or balances identified and recorded in financial accounting systems?

*Processing:* How are the transactions or balances processed after they are recorded (if at all)? Processing may be manual or automated and may occur at a subsidiary system level or at the general ledger level.

*Reporting:* How are records translated into the financial statements? This part of the transaction flow extends the understanding to the actual financial statements that the audit is opining on. Since we already document an understanding of the financial reporting process in general, it is usually enough to simply reference this overall understanding. However, if there are important steps unique to the covered balances, it may be more appropriate to mention them here.

Although transaction flow is a good way to think about understanding and documenting a control system, auditors should not worry too much about documenting "each element, in order" because often elements may be combined, not noticeable, not applicable or occur in a different order.

Guidance/Criteria:
--------------------

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

# State of Washington

SAO Audit Policy [2310](#) - Reporting Identified Audit Issues

SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk

[Financial Statement Audits](#) Planning Guide

Record of Work Done:

**This record may contain information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited.**

Internal controls address the following balance:

Paid Family & Medical Leave Compensation (Expenses)

For the following assertions:

Rights and Obligations - There is a risk that ineligible claimants were improperly approved for benefits.

Valuation - There is a risk that benefit amounts paid were not accurately calculated based on claimant wages and hours worked during the qualifying period.

Completeness - There is a risk that the year-end actuarial accrual amount for claims payable used unreasonable estimation methodology or source data. There is a risk that balances reported between Microsoft Dynamics and AFRS are incomplete.

## **Gain an Understanding of Internal Controls**

We gained an understanding of internal controls over PFML claim expenditures as follows:

Meeting with Steve Zawoysky (Leave and Care Division Treasury Manager) and Mary Turpin (Chief Financial Accountant) on 4/25/2024.

Meeting with John Mattes (Leave and Care Operations Manager) and Rob Rohrer (PFML Customer Service Manager) on 4/30/2024.

Meeting with Imran Shaik (Leave and Care Developer), Bora Kim (Application Developer), Bryon Schabell (Application Quality Assurance Supervisor), and Jeanette Ritchie (Leave and Care Product Manager) on 7/9/2024.

## **Filing a New Claim**

The majority of PFML claimants file their initial benefits application through the external OMAC online portal (the Portal), located at:

[secureaccess.wa.gov](https://secureaccess.wa.gov). Applicants must go through Secure Access Washington multi-factor authentication steps to access the Portal. In cases where a paper application is received, a customer care specialist will enter information into the Portal on the claimant's behalf.

The application requires several fields relating to personal and contact information (phone number, email address, street address, SSN, first and

## State of Washington

last name), demographic information (gender, ethnicity/race), and employment history. The application also guides users through several sets of questions, designed to ensure adherence to the provisions of the program (e.g., 'Did you know you would need to take leave before your leave started?', and 'Did you notify your employer in advance that you needed leave?'). The application also includes user-friendly definitions; for example, the yes/no question 'Are you experiencing complications related to your pregnancy?' includes a pop-up definition box reading: "Complications can include severe morning sickness, prenatal complications resulting in bedrest, pre-eclampsia, infections, or other prenatal complications." Finally, the Portal requires claimants to upload documentation supporting their application. A list of acceptable documentation can be found at: [paidleave.wa.gov/library](https://paidleave.wa.gov/library).

Once an application is received, ESD's customer relationship management software (CRM) automatically queues all applications in the order in which they were received, and assigns them to adjudicators. All applications are reviewed by an adjudicator to determine eligibility, prior to issuing an approval or denial decision for benefits (**Key Control 1 - Rights & Obligations**). The eligibility decision is documented in all cases by using standardized case template notes, which includes the adjudicator's name and a description of what verification and fact-finding steps were performed. Adjudicators receive a formal training process, which lasts approximately one year. During the training period, adjudicators work through applications under supervision and all work performed by an adjudicator-trainee receives a secondary review by a journey-level adjudicator. After completing a year of training, qualified adjudicator-trainees are promoted to 'Adjudicating Specialist 2', and are allowed to adjudicate claims independently.

When reviewing an application, adjudicators perform the following steps:

### **Verifies ID documentation provided by the applicant**

We reviewed ESD Policy 2.415 'Discrepancies Between ID Documents and Applicants Name'. Adjudicators are required to verify claimant identity by comparing information provided on the application to the claimant's ID document. There are varying levels of identification required to be performed, each dependent on a variety of scenarios. If a claimant's full name matches exactly between the two documents, then no additional fact finding is needed. If a claimant's name is a close match (e.g., multiple last names on ID, but one last name in CRM, or Matthew Jones vs. Matt Jones), then the date of birth must also be verified. If two different names are provided, then additional fact finding must be performed for government-issued documentation which shows the change from one name to another. In all cases where the two names are not an exact match, then the adjudicator will make a note of their findings about the claimant's name in the 'Remarks' section of the *Benefit Claim Decision* case note.

### **Verifies applicant eligibility for benefits by:**

#### **Reviewing hours and wages reported by for the applicant by their employer**

#### **Determining whether a qualifying event occurred under [RCW Title 50A](#)**

To verify eligibility, adjudicators review information within the application, as well as supporting documentation uploaded to the Portal. Per ESD Policy 2.439 'Fact-Finding Procedure', if there is not enough information to determine eligibility for benefits, adjudicators are required to perform fact-finding. Fact-finding consists of (at minimum) two contact attempts, using two different methods, prior to making an adjudicative decision. All fact-finding attempts, responses, and outcomes (including copies of letters) must be recorded and attached in

## State of Washington

the case's *Timeline*, and as a *Fact-finding* case note.

To verify hours and wages reported by the employer, the adjudicator first identifies the qualifying period, based on the application date. Then, they review information in the *Wage Search* page, determining whether reported information appears complete and correct. If information appears to be missing or incorrect, the adjudicator is required to contact both the claimant and employer to perform additional fact-finding.

To determine whether a qualifying event occurred under RCW Title 50A, the adjudicator may accept one of the following forms of documentation:

- FMLA Designation Notice (i.e., approval letter) paired with an FMLA medical certification

- Written documentation from the employer, that they accept the certification of a serious healthcare condition from the healthcare provider in question

- A certification form with an authorized provider's signature

- An Explanation of Benefits showing that the chosen healthcare provider is covered under the employer's group health plan

- Documentation of birth or adoption, showing the name of the claimant as the parent

- Documentation showing military deployment or leave, including applicable dates

### **Enters the approved leave starting and ending dates, and generates an approval letter to the claimant**

After reviewing applicable documentation, adjudicators are responsible for manually setting the applicable start and end dates for the number of approved leave weeks within the Portal. They also generate and send an appropriate approval or denial letter, which is sent via U.S.P.S. to the applicant's address on file. A copy of the letter is maintained and uploaded to the Portal for recordkeeping.

### Calculating Benefits

Once an applicant has been approved for PFML benefits, they must submit weekly claims in order to continue collecting payments. Weekly claims are submitted online, in the same external OMAC Portal used for new applications. After filing a weekly claim, the Portal then automatically calculates payments via the Benefit Calculator Tool (**Key Control 2 - Automated Software Calculation - Valuation**). This tool relies on any manual information input by adjudicators during the application review, as well as cross-matched data from employer-submitted quarterly wage reports showing hours worked and employee salary information.

The weekly benefit amount is calculated based on a worker's average weekly wage, and the amount actually paid is then prorated based on a comparison of actual to average work week hours. It's important to note that these averages are calculated based on hours worked and wages earned during the qualifying period and are *not* based on a claimant's current work schedule or current earnings at the time of adjudication.

During our control meetings, we found that adjudicators have the ability to manually adjust/override the system-calculated benefit amount; there is no secondary review performed over such manual adjustments (**Control Weakness 1**).

# State of Washington

## *State Average Weekly Wage Determination*

The weekly benefit amount also takes into consideration the State's average weekly wage. The State average weekly and average annual wage is calculated annually by ESD's DATA division. The source data used for the average annual wage calculation is a computer-generated report within the unemployment (UI) data warehouse and is calculated by dividing the total wages reported by all employers by the average number of workers reported for all months of the year. The State's average weekly wage is then derived by dividing the average annual wage by 52, rounded down to the nearest dollar. For more information, see: [RCW 50.04.355](#).

## *Average Weekly Wage and Weekly Benefit Amount*

For more information, see: [WAC 192-610-051](#).

A worker's average weekly wage is established as follows: total reported wages in the claimant's two highest-paid quarters during the qualifying period is divided by 26, then rounded down to the nearest multiple of one dollar.

The weekly benefit amount is then calculated as follows:

If the worker's average weekly wage is less than or equal to 50% of the State's average weekly wage, then the weekly benefit amount will be 90% of the worker's average weekly wage.

If the worker's average weekly wage is greater than 50% of the State's average weekly wage, then the benefit amount is as follows:

90% of 1/2 of the State's average weekly wage, plus:

50% of the difference between 1/2 of the State's average weekly wage and the worker's average weekly wage.

## *Average Work Week Hours*

For more information, see: [WAC 192-610-050](#).

For salaried workers - typical work week hours are determined to be 40.

For all other workers - the system calculates using the sum of all hours reported during the qualifying period, divided by 52, then rounded down to the nearest hour.

## *Factors Affecting Weekly Benefit Amounts Actually Paid*

The weekly benefit is subject to minimum and maximum payment amounts; in FY24, these amounts were as follows:

CY23 (July 2023 - December 2023) - minimum benefit amount of \$100/week, maximum benefit amount of \$1,427/week.

CY24 (January 2024 - June 2024) - minimum benefit amount of \$100/week, maximum benefit amount of \$1,456/week.

The weekly benefit amount is reduced by the amount of employer-paid leave reported by the claimant for that given week (with the exception of the waiting week). As mentioned above in 'Calculating Benefits', the weekly benefit amount is also subject to proration by the number of actual hours claimed for PFML, relative to the workers' average work week hours. For example, assume that an employee has a weekly benefit amount of \$600:

## State of Washington

If an employee files a weekly claim for 40 hours of PFML, and their average work week hours are also determined to be 40 hours, then they will receive \$600 in benefits that week.

If an employee files a weekly claim for 20 hours of PFML, and their average work week hours are determined to be 40 hours, then they will receive \$300 in benefits that week ( $=(20/40)*600$ ).

A claimant is not eligible for PFML benefits to be paid if they report claiming unemployment or workers' compensation benefits in that same week; the system will automatically reduce the weekly benefit to zero in such cases. We note that prior to January 2023, ESD relied on claimant self-attestation to prevent 'double dipping' in multiple benefit programs. Beginning in January 2023, ESD implemented a cross-match between PFML and unemployment benefit (UI) data. Each week, the Leave and Care division sends a list of all new PFML claims captured in the prior week to the Data Analytic (DA) team. Team DA then adds UI data to the PFML claim spreadsheet, and utilizes a formula to identify cross-matches within the two populations, based on SSN and payment week. The results are then sent to the Fraud team for further investigation and follow-up. At this time, there are no detective controls in place to identify multiple payments made to a single claimant between the PFML and workers' compensation benefit programs (**Control Weakness 2**).

### **How Transactions are Recorded in AFRS:**

Weekly claims submitted through the Portal are automatically routed to Microsoft Dynamics via an overnight, automated upload process. During this automated process, claim information is entered in Dynamics as a vendor payment journal. Prior to posting in AFRS, PFML benefit expenditures go through two levels of review in the Dynamics system.

On a daily basis, Fiscal Analyst 3 (FA3)'s are tasked with downloading and preparing Dynamics payment journals, which summarize all claims approved and auto-uploaded from the preceding day, detailing where benefit payments will be routed. While preparing this report, the FA3s ensure that the journals present ACH payment totals separately, depending on whether the payment will route to a personal or a business account. After preparing these reports, the FA3 will mark the files as 'prepared' within Dynamics and the system will automatically route for a reviewer's approval.

ESD Treasury Department Leads perform the first level of review over pending benefit payments. During their review, the Lead performs fraud verification, ensuring that approved benefits correspond to valid, approved Portal accounts, and that the claimant is not included on an identity fraud list which is maintained by ESD's Compliance Division. Additionally, the Lead reviews that claimed weekly benefit amounts do not exceed the program's maximum weekly benefit amount, which was \$1,456/week in FY24. Finally, the Lead ensures that the payment journal totals are in agreement with claims filed via the Portal. Once this first review has been completed, the Lead indicates their approval electronically in Dynamics, and the payment file is routed to a Treasury Supervisor.

During the second level of review, the Treasury Supervisor will again ensure that Portal information ties out to the payment journals, that there are separate payment journals attached for each payment process (i.e., personal vs. business ACH routing destinations), that the total of each payment process type is accurate, and that the effective date is correct. Once complete, the Supervisor indicates their approval electronically in

## State of Washington

Dynamics. As a final approval indication, Steve Zawoysky (or, as backup, a Supervisor) will sign the transmittal register, and transmit the reviewed benefit payment information to the Treasury Management System (TMS), via a Managed File (MFT) drop. OST is responsible for maintaining TMS, which communicates with AFRS.

### AFRS Reconciliation

At the end of each month, Mary Turpin oversees as FA3's perform a reconciliation of information which was reported to AFRS via TMS, using 'Toolbox' software. First, staff runs a monthly summary of the Vendor Payment Journal in Dynamics, showing all monthly activity which was reported to AFRS. Then, they run the 'General Ledger Activity Flexible' WebI report in the Enterprise Reporting system for the same month, showing how AFRS is currently reporting the data for relevant GLs and funds; the coding for PFML benefit claims is Fund 22F, GLs 5118, 5190 and 6510. PFML benefit claims also hits cash accounts, which are coded as Fund 22F, GLs 1100, 7110, 7120, and 7140. The two amounts are compared for accuracy and completeness (**Key Control 3 - Valuation, Completeness**). Any adjustments needed, such as amounts which are missing a program designation, are completed via the Toolbox software and, as necessary, Form A7-A 'AFRS Journal Voucher'. After reconciling the data and preparing any adjustments, the FA3 will email an approver, requesting that the toolbox reconciliation be reviewed and released. This same process occurs again at year-end, for the entire fiscal years' reporting activity. Mary is responsible for reviewing and approving any year-end reconciliations and adjustments.

At year-end, Mary is also responsible for receiving an actuarial estimate regarding claims payable, and preparing a manual journal entry to record the accrual (**Key Control 4 - Completeness**). The estimate is comprised of two components: claims which have already been filed and have a remaining payable associated, as well as claims which have been incurred, but not yet been filed. The PFML Actuarial team completes the estimate using historical data compiled by the Data and Research team. The IBNR is measured using Actuarial Standard of Practice No. 43.

Significant assumptions relevant to the estimate are as follows:

- Employee wage growth by year
- Investment yield
- PRAD confidence level
- Expense ratio
- Wage seasonality
- UI rates
- Covered employee development factor
- Assessed premium development factor

For more information regarding the actuarial estimate, see: [\[Estimates List\]](#). After the PFML Actuary team completes their estimate, the amount is emailed to Mary after being approved in a 'go/no-go' meeting. Once Mary completes the accrual JV, her work is reviewed for accuracy by the PFML Actuary team, the Treasury Manager, and the Deputy CFO prior to posting. After year-end close, the accrual entry is then reversed at the beginning of the next fiscal year.

## State of Washington

### Key Controls are as Follows:

- Key Control 1 (Rights & Obligations)** - All PFML applications are reviewed for eligibility by an ESD adjudicator prior to issuing an approval or denial decision for benefits.
- Key Control 2 (Automated Software Calculation - Valuation)** - The external OMAC online portal automatically calculates weekly benefit payment amounts via the Benefit Calculator Tool.
- Key Control 3 (Valuation, Completeness)** - ESD Treasury staff perform a monthly reconciliation between AFRS and Dynamics, ensuring that amounts reported between the two systems are accurate and complete.
- Key Control 4 (Completeness)** - At year-end, the Chief Financial Accountant is responsible for preparing a manual journal entry to record an accrual for claims payable, based on actuarial estimates.

### Noted Weaknesses are as Follows:

- Control Weakness 1** - PFML claim adjudicators have the ability to manually adjust/override system-calculated benefit amounts; there is no secondary review performed over such manual adjustments.
- Control Weakness 2** - ESD has not implemented detective controls to identify multiple payments made to a single claimant between the PFML and workers' compensation benefit programs.

### I.7.PR.G - Paid Family & Medical Leave - Expenses

*Procedure Step:* Key Control 1 (Manual)

*Prepared By:* JLE, 6/21/2024

*Reviewed By:* SHW, 7/10/2024

Purpose/Conclusion.*
----------------------

#### **Purpose**

To confirm that all Paid Family and Medical Leave claim applications are reviewed for eligibility by an Employment Security Department adjudicator (**Key Control 1 for the OMAC Portal**), in order to assess control risk.

#### **Conclusion**

We noted **no** material weaknesses or significant deficiencies in internal controls. **No control weaknesses noted.**

# State of Washington

## Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified*

## State of Washington

*issue represents a material weakness or significant deficiency.*

***All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.***

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

# State of Washington

## SAO Audit Policy [2310](#) - Reporting Identified Audit Issues

## SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk

Record of Work Done:

**This record may contain information considered exempt from public disclosure under RCW 42.56.365 of the Public Records Act. As such, distribution of this record is limited.**

**Key Control 1 (Rights & Obligations): All PFML applications are reviewed for eligibility by an ESD adjudicator prior to issuing an approval or denial decision for benefits.**

The understanding for this system is documented above in the "Controls - OMAC Portal & Dynamics" step.

### **1. Confirmation of Key Manual Control**

We confirmed this key control through a live walkthrough demonstration with Jeannette Ritchie (Leave and Care Transformation Team Product Manager) and Eric Ayres (Leave and Care Service Delivery Manager), on 6/13/2024, as follows:

First, we reviewed the PFML Customer Care Team CRM System main page. Jeannette navigated to 'Service Cases' and entered case number FJS2YSKM0X-1, which pulled up a 'Benefits Claim - Portal' page. We noted the following case information from the Claim Summary:

The application was submitted by Janice Marie C Palacios (the claimant) on 6/3/2024.

Claimant's birthdate was listed as 1/22/1974.

As of 6/13/2024, the case status was 'Resolved' and the claim status was 'Approved'.

The claim type was identified as 'Medical', and the question Secondary Qualifying Event? was marked as 'Yes'. The claim sub-type was 'Self-Serious Medical Condition'.

Leave start date requested was 5/25/2024, and leave end date requested was 6/10/2024.

The effective start date and claim year start date was 5/19/2024, and the effective end date was 6/15/2024.

The qualifying period start date was 1/1/2023.

There were 2 employers automatically identified by the Portal (due to cross-match with employer quarterly wage reporting):

Infinity Global Distribution LLC and Barmor Temporaries, Inc.

Current employment status is hourly, or part-time salaried, employee.

There were no other employers manually added by the claimant.

## State of Washington

A case note was added on 6/13/2024 at 8:45AM by James Moses (ESD), specifically noting that the following was verified: proof of identity, claim year, hours worked in base qualifying period, claim type, and leave dates. The claim status was updated to 'Approved' per the case note.

Next, we reviewed 3 supporting documents uploaded by the claimant:

### Proof of Identity

The claimant submitted a State driver's license.

We note that the claimant's name and DOB match exactly to that which was submitted on their application.

We additionally note that the driver's license appears legitimate, and is unexpired.

### Medical Certification

The claimant utilized ESD's PFML Medical Certification template form.

The claimant name, DOB, and leave request dates match that per the application without exception.

The serious health condition was due to an emergency surgery needed.

The form was signed by the claimant's medical provider on 6/3/2024, and included their certified physician assistant license number, medical practice type (general surgery), and contact information.

### Other

The claimant submitted a copy of the written record which they provided their supervisor on 5/28/2024, stating their intent to take leave due to surgery, from 5/28/2024 - 6/10/2024.

Finally, we reviewed 'Wage Search' information, which displays quarterly wage report information submitted by employers via the Portal, cross-matched to the claimant's name and SSN:

We note that the summary from wage search displayed information relevant to the claim year start date of 5/19/2024 - the summary included wage reporting information for CY23 Q1 - CY24 Q1.

*Note - the qualifying period is the first four of the last five completed calendar quarters starting from the day the employee intends to take leave.*

The claimant worked 1,668 hours in CY23 Q1 - Q4, putting them well above the needed threshold of 820 hours in order to qualify for PFML leave.

We confirmed that the claimant's identity is valid (Step 2), that they experienced a qualifying medical event (Step 2), and that they worked sufficient hours in the qualifying period to qualify for PFML leave (Step 3). We additionally confirmed that this information was verified by an ESD adjudicator prior to application approval, as indicated in the case notes (Step 1). **No issues noted.**

**Noted Weaknesses are as Follows:**

# State of Washington

None noted.

## **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at '**MAX**' because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

## **3. Control Risk at LOW - Test Key Manual Control**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at '**MAX**'.

### **I.7.PRG - Paid Family & Medical Leave - Expenses**

*Procedure Step:* Key Control 2 (AUTOMATED)

*Prepared By:* JLE, 8/6/2024

*Reviewed By:* RKM, 8/13/2024

Purpose/Conclusion.:

#### **Purpose**

To determine whether the automatic calculation of weekly benefits (Key Control 2 for the OMAC Portal) was in place and operating effectively, and to consider related general IT controls, in order to assess control risk.

#### **Conclusion**

Based on our understanding and test results, we concluded that the automated control **was** in place and operating effectively.

Based on our understanding, related general IT controls **were** in place and adequately designed to ensure the control operated consistently during the audit period; however, we did not test the operating effectiveness of general IT controls.

Our understanding and control risk assessment, which incorporates these conclusions, is documented above in the "Controls - OMAC Portal & Dynamics" step.

Testing Strategy.:

The following procedures are **required** for all automated key controls for financial and single audits:

# State of Washington

## **STEP 1: Understand Automated Key Control**

Gain an understanding of the automated key control. The understanding can either be documented in the control system step or could be documented here in this step.

Auditors should consider the following aspects of the automated control when gaining an understanding:

Is there written documentation of the calculation, and/or the source rates and factors used in the calculation?

*We would expect written documentation that defines the calculation and is an official, approved source for the formulas, rates and factors. This may be an approved policy or could be system documentation.*

What formulas are used to make the calculation?

What values or factors are used to make the calculation? For example:

- Rate tables used by the calculation

- Profile fields (i.e., applicable transaction types)

- Programmed/set formulas and/or values

- Constraints (i.e., effective date, minimums/maximums, etc.)

How is the calculation triggered or initiated?

How is the calculation recorded in the accounting system (or used in an end result)?

## **STEP 2: Confirm and Test Automated Key Control**

Confirm and test the automated control.

To test the automated control, consider the following procedures:

Re-perform the calculation for selected transactions.

*Auditors would NOT normally use sampling for automated controls. Instead, auditors should judgmentally select one instance of each significant variation of the calculation. If the number of potential variations is large, auditors would judgmentally select based on risk factors (for example, the most common scenarios, or scenarios associated with identified risks, or scenarios that are not addressed by the entity's testing procedures).*

*In some cases, it may be possible for the auditor to reperform the calculation for the entire population.*

If any rate tables or values were updated during the period, view the current values (by observing the rate table or values in an admin menu or from a printed system report) and compare to approved sources.

*If no updates were made or there are only a few values, this risk could be addressed by re-performing the calculation. However, if source*

## State of Washington

*rate tables or values are large or complex, it may be more efficient to test these values directly than to recalculate a larger number of transactions.*

Consider the use of analytical procedures such as trends or descriptive statistics on the population (like average, minimum and maximum values, or a graph of values across the population) and follow up on any unexpected values or trends. *Analytical procedures would normally also count as a substantive test.*

### **STEP 3: Understand General IT Controls**

Gain an understanding of the general IT controls that support the continued proper operation of the automated control. Identify key general IT controls and note any control weaknesses.

Auditors should consider the following aspects of general IT controls when gaining an understanding:

Inquire if the entity has experienced any errors or irregularities with the calculation. Also how often changes are made to the calculation, and how many changes (if any) were made during the year.

How can the software calculation (formulas, rates/values, settings/configurations) be changed or customized?

*Software calculations will usually have one or more administrative menus that allow the government to modify rate tables or other calculation values, or to configure the calculation or apply settings.*

*In other cases, software calculation formulas and/or values may be hard-coded into the system and require programmers to make the changes. If the government has access to source code, then it needs internal procedures for program changes. If the program is controlled by vendors, we would expect program change procedures and expectations to be included in the contract.*

What are the procedures to authorize and make program changes or configuration/setting changes to the software calculation?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

*If utilizing a test environment, there should be controls to ensure that the live environment is updated and is consistent with the live production environment. As management is responsible for the accuracy of their automated controls (i.e., in the live environment), we would expect there to be a procedure to confirm each key automated control once it is in the live environment. This could be manually re-performing the calculation, reviewing reports against known expectations, etc.*

## State of Washington

How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change programming, but they may be responsible for patch management, master table data, and/or configurations.*

### **STEP 4: Confirm Key General IT Controls**

Confirm your understanding of key general IT controls to determine whether they have been placed in operation (*whether the entity has actually implemented key controls*).

### **STEP 5: Test Key General IT Controls**

Document whether general IT controls will be tested. Option 1 would result in control risk at MAX for the automated control. Either option 2 or 3 is necessary in order to set control risk at LOW.

If general IT controls are tested, consider the following procedures:

If program changes or setting/configuration changes are logged, review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the calculation may also provide this evidence if the re-performance tests address all states of the calculation during the period.

If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

### **STEP 6: Final Control Risk**

## State of Washington

Evaluate the results and document a final control risk assessment in the control system step. Consider whether any deficiencies identified with either the automated control or related general IT controls represent material weaknesses or significant deficiencies.

*Note: general IT control deficiencies do not necessarily mean the automated control is not properly functioning. General IT control deficiencies would normally be considered a significant deficiency or material weakness only if it caused an issue with the compliance requirement or assertion.*

### **Recommendation Review Requirement**

IT Security related information is considered category 3 data protected by Public Request Exemption RCW 42.56.420. Issues related to IT Security require the following special handling:

[Instructions](#) are located in Team IT Audit's System's Sharepoint page.

Details of IT Security related issues should NOT be included in any emails or helpdesks.

Exit, ML and Findings should be separately communicated in an IT Security Results Document.

Findings will be referenced, but not included in the audit report.

All IT security-related recommendations must be reviewed by [Team IT Audit](#).

Template language for common IT related recommendations can be found in [ARS Part 5 Chapter 8](#).

### **PUBLIC REQUEST EXEMPTION**

Some IT related information is protected by Public Request Exemption RCW 42.56.420 for cyber security purposes. The details documented in the record of work and support workpapers may qualify for this exemption. If so, auditors must include this statement in the record of work done and any related workpapers: **"This record contains information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited "**.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

A **software calculation control** exists when the value of a transaction is determined by a software application. This process can be a key control when the entity relies on the system to generate calculations correctly to determine the amount of transactions (i.e., summarizing/account code allocation to post to general ledger, calculate student, utility, other charges, etc.).

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Information Technology Planning Guide](#)**

Auditors may contact [Team IT Audit](#) with any testing strategy or control assessment questions or to request assistance from an IT Specialist.

Record of Work Done:

**This record may contain information considered exempt from public disclosure under RCW 42.56.420 and RCW 42.56.365 of the Public Records Act. As such, distribution of this record is limited.**

# State of Washington

**Key Control (Automated Software Calculation - Valuation)** - The external OMAC online portal automatically calculates weekly benefit payment amounts via the Benefit Calculator Tool.

## **STEP 1: Understand Automated Key Control**

After a worker files a Paid Family and Medical Leave (PFML) claim, the external OMAC Portal then automatically calculates payments via the Benefit Calculator Tool. This tool relies on any manual information input by ESD adjudicators during the initial application review, as well as cross-matched data from employer-submitted quarterly wage reports, showing hours worked and employee salary information.

The weekly benefit amount is calculated based on a worker's average weekly wage and the amount actually paid is then prorated based on a comparison of actual to average work week hours. See further understanding of the automated control documented above in the "Controls - OMAC Portal & Dynamics" step, under the section header 'Calculating Benefits'.

## **STEP 2: Confirm and Test Automated Key Control**

### Automated Key Control Confirmation

We confirmed the automated key control via a live walkthrough demonstration with Jeannette Ritchie (Leave and Care Transformation Team Product Manager) and Eric Ayres (Leave and Care Service Delivery Manager), on 6/13/2024, as follows:

We observed as Jeannette navigated to 'Service Cases' and entered case number FJS2YSKM0X-1, which pulled up a 'Benefits Claim - Portal' page. We note that relevant case information was as follows:

- The application was submitted by Janice Marie C Palacios (the claimant) on 6/3/2024.

- Leave start date requested was 5/25/2024 and leave end date requested was 6/10/2024.

- The effective start date and claim year start date was 5/19/2024 and the effective end date was 6/15/2024.

- The qualifying period start date was 1/1/2023.

- There were 2 employers automatically identified by the Portal (due to cross-match with employer quarterly wage reporting): Inifinity Global Distribution LLC and Barmor Temporaries, Inc.

- Current employment status is hourly, or part-time salaried, employee.

- There were no other employers manually added by the claimant.

We note that the Portal's Weekly Benefit Calculator Tool calculated the typical work week hours as 32 and the weekly benefit amount as \$744.

### *Auditor Re-Calculation of Typical Work Week Hours*

As described above in the "Controls - OMAC Portal & Dynamics" step, we found that for non-salaried workers, typical work week hours are calculated as the sum of all hours reported during the qualifying period, divided by 52, rounded down to the nearest hour. The qualifying period is the first four of the last five completed calendar quarters starting from the day the employee intends to take leave.

## State of Washington

The claimant in case number FJS2YSKM0X-1 intended to take leave beginning 5/25/2024. The last five completed calendar quarters were CY23 Qtr 1-4, and CY24 Qtr 1; the first four of which included CY23 Qtr 1-4. During CY23 Qtr 1-4, the claimant worked a total of 1,668 hours, according to previously submitted employer wage reports.

$1,668 / 52 = 32.0769$ , which rounds down to 32. We find that 32 typical work week hours matches the Portal's calculation without exception. **No issues noted.**

### *Auditor Re-Calculation of Weekly Benefit Amount*

As described above in the "Controls - OMAC Portal & Dynamics" step, we found that the weekly benefit amount is calculated as follows. Per ESD's website (see: [esd.wa.gov](https://esd.wa.gov)), for PFML claims filed on or after 1/1/2024, the State's average annual wage was considered to be \$84,167.

A worker's average weekly wage: total reported wages in the claimant's two highest-paid quarters during the qualifying period is divided by 26, then rounded down to the nearest multiple of one dollar.

The weekly benefit amount:

If the worker's average weekly wage is less than or equal to 50% of the State's average weekly wage, then the weekly benefit amount will be 90% of the worker's average weekly wage.

If the worker's average weekly wage is greater than 50% of the State's average weekly wage, then the benefit amount is as follows:

90% of 1/2 of the State's average weekly wage, plus:

50% of the difference between 1/2 of the State's average weekly wage and the worker's average weekly wage.

### Worker's Average Weekly Wage:

We note that the claimant's wages during their two highest-paid quarters during the qualifying period was \$21,875.07.

$\$21,875.07 / 26 = \$841.3488$ , which rounds down to \$841.

### State's Average Weekly Wage:

$\$84,167 / 52 = \$1,618.5961$ , which rounds down to \$1,618 (the State's average weekly wage amount)

$\$1,618 * 50\% = \$809$  (50% of the State's average weekly wage amount)

As the claimant's average weekly wage was greater than 50% of the State's average weekly wage, we re-calculated the benefit amount as follows:

50% of the State's average weekly wage (calculated above) = \$809

90% of 1/2 of the State's average weekly wage:  $\$809 * 90\% = \$728.1$ , which rounds down to \$728.

Difference between 50% of the State's average weekly wage and the claimant's average weekly wage:  $\$841 - \$809 = \$32$

50% of the above-calculated difference:  $\$32 * 50\% = \$16$

## State of Washington

Add 90% of 1/2 of the State's average weekly wage, and 50% of the difference between State and worker average weekly wage:  $\$728 + \$16 = \$744$ .

We find that a weekly benefit amount of \$744 matches the Portal's calculation without exception. **No issues noted.**

### Automated Key Control Testing

**Not applicable** - we are not planning to rely on automated controls and therefore do not need to test automated controls; control risk will be assessed at 'MAX'.

### **STEP 3: Understand General IT Controls**

We gained an understanding of general IT controls as follows: on 7/9/2024, we met with Bryon Schabell (Quality Supervisor), Bora Kim (Delivery Architect), Jeanette Ritchie (Product Manager), and Ed Heredia (Application Manager).

As documented above in the "Controls - OMAC Portal & Dynamics" step, the State average (weekly and annual) wage amounts are calculated annually by ESD's DATA division, based on a computer-generated report within the unemployment (UI) data warehouse. Annually, these average wage amounts and the updated maximum PFML benefit amount are communicated to ESD via the ESD Product Manager. Such communication includes ADO (Azure Development Operations) order requirements, which specify how these amounts are to be applied within the system.

As of CY24, changes to these amounts are made within the 'Manage Program Rates' tool. This tool is presented in a user-friendly format, displaying current values and proposed changes for the following categories: start date, end date, minimum benefit wage, maximum benefit amount, State average weekly wage, minimum qualifying hours, medical leave weeks, family leave weeks, combined leave weeks, and pregnancy complication weeks. Once proposed changes are entered, they are automatically routed for approval (known as 'Pull Requests'). Prior to CY24, changes to rate amounts were made by manually creating pull requests and manually inserting scripts directly into the system.

In all cases, pull requests require approval within the system before they will post to the production environment (**General IT Control 1**). There are a limited number of individuals within ESD who have system-authorization to approve pull requests (i.e., rate changes) (**General IT Control 2**). Currently, there are three individuals with such authorization. All changes and approvals relating to premium rate information are tracked within ADO and git (a version controlling tool which captures changes in system versions).

Prior to approving changes, reviewers will ensure that testing was performed, ensuring correct functioning of the system calculation. The testing phase is completed in five steps: developer testing in the Development environment, testers testing in the Test environment, integration team testing in the Test 2 environment, performance team testing in the Integration Testing environment, and end-to-end team testing in the Staging environment.

### **STEP 4: Confirm Key General IT Controls**

**Key Control 1 - Changes made to the State Average Weekly Wage and maximum benefit amounts (known as 'pull requests')**

## State of Washington

### **require approval within the system before they will post to the production environment.**

On 7/9/2024, we observed as Bora Kim (Delivery Architect) launched Microsoft SQL Server Management Studio, and navigated to the 'OMAC' database, sub-table 'dbo.BenefitConfiguration', and right clicked to select the option 'Select Top 1000 Rows'. We note that the most recent request was created by user ABillington on 12/12/2023. The request included a start date of 1/1/2024, an end date of 12/31/2024, a maximum weekly benefit amount of \$1,456, and a State average weekly wage amount of \$1,618. We note that this amount and the date ranges agree without exception to Work Order 143703 'Adjust PFML Systems for 2024 maximum WBA amount', which was created by Thomas Jones (ESD Product Manager). The pull request was approved by Rebecca Grady (Data Research Team Manager) on 12/12/2023; the pull request 'Status' is currently marked as 'A' (approved), and the 'Update Process' status reads "Operation.ProgramRateManager.Approved()". As confirmed below, Rebecca Grady is an authorized approver for pull requests. **No issues noted.**

### **Key Control 2 - There are a limited number of individuals within ESD who have system-authorization to approve pull requests (i.e., rate changes).**

On 7/9/2024, we observed as Bora Kim (Delivery Architect) launched Microsoft SQL Server Management Studio, and navigated to the 'OMAC' database, sub-table 'dbo.BenefitConfiguration'. Bora then ran the following SQL query: "select 'from Security Permission' where Target Name = STFSYSOPSAPPR". This query generated a list of three individuals who have system authorization to approve pull requests and the associated dates when they were granted such system authorization. The list included: Alison Eldridge (Production Team Manager, added 2/6/2020), John Mattes (Operations Team Manager, added 2/6/2020), and Rebecca Grady (Data Research Team Manager, added 3/19/2020). All users were granted system authorization by the Development Team. **No issues noted.**

### **STEP 5: Test Key General IT Controls**

Not applicable - we are not planning to rely on automated controls and therefore do not need to test general controls; control risk will be assessed at '**MAX**'.

### **I.7.PRГ - Paid Family & Medical Leave - Expenses**

*Procedure Step:* Key Control 3 (Manual)

*Prepared By:* JLE, 7/16/2024

*Reviewed By:* RKM, 8/13/2024

Purpose/Conclusion:
---------------------

### **Purpose**

To confirm that Employment Security Department staff perform a monthly reconciliation between AFRS and Microsoft Dynamics (Key Control 3 for

## State of Washington

Microsoft Dynamics), in order to assess control risk.

### **Conclusion**

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*

## State of Washington

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency.*

***All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.***

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

# State of Washington

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

**Key Control 3 (Valuation, Completeness): ESD Treasury staff perform a monthly reconciliation between AFRS and Dynamics, ensuring that amounts reported between the two systems are accurate and complete.**

The understanding for this system is documented above in the "Controls - OMAC Portal & Dynamics" step.

### **1. Confirmation of Key Manual Control**

We obtained the ESD AFRS to Dynamics reconciliation for the month of March (3/1/2024 - 3/31/2024) from Steve Zawoysky (Treasury Manager) on 6/26/2024. The reconciliation was presented in an Excel Workbook named 'Treasury Recon FM09.FY24', and was prepared by Mary Turpin (former Chief Financial Accountant) on 4/27/2024, for PFML Fund 22F.

As noted above in the *Controls - OMAC Portal & Dynamics* step, we would expect the reconciliation to consider data from both Dynamics (AX) and Webi. We noted that the workbook contained tabs for Webi report data and additional tabs formatting Webi information into an Excel pivot table (as noted in tabs 'WebI' and 'Webi Pivot'). The workbook also contained tabs for Dynamics (AX) data, as noted in the tabs 'FM08' and 'AX TB'. A 'Comparison' tab then used Excel formulas to pull data from the 'AX TB' and 'Webi Pivot' tabs for a detailed analysis between AFRS and Dynamics (AX) data. Sub-totals of amounts reported per the 'Comparison' tab then corresponded without exception to the totals seen on the summary tab 'Blank Recon Template' (which is discussed below).

We note that a summary tab, called 'Blank Recon Template' displayed a summary-level description of balances reported per AFRS, compared to those reported per Dynamics (AX). Balance categories included cash, receivables, revenue, liabilities, and expenses. Total differences which needed to be reconciled, reclassified, or corrected for each balance within Fund 22F were as follows:

Cash - \$(4,289,490.47)

Receivables - \$(579,382.84)

Revenue - \$(1,258,994.38)

## State of Washington

Liabilities - \$(536,515.72)

Expenses - \$6,664,383.41

After reconciling these differences, the Treasury team made various adjustments to the amounts reported for Dynamics, as seen on the 'Comparison' tab. After such adjustments, remaining differences (which represent timing differences, as well as unknown variances) were as follows:

Cash - Dynamics overstated by \$568,185

Receivables - Dynamics overstated by \$577,704

Revenue - Dynamics understated by \$16

Liabilities - Dynamics overstated by \$14,411

Expenses - Dynamics overstated by \$4,876

As none of the remaining differences are above the floor, we will not create an audit issue. Steve Zawoysky (Treasury Manager) stated that the unknown variances will continue to be investigated as part of the year-end reconciliation process. We confirmed that ESD Treasury staff perform a monthly reconciliation between AFRS and Dynamics for accuracy and completeness as asserted. **No issues noted.**

### **Noted Weaknesses are as Follows:**

None noted.

### **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at '**MAX**' because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **3. Control Risk at LOW - Test Key Manual Control**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at '**MAX**'.

### **I.7.PR.G - Paid Family & Medical Leave - Expenses**

*Procedure Step:* Key Control 4 (Manual)

*Prepared By:* JLE, 10/4/2024

*Reviewed By:* RKM, 10/9/2024

# State of Washington

Purpose/Conclusion:

## **Purpose**

To confirm that the Employment Security Department prepares a year-end journal entry to record an accrual for claims payable, based on actuarial estimates (Key Control 4 for Microsoft Dynamics), in order to assess control risk.

## **Conclusion**

We noted **no** material weaknesses or significant deficiencies in internal controls. **No control weaknesses noted.**

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

## State of Washington

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency.*

***All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.***

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. *Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. *Controls are not related to a "significant risk" identified in the audit plan.*
- C. *Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all*

## State of Washington

*control testing.*

*D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

**Key Control 4 (Completeness): At year-end, the Treasury team is responsible for preparing a manual journal entry to record an accrual for claims payable, based on actuarial estimates.**

The understanding for this system is documented above in the "Controls - SAW Portal & Dynamics" step.

### **1. Confirmation of Key Manual Control**

We obtained a copy of the claims payable accrual from Stephanie Eskesen (External Audit Liaison) on 10/3/2024. We reviewed the accrual JV #YEADJ003, noting that it was for \$295,963,207, and that it was appropriately credited to fund 22F, and general ledger account code 5118 (short-term payables, current benefits claims payable). We compared the accrual amount to actuarial workbooks obtained during our 'Rely on Specialist' procedures, noting that the ESD actuary specialist estimated there was an outstanding claims liability of \$295,963,207 as of 6/30/2024. The actuary estimate and claims payable accrual agree without exception. **No issues noted.**

### **Noted Weaknesses are as Follows:**

None noted.

### **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at '**MAX**' because we have determined that substantive procedures alone will be

## State of Washington

effective to reduce detection risk to an acceptable level.

### **3. Control Risk at LOW - Test Key Manual Control**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at '**MAX**'.

### **I.7.PRG - Paid Family & Medical Leave - Expenses**

*Procedure Step:* Risk Assessment

*Prepared By:* JLE, 8/6/2024

*Reviewed By:* RKM, 8/13/2024

Purpose/Conclusion:

Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

### **STEP 1: Inherent Risk (IR)**

Assess inherent risk for each relevant assertion. This assessment is based on understanding of the entity and the nature of the account balance or class of transactions.

*Inherent risk is the susceptibility of an assertion to material misstatement. It is our assessment of "total threat", which includes both "natural risk" and identified risk indicators, without any regard to any potential control activities. As inherent risk is fully independent of control risk, any understanding of controls cannot be used to increase/decrease the assessment of inherent risk. Consider the following factors as your basis for this assessment:*

#### *General Considerations*

*Does the balance include transactions that are difficult to audit or involve complex accounting issues?*

*Were there significant misstatements identified in previous audits or prior-period adjustments in the account balance or transaction class? If so, analyzing the cause of prior period misstatements will help in analyzing inherent risk.*

*Are there any inherent risk factors at the entity or industry level, such as changes in regulation or accounting rules, unique transactions or accounting practices, use of information technology, etc that affect the balance?*

## State of Washington

### *Inherent Risk due to Error*

*How large are the transactions making up the balance? If the balance has only a few large transactions, even a single error may mean a significant misstatement.*

*Have there been changes in the transactions making up the balance that may increase risk? For example, significantly different composition, nature or volume of transactions may inherently disrupt established controls.*

*Are financial events originated or identified by accounting personnel or non-accounting personnel? This consideration is mainly for the completeness assertion.*

*Does the process to account for transactions involve judgment or estimation, complex calculations, numerous steps or significant manual steps?*

*Do transactions have widely varying attributes that need to be manually identified? For example, grant loans that are accounted for in one of several ways depending on the terms of the agreement.*

### *Inherent Risk due to Fraudulent Reporting (intentional misstatements)*

*Are there substantial pressures or motivations to misstate the balance?*

### *Inherent Risk due to Misappropriation*

*Is the account balance or transaction class susceptible to sizable misappropriation?*

### *Inherent Risk due to Non-Compliance*

*Are there any laws, contracts or grant agreements affecting the balance? If so, would non-compliance lead to sizable misstatements?*

*Are compliance requirements complex, hard to understand, subject to judgment or otherwise difficult to comply with?*

*Are there any motivations or pressures to not comply?*

## **STEP 2: Control Risk (CR)**

Assess control risk by system and assertion. This assessment should be based on the results of the control understanding, confirmation, and (if setting control risk to LOW) testing. If applicable, auditors will evaluate any control deficiencies and determine whether those deficiencies, individually or in combination, are significant deficiencies or material weaknesses.

*Control risk is the risk that material misstatements would not be prevented or detected timely by the system of internal control. Control risk could be thought of as the "vulnerability" of an entity to misstatements. Control risk exists independently of the inherent risk (the level of vulnerability exists independent of the level of threat).*

*Control risk is MAX in both of the following situations: (1) controls aren't tested or (2) controls are problematic and cannot be relied upon. In order to set control risk to LOW, the auditor must test that controls operated effectively throughout the period.*

*A material weakness exists when the design or operation of controls results in a reasonable possibility a material misstatement will not be prevented or detected and corrected in a timely manner. A significant deficiency is less severe than a material weakness, yet important enough to merit the attention of the governing body. **All potential material weaknesses and significant deficiencies should be***

## State of Washington

*discussed with the AIC, since they must be reported as findings.*

### **STEP 3: Risk of Material Misstatement (RMM)**

Assess the risk of material misstatement for each relevant assertion for each significant line item. The risk of material misstatement (RMM) is a combination of the auditor's separate assessment of inherent and control risk.

*In practice, the RMM is the amount of substantive evidence that's needed, and the only way to reduce the amount of needed substantive evidence (equal to the inherent risk) is to test controls. As such, when control risk is MAX, the RMM must always equal the inherent risk (IR).*

*When controls are tested & can be relied upon (are determined to be effective) it is a matter of professional judgment how much the RMM should be set lower than inherent risk (1 or 2 steps).*

*Auditors should assess RMM by assertion, if different. For example, if RMM is assessed at MOD for the existence assertion, but LOW for the rights & obligations assertion, then document "MOD – existence and LOW – rights & obligations".*

### **STEP 4: Design Substantive Testing**

Design a substantive testing strategy that addresses the relevant assertion (identified risk) in the portion of the line item that relates to that risk.

*Planning identifies where to audit (significant balances, classes of transactions & disclosures) what to audit for (relevant assertions), and how much to audit (RMM). The quantity and quality of evidence obtained by substantive tests needs to match the level of risk. The higher the risk of material misstatement, the greater evidence needed. "Greater evidence" could either be greater quantity of evidence, greater quality of evidence, or some combination of greater quality and quantity.*

Guidance/Criteria.:

Record of Work Done.:

#### **(1) Inherent Risk (IR)**

Based on our understanding of the line item, we assessed inherent risk for each relevant assertion and significant class of transactions relating to the Paid Family & Medical Leave Compensation Expenses balance:

**Rights and Obligations - Inherent Risk Assessment - HIGH**

**Valuation - Inherent Risk Assessment - HIGH**

# State of Washington

## **Completeness - Inherent Risk Assessment - HIGH**

### **(2) Control Risk (CR)**

We assessed control risk as follows for each system and relevant assertion:

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **(3) Risk of Material Misstatement (RMM)**

We considered both inherent and control risk and assessed the risk of material misstatement as follows for each relevant assertion and significant class of transactions:

**Rights and Obligations - HIGH**

**Valuation - HIGH**

**Completeness - HIGH**

### **(4) Testing Strategy**

We designed our substantive testing strategy based on our assessment of the risk of material misstatement. We anticipate that these tests will provide sufficient appropriate audit evidence to address the assessed risk of material misstatement for relevant assertions in significant classes of transactions.

We plan to perform the following tests:

**Rights & Obligations** - We will obtain a population of all PFML claims paid during FY24. Using the sampling spreadsheet from the TeamStore, we will sample claims paid during the fiscal year, determining whether eligibility was properly adjudicated based on: positive applicant identification, qualifying event occurrence, and hours worked (including consideration of whether the correct qualifying period was utilized in the determination).

**Valuation** - We will obtain a population of all PFML claims paid during FY24. Using the sampling spreadsheet from the TeamStore, we will sample claims paid during the fiscal year. Due to the increased risk from manual adjudicator overrides, we will consider stratifying our population into two sample populations (claims which indicate a manual override, and claims which do not). For each testing selection, we will re-calculate the worker's weekly benefit amount paid.

**Completeness** - We will bring in 'Rely on Specialist' procedures from the TeamStore, following all required elements in the associated testing strategy. We will gain an understanding of the source of data used by actuaries to develop the claims payable

## State of Washington

amount, considering whether testing coverage over this data has been adequately addressed in our testing of data relating to the rights and obligations and valuation assertions.

### I.7.PRG - Paid Family & Medical Leave - Expenses

*Procedure Step:* Substantive Testing

*Prepared By:* JLE, 10/9/2024

*Reviewed By:* RKM, 10/10/2024

Purpose/Conclusion:

#### **Purpose**

To determine whether:

- FY24 PFML claimants were eligible for benefits paid (Rights and Obligations)
- FY24 benefit payments were properly accrued during the fiscal year (Completeness)
- FY24 benefits payments were correctly calculated (Valuation)

#### **Conclusion**

We determined that FY24 PFML claimants were eligible for benefits paid, that FY24 benefit payments were properly accrued during the fiscal year, and that FY24 benefit payments were correctly calculated. **No issues noted.**

Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

#### **STEP 1: Prior Audit Exceptions**

Document any exceptions noted during the prior audit. Follow-up to determine how the agency has responded to or corrected the issue, unless this work is anticipated as part of the testing strategy.

#### **STEP 2: Analyze Composition and Changes of Line Item**

Include link to the line item leadsheet. This will be completed at the end of the audit. Leadsheet analysis should be documented in this spreadsheet.

## State of Washington

Inquire with agency staff about the activities and transactions that make up the balance and any changes to those activities or transactions in relation to the prior year.

Determine relevant classes of transactions or account balances within the line item to analyze (such as agencies, funds, programs, departments, accounts, and/or objects), and use AFRS to create trends of those elements. This step should not include any specific dollar amounts associate with the line item.

Evaluate trends to identify:

- (1) What classes of transactions or account balances are primary to the identified risk. Auditors should specifically consider what elements are primary to the line item (comprising a large percentage of the line item), and which elements the identified risk would apply to, and which elements might be most susceptible to the identified risk (having a high risk of non-trivial misstatement for a relevant assertion, considering likelihood and impact of potential for misstatement).
- (2) What changes are primary to the identified risk, if applicable. Auditors should specifically consider whether the overall change to the line item from the prior year was significant, what elements were the primary drivers of overall change, whether any elements changed significantly from the prior year, and which changes (if any) might relate to the identified risk.
- (3) Any unusual or unexpected elements, amounts, or changes that may indicate a risk, whether the one identified in planning or a new one that may need to be considered for a change to the plan.

**Consider** other procedures to gain an understanding of the line item, such as review of key policy documents, review of program information or reports, inquiry of staff, budget information, or other analytical procedures.

### **STEP 3: Update Significant Account Matrix**

Based on your understanding of the line item, update the Significant Account Matrix with final conclusions on the agencies covered, account description, significant accounting systems, and risk (what could go wrong and relevant assertions). The account description should reflect the significant transaction streams or account balances relevant to the risk.

*The description of agencies, significant accounting systems, and what could go wrong in the Significant Account Matrix constitute the overall scope of substantive testing.*

*A transaction stream is significant based on the potential for misstatement. This is often due in part to its size (ie: comprising a large percentage of the total line item), but is ultimately a judgment about the susceptibility to the identified risk (for example, when the risk is understatement a small or omitted account may hold the most potential for the largest misstatement).*

*Significant accounting system(s) are those that contain key controls over significant classes of transactions included in the line item. Control systems identified in this step must match the Significant Account Matrix and have a separate control understanding documented.*

*Talk with the AIC if you identify any changes to the Significant Account Matrix.*

Guidance/Criteria.7

# State of Washington

## Record of Work Done:

We performed the following substantive tests to meet identified risks and assertions as documented at: [\[Risk Assessment\]](#):

### 1. Rights and Obligations

See testing at: [\[Substantive Testing - Rights & Obligations\]](#).

We obtained two populations from ESD: PFML claims submitted during FY24, and PFML claim benefits paid during FY24. Team IT Audit performed a cross-match between these two populations. Next, we utilized the sampling spreadsheet from the TeamStore to randomly select 39 testing selections from the cross-matched population. To determine whether FY24 claims paid represent valid obligations of ESD, we met with Max Tavaréz (ESD Leave and Care Specialist) on 9/30 and 10/2 via Teams. Max utilized the screenshare function of Teams to demonstrate supporting documentation within the OMAC Portal, LINIX system, and Benefit Calculator Tool. For each testing selection, we viewed identification documentation, medical certification, and employer wage reporting, to determine: whether positive applicant identification was made, whether a qualifying event occurred, whether the correct qualifying period was used in the adjudication determination, and whether the 820 working hours requirement was met by the applicant. We found that all samples were correctly adjudicated and were supported by adequate documentation. **No issues noted.**

### 2. Valuation

See testing at: [\[Substantive Testing - Valuation\]](#).

We obtained a population of PFML claim benefits paid during FY24 from Stephanie Eskesen (ESD External Audit Liaison). We then relied on Team IT Audit to use this data to produce two sub-populations: one of claims which were 'auto-approved' by the Benefit Calculator Tool, and one of claims which were not 'auto-approved', indicating that manual adjustment by adjudicators had taken place. Using the sampling spreadsheet from the TeamStore, Team IT Audit randomly selected 39 samples from each population on our behalf. For these 78 total samples, we requested the following additional information from ESD: claimant wages reported for each quarter of the qualifying period, total hours worked during the qualifying period, whether each claimant was considered to be a salaried or non-salaried worker, and whether the claim week selected for testing was considered to be the claimant's waiting week. For each testing selection, we re-calculated the claimant's base weekly benefit amount, and the weekly benefit amount paid in the given claim week, based on our understanding of RCW 50.04.355, WAC 192-610-051, and WAC 192-610-050 (as documented in the 'Controls' step above). In our recalculation we also tested to ensure the payment didn't exceed the statutory weekly limits. We found no misstatements in our re-calculation of claimant base weekly benefit amounts. For the re-calculation of weekly benefit amounts relating to auto-approved claims, we found an overstatement of \$12, which resulted in projected overstatement of \$576,689. For the re-calculation of weekly benefit amounts paid relating to manually adjusted claims, we found an understatement of \$24, resulting in a projected understatement of \$518,763. Actual and projected misstatements are beneath the floor (both individually and in aggregate). **No issues noted.**

### 3. Completeness

See testing at: [\[Rely on Specialist\]](#).

## State of Washington

We identified a completeness risk that PMFL claims payable benefits were not properly accrued during the fiscal year. After gaining an understanding of the PFML program and controls over claims expense, we found that ESD relies on an internal actuary team to develop a year-end accrual estimate. We brought in 'Rely on Specialist' procedures from the TeamStore, to determine whether we could rely on these actuarial accrual estimates in consideration of our audit work. As part of these procedures, we assessed competency, capability, and objectivity of the actuary specialist. We also gained an understanding of the specialist's procedures and conclusions, and assessed reasonableness of the methods and assumptions used in their work. We additionally gained an understanding of the source data used by actuaries, determining that testing coverage over this data has been adequately addressed in our consideration of population completeness relating to our tests over rights and obligations and valuation assertions. Finally, we assessed reasonableness of the specialist's conclusions, and evaluated whether such conclusions were appropriately reflected in the financial statements. We determined that we can rely on ESD actuarial accrual estimates in consideration of our audit work, specifically noting that specialist conclusions are reasonable, and are reflected in the financial statements. **No issues noted.**

### I.7.PRГ - Paid Family & Medical Leave - Expenses

*Procedure Step:* Rely on Specialist

*Prepared By:* JLE, 10/4/2024

*Reviewed By:* RKM, 10/9/2024

#### Purpose/Conclusion.

##### **Purpose**

To determine if we can rely on the work of the Employment Security Department's Managing Actuary to provide audit evidence for the fiscal year 2024 Paid Family and Medical Leave claims payable estimate.

##### **Conclusion**

We determined that we **can** rely on the work of the specialist. **No issues noted.**

#### Testing Strategy.

To determine whether the audit can rely on the work of the outside specialist and whether the specialist's work supports the financial statements, the following procedures are **required** to be performed:

Auditor should check with their supervisor whenever they determine that the use of a specialist may be necessary.

## State of Washington

*A specialist is an individual or organization possessing expertise in a field other than accounting or auditing (for example, information technology specialists, engineers and actuaries). Specialists may be contracted or employed by entity management to assist them in performing their responsibilities (management's specialist) or contracted or employed by our Office (auditor's specialist).*

*This step does not need to be completed when consulting with attorney general assistants, LGS, TAS, LISA, STAT, DSI or "Subject Matter Experts" designated on the intranet. Contact TAS for assistance if needed to determine whether someone would be considered a specialist or not.*

Assess the specialist's competence, capability and objectivity as it relates to the work that we intend to rely on for the audit.

*Competence refers to the specialist's relevant qualifications and experience. In assessing competence, auditors should consider:*

*The education, professional certifications or licenses of the specialist in his or her field, as appropriate.*

*The reputation and standing of the specialist.*

*The specialist's experience in the type of work under consideration.*

*Our Office's experience in using the specialist's work, if applicable.*

*Capability refers to effect of any access, resource or other limitations on the specialist's work. In assessing capability, auditors should consider:*

*Timing of the specialists work*

*Any significant limitations on the specialist's access to needed information or people*

*Any significant limitations on the time the specialist was able to devote to the work*

*Our Office's experience in using the specialist's work, if applicable.*

*Objectivity refers to the possible effects of any bias, conflicts of interest or undue influence on the specialist's judgment. If the specialist's objectivity is impaired, the auditor may not rely on the work of the specialist. In assessing objectivity, auditors should consider:*

*Any pressures or incentives on either specialists or management to misstate*

*Threats to objectivity of the specialist (including self-interest, advocacy, familiarity, self-review or intimidation threats) and any safeguards in place (segregation of duties, lines of reporting, professional standards, formality and consistency of methods and assumptions, retrospective reviews, etc)*

## State of Washington

*Our Office's experience in using the specialist's work, if applicable.*

*Auditors should contact TAS if the auditor has any concerns with assessing the competence, capabilities or objectivity of specialists.*

Obtain an understanding of the work and conclusions of the specialist. This understanding should include the following elements:

- Objectives and scope of the specialist's work
- Intended use of the specialist's work to support the audit objective
- Specialist procedures and conclusions
- Assumptions and methods used by the specialist

*The objectives and scope of the specialists work and intended use of the specialist's work to support our audit objective should have already been included in the audit plan or else will need to be documented as a change to the audit plan.*

Evaluate the work and conclusions of the specialist. This evaluation should include the following elements as applicable:

Relevance and reasonableness of the specialist's methods and assumptions

*The appropriateness and reasonableness of methods and assumptions used and their application are the responsibility of the specialist. However, if the auditor concludes that the specialist's findings are unreasonable in the circumstances, the auditor should apply alternative procedures, which may include obtaining the opinion of another specialist.*

*Auditors should specifically consider whether methods and assumptions changed from the preceding period and the reasons for such changes, if applicable.*

Appropriate tests of source data provided by the entity to the specialist.

*If any data used by the specialist was provided by the entity, the auditor should consider the risk that incomplete or inaccurate data may materially affect the specialist's conclusions. This risk may be affected by the auditor's assessment of overall COSO elements and control risk for the related system.*

*For example: when relying on work of an actuary for self-insurance liabilities, auditors would normally verify the completeness and accuracy of claims information provided to the actuary against claims information per the pool's system. This can be done by comparing the total claim payments per pool's records to total claims paid shown on the actuary reports (in aggregate or on annual basis) – the figures may not match exactly but should be very close.*

# State of Washington

Relevance and reasonableness of the specialist's conclusions.

Verifying that the specialist's conclusions are reflected in the financial statements

Add an additional representation to the rep letter if the specialist used was employed or contracted by management (rather than SAO). See the List of Additional Representations located in the Auditor Reference Guide here: [Representation Letter Resource.docx](#)

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

### **SAO Audit Policy [3230](#) - Using the Work of Specialists**

Record of Work Done:

In order to perform the steps below, we met with Eve Sheng (ESD Managing Actuary) on 9/3/2024. Eve performed all actuary procedures relating to the FY24 Paid Family and Medical Leave (PFML) claims payable estimate.

#### **1. Assessment of Competence, Capabilities and Objectivity of Specialist**

We assessed the competence, capabilities, and objectivity of the specialist, specifically considering factors described in the testing strategy, noting the following:

##### Competence

Eve holds a Master of Science from Boston University, and two professional designations: Fellow of the Conference of Consulting Actuaries (FCA), and Member of the American Academy of Actuaries (MAAA). Eve's professional experience spans 17 years and includes work in reserving, pricing, capital modeling, and predictive analytics. As a manager, she has overseen actuarial, data science, and product management processes. Prior to joining ESD, Eve was employed as the Chief Actuary for Liberty Insurance Group's Malaysian operations division. In this role, she evaluated the company's claim liabilities, assessed financial condition, and provided opinions on pricing soundness. She also implemented the first Liberty Specialty Market casualty pricing model. Her position reported to the Board, acted as an ELT member, and was overseen by regulators.

##### Capability

Eve asserted that there were no limitations on her ability to access relevant information, data, or individuals at the Employment Security Department (ESD); however, she noted that for gross wage data, ESD is relying on Statewide employer reporting (via the quarterly wage reporting process). This risk is mitigated by the cross-match that ESD performs during the claim adjudication process (i.e., employee reported wages are compared to employer reported wages for accuracy). The timing of employer wage reporting also creates a small limitation, in that

## State of Washington

wage data is reported a month after the calendar-year quarter ends. To mitigate this limitation, Eve waits to finalize her actuarial estimation amount for claims payable until August (1 month after the end of calendar-year quarter 2). There were no limitations on the time she was able to devote to her work, as development of this actuarial estimation is her primary job responsibility; she holds no other employment outside of ESD.

### Objectivity

During our inquiry, we noted no pressures or incentives placed on Eve or ESD management which would encourage misstatement of the claims payable accrual amount. We note that the ESD actuarial team was initiated in 2022, and that Eve was the first member of this new team. In the future, she will function in a supervisory position and oversee the actuarial work of other staff. However, for the current year, she was tasked with developing the estimation approach and performing the work herself, creating an objectivity threat of self-review.

This threat has been mitigated through collaboration with ESD's finance team. Prior to beginning any work, Eve led internal workshops where she provided detailed information regarding her planned estimation approach. We viewed one of the PowerPoints which she presented, noting that she covered information such as the purpose of a claim reserve, and the implications of different reserving methods. She also demonstrated basic reserving techniques, developed from actuarial standards, to produce paid claim development factors and estimations of incurred but not reported (IBNR) amounts. Eve had to gain the buy-in of ESD upper management and finance specialists in order to proceed with her planned estimation approach, and collaborated with these teams throughout the estimation process. Her final estimation amount was reviewed by these teams, and would not have been relied on if there were disagreements as to the methods used or results of her work.

We noted **no issues** concerning the specialist's competence, capability, or objectivity.

## **2. Understanding of Specialist's Work and Conclusions**

We gained an understanding of the specialist's procedures and conclusions, including the methods and assumptions used, noting the following:

### Specialist Objective and Scope

The primary objective of Eve's work was to develop an accurate estimate of PFML claims payable as of 6/30/2024, for ESD's year-end financial reporting. Scope for this work included historical claims paid data from the inception of the PFML program (which was implemented on 1/1/2020) through present (July 2024 at time of development).

### Specialist's Work in Relation to Audit Objective

The PFML claims expense line item is reported in the Government-Wide Statement of Activities, under the Business-Type Activities opinion unit. This balance represents a new line item selected for testing within the 2024 ACFR audit (i.e., there is no prior audit history for this balance). During initial audit planning, we identified a completeness risk that benefit payments were not properly accrued during the fiscal year. After gaining an understanding of the PFML program and controls over claims expense (i.e., that ESD relies on an internal actuary team to develop a year-end accrual estimate), we refined our risk, considering whether the year-end actuarial estimate for claims payable used reasonable estimation methodology and source data. Eve's work was the primary source used by ESD in developing their year-end claims payable accrual

## State of Washington

amount; as such, her work supports our consideration of the completeness risk for this balance.

### Specialist Methodology

Eve relied on Actuarial Standards of Practice (ASOPs) as a methodology for developing procedures to estimate the claims payable amount. ASOPs provide guidance on the techniques, procedures, and methods that reflect appropriate actuarial practices in the United States. The Actuarial Standards Board establishes and improves such standards of actuarial practice, identifying what the actuary should consider, document, and disclose when performing an actuarial assignment. Current ASOPs indicate that multiple actuarial methods should be used to determine the estimated ultimate losses when completing an actuarial analysis of unpaid claim liabilities. Common methods include: Chain Ladder Methods, Bornhetter-Ferguson Methods, Frequency Severity Methods, and Loss Projection Methods. Eve relied on two methods to perform procedures: the Frequency Severity Method and Chain Ladder Method (CLM).

### *Frequency Severity Method*

The frequency severity method (FSM) is used to determine the expected number of claims an insurer will receive during a time period (frequency), and the average claim's cost (severity). This method looks at past years, in order to determine average costs for future years. First, the actuary gathers historical data on past claims. Then, they analyze collected data to identify trends and patterns for both claim occurrence, and costs. Next, they project future frequency and severity of claims based on those historical trends. Finally, the actuary uses advanced statistical techniques to develop a risk model which incorporates those projected frequencies and severities.

### *Chain Ladder Method*

This method is used to forecast the amount of reserves which must be established in order to cover projected future claims (which are calculated by projecting past claims experience into the future). The method functions by calculating INBR claim estimates, using run-off triangles of paid (historical) claims and incurred (known outstanding) claims. Run-off triangles are two-dimensional matrices which are generated by accumulating claim data over a period of time. This method then relies on the application of a development factor to the known (paid and incurred) losses. Development factors can be based on a company's unique data, on industry data, or a combination of the two. The method can handle data with limited information, making it particularly useful for smaller insurance companies or lines of business with less historical data.

There are seven steps necessary in order to apply the CLM:

- Compile claims data into a development triangle
- Calculate loss development factors (LDFs)\*\*
- Calculate averages of the LDFs
- Select claim development factors
- Select tail factor
- Calculate cumulative chain development factors
- Project ultimate claims

# State of Washington

\*\*LDFs represent the ratio of claim amounts from one valuation date to the next, and are intended to capture growth patterns of claims over time.

## Specialist Assumptions

The significant assumption underlying the Chain Ladder Method is that past claim development patterns will persist in the future (i.e., the development pattern is assumed to be the same for all rows in a loss triangle; no allowance is made to account for change in speed with which claims are settled, or for any other factors which may change the shape of the run-off pattern; each row is assumed to have the same age-to-age development factors).

Accuracy of this assumption depends on the reliability of past loss experience data. Factors such as changes in product offerings, regulatory and legal changes, periods of high severity claims, and changes in the claims settlement process, can impact the validity of these assumptions. Consequently, insurers must continuously evaluate and adjust the model based on actual claim experience to maintain accuracy. If the assumptions built into the model differ from observed claims, insurers may have to make adjustments to the model.

## Specialist Procedures and Conclusions

### *Source Data*

Eve obtains actuarial source data from the ESD Data and Research Team (Leave and Care Division). The Data team used SQL coding to create two tables which run in the ESD1DBOLYLCRD01 server, designed to pull data related to all PFML claims submitted since 1/1/2020. These tables are scripted to run automatically (using a scheduler) on a monthly basis (the 1st of each month at 6am Pacific). The results are then sent to Eve, to ensure relevant and timely information is being utilized in actuarial projections.

The SQL database queries provide 42 columns of information, which are then joined in the two tables. The information contains detailed breakdowns of claim submittal dates, claim adjudication dates, claim benefits paid, leave hours claimed, coding to indicate associated leave type taken, claimant employment status, claimant demographic information, reasons for claim denial, etc.

All columns in the two tables derive directly from columns in the OMAC Portal database and PFML\_DataTeam database, or are simple summations of those columns. The results from these tables are then joined using outer left joins - a command which keeps all rows of the left table, regardless of whether there is a matched key in the right table. A unique identifier assigned to each claim application once it has been submitted, known as ClaimID, was the main key used to join results in these two tables.

### *Procedures*

Eve began by using the FSM to determine averages for each category of claim leave type in her analysis. For example, for family leave claims, Eve determined the number of claims submitted per calendar quarter, and the relevant number of covered employees reported in that same quarter, for the last three years of data from the measurement date (i.e., Q3 of 2021 through Q2 of 2024). This data was used to develop a quarterly incident rate, which was then annualized. Eve translated this into a percent, to show the % of claims ultimately approved out of those submitted

## State of Washington

in a given quarter or year. This approach was used for all categories of claim leave types.

Next, Eve developed run-off triangles using the CLM. There were over 72 triangles developed, examining various factors for each category of claim leave type. For example, in the family leave claim paid amount table, columns were used to represent valuation dates (expressed in months), and rows represent reporting quarters (ex: 20213 = Q3 of 2021). As such, the upper left cell of the table showed the total dollar amount of family leave claim benefits paid, associated with claims submitted during Q3 of 2021, within three months past the end of Q3 of 2021. The cell to the right then showed total claim benefits paid within six months of Q3 of 2021.

The triangles were filled in for all available historical reporting data within the last 3 years, from the date of actuary measurement (Q3 of 2021 through Q2 of 2024), and were updated monthly, based on newly available source data (i.e., most recent data used in the triangles was for claims submitted during Q2 of 2024, paid up to three months after that date).

Next, Eve determined age-to-age factors for each triangle, rounded to the nearest thousandth of a percent. For example, family claims paid (associated with reporting Q3 of 2021), valued as of 3 months, was \$59,584,695. Claims paid for that quarter valued as of 6 months was \$129,535,554, resulting in an age-to-age factor of 2.174 (\$129.5M divided by \$59.5M). These factors were then averaged based on valuation aging. For example, the average 3-6 month aging factor for all historical family claims paid data (Q3 of 2021 through Q2 of 2024) was 2.029. An average was also developed for the most recent 3 and 5 reporting quarters, and the TRIMMEAN Excel function was used to exclude outliers from the 'all quarters' and 'most recent 5 quarters' averages. These averages were calculated for each column (i.e., for each month-to-month valuation date).

Then, Eve developed a 'tail factor', which is used to estimate the additional development that will occur after the eldest maturity in a given run-off triangle. For all triangles, the oldest available data was measured at 36 months after Q3 of 2021. For all triangles, the tail factor used was 1.000 - indicating that no additional activity can be expected for claims 36 months after their submittal date.

Next, Eve used the FSM, tail factor, and age-to-age factors, to calculate an age-to-ultimate factor. These age-to-ultimate factors were used for all tables except the claims paid table. For example, for family leave incurred claims: these age-to-ultimate factors were applied to estimate the ultimate number of claims which would incur weekly benefit payment liabilities, as of a given quarter in which the claims were initially submitted, for all quarters within the past three years. In this particular family leave claims incurred triangle, the 3 month to ultimate factor was 1.084. As of Q2 of 2024, historic data was only available for up to the 3-month valuation period. The total number of claims which were submitted in Q2 of 2024, and which had incurred benefit payment liabilities as of the 3-month valuation period, was 30,539. These total claims were multiplied by the 3 month to ultimate factor of 1.084, to estimate that there would ultimately be 33,107 total claims incurring benefit payment liabilities, which were initially submitted in Q2 of 2024.

Eve utilized these run-off tables and aging factors to estimate for each category of leave: total claims which would incur weekly benefit payment liabilities, total claims which were submitted but which would ultimately be denied, the average number of claim paid weeks per claim, and the

## State of Washington

average weekly benefit amount.

Finally, Eve calculated an estimate of an ultimate claim payable dollar amount (for each category of leave, and for each measured quarter of claims submitted) as follows: estimated total claim weeks \* estimated average weekly benefit amount \* (estimated incurred claims - estimated denied claims). Actual paid claims data was subtracted from the estimate of the ultimate claim payable amount, to arrive at an estimated amount of IBNR claims, for a given reporting quarter. The estimated amount of IBNR claims per quarter was then aggregated for each category of leave, to arrive at a final estimate.

### *Conclusions*

Total liability was summed from IBNR claims, as estimated for each of the past 12 reporting quarters, as follows:

- Q3 2021 (FY22) - \$0
- Q4 2021 (FY22) - \$0
- Q1 2022 (FY22) - \$0
- Q2 2022 (FY22) - \$0
- Q3 2022 (FY23) - \$0
- Q4 2022 (FY23) - \$0
- Q1 2023 (FY23) - \$32,909
- Q2 2023 (FY23) - \$173,597
- Q3 2023 (FY24) - \$2,717,759
- Q4 2023 (FY24) - \$10,031,179
- Q1 2024 (FY24) - \$30,176,058
- Q2 2024 (FY24) - \$252,831,705

For FY24, Eve ultimately estimated there was an outstanding claims payable liability of \$295,963,207.

### **Evaluation of Specialist's Work**

#### Auditor Assessment: Reasonableness of Specialist Methodology and Assumptions

We consider the calculation of INBR claim estimates (via CLM and FSM) to be an appropriate consideration given the nature of PFML reporting. Claimants may apply for leave up to 30 days after a qualifying event occurs. After receiving an 'approved' determination for their application, they then have up to 52 weeks to submit their weekly claims, which can result in a need to backpay claimants at a future date, for past qualifying events (i.e., PFML claims payable liabilities are INBR as of year-end).

We additionally consider significant assumptions underlying the CLM to be reasonable (i.e., the assumption that past claim development patterns will persist in the future). Although accuracy of assumptions can be impacted by changes in product offerings, regulatory changes, process changes, periods of high severity, etc., this risk may be mitigated by the actuary's continuous evaluation and adjustment of the model. Eve is

## State of Washington

employed in her position as Managing Actuary full-time by ESD. Prior to selecting actuary measurement methods, she spent a significant amount of time gaining an understanding of all relevant aspects of the PFML program. Due to her continuous employment, she is kept abreast of any changes affecting the program, which could affect model assumptions. Additionally, she evaluates the model on a monthly basis to determine whether adjustments are needed.

During our review, we inquired whether there have been any significant changes in methods or assumptions used in the prior period. We note that prior to FY23, the ESD Treasury team had been developing a claims payable estimate using various internal methods which did not adhere to any recognized standards or practices. Eve was hired by ESD in 2022, for purposes of establishing credible, more accurate methodologies for the agency; FY23 was the first year in which ESD adopted ASOPs as the basis for their claims payable estimate. There have been no changes in methodology, significant assumptions, or data sources between FY23 and FY24.

We consider the specialist's FY24 methods and assumptions to be relevant and reasonable. **No issues noted.**

### Tests of Source Data

In consideration of our planned testing procedures over the 'Valuation' assertion for the PFML claims expenditure balance, we received a population of all weekly benefit payments made by ESD during FY24, totaling \$1,678,762,707. We compared this total to the FY23 reported balance of \$1,649,030,286, noting that balances are comparable and showing a year-over-year growth pattern, which is consistent with our understanding of the program. We additionally relied on Team IT Audit to perform certain 'reasonableness' procedures over the received data, as documented at: [\[PFML Claims Sample\]](#). Finally, we compared ESD's FY24 claims expenditure data population to balances reported per AFRS, as documented at: [\[Substantive Testing - Valuation\]](#).

We then compared the FY24 claims expenditure data to amounts utilized by Eve within the run-off triangles for 'family' and 'medical' claims paid amounts. Eve's workbook reported \$1,665,767,669 of FY24 claims paid (a difference of \$12,995,038 from the ESD-provided weekly benefit payments population). These differences are due to measurement timing: Eve completed her actuarial estimate for claims IBNR as of 6/30/2024. However, ESD continued to make benefit payments relating to FY24 through 9/15 (i.e., up until the date they booked the year-end accrual). When booking the year-end final accrual amount, the Treasury team then reduces the actuarial estimate by actual claims activity observed in July - September.

Given these differences in measurement timing, we consider the source data used in the actuarial estimate to be complete. **No issues noted.**

### Auditor Assessment: Reasonableness of Specialist Conclusions

Based on our review and assessment of specialist methods, assumptions, source data, and procedures, we have determined that the specialist's FY24 conclusions are reasonable. We specifically evaluated the projected claims payable outcome for each reporting quarter, noting that claims may be paid up to 52 past the date of submittal. We inquired as to the validity of including projected claims payable for claims submitted more than 52 weeks prior to the measurement period (i.e., claims submitted during Q1 of FY23); Eve explained that various scenarios could lead to

## State of Washington

payment streams continuing past 52 weeks of leave start date (e.g., new programs, redetermination processes, checks bouncing and being sent again, payment delay, etc.). We additionally considered the triviality of FY23 Q1 projected claims payable amounts (\$32k), noting that this amount is well beneath the floor for materiality.

We consider the specialist's FY24 conclusions to be relevant and reasonable. **No issues noted.**

### Specialist's Conclusions: Financial Statement Inclusion and Audit Impact

We have documented use of Eve's work to support our audit objective as a change to the audit plan, see: [ ].

As Eve was employed by ESD to complete her work, we have included additional representations to the management representation letter, see: [October 2024 Draft Management Representation Letter].

We verified that Eve's conclusions are reflected in the financial statements through our confirmation of Key Control 4, see: [Key Control 4 (Manual)]. We specifically considered whether the final accrual amount agrees to Eve's actuarial estimate conclusions, noting that the accrual agrees to the actuarial estimate without exception. **No issues noted.**

### I.7.PRГ - Paid Family & Medical Leave - Expenses

*Procedure Step:* PFML Claims Sample

*Prepared By:* PS, 9/17/2024

*Reviewed By:* RKM, 10/18/2024

Purpose/Conclusion.:

**Purpose:** To select 78 test samples from PFML claims paid in fiscal year 2024.

**Conclusion:** Test samples were provided to audit team.

Testing Strategy.:

Guidance/Criteria.:

# State of Washington

Record of Work Done:

## **Request and Import PFML Claims**

IT Audit emailed Stephanie Eskesen, ESD External Audit Liaison, to request for PFML claims datasets.

An email was sent on August 19th, 2024, to request for the all claims paid in fiscal year 2024. ESD provided the dataset in csv format to us on August 21st, 2024. The files were sent to SAO via the WaTech secure file transfer site (mft.wa.gov). Files were saved to the SAO network drive and imported into SQL database. We have confirmed the record count of the file received with ESD staff. No exception. We have performed procedures at ESD PFML Claims Reasonableness and determined that the data are reasonable.

## **Document Test Objective and Methodology**

Team FA submitted helpdesk 68027 to request for the PFML claims population for fiscal year 2024 so that we can select samples for audit team to determine if claims were calculated correctly.

The following describes the steps taken to meet the test objective:

- Import the fiscal year 2024 PFML claims provided by ESD.

- Create two populations from step 1:

- Population 1: Claims processed by system - IsSystemDecision field = TRUE.

- Population 2: EClaims processed by system - IsSystemDecision field = FALSE.

- Select 39 random transactions from the transactions where IsSystemDecision field = TRUE.

- Select 39 random transactions from the transactions where IsSystemDecision field = FALSE.

As we perform our testing, we will make adjustments to this plan as necessary.

## **Queries**

The queries to complete the testing can be seen at PFML Claims Samples.

## **Reasonableness**

The reasonableness of test results has been performed and documented in the above queries. Based upon our checks, we consider our test results to be complete and reasonable.

## **Results**

Samples were provided to the audit team, through an Excel spreadsheet titled, **!2024\_PFML\_Claims\_Samples.xlsx** (78 records). The file

# State of Washington

provided contain CONFIDENTIAL DATA.

Total PFML claim population	2,605,326 records	\$1,678,762,707.00
IsSystemDecision is FALSE	915,330 records	\$193,935,343.00
IsSystemDecision is TRUE	1,689,996 records	\$1,484,827,364.00

## I.7.PRG - Paid Family & Medical Leave - Expenses

*Procedure Step:* PFML Application and Claims

*Prepared By:* PS, 9/4/2024

*Reviewed By:* JMT, 9/6/2024

Purpose/Conclusion.:

**Purpose:** To identify PFML Applications that have claims in the FY2024 PFML Claims data.

**Conclusion:** We have identify PFML Applications that have claims in FY2024.

Testing Strategy.:

Guidance/Criteria.:

Record of Work Done.:

### **Document Test Objective and Methodology**

Team FA requested for an additional match to the PFML Claims data, see helpdesk 68027. They would like to match a list of PFML applications to the FY2024 PFML claims population to identify applications that have claims.

Step 1: Import the PFML Application list, All\_apps\_submitted\_FY24, provided by Team FA.

# State of Washington

Step 2: Match PFML Application list to PFML Claims data by claim ID.

## **Queries**

The queries to complete the testing can be seen at [PFML\\_ApplicationMatchClaims](#).

## **Reasonableness**

The reasonableness of test results has been performed and documented in the above queries. Based upon our checks, we consider our test results to be complete and reasonable.

## **Results**

Test results were provided to the audit team, through an Excel spreadsheet titled, **!2024\_PFML\_ApplicationsMatchClaims.xlsx**. The results provided contain CONFIDENTIAL DATA.

## **I.8.PRG - Paid Family & Medical Leave - Revenues**

*Procedure Step:* Summary & Conclusion

*Prepared By:* JLE, 10/17/2024

*Reviewed By:* RKM, 11/20/2024

Purpose/Conclusion:

## **Purpose**

To evaluate risk assessments and the sufficiency and appropriateness of evidence obtained based on results of substantive work.

## **Conclusion**

We determined that **no modifications were necessary** to inherent risk, control risk, or the risk of material misstatement as assessed in planning.

We also determined that evidence obtained was sufficient and appropriate in response to the risk of material misstatement.

Testing Strategy:

# State of Washington

Auditors are **required** to evaluate conclusions for substantive testing as follows:

*Auditors may wish to use the optional Lead Sheet available in the Store to summarize testing related to each balance and assertion.*

**1.** Determine whether the results of substantive testing indicate a need to modify the inherent risk assessment (IR), control risk assessment (CR), risk of material misstatement (RMM) or other aspects of planning (such as material balances or assertions). If so, document changes and consider the need for additional testing.

*If the results of substantive testing indicate a need to change control risk, auditors should also update the **Permanent File** by either correcting the documentation or by adding an update section describing changes to the top of the record of work done. For all changes to IR, CR, or RMM the **Material Balances** spreadsheet should be updated.*

*More significant changes to other aspects of planning (such as material balances or assertions) should be referenced in this step and documented in detail in the **Changes to FS Audit Plan** step.*

**2.** Evaluate whether the quality and quantity of evidence obtained is sufficient and appropriate in response to the risk of material misstatement. In making this determination, auditors should evaluate:

Information to be used as audit evidence:

- Does evidence relate to the population, period of time and risk (assertion and “what could go wrong” from the Material Balance Spreadsheet)? If there are any gaps or uncertainties in the logical connection between the evidence and conclusions, is there a documented consideration and explanation?
- Are the sources of information sufficiently reliable and appropriate for the risk (whether internal to the government, external, or auditor developed)? If key information is not from a sufficiently reliable source (for example, inquiry), then is it corroborated by information that is?
- Are there any concerns about accuracy, completeness, authenticity, or bias in information? If so, did the auditor perform sufficient procedures to confirm reliability of that information?
- Is information precise enough to catch if misstatements exceeded the tolerable level?
- Is information detailed enough to conclude on whether or not there were misstatements?
- Was there any information that appeared contradictory or inconsistent? If so, was there a documented response to the inconsistencies or doubts about the reliability of evidence?

Results:

- How much misstatement was identified by testing, and the likelihood and magnitude of further potential misstatement?
- How did misstatements occur and how often might they occur again in the population?

## State of Washington

Were misstatements caused by control deficiencies or circumvention of controls?

If control deficiencies, is there a need to re-evaluate our understanding of controls in the [Permanent File](#) folder or assessment of control risk?

If circumvention, the [Management Override of Controls](#) step should address or reference this area. Auditors should also consider whether a fraud risk has been identified.

Did tests identify a different level or type of risk than the planned audit response was designed to address?

If likely misstatements are identified, are further procedures necessary to improve the precision of our estimate?

*To support the overall evaluation of audit risk and provide a basis for concluding on the overall sufficiency and appropriateness of evidence in the [FS Summary & Report](#) step, auditors should conclude in each area whether the auditor continues to believe that the tests performed and quality and quantity of evidence obtained are commensurate with RMM for all relevant risks (the "what could go wrong", in the [Material Balances](#) spreadsheet).*

If the auditor determines that evidence is not sufficient or appropriate, additional substantive testing should be done. If sufficient, appropriate evidence is not available for audit, the AIC should discuss the effect on our audit report with the AAM and AM.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6310](#) – Determining the Nature, Timing and Extent of Substantive Testing**

**SAO Audit Policy [3210](#) – Audit Evidence**

Record of Work Done:

Based on test results, we re-evaluated risk assessments, procedures, evidence obtained and conclusions as follows:

### **(1) Do the results of substantive tests indicate a need to modify our risk assessment (IR, CR and RMM)?**

The results of substantive tests do not indicate a need to modify our risk assessment.

### **(2) Was the quality and quantity of evidence obtained sufficient and appropriate?**

The quality and quantity of evidence obtained was sufficient and appropriate.

# State of Washington

## I.8.PRG - Paid Family & Medical Leave - Revenues

*Procedure Step:* Understanding of Line Item

*Prepared By:* JLE, 6/18/2024

*Reviewed By:* RKM, 8/28/2024

Purpose/Conclusion:

### **Purpose / Conclusion**

To gain an understanding of the line item and confirm the scope of testing as documented in the Significant Account Matrix.

Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

### **STEP 1: Prior Audit Exceptions**

Document any exceptions noted during the prior audit. Follow-up to determine how the agency has responded to or corrected the issue, unless this work is anticipated as part of the testing strategy.

### **STEP 2: Analyze Composition and Changes of Line Item**

Include link to the line item leadsheet. This will be completed at the end of the audit. Leadsheet analysis should be documented in this spreadsheet.

Inquire with agency staff about the activities and transactions that make up the balance and any changes to those activities or transactions in relation to the prior year.

Determine relevant classes of transactions or account balances within the line item to analyze (such as agencies, funds, programs, departments, accounts, and/or objects), and use AFRS to create trends of those elements. This step should not include any specific dollar amounts associate with the line item.

Evaluate trends to identify:

(1) What classes of transactions or account balances are primary to the identified risk. Auditors should specifically consider what elements are primary to the line item (comprising a large percentage of the line item), and which elements the identified risk would apply to, and which elements might be most susceptible to the identified risk (having a high risk of non-trivial misstatement for a relevant assertion, considering likelihood and impact of potential for misstatement).

## State of Washington

(2) What changes are primary to the identified risk, if applicable. Auditors should specifically consider whether the overall change to the line item from the prior year was significant, what elements were the primary drivers of overall change, whether any elements changed significantly from the prior year, and which changes (if any) might relate to the identified risk.

(3) Any unusual or unexpected elements, amounts, or changes that may indicate a risk, whether the one identified in planning or a new one that may need to be considered for a change to the plan.

**Consider** other procedures to gain an understanding of the line item, such as review of key policy documents, review of program information or reports, inquiry of staff, budget information, or other analytical procedures.

### STEP 3: Update Significant Account Matrix

Based on your understanding of the line item, update the Significant Account Matrix with final conclusions on the agencies covered, account description, significant accounting systems, and risk (what could go wrong and relevant assertions). The account description should reflect the significant transaction streams or account balances relevant to the risk.

*The description of agencies, significant accounting systems, and what could go wrong in the Significant Account Matrix constitute the overall scope of substantive testing.*

*A transaction stream is significant based on the potential for misstatement. This is often due in part to its size (ie: comprising a large percentage of the total line item), but is ultimately a judgment about the susceptibility to the identified risk (for example, when the risk is understatement a small or omitted account may hold the most potential for the largest misstatement).*

*Significant accounting system(s) are those that contain key controls over significant classes of transactions included in the line item. Control systems identified in this step must match the Significant Account Matrix and have a separate control understanding documented.*

*Talk with the AIC if you identify any changes to the Significant Account Matrix.*

Guidance/Criteria.:

Record of Work Done.:

### **(1) Prior Audit Exceptions**

None.

### **(2) Composition & Change Analysis**

See Line Item Leadsheet at: [[Line Item Lead Sheet](#)].

PFML program revenues represent statutorily-required premiums which are assessed on all Washington State employees and on certain Washington State employers. Such premiums are remitted by employers on behalf of their employees. ESD is responsible for collection and processing all premiums associated with the program. Premiums are calculated at a flat-rate percentage of employee gross wages.

## State of Washington

We analyzed revenue amounts, identifying Revenue Source Code 475 'Paid Family and Medical Leave Premiums' as significant, comprising 100% of total FY23 balance revenues. The AFRS transaction code associated with PFML revenues is 007 'Rcrd Current Rec (Ins)'. Revenues are split between Revenue Sub-Source codes 410 'PFLP' (family leave premiums), 420 'PMLP' (medical leave premiums), and 430 '4109' (voluntary premium plans). Revenue Source Code 475 additionally encompasses related refund activity.

Per our analysis on the 'Balance Detail' tab of the Line Item Leadsheet, we specifically noted the following relating to PFML premiums:

Family leave premium and medical leave premium revenues are equally significant, representing 55% and 45% of total FY23 revenues, respectively.

Revenue from voluntary premium plans is insignificant, representing 0% of FY23 revenues.

Refund activity is also insignificant, representing 2% of FY23 revenues.

We additionally noted that April, July, October, and January represent months of significant PFML premium revenue activity. This is consistent with our understanding of when employer quarterly premium payments are due:

Q1 - due 4/30 (Jan, Feb, Mar)

Q2 - due 7/31 (Apr, May, Jun)

Q3 - due 10/31 (Jul, Aug, Sep)

Q4 - due 1/31 (Oct, Nov, Dec)

During our analysis, we noted a 57% increase between FY22 and FY23 revenues. Per ESD's [FY23 Actuarial Annual Report](#) for PFML (ref: page 8), we found that this change was primarily caused by an increases in the premium rate. During CY21, the rate was 0.4%, which increased to 0.6% in CY22, and increased again to 0.8% in CY23, resulting in the following fiscal year split-rates:

Fiscal Year 2022:

July 2021 - December 2021 = 0.4% rate

January 2022 - June 2022 = 0.6% rate

Fiscal Year 2023:

July 2022 - December 2022 = 0.6% rate

January 2023 - June 2023 = 0.8% rate

*Note: In CY24, the premium rate decreased to 0.74%. FY24 data will have the following associated split rates: July 2023 - December 2023 = 0.8% rate; January 2024 - June 2024 = 0.74% rate.*

Our analysis of the actuarial annual report additionally showed the following:

Covered employees increased approx. 3.1% between Q2 of CY22 and Q2 of CY23.

Taxable (gross) wages increased approx. 9% between Q2 of CY22 and Q2 of CY23.

# State of Washington

**Overall, we identified no unusual or unexpected elements that may indicate unidentified areas of risk for PFML revenues.**

## Additional Background: Program Information

Gross wages subject to PFML premiums are limited by the amount of the federal Social Security cap. The 2024 Social Security cap is \$168,600.

Premium rates are expressed as a total (not by employee v. employer) when being billed. In 2024, the premium rate is .74% of each employee's gross wages (not including tips). The employee's share of the premium is up to 71.43% for FY24, and the employer's share is up to 28.57% for businesses with 50 or more employees.

The PFML program is made up of two claimant categories: medical leave and family leave. Benefits are paid at a rate of up to 90% of a worker's average weekly pay.

Medical leave is provided for an individual's personal health condition (e.g., surgery, pregnancy, mental health, chronic conditions, or inpatient treatment); claimants may receive up to 12 weeks\* of leave per claim year\*\*.

Family leave is provided to assist with a relative's serious health condition, for bonding with newly born/adopted children, and for military family leave relating to deployments; up to 12 weeks\* of leave per claim year\*\*.

*\* If an individual has more than one qualifying event in the same claim year, they may receive up to 16 weeks of combined family/medical leave. If an individual experiences a condition in pregnancy which results in incapacity, they may receive up to 18 weeks of combined family/medical leave.*

*\*\* The claim year begins on the Sunday of the week in which a worker submits an initial application, and expires 52 weeks later.*

## **(3) Updates to Significant Account Matrix**

We updated the relevant accounting systems to include the OMAC Portal, and Microsoft Dynamics.

## **I.8.PR.G - Paid Family & Medical Leave - Revenues**

*Procedure Step:* Controls - OMAC Portal & Dynamics

*Prepared By:* JLE, 7/2/2024

*Reviewed By:* RKM, 8/28/2024

Purpose/Conclusion:
---------------------

# State of Washington

## **Purpose**

To gain an understanding of internal controls within the OMAC Portal and Microsoft Dynamics systems used by ESD; relevant to the valuation and completeness assertions.

## **Conclusion**

We gained an understanding of internal controls as documented in the record of work done.

Testing Strategy:

## **The following procedures are required for all material systems:**

1. List the financial statement balance(s) and relevant assertion(s) addressed by the understanding.
2. Gain an understanding of the internal control process, identify how transactions are recorded in AFRS, identify key controls over relevant assertion(s), and note any control weaknesses.
  - In gaining an understanding of controls, consider the overall understanding of State-Level control elements as documented in the "State-Level Controls" step as they relate to this particular system.
  - Identify controls systems covering all relevant assertions for all significant classes of transactions.
  - Standards require the auditor to gain an understanding of the significant accounting system(s) that contain key controls over significant classes of transactions included in the line item.
  - Control systems identified in this step must match the Material Account Matrix and have a separate control understanding documented.
  - Talk with the ACFR Specialist or AIC if you identify different systems than the ones anticipated in the Material Account Matrix.

For each material system, auditors must document:

- A brief outline of the transaction flow from beginning to end.

- An expanded description of key controls.

- Business processes relevant to financial reporting of the relevant assertion for the material balance. Processes should encompass automated and manual procedures by which transactions or events are identified or initiated, authorized as needed, recorded, processed and corrected as needed.

- Original accounting records and how records are rolled-up to intermediary ledgers and transferred to the general ledger (AFRS) or financial statements.

- Detailed descriptions of key controls. Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

## State of Washington

The following is information to **consider** when identifying key controls and transaction flow.

"Key controls" refer to the few controls that together provide reasonable assurance that material misstatements will be prevented or detected and corrected. This is contrasted with ancillary or supporting controls, which – although helpful and recommended – would provide less than reasonable assurance by themselves.

The focus of the write-up is on the key controls. Key controls should be specifically identified (as "key controls") in the write-up. This can be done in whatever way the auditor prefers, so long as it is obvious. Details that the auditor should document regarding key controls may include:

- Who or what initiates the control
- When (or how often) is the control applied
- Who performs the control
- As needed, the experience, knowledge and attitude of the person applying the control
- Detailed description of the control process or activity. For example, if the control is a review: what exactly is reviewed, what is the reviewer looking at or for and what are the reviewer's criteria?
- How the key control is documented or evidenced
- If not obvious from the description, how the control prevents or timely detects and corrects misstatements
- Any exceptions or alternative processing to the normal process
- What happens when misstatements or issues are identified by the control

The "transaction flow" refers to the process by which transactions are initiated, authorized, recorded, processed and reported (as applicable). Outlining the transaction flow gives context to key controls, especially how transactions become subject to controls in the first place. If a control inherently ensures that all applicable transactions are included (ex: bank reconciliation where the assertion is existence), the auditor may decide to just start the write-up with the initiation of the control procedure and go from there.

Elements of the transaction flow are defined informally as follows:

- Initiation:* How are transactions initiated?
- Authorization:* How are transactions and accounting record maintenance authorized?
- Recording:* How are transactions or balances identified and recorded in financial accounting systems?
- Processing:* How are the transactions or balances processed after they are recorded (if at all)? Processing may be manual or automated and may occur at a subsidiary system level or at the general ledger level.
- Reporting:* How are records translated into the financial statements? This part of the transaction flow extends the understanding to the actual financial statements that the audit is opining on. Since we already document an understanding of the financial reporting process in general,

## State of Washington

it is usually enough to simply reference this overall understanding. However, if there are important steps unique to the covered balances, it may be more appropriate to mention them here.

Although transaction flow is a good way to think about understanding and documenting a control system, auditors should not worry too much about documenting “each element, in order” because often elements may be combined, not noticeable, not applicable or occur in a different order.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits Planning Guide](#)**

Record of Work Done:

Internal controls address the following balance:

Paid Family & Medical Leave Compensation (Premium Revenue)

For the following assertions:

Valuation - There is a risk that premium revenues (rates and gross wages) have not been properly calculated

Completeness - There is a risk that ESD did not identify and follow-up with employers who missed, but were liable for, quarterly wage reporting. There is a risk that the year-end premium revenue accrual amount was not accurately determined based on FY24 premiums due after year-end. There is a risk that balances reported between Microsoft Dynamics and AFRS are incomplete.

### **Gain an Understanding of Internal Controls**

We gained an understanding of internal controls over Paid Family and Medical Leave (PFML) premium revenues as follows:

Meeting with Steve Zawoysky (Leave and Care Division Treasury Manager) and Mary Turpin (Chief Financial Accountant) on 4/25/2024.

Meeting with Nicole Ross (Employer Compliance Manager), Cezanne Levesque (Transformation Manager), John Mattes (Leave and Care Operations Manager), and Rob Rohrer (PFML Customer Service Manager) on 5/20/2024.

Meeting with Rebecca Grady (Leave and Care Research and Data Manager) and Jose Hernandez (Leave and Care Statistical Program Research Specialist) on 5/30/2024.

# State of Washington

Meeting with Imran Shaik (Leave and Care Developer), Bora Kim (Application Developer), Bryon Schabell (Application Quality Assurance Supervisor), and Jeanette Ritchie (Leave and Care Product Manager) on 6/28/2024.

## Premium Rate Calculation

Per [RCW 50A.10.030](#), premium rates assessed for the PFML program are to be determined annually (in October) by the Commissioner, as follows:

- Calculate 140% of the prior fiscal year's expenses (including total amount of benefit claims paid, and the Department's administrative costs)

- Subtract the balance of the PFML insurance account as of September 30th

- Divide the difference by the prior fiscal year's taxable wages (carry to the fourth decimal place, and round up to the nearest 100th of one percent). This determines the total premium rate.

The percentage of premium applied to family leave versus medical leave is then determined as follows:

- Calculate the percentage of paid claims related to family and medical leave benefits separately

- Apply the proportional share of paid claims for each type of leave to the total premium rate

The rate, as calculated above, is subject to two exceptions: first, the total premium rate cannot exceed 1.20%. Second, if the total premium rate exceeds the amount needed to maintain a three-month reserve at the end of the rate collection year, then it must be reduced to the minimum rate necessary to maintain the reserve.

The premium rates are applied based on each individual worker's gross wages. Annually, the maximum amount of individual wages subject to PFML premiums is equal to the maximum amount of wages subject to federal social security tax.

- For family leave premiums - an employer may choose to deduct the full amount of the premium from an employee's wages

- For medical leave premiums - an employer may choose to deduct up to 45% of the premium from an employee's wages

- In all cases, an employer may choose to pay any portion of the employee's share of premiums on their behalf

## *Updating Premium Rates*

There are approximately ten individuals within the Employment Security Department (ESD)'s System Operations team who have the access to edit screens containing premium rate information. Annually, these individuals are tasked with entering the new rates for each category (i.e., employee v. employer premium split, medical leave premium rates, family leave premium rates, and the social security wage cap are all entered separately).

After entering the new rates, these changes are approved by one of three individuals within the Systems Operation leadership team: the Research Manager, Operations Manager, or Deputy Director. The approver verifies the rate change amounts in the 'TEST' environment, comparing prior year rates to current year updated rates. After verifying accuracy, the approver will make these changes live in the production environment. This current rate change process was implemented in December 2023. Prior to this date, the process was handled by ESD's Development team. The process was similar, just performed by a different team - the Development team would insert new rate tables into the database, then publish the

## State of Washington

rate tables and test for correct functioning of calculations, prior to pushing the update into production.

The annual premium rate update process is described in further detail, in the "Key Control 1 (AUTOMATED)" step, under the 'Understand General IT Controls' header.

### Quarterly Wage Reporting and Invoicing

As described in the "Understanding of Line Item" step, employer premiums are due on a quarterly basis. The premium amount is calculated based on gross wage reports, which are submitted directly by employers (or 3rd party administrators) via the Portal. These reports contain additional information such as employee date of birth and total hours worked (including paid time off). As of 10/1/2023, *all* employers must file a report, even if they did not have payroll for the quarter (if they do not have payroll to report, they're expected to file a specific 'no payroll' report). It's important to note that during the invoicing and billing process, there is no difference in how the employer vs. employee's share of premiums is recorded. ESD does not perform procedures to verify how employers are withholding the employee portion of premiums; invoicing and payments are made in total, are billed to the employer, and do not require separate coding.

After a gross wage report is submitted, the Portal automatically creates an invoice for premiums within 24 hours (**Key Control 1 - AUTOMATED - Valuation**). Employers can then make payment using a separate application within the Portal. Payments can be made directly on the Portal via credit card or checks can be mailed to either a U.S. Bank lock box service or to Maple Park headquarters. Mailed checks comprise approximately 1% of total payments received.

### Identifying Missing Reporting

All Washington State employees who work for an employer are subject to pay employee premiums for the PFML program. Corporate officers are considered to be employees for purposes of the program. Self-employed individuals or independent contractors are not considered employees, but may voluntarily opt into the program. Additionally, all Washington State employers with more than 50 employees are subject to pay employer premiums for the PFML program. Exceptions to these requirements include: federal employees, employees of a tribally-owned business on tribal land, self-employed people, independent contractors, and workers covered by an employer's approved voluntary plan.

ESD's Research and Data team is tasked with identifying employers who should be filing quarterly wage reports, but fail to do so. On a quarterly basis, Jose Hernandez (Leave and Care Specialist) performs a cross-match between historical employer wage reporting data per the OMAC Portal and ESD unemployment (UI) data per NGTS, using Department of Revenue (DOR) registered business information, for the purpose of identifying employers liable for PFML premium assessment, but who have failed to file quarterly reports (**Key Control 2 - Completeness**). This process is accomplished as follows:

ESD and DOR have entered into a data-sharing agreement, which allows for DOR State-registered business information to automatically populate within the OMAC Portal. A SQL database within the ESD server houses this information. To begin cross-match procedures, Jose uses SQL coding and 'R' programming language, which tells the system to perform the following steps:

## State of Washington

First, this SQL database is 'grabbed' from the server as a table, displaying a current list of businesses which have an associated unified business identifier (UBI) (UBI's function as individual employer ID numbers - businesses are assigned UBIs when they register to operate within Washington State). The table changes frequently due to new and closing business operations within the State. The report also shows additional data such as business address, legal entity name and contact information. There are approximately 1.5M employer records which populate into the table.

Next, the OMAC Portal is queried for employer wage reporting, by year and quarter. Each row contains reporting history for the total amount of gross wages and number of employees. For cross-matching purposes, the query pulls information for Qtr 1 of 2019 through present day. This data helps ESD identify how many quarters of wage reports are potentially missing for a given employer.

Then, additional table columns are filled in using information from ESD's Next Generation Tax System (NGTS), using a query created by ESD's IT BI team. The NGTS system is where UI reporting takes place and the query identifies employers who have an associated liability start and end date for UI reporting. PFML covers a broader range of individuals than UI, and as such, most businesses reporting UI should also be reporting for PFML. The NGTS data helps ESD identify whether an employer is also liable for PFML premiums.

Ultimately, the SQL and R programming command cross-matches employer quarterly wage reports from the Portal, with UI premium information from NGTS, using DOR UBI records as a 'link' between the two data sets. The programming commands also format this data into a useable format. The end result clearly identifies which employers appear to be missing wage reports for specific quarters, based on UI liability dates. The report also displays a separate list of employers who are missing wage reports, but who do not have an associated UI liability date. These employers require further research to determine whether or not they were truly liable for PFML wage reporting.

After completing his report, Jose then uploads the results in a .csv document to an internal shared drive accessed by the Employer Compliance team, who is responsible for contacting each employer, attempting to bring them into compliance with the program's reporting requirements. As an additional step, adjudicators from the Customer Care team also refer employers to the Employer Compliance team. Adjudicators would make such a referral if a new claim was submitted and ESD discovered there were no employer wages reported on behalf of that employee.

### *No Payroll Reporting*

In place of a quarterly wage report, employers may file a 'no payroll' report, which attests that the employer has no employees for the relevant filing quarter. These reports were implemented in Qtr 3 of 2023 and were developed to help identify the difference between missing wage reports vs. having no wage report to submit. If an employer submits a no payroll report for four consecutive quarters, they have the ability to cease reporting and would no longer be considered an employer in the State.

### **How Transactions are Recorded in AFRS:**

## State of Washington

Employer invoice and payment data is automatically transferred from the OMAC Portal via software integration to Microsoft Dynamics. There are three project codes used by the system when recording transactions: PFLP (family leave premiums), PMLP (medical leave premiums), and 4109 (voluntary payment plans). On a daily basis, Fiscal Analyst 3 (FA3)'s are tasked with uploading Dynamics employer premium and payment data to AFRS using 'Toolbox' software. Prior to releasing the upload, the FA3's work is reviewed by an FA4, Treasury lead, or Treasury supervisor.

On a weekly basis, ESD's System Operations team performs a reconciliation between information captured in the OMAC Portal and data recorded in Dynamics. After completing their reconciliation, the System Operations team generates a spreadsheet summarizing total amounts from both the OMAC Portal and Dynamics, and any variances between the two systems. This spreadsheet is emailed to Steve Zawoysky (Treasury Manager) and other Treasury team supervisors. FA3's on the Treasury team are then responsible for completing any necessary adjusting entries to AFRS.

### AFRS Reconciliation

At the end of each month, Mary Turpin oversees as FA3's perform a reconciliation of information which was reported to AFRS, using 'Toolbox' software. First, they run a monthly summary of the Vendor Payment Journal in Dynamics, showing all monthly activity which was reported to AFRS. Then, they run the 'General Ledger Activity Flexible' WebI report in the Enterprise Reporting system for the same month, showing how AFRS is currently reporting the data for relevant GLs and funds; the coding for PFML premium revenues is Fund 22F, GLs 1312, 1319 and 3210. PFML revenues also hits cash accounts, which are coded as Fund 22F, GLs 1100, 7110, 7120, and 7140. The two amounts are compared for accuracy and completeness (**Key Control 3 - Valuation, Completeness**). Any adjustments needed, such as amounts which are missing a program designation, are completed via the Toolbox software and, as necessary, Form A7-A 'AFRS Journal Voucher'. After reconciling the data and preparing any adjustments, the FA3 will email an approver, requesting that the toolbox reconciliation be reviewed and released. This same process occurs again at year-end, for the entire fiscal years' reporting activity. Mary is responsible for reviewing and approving any year-end reconciliations and adjustments.

At year-end, Mary is also responsible for preparing a manual journal entry to record the accrual of employer premium revenue, based on the 'AFRS Financial Transaction Code' report (**Key Control 4 - Completeness**). This report is run out of the Microsoft Dynamics system at the end of August. For FY24, the report will total premiums due (GL 3210) throughout July and August of 2024. These totals are then used to develop an estimated accrual amount for premium revenue receivable relating to FY24 for reporting purposes. The accrual will be booked for year-end (6/30/2024) and reversed out immediately in the new fiscal year (7/1/2024). July and August are utilized as a basis for the accrual due to the timing of quarterly payments due; the July reporting period covers premiums due for the previous quarter (4/1/2024 - 6/30/2024).

### **Key Controls are as Follows:**

**Key Control 1 (AUTOMATED - Valuation)** - After an employer submits a gross wage report, within 24 hours the external OMAC Portal automatically creates an invoice for premiums due based on the approved premium rate.

**Key Control 2 (Completeness)** - Quarterly, a Leave and Care Specialist performs a cross-match between historical employer wage reporting data per the OMAC Portal, and unemployment data per NGTS, using Department of Revenue registered business information, for the purpose of identifying employers liable for PFML premium assessment, but who have failed to file quarterly reports.

## State of Washington

**Key Control 3 (Valuation, Completeness)** - ESD Treasury staff perform a monthly reconciliation between AFRS and Dynamics, ensuring that amounts reported between the two systems are accurate and complete.

**Key Control 4 (Completeness)** - At year-end the Chief Financial Accountant prepares an accrual JV for PFML premium revenues receivable, based on the 'AFRS Financial Transaction Code' report.

### I.8.PRG - Paid Family & Medical Leave - Revenues

*Procedure Step:* Key Control 1 (AUTOMATED)

*Prepared By:* JLE, 9/24/2024

*Reviewed By:* RKM, 11/8/2024

#### Purpose/Conclusion:

##### **Purpose**

To determine whether the OMAC Portal automatic premium invoice calculation based on approved premium rate (Key Control 1 for the OMAC Portal) was in place and operating effectively, and to consider related general IT controls, in order to assess control risk.

##### **Conclusion**

Based on our understanding and test results, we concluded that the automated control **was** in place and operating effectively.

Based on our understanding, related general IT controls **were** in place and adequately designed to ensure the control operated consistently during the audit period; however, we did not test the operating effectiveness of general IT controls.

Our understanding and control risk assessment, which incorporates these conclusions, is documented above in the "Controls - OMAC Portal & Dynamics" step.

#### Testing Strategy:

The following procedures are **required** for all automated key controls for financial and single audits:

##### **STEP 1: Understand Automated Key Control**

Gain an understanding of the automated key control. The understanding can either be documented in the control system step or could be documented here in this step.

Auditors should consider the following aspects of the automated control when gaining an understanding:

Is there written documentation of the calculation, and/or the source rates and factors used in the calculation?

## State of Washington

*We would expect written documentation that defines the calculation and is an official, approved source for the formulas, rates and factors. This may be an approved policy or could be system documentation.*

What formulas are used to make the calculation?

What values or factors are used to make the calculation? For example:

- Rate tables used by the calculation

- Profile fields (i.e., applicable transaction types)

- Programmed/set formulas and/or values

- Constraints (i.e., effective date, minimums/maximums, etc.)

How is the calculation triggered or initiated?

How is the calculation recorded in the accounting system (or used in an end result)?

### **STEP 2: Confirm and Test Automated Key Control**

Confirm and test the automated control.

To test the automated control, consider the following procedures:

Re-perform the calculation for selected transactions.

*Auditors would NOT normally use sampling for automated controls. Instead, auditors should judgmentally select one instance of each significant variation of the calculation. If the number of potential variations is large, auditors would judgmentally select based on risk factors (for example, the most common scenarios, or scenarios associated with identified risks, or scenarios that are not addressed by the entity's testing procedures).*

*In some cases, it may be possible for the auditor to reperform the calculation for the entire population.*

If any rate tables or values were updated during the period, view the current values (by observing the rate table or values in an admin menu or from a printed system report) and compare to approved sources.

*If no updates were made or there are only a few values, this risk could be addressed by re-performing the calculation. However, if source rate tables or values are large or complex, it may be more efficient to test these values directly than to recalculate a larger number of transactions.*

Consider the use of analytical procedures such as trends or descriptive statistics on the population (like average, minimum and maximum values, or a graph of values across the population) and follow up on any unexpected values or trends. *Analytical procedures would normally also count as a substantive test.*

# State of Washington

## **STEP 3: Understand General IT Controls**

Gain an understanding of the general IT controls that support the continued proper operation of the automated control. Identify key general IT controls and note any control weaknesses.

Auditors should consider the following aspects of general IT controls when gaining an understanding:

Inquire if the entity has experienced any errors or irregularities with the calculation. Also how often changes are made to the calculation, and how many changes (if any) were made during the year.

How can the software calculation (formulas, rates/values, settings/configurations) be changed or customized?

*Software calculations will usually have one or more administrative menus that allow the government to modify rate tables or other calculation values, or to configure the calculation or apply settings.*

*In other cases, software calculation formulas and/or values may be hard-coded into the system and require programmers to make the changes. If the government has access to source code, then it needs internal procedures for program changes. If the program is controlled by vendors, we would expect program change procedures and expectations to be included in the contract.*

What are the procedures to authorize and make program changes or configuration/setting changes to the software calculation?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

*If utilizing a test environment, there should be controls to ensure that the live environment is updated and is consistent with the live production environment. As management is responsible for the accuracy of their automated controls (i.e., in the live environment), we would expect there to be a procedure to confirm each key automated control once it is in the live environment. This could be manually re-performing the calculation, reviewing reports against known expectations, etc.*

How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

## State of Washington

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change programming, but they may be responsible for patch management, master table data, and/or configurations.*

### **STEP 4: Confirm Key General IT Controls**

Confirm your understanding of key general IT controls to determine whether they have been placed in operation (*whether the entity has actually implemented key controls*).

### **STEP 5: Test Key General IT Controls**

Document whether general IT controls will be tested. Option 1 would result in control risk at MAX for the automated control. Either option 2 or 3 is necessary in order to set control risk at LOW.

If general IT controls are tested, consider the following procedures:

If program changes or setting/configuration changes are logged, review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the calculation may also provide this evidence if the re-performance tests address all states of the calculation during the period.

If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

### **STEP 6: Final Control Risk**

Evaluate the results and document a final control risk assessment in the control system step. Consider whether any deficiencies identified with either the automated control or related general IT controls represent material weaknesses or significant deficiencies.

*Note: general IT control deficiencies do not necessarily mean the automated control is not properly functioning. General IT control deficiencies would normally be considered a significant deficiency or material weakness only if it caused an issue with the compliance requirement or assertion.*

### **Recommendation Review Requirement**

## State of Washington

IT Security related information is considered category 3 data protected by Public Request Exemption RCW 42.56.420. Issues related to IT Security require the following special handling:

[Instructions](#) are located in Team IT Audit's System's Sharepoint page.

Details of IT Security related issues should NOT be included in any emails or helpdesks.

Exit, ML and Findings should be separately communicated in an IT Security Results Document.

Findings will be referenced, but not included in the audit report.

All IT security-related recommendations must be reviewed by [Team IT Audit](#).

Template language for common IT related recommendations can be found in [ARS Part 5 Chapter 8](#).

### **PUBLIC REQUEST EXEMPTION**

Some IT related information is protected by Public Request Exemption RCW 42.56.420 for cyber security purposes. The details documented in the record of work and support workpapers may qualify for this exemption. If so, auditors must include this statement in the record of work done and any related workpapers: **"This record contains information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited "**.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

A **software calculation control** exists when the value of a transaction is determined by a software application. This process can be a key control when the entity relies on the system to generate calculations correctly to determine the amount of transactions (i.e., summarizing/account code allocation to post to general ledger, calculate student, utility, other charges, etc.).

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**  
**[Information Technology](#) Planning Guide**

Auditors may contact [Team IT Audit](#) with any testing strategy or control assessment questions or to request assistance from an IT Specialist.

Record of Work Done:

**This record may contain information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited.**

### **STEP 1: Understand Automated Key Control**

After an employer files a quarterly wage report, the OMAC Portal then automatically calculates premium liability and generates an invoice. The calculation is performed based on premium rate information housed in the OMAC Portal, as well as employer size and total gross wages reported per the quarterly wage report.

Employee wages subject to premium are limited to the amount of the federal Social Security cap for any given year (\$168,600 in FY24). Premium

## State of Washington

rates are established annually by the Commissioner for the following categories: family leave, medical leave, employer-level, and employee-level. Premium rate information is then updated annually, in November or December (prior to the start of a new calendar year), based on these Commissioner-established rates, as communicated by the ESD Product Manager (in CY24, this was Thomas Jones).

When generating an invoice, the OMAC Portal bills employers for a total amount due, and does not display the separate rate categories. See further understanding of the automated control documented above in the "Controls - OMAC Portal & Dynamics" step.

### **STEP 2: Confirm and Test Automated Key Control**

#### Automated Key Control Confirmation

We confirmed the automated key control by re-calculating the premium liability amount assessed to ESD Employer ID 100172957 (UBI 603221325). This employer filed a quarterly wage report in Q2 (June) of 2024, reporting \$1,066.32 in gross wages paid subject to premiums. The employer did not participate in any elective coverage programs or voluntary plans. The employer reported 65 employees, and was considered a 'large' employer by ESD.

The employer was assessed \$7.89 in total PFML premiums by the OMAC Portal, with the following coding split:

Employee contribution amount: \$5.63.

Employer contribution amount: \$2.26.

Gross wages subject to premium are limited by social security caps (\$168,600 in CY24). The \$1,066.32 of gross wages is beneath this maximum, as such, the full amount of gross wages are subject to premium. **No issues noted.**

SAO re-calculated the PFML total premium invoice amount, and coding splits, as follows:

Total premium invoice amount:

The CY24 premium rate amount was 0.74%.

\$1,066.32 of gross wages subject to premiums multiplied by 0.0074 = \$7.89. **No issues noted.**

Coding splits:

For CY24, employers with more than 50 employees are responsible for 28.57% of the premium, and employees are responsible for 71.43%.

Employer contribution - \$7.89 multiplied by .2857 = \$2.25. Difference due to rounding. **No issues noted.**

Employee contribution - \$7.89 multiplied by .7143 = \$5.63. **No issues noted.**

SAO re-calculated the premium amount assessed to ESD Employer ID 101172957 without exception, confirming that Automated Key Control 1 was in place and operating effectively during FY24. **No issues noted.**

# State of Washington

## Automated Key Control Testing

**Not applicable** - we are not planning to rely on automated controls and therefore do not need to test automated controls; control risk will be assessed at 'MAX'.

## **STEP 3: Understand General IT Controls**

We gained an understanding of general IT controls as follows: on 6/28/24, we met with Bryon Schabell (Quality Assurance Supervisor), Bora Kim (Delivery Architect), Jeanette Ritchie (Product Manager), and Imran Shaik (Delivery Architect).

Updated premium rate information is communicated to ESD via the ESD Product Manager. Such communication includes the Commissioner-approved rate amounts, as well as ADO (Azure Development Operations) order requirements (such requirements specify how the rates are to be applied within the system).

As of CY24, changes to premium rate amounts are made within the 'Manage Program Rates' tool. This tool is presented in a user-friendly format, displaying current values and proposed changes for the following categories: start date, end date, premium rate, employee medical rate, employee family rate, and premium wage base. The system also displays a list of approved-premiums history. Once proposed changes are entered, they are automatically routed for approval (known as 'Pull Requests'). Prior to CY24, changes to rate amounts were made by manually creating pull requests and manually inserting scripts directly into the system.

In all cases, pull requests require approval within the system before they will post to the production environment (**General IT Control 1**). There are a limited number of individuals within ESD who have system-authorization to approve pull requests (i.e., rate changes) (**General IT Control 2**). Currently, there are five individuals with such authorization. All changes and approvals relating to premium rate information are tracked within ADO and git (a version controlling tool which captures changes in system versions).

Prior to approving changes, reviewers will ensure that testing was performed, ensuring correct functioning of the system calculation. The testing phase is completed in five steps: developer testing in the Development environment, testers testing in the Test environment, integration team testing in the Test2 environment, performance team testing in the Integration Testing environment, and end-to-end team testing in the Staging environment.

## **STEP 4: Confirm Key General IT Controls**

**General IT Control 1 - Changes made to premium rate information (known as 'pull requests') require approval within the system before they will post to the production environment.**

On 6/28/2024, we observed as Bora Kim (Delivery Architect) launched Microsoft SQL Server Management Studio, and navigated to the 'OMAC' database, sub-table 'dbo.PremiumRateRequest', and right clicked to select the option 'Select Top 1000 Rows'. The command displayed one result, which is within expectations given that the current approval request method has only been implemented relating to CY24 rate changes. We note that the request was created by user ABillington on 12/11/2023. The request included a start date of 1/1/2024, an end date of 12/31/2024, a premium rate of .0074, an employee family rate of 0.4805, an employee medicate rate of 0.2338, and a premium wage base of \$168,600. We note

## State of Washington

that these rates and date ranges agree without exception to Work Order 143704 'Adjust PFML Systems for 2024 Premium Rates and Taxable Wages', which was created by Thomas Jones (ESD Product Manager). The pull request was approved by Rebecca Grady (Data Research Team Manager) on 12/11/2023; the pull request 'Status' is currently marked as 'A' (approved), and the 'Update Process' status reads "Operation.ProgramRateManager.Approved()". As confirmed below, Rebecca Grady is an authorized approver for pull requests. **No issues noted.**

### **General IT Control 2 - There are a limited number of individuals within ESD who have system-authorization to approve pull requests (i.e., rate changes).**

On 6/28/2024, we observed as Bora Kim (Delivery Architect) launched Microsoft SQL Server Management Studio, and navigated to the 'OMAC' database, sub-table 'dbo.PremiumRate'. Bora then ran the following SQL query: "select 'from Security Permission' where Target Name = STFSYSOPSAPPR". This query generated a list of five individuals who have system authorization to approve pull requests, and the associated dates when they were granted such system authorization. The list included: Alison Eldridge (Production Team Manager, added 2/6/2020), Baldeep Kang (System Support Specialist, added 7/16/2019), John Mattes (Operations Team Manager, added 2/6/2020), Rebecca Grady (Data Research Team Manager, added 3/19/2020), and Vanessa Lemus (Benefits Specialist, added 1/11/2024). All users were granted system authorization by the Development Team, with the exception of Vanessa Lemus, who was granted authorization by Baldeep Kang. **No issues noted.**

### **STEP 5: Test Key General IT Controls**

Not applicable - we are not planning to rely on automated controls and therefore do not need to test general controls; control risk will be assessed at '**MAX**'.

### **I.8.PRГ - Paid Family & Medical Leave - Revenues**

*Procedure Step:* Key Control 2 (Manual)

*Prepared By:* JLE, 6/28/2024

*Reviewed By:* RKM, 8/28/2024

Purpose/Conclusion.*
----------------------

### **Purpose**

To confirm that ESD performs a weekly cross-match of OMAC Portal and NGTS unemployment data using Department of Revenue business identifying information, to identify employers who are liable for PFML premium assessment (**Key Control 2 for the OMAC Portal**), in order to assess control risk.

### **Conclusion**

## State of Washington

We confirmed that ESD performs a weekly data cross-match as asserted; however, we found that ESD does not maintain documentation relating to this control activity. **See issue at:** [\[E: ESD PFML Control Weaknesses\]](#).

We **do not** consider this control weakness to represent a significant deficiency or material weakness.

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.*

## State of Washington

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency.*

***All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.***

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

# State of Washington

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

**This record may contain information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited.**

**Key Control 2 (Completeness) - Quarterly, a Leave and Care Specialist performs a cross-match between historical employer wage reporting data per the OMAC Portal, and unemployment data per NGTS, using Department of Revenue registered business information, for the purpose of identifying employers liable for PFML premium assessment, but who have failed to file quarterly reports.**

The understanding for this system is documented above in the "Controls - OMAC Portal & Dynamics" step.

### **1. Confirmation of Key Manual Control**

We confirmed this key control through a live walkthrough demonstration with Jose Hernandez (Leave and Care Specialist) on 6/25/2024, as follows:

First, Jose launched the 'RStudio' program, which is the application used to: access each relevant database, transform data for meaningful analysis, and house saved coding language in in tabs known as 'projects'. Jose accessed the project titled "AllEmployersMissingReports", which brought up approx. 800 rows of coding language. We noted that the code was last updated in April 2024; Jose explained that the code is updated annually during April in order to capture data for the new calendar year (i.e., employer wage reports for CY Qtr 1 (January - March) are due annually in April).

Jose provided the following walkthrough of coding language used and its purpose:

# State of Washington

## Querying the OMAC Portal

Rows 22:28 - RStudio connects to the OMAC Portal database.

Rows 32:35 - Tells the program for which years it should pull employer wage reporting data (currently, language is set to include 2019 - 2024; prior to April, language was set at 2019 - 2023).

Rows 38:51 - SQL code used to query the OMAC Portal database; tells the system to pull employer wage reporting data and create a table in RStudio, by creating objects known as 'data frames'.

Rows 57:67 - RStudio connects to the ESD sub-database housing DOR State-registered business information (the database is located within the OMAC Portal connection).

Rows 71:99 - SQL code used to query for UBI and legal entity name, as well as business contact information (such as address, city, email, etc.)

Rows 103:117 - SQL code used to pull a Wage Transaction table, which identifies employers who submitted reports using a 3rd party administrator, and displays the 3rd party's contact information, such as SAW ID and email.

Rows 142:172 - SQL code used to pull additional employer information about the most recent wage report submitted (when was the submitted, how many employees were reported for, employer size, etc.)

Rows 176:187 - SQL code used to pull information about the number and timing of claims linked to each employer

Rows 191:198 - SQL code used to pull North American Industry Classification Standards (NAICS) for each employer (i.e., industry classification, such as construction, healthcare, etc.)

Rows 203:216 - SQL code used to pull information about employers which have opted out of PFML due to providing an approved voluntary plan

Rows 232:233 - RStudio closes the connection to the OMAC Portal database.

## Querying NGTS

Rows 236:241 - RStudio connects to the NGTS database.

Rows 257:407 - Code created by ESD's BI team, which pulls the following information from NGTS, based on UBI's identified from the OMAC Portal database:

- Employer class

- Unemployment wage reports (excluding tribal and federal employers)

- FEIN (industry number)

- Liability start and end dates (for relevant each relevant reporting year) - this part of the code essentially tells the program to run the entire code for each relevant reporting year (currently coded as 2019 - 2024).

Rows 408:431 - Tells the system to add the information pulled using the code above, to the table created earlier in RStudio (see note on rows 38:51).

Rows 434:435 - RStudio closes the connection to the NGTS database.

Jose demonstrated a few codes and their function, so that we could observe how the individual pieces work. For example, when connected to the

## State of Washington

OMAC Portal, we noted that after running the code in rows 22:28 the 'Connections' display in the upper-right hand of the screen displayed 'Microsoft SQL Server - PFML'. The server contained approx. 15 individual databases; Jose drilled into the OMAC database to show a large amount of sub-databases. These sub-databases are what the program was querying, and their data is displayed as columns within the final report.

Next, Jose provided an overview of the remaining coding language, labeled as 'Steps':

### Step 1 (Rows 440:449)

Jose ran an example of the query for employer wage reporting data (see description of code in rows 32:35 and 38:51). The results generated in the 'Console' display on the bottom of the screen showed 1.4M records, in 3 columns (Employer ID, UBI, and Legal Entity Name). The code in Step 1 (row 444) told RStudio to arrange this data based on CCYYQId; after Jose applied this part of the code, the data then presented 2 columns of data: UBI and CCYYQId. For example, the business with UBI 000000084 displayed three rows of data, showing that they filed employer wage reporting data in: 20192, 20191 and 20193 (i.e., 2019 for Qtrs 1 - 3).

After Jose ran the remainder of the code in Step 1, the employer wage reporting data was transformed from long-format (2 column display) to a wide-format table. Now, UBIs were displayed once per row, and each column represented every reporting quarter from 2019 - (2024 Qtr 1). For quarters where an employer filed a wage report, a 'Y' was entered. For quarters missing employer wage reports, a red 'NA' was entered. The table showed that there were 302,459 employers which have ever reported to ESD for PFML since 2019.

### Step 2 (Rows 464:588)

Jose explained that this step brings in the corresponding liability dates from the NGTS data, and replaces any 'NA's per the table with a date range for that quarter. Then, the system compares this date to NGTS data (using UBIs as the comparative link) checking to see whether that quarter was 'active' (i.e., within boundaries) for employer unemployment liability. If the result is within boundaries, then the employer is considered liable for missing PFML wage reporting. If there is no associated unemployment liability for that quarter (i.e., outside boundaries), then that quarter is not counted as missing.

### Step 3 (Rows 594:598)

This step creates a separate table for employers which were identified as missing quarters of wage reporting, but for which there was no corresponding NGTS unemployment information. This table represents employers which may be liable for PFML wage reporting; such cases require further follow-up from the Employer Compliance team.

The final piece of code is located in row 755; this step tells the RStudio program to save results in a .csv file in a folder called 'Tables'. We observed as Jose accessed an internal folder on ESD's share drive named 'Jose', he then drilled down to sub-folder 'Employer\_Reporting\_Dashboard', and again to sub-folder 'Tables'. We viewed the .csv file which was saved from the week prior on 6/18/2024 titled "allEmployersMissingWR\_WithLiabilityNGTS\_2024-06-18".

# State of Washington

Jose then demonstrated how he shares his results with the Employer Compliance team. He accessed the internal shared folder named 'HW\_DataReportDrop', and drilled down to the sub-folder 'Employer Compliance Data Requests', and again to sub-folder 'All Employers Missing Wage Reports'. Within this sub-folder, was a copy of the same .csv file "allEmployersMissingWR\_WithLiabilityNGTS\_2024-06-18".

Finally, we observed as Jose clicked the 'Source' button in RStudio (this button runs the entire code) at 10:49AM. At 2:18PM, Jose notified us via email that the R script had finished running, producing a .csv file with 300k+ employer records. We obtained a copy of the final .csv file which was ran on 6/25/2024, noting the following:

- The report was titled "allEmployersMissingWR\_WithLiabilityNGTS\_2024-06-25".

- The report included rows for per unique UBI, totaling 302,808 employers.

- Column headers were as follows: UBI, LegalEntityName, InNGTS, LiabilityStartDate, LiabilityEndDate, totalReportsMissingSince2019WithLiability, QuartersMissingPFMLWithLiability\_2019 (and subsequent headers for 2020-2024), Address, City, StateCode, ZipCode, EmployerEmailAddress, Naics3DigitTitle, LastEmployeeCount, LastEmployerSize, TotalApprovedClaims, EmployerWithActiveVP, VPTYPE, mostRecentSawId, and SAWEmailAddress.

- In the column for 'In NGTS', responses were either "UBI appears in NGTS", or "UBI does not appear in NGTS". For employers appearing in NGTS, there was an associated single date in the 'Liability Start Date' column, from as early as 2001; as well as an associated single date in the 'Liability End Date' column (or, for employers with current NGTS liability dates, "NA" was entered in the 'End Date' column). For employers not appearing in NGTS, liability start and end date columns were both marked as "NA".

- In each column for reports missing by year, the specific missing quarter(s) from that year were identified. For example, employer 'Evergreen Implement, Inc.' showed 15 total missing records since 2019, and in 2019 they only missed wage reporting for Qtr 4. However, in 2020, they missed wage reporting for Qtrs 1-4. (We additionally note that this employer's data does not appear in NGTS, which is why there were a higher number of missing records identified; there were no associated NGTS liability dates to help exclude missing wage reports for which there may have not been a reporting requirement).

We determined that all aspects of the final .csv file matched our expectations. We confirmed that ESD performs a quarterly cross-match of NGTS and Portal data (using DOR registered business identifying information) as expected per our control understanding. **No issues noted.**

## **Noted Weaknesses are as Follows:**

None noted.

## **2. Preliminary Control Risk Assessment**

**LOW** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. We will perform testing below to determine if we can place reliance on the controls.

## **3. Control Risk at 'LOW' - Test Key Manual Control**

In order to support a '**LOW**' control risk assessment, we planned to test **all instances of** the control's application during FY24. For each instance of

## State of Washington

control application, we planned to examine whether the **quarterly** cross-match data query was performed according to our understanding, and whether the results were sent to the Employer Compliance team for further follow-up. Per inquiry with Stephanie Eskesen (Audit Liaison) and Jose Hernandez (Leave and Care Specialist) on 8/12/2024, we found that ESD does not maintain documentation relating to this control activity. **See issue in conclusion above.**

As we are unable to test this key control, control risk will be set at '**MAX**'. See final risk assessment and planned substantive testing strategy below in the "Risk Assessment" step.

### I.8.PRG - Paid Family & Medical Leave - Revenues

*Procedure Step:* Key Control 3 (Manual)

*Prepared By:* JLE, 7/16/2024

*Reviewed By:* RKM, 8/13/2024

Purpose/Conclusion:

#### **Purpose**

To confirm that Employment Security Department staff perform a monthly reconciliation between AFRS and Microsoft Dynamics (Key Control 3 for Microsoft Dynamics), in order to assess control risk.

#### **Conclusion**

We noted **no** material weaknesses or significant deficiencies in internal controls. **No control weaknesses noted.**

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

## State of Washington

*A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. - B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

**Key Control 3 (Valuation, Completeness): ESD Treasury staff perform a monthly reconciliation between AFRS and Dynamics,**

## State of Washington

**ensuring that amounts reported between the two systems are accurate and complete.**

The understanding for this system is documented above in the "Controls - OMAC Portal & Dynamics" step.

### **1. Confirmation of Key Manual Control**

We note that Key Control 3 for PFML premium revenues and Key Control 3 for PFML benefit expenditures (for valuation and completeness assertions relating to the Microsoft Dynamics system), are the same key control. See our documentation of control confirmation at: [[Key Control 3 \(Manual\)](#)]. **No issues noted.**

### **Noted Weaknesses are as Follows:**

None noted.

### **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at '**MAX**' because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **3. Control Risk at LOW - Test Key Manual Control**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at '**MAX**'.

## **I.8.PRГ - Paid Family & Medical Leave - Revenues**

*Procedure Step:* Key Control 4 (Manual)

*Prepared By:* JLE, 10/17/2024

*Reviewed By:* RKM, 10/28/2024

Purpose/Conclusion:
---------------------

### **Purpose**

To confirm that the Employment Security Department prepares a year-end journal entry to record an accrual for premium revenues receivable, based on the AFRS Financial Transaction Code Report (Key Control 4 for Microsoft Dynamics), in order to assess control risk.

# State of Washington

## **Conclusion**

We noted **no** material weaknesses or significant deficiencies in internal controls. **No control weaknesses noted.**

Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

# State of Washington

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

**Key Control 4 (Completeness): At year-end, the Chief Financial Accountant is responsible for preparing a manual journal entry to record an accrual for premium revenues receivable, based on the 'AFRS Financial Transaction Code' report.**

The understanding for this system is documented above in the "Controls - OMAC Portal & Dynamics" step.

### **1. Confirmation of Key Manual Control**

We obtained a copy of the year-end accrual, as evidenced by screenshots of the OFM Financial Toolbox 'Batch Interface to AFRS' file upload detail. On 8/14/2024, ESD uploaded a total batch amount of \$449,045,133.83, with \$445,962,662.48 representing FY25 premiums billed during July and August (related to FY24 CY Q2 wage activity), and \$3,082,471.35 representing associated refund activity, for a total net premium receivable amount of \$442,880,191.13. We note that under 'Results', Toolbox confirmed that the upload process was completed successfully.

We then obtained a copy of the AFRS Financial Transaction Code report, noting that there were six rows of data. Four of these rows were associated with AFRS transaction type 007, account 3210, totaling \$445,962,662.48. The remaining two rows were associated with AFRS transaction type 007R, account 1312, totaling \$3,082,471.35. The combined total of these six rows was \$449,045,133.83. The net amount of transaction types 007 (premium revenue) and 007R (premium revenue refunds) was \$442,880,191.13.

We confirmed that all amounts reported per the AFRS Financial Transaction Code report agree without exception to the OFM Financial Toolbox upload, and FY24 premium revenue receivable accrual. **No issues noted.**

### **Noted Weaknesses are as Follows:**

None noted.

### **2. Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at '**MAX**' because we have determined that substantive procedures alone will be

# State of Washington

effective to reduce detection risk to an acceptable level.

### **3. Control Risk at LOW - Test Key Manual Control**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at '**MAX**'.

### **I.8.PR.G - Paid Family & Medical Leave - Revenues**

*Procedure Step:* Risk Assessment

*Prepared By:* JLE, 8/6/2024

*Reviewed By:* RKM, 10/18/2024

Purpose/Conclusion:

#### **Purpose / Conclusion**

To assess inherent risk, control risk, and the risk of material misstatement in order to design an initial testing strategy for each assertion.

Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

#### **STEP 1: Inherent Risk (IR)**

Assess inherent risk for each relevant assertion. This assessment is based on understanding of the entity and the nature of the account balance or class of transactions.

*Inherent risk is the susceptibility of an assertion to material misstatement. It is our assessment of "total threat", which includes both "natural risk" and identified risk indicators, without any regard to any potential control activities. As inherent risk is fully independent of control risk, any understanding of controls cannot be used to increase/decrease the assessment of inherent risk. Consider the following factors as your basis for this assessment:*

##### *General Considerations*

*Does the balance include transactions that are difficult to audit or involve complex accounting issues?*

*Were there significant misstatements identified in previous audits or prior-period adjustments in the account balance or transaction class? If so, analyzing the cause of prior period misstatements will help in analyzing inherent risk.*

## State of Washington

*Are there any inherent risk factors at the entity or industry level, such as changes in regulation or accounting rules, unique transactions or accounting practices, use of information technology, etc that affect the balance?*

### *Inherent Risk due to Error*

*How large are the transactions making up the balance? If the balance has only a few large transactions, even a single error may mean a significant misstatement.*

*Have there been changes in the transactions making up the balance that may increase risk? For example, significantly different composition, nature or volume of transactions may inherently disrupt established controls.*

*Are financial events originated or identified by accounting personnel or non-accounting personnel? This consideration is mainly for the completeness assertion.*

*Does the process to account for transactions involve judgment or estimation, complex calculations, numerous steps or significant manual steps?*

*Do transactions have widely varying attributes that need to be manually identified? For example, grant loans that are accounted for in one of several ways depending on the terms of the agreement.*

### *Inherent Risk due to Fraudulent Reporting (intentional misstatements)*

*Are there substantial pressures or motivations to misstate the balance?*

### *Inherent Risk due to Misappropriation*

*Is the account balance or transaction class susceptible to sizable misappropriation?*

### *Inherent Risk due to Non-Compliance*

*Are there any laws, contracts or grant agreements affecting the balance? If so, would non-compliance lead to sizable misstatements?*

*Are compliance requirements complex, hard to understand, subject to judgment or otherwise difficult to comply with?*

*Are there any motivations or pressures to not comply?*

## **STEP 2: Control Risk (CR)**

Assess control risk by system and assertion. This assessment should be based on the results of the control understanding, confirmation, and (if setting control risk to LOW) testing. If applicable, auditors will evaluate any control deficiencies and determine whether those deficiencies, individually or in combination, are significant deficiencies or material weaknesses.

*Control risk is the risk that material misstatements would not be prevented or detected timely by the system of internal control. Control risk could be thought of as the "vulnerability" of an entity to misstatements. Control risk exists independently of the inherent risk (the level of vulnerability exists independent of the level of threat).*

*Control risk is MAX in both of the following situations: (1) controls aren't tested or (2) controls are problematic and cannot be relied upon. In order to set control risk to LOW, the auditor must test that controls operated effectively throughout the period.*

*A material weakness exists when the design or operation of controls results in a reasonable possibility a material misstatement will not be*

## State of Washington

*prevented or detected and corrected in a timely manner. A significant deficiency is less severe than a material weakness, yet important enough to merit the attention of the governing body. **All potential material weaknesses and significant deficiencies should be discussed with the AIC, since they must be reported as findings.***

### **STEP 3: Risk of Material Misstatement (RMM)**

Assess the risk of material misstatement for each relevant assertion for each significant line item. The risk of material misstatement (RMM) is a combination of the auditor's separate assessment of inherent and control risk.

*In practice, the RMM is the amount of substantive evidence that's needed, and the only way to reduce the amount of needed substantive evidence (equal to the inherent risk) is to test controls. As such, when control risk is MAX, the RMM must always equal the inherent risk (IR).*

*When controls are tested & can be relied upon (are determined to be effective) it is a matter of professional judgment how much the RMM should be set lower than inherent risk (1 or 2 steps).*

*Auditors should assess RMM by assertion, if different. For example, if RMM is assessed at MOD for the existence assertion, but LOW for the rights & obligations assertion, then document "MOD – existence and LOW – rights & obligations".*

### **STEP 4: Design Substantive Testing**

Design a substantive testing strategy that addresses the relevant assertion (identified risk) in the portion of the line item that relates to that risk.

*Planning identifies where to audit (significant balances, classes of transactions & disclosures) what to audit for (relevant assertions), and how much to audit (RMM). The quantity and quality of evidence obtained by substantive tests needs to match the level of risk. The higher the risk of material misstatement, the greater evidence needed. "Greater evidence" could either be greater quantity of evidence, greater quality of evidence, or some combination of greater quality and quantity.*

Guidance/Criteria.:

Record of Work Done.:

#### **(1) Inherent Risk (IR)**

Based on our understanding of the line item, we assessed inherent risk for each relevant assertion and significant class of transactions relating to the Paid Family & Medical Leave Compensation Premium Revenue balance:

**Valuation - Inherent Risk Assessment - MODERATE**

# State of Washington

## **Completeness - Inherent Risk Assessment - MODERATE**

### **(2) Control Risk (CR)**

We assessed control risk as follows for each system and relevant assertion:

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at '**MAX**' because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **(3) Risk of Material Misstatement (RMM)**

We considered both inherent and control risk and assessed the risk of material misstatement as follows for each relevant assertion and significant class of transactions:

**Valuation - MODERATE**  
**Completeness - MODERATE**

### **(4) Testing Strategy**

We designed our substantive testing strategy based on our assessment of the risk of material misstatement. We anticipate that these tests will provide sufficient appropriate audit evidence to address the assessed risk of material misstatement for relevant assertions in significant classes of transactions.

We plan to perform the following tests:

**1. Valuation** - We will gain an understanding of the premium rate calculation process, including how each calculation input was determined; verifying that the process agrees to our understanding of [RCW 50A.10.030](#) and determining reasonableness of underlying data used in the FY24 calculation. We will obtain specific amounts used by ESD as rate calculation inputs for FY24, re-calculating the FY24 premium rate amounts. Using the sampling spreadsheet from the TeamStore, we will sample and re-calculate premium revenues invoiced during FY24.

**2. Completeness** - To consider completeness of premium revenues invoiced during FY24, we will use Next Generation Tax System (NGTS) data to select a sample of employers who were liable for unemployment premiums during FY24. We will test to ensure that these employers filed PFML quarterly wage reports during the associated period of liability, or, that the ESD Employer Compliance team appropriately attempted to contact the employer regarding their liability. To consider completeness of the year-end premium accrual, we will obtain a copy of the 'AFRS Financial Transaction Code' report for FY24 (which totals Qtr 2 premiums due in July and August of 2024). We will compare totals from this report, to total premium revenue accrued for FY24, determining reasonableness of the total accrual

## State of Washington

amount. We will also obtain a transactional level detail of the data contained within the 'AFRS Financial Transaction Code' report. Using the sampling spreadsheet from the TeamStore, we will sample premiums due after year-end, testing to ensure that accrued premium amounts appropriately relate to premiums during FY24. To consider completeness of the balances reported between Dyamics and AFRS, we will substantiate our population of total premium revenues invoiced during FY24 (population to be obtained as part of our Valuation testing procedures).

### I.8.PRG - Paid Family & Medical Leave - Revenues

*Procedure Step:* Substantive Testing

*Prepared By:* JLE, 10/17/2024

*Reviewed By:* RKM, 10/28/2024

Purpose/Conclusion.:

#### **Purpose**

To determine whether:

All FY24 PFML premiums occurring during the period were reported (Completeness)

FY24 premium rates and revenues were properly calculated (Valuation)

#### **Conclusion**

We determined that all FY24 PFML premiums relating to the period were reported, and that FY24 premium rates and revenues were properly calculated. **No issues noted.**

Testing Strategy.:

Guidance/Criteria.:

Record of Work Done.:

We performed the following substantive tests to meet identified risks and assertions as documented at: [\[Risk Assessment\]](#):

# State of Washington

## 1. Valuation

### Premium Rates

See testing at [\[FY24 Premium Rate Calculation Processes - Valuation\]](#) and [\[FY24 Substantive Testing - Valuation\]](#).

We gained an understanding of the PFML premium rate setting process, specifically considering whether ESD processes agree to RCW 50A.10.030. We then obtained premium rate calculation workbooks and data inputs from ESD, in order to re-calculate the FY24 PFML premium rates, specifically considering reasonableness of source data used by ESD in the calculation. **No issues noted.**

### Premium Revenue

See testing at: [\[FY24 Substantive Testing - Valuation\]](#).

ESD provided a dataset of all premium revenue invoiced for the PFML program during FY24. We utilized SQL queries to consider completeness of the dataset provided by ESD as compared to balances reported in AFRS. We found a difference of \$14.5M between systems, which we found to be caused by the timing of when data was pulled for our population, vs. the timing of when data is reported to AFRS. Our audit testing provided 100% balance coverage of the amount reported per the AFRS database. **No issues noted.**

Utilizing stratification methods and the sampling spreadsheet from the TeamStore, we randomly selected 32 samples to test. For each testing selection we re-calculated the premium assessed, based on: the applicable premium rate, the number of employees reported, and the amount of gross wages paid to employees. **No issues noted.**

## 2. Completeness

### Premium Revenues Invoiced (Employer Quarterly Wage Reporting)

See testing at: [\[FY24 Substantive Testing - Completeness\]](#).

We relied on Team IT Audit and utilized the sampling spreadsheet from the TeamStore to obtain a sample of employers who were liable for FY24 unemployment premiums from ESD's Next Generation Tax System (NGTS). We obtained two separate populations and samples: employers which were considered delinquent per NGTS, and those which were not. For each sample selection, Team IT Audit performed a cross-match to PFML premium data from the OMAC Portal system, based on Unified Business Identifier (UBI), in order to determine whether the employer had submitted quarterly wage reports for PFML premiums during FY24. For those employers which had not submitted PFML quarterly wage reports, we met with Nicole Ross (ESD Employer Compliance Manager), to understand ESD's processes for following-up with each employer, and whether they were ultimately determined to be liable for PFML quarterly wage reporting. We found that all employers from our sample either filed PFML quarterly wage reports, or were not liable for PFML reporting. **No issues noted.**

### Year-End Premium Accrual

See testing at: [\[FY24 Substantive Testing - Completeness\]](#).

We obtained copies of the AFRS Transaction Report and associated transactional level detail (represented by LCD Customer Invoice Journal Reports). Utilizing the sampling spreadsheet from the TeamStore, we haphazardly selected 30 samples to test. For each testing selection, we

## State of Washington

received screenshots of employer 'Wage Submission History' from the OMAC Portal, and determined whether: the relevant wage reporting period was within FY24, the recorded premium amount per the Portal agrees to the accrued premium revenue amount, and whether the employer wage submission date fell on, or before, the invoice date. We determined that premium revenues accrued at year-end were appropriately related to FY24 activity, noting no exceptions within our testing. **No issues noted.**

### I.8.PRQ - Paid Family & Medical Leave - Revenues

*Procedure Step:* PFML Premium Population

*Prepared By:* PS, 9/30/2024

*Reviewed By:* JMT, 10/1/2024

Purpose/Conclusion.:

**Purpose:** To select test samples from PFML premium in fiscal year 2024.

**Conclusion:** Test samples were provided to audit team.

Testing Strategy.:

Guidance/Criteria.:

Record of Work Done.:

### **Request and Import PFML Claims**

IT Audit emailed Stephanie Eskesen, ESD External Audit Liaison, to request for PFML Premium datasets.

An email was sent on August 19th, 2024, to request for the all PFML premium billed in fiscal year 2024. ESD provided the dataset in csv format to us on August 27th 2024. The files were sent to SAO via the WaTech secure file transfer site (mft.wa.gov). Files were saved to the SAO network drive and imported into SQL database. We have confirmed the record count of the file received with ESD staff. No exception.

# State of Washington

The audit team has added an additional test for this data. They would like to match PFML Premium to NGTS delinquent and non-delinquent employers. To perform this test we will need the UBI and FEIN numbers for the employers in the PFML Premium dataset. ESD staff added the two additional fields to the PFML Premium dataset and sent it to us on September 11th, 2024. Files were saved to the SAO network drive and imported into SQL database. We have confirmed the record count of the file received with ESD staff. No exception.

## **Document Test Objective and Methodology**

Team FA submitted helpdesk 68026 to request for the fiscal year 2024 PFML premium dataset.

The following describes the steps taken to meet the test objective:

- Import the fiscal year 2024 PFML premium provided by ESD.
- Determine if the dataset provided is reasonable.
- Select 31 random transactions for audit team. This was completed but the average premium amount of the samples did not meet expectation. This sample was not use for testing.
- Stratified the PFML premium population for audit team.
- Select sample size per instruction from audit team.

As we perform our testing, we will make adjustments to this plan as necessary.

## **Queries**

The queries to complete the testing can be seen at [PFML Premium Samples](#). After selecting the samples, we realized that the average premium amount of the samples did not meet expectation. It was about 27% of the average premium amount of the test population.

To address this, we have prepared a stratified summary of the total population for the audit team at [!2024\\_PFMLPremiumPopulation&Samples](#). Using this, the audit team will select sample size for testing.

## **Reasonableness**

The reasonableness of test results has been performed and documented in the above queries. Based upon our checks, we consider our test results to be complete and reasonable.

## **Results**

Samples were provided to the audit team, through an Excel spreadsheet titled, **!2024\_PFMLPremiumPopulation&Samples.xlsx**. The file provided does not contain CONFIDENTIAL DATA.

# State of Washington

A table of Stratified Population  
32 samples per request from audit team as:

- Strata 1 (transactions ranging from \$25.01 to \$4,000): 6 samples
- Strata 2 (transactions ranging from \$4,000.01 to \$50,000): 9 samples
- Strata 3 (transactions ranging from \$50,000.01 to \$800,000): 10 samples
- Strata 4 (transactions \$800,000.01 or greater): 7 samples

## I.8.PRG - Paid Family & Medical Leave - Revenues

*Procedure Step:* PFML Premium CAATS  
*Prepared By:* PS, 9/11/2024  
*Reviewed By:* JMT, 9/12/2024

Purpose/Conclusion.:

**Purpose:** To determine if a random sample selection of delinquent employers and non-delinquent employers was billed for PFML premiums.

**Conclusion:** We have identified employers who were billed and those who were not billed PFML premiums. Results provided to audit team.

Testing Strategy.:

Guidance/Criteria.:

Record of Work Done.:

# State of Washington

## **Request and Import PFML Claims**

IT Audit team had requested for PFML Premium dataset from ESD and imported the dataset into SQL. Details of the request and import is documented at [PFML Premium Population](#).

## **Document Test Objective and Methodology**

Team FA, Jessica Elsner, has provided a list of delinquent and non-delinquent employers ([UF Premiums and Assessments Sample Selections](#)) and requested that we determine if these employers had PFML premiums billed. This request will be added to helpdesk 68026.

The following describes the steps taken to meet the test objective:

Import the delinquent and non-delinquent employers lists provided by audit team.

Add employers UBI and FEIN to the delinquent and non-delinquent list.

Match delinquent and non-delinquent employers lists to PFML Premium by UBI (if UBI is unavailable, match by FEIN) to determine if they were billed for PFML Premium.

As we perform our testing, we will make adjustments to this plan as necessary.

## **Queries**

The queries to complete the testing can be seen at [PFMLPremiumEmployersMatch](#).

## **Reasonableness**

The reasonableness of test results has been performed and documented in the above queries. Based upon our checks, we consider our test results to be complete and reasonable.

## **Results**

Results were provided to the audit team, through an Excel spreadsheet titled, **!2024\_PFML\_Premium\_Employers.xlsx**. The file provided contain CONFIDENTIAL DATA.

Delinquent employers and the total premium amount billed - 57 records

Non-delinquent employers and the total premium amount billed - 57 records.

## **J.1.PRG - Community and Technical Colleges**

# State of Washington

*Procedure Step:* Summary & Conclusion  
*Prepared By:* DRR, 11/19/2024  
*Reviewed By:* RKM, 11/20/2024

## Purpose/Conclusion:

### **Purpose:**

To evaluate risk assessments and the sufficiency and appropriateness of evidence obtained based on results of substantive work.

### **Conclusion:**

We determined that **no** modifications were necessary to inherent risk, control risk, or the risk of material misstatement as assessed in planning.

We also determined that evidence obtained was sufficient and appropriate in response to the risk of material misstatement.

## Testing Strategy:

Auditors are **required** to evaluate conclusions for substantive testing as follows:

*Auditors may wish to use the optional Lead Sheet available in the Store to summarize testing related to each balance and assertion.*

**1.** Determine whether the results of substantive testing indicate a need to modify the inherent risk assessment (IR), control risk assessment (CR), risk of material misstatement (RMM) or other aspects of planning (such as material balances or assertions). If so, document changes and consider the need for additional testing.

*If the results of substantive testing indicate a need to change control risk, auditors should also update the **Permanent File** by either correcting the documentation or by adding an update section describing changes to the top of the record of work done. For all changes to IR, CR, or RMM the **Material Balances** spreadsheet should be updated.*

*More significant changes to other aspects of planning (such as material balances or assertions) should be referenced in this step and documented in detail in the **Changes to FS Audit Plan** step.*

**2.** Evaluate whether the quality and quantity of evidence obtained is sufficient and appropriate in response to the risk of material misstatement. In making this determination, auditors should evaluate:

# State of Washington

## Information to be used as audit evidence:

- Does evidence relate to the population, period of time and risk (assertion and “what could go wrong” from the Material Balance Spreadsheet)? If there are any gaps or uncertainties in the logical connection between the evidence and conclusions, is there a documented consideration and explanation?
- Are the sources of information sufficiently reliable and appropriate for the risk (whether internal to the government, external, or auditor developed)? If key information is not from a sufficiently reliable source (for example, inquiry), then is it corroborated by information that is?
- Are there any concerns about accuracy, completeness, authenticity, or bias in information? If so, did the auditor perform sufficient procedures to confirm reliability of that information?
- Is information precise enough to catch if misstatements exceeded the tolerable level?
- Is information detailed enough to conclude on whether or not there were misstatements?
- Was there any information that appeared contradictory or inconsistent? If so, was there a documented response to the inconsistencies or doubts about the reliability of evidence?

## Results:

- How much misstatement was identified by testing, and the likelihood and magnitude of further potential misstatement?
- How did misstatements occur and how often might they occur again in the population?
- Were misstatements caused by control deficiencies or circumvention of controls?
  - If control deficiencies, is there a need to re-evaluate our understanding of controls in the [Permanent File](#) folder or assessment of control risk?
  - If circumvention, the [Management Override of Controls](#) step should address or reference this area. Auditors should also consider whether a fraud risk has been identified.
- Did tests identify a different level or type of risk than the planned audit response was designed to address?
- If likely misstatements are identified, are further procedures necessary to improve the precision of our estimate?

*To support the overall evaluation of audit risk and provide a basis for concluding on the overall sufficiency and appropriateness of evidence in the [FS Summary & Report](#) step, auditors should conclude in each area whether the auditor continues to believe that the tests performed and quality and quantity of evidence obtained are commensurate with RMM for all relevant risks (the “what could go wrong”, in the [Material Balances](#) spreadsheet).*

If the auditor determines that evidence is not sufficient or appropriate, additional substantive testing should be done. If sufficient, appropriate evidence is not available for audit, the AIC should discuss the effect on our audit report with the AAM and AM.

Guidance/Criteria.*
---------------------

# State of Washington

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6310](#) – Determining the Nature, Timing and Extent of Substantive Testing**

**SAO Audit Policy [3210](#) – Audit Evidence**

Record of Work Done.:

Based on test results, we re-evaluated risk assessments, procedures, evidence obtained and conclusions as follows:

**(1) Do the results of substantive tests indicate a need to modify our risk assessment (IR, CR and RMM)?**

The results of substantive tests do not indicate a need to modify our risk assessment.

**(2) Was the quality and quantity of evidence obtained sufficient and appropriate?**

The quality and quantity of evidence obtained was sufficient and appropriate.

### **J.1.PRG - Community and Technical Colleges**

*Procedure Step:* Understanding of Line Item

*Prepared By:* DRR, 5/21/2024

*Reviewed By:* BM2, 11/20/2024

Purpose/Conclusion.:

**Purpose / Conclusion:**

To gain an understanding of the line item and confirm the scope of testing as documented in the Significant Account Matrix.

Testing Strategy.:

Auditors are **required** to perform the following procedures for each line item:

# State of Washington

## **STEP 1: Prior Audit Exceptions**

Document any exceptions noted during the prior audit. Follow-up to determine how the agency has responded to or corrected the issue, unless this work is anticipated as part of the testing strategy.

## **STEP 2: Analyze Composition and Changes of Line Item**

Include link to the line item leadsheet. This will be completed at the end of the audit. Leadsheet analysis should be documented in this spreadsheet.

Inquire with agency staff about the activities and transactions that make up the balance and any changes to those activities or transactions in relation to the prior year.

Determine relevant classes of transactions or account balances within the line item to analyze (such as agencies, funds, programs, departments, accounts, and/or objects), and use AFRS to create trends of those elements. This step should not include any specific dollar amounts associate with the line item.

Evaluate trends to identify:

- (1) What classes of transactions or account balances are primary to the identified risk. Auditors should specifically consider what elements are primary to the line item (comprising a large percentage of the line item), and which elements the identified risk would apply to, and which elements might be most susceptible to the identified risk (having a high risk of non-trivial misstatement for a relevant assertion, considering likelihood and impact of potential for misstatement).
- (2) What changes are primary to the identified risk, if applicable. Auditors should specifically consider whether the overall change to the line item from the prior year was significant, what elements were the primary drivers of overall change, whether any elements changed significantly from the prior year, and which changes (if any) might relate to the identified risk.
- (3) Any unusual or unexpected elements, amounts, or changes that may indicate a risk, whether the one identified in planning or a new one that may need to be considered for a change to the plan.

**Consider** other procedures to gain an understanding of the line item, such as review of key policy documents, review of program information or reports, inquiry of staff, budget information, or other analytical procedures.

## **STEP 3: Update Significant Account Matrix**

Based on your understanding of the line item, update the Significant Account Matrix with final conclusions on the agencies covered, account description, significant accounting systems, and risk (what could go wrong and relevant assertions). The account description should reflect the significant transaction streams or account balances relevant to the risk.

*The description of agencies, significant accounting systems, and what could go wrong in the Significant Account Matrix constitute the overall scope of substantive testing.*

*A transaction stream is significant based on the potential for misstatement. This is often due in part to its size (ie: comprising a large*

## State of Washington

*percentage of the total line item), but is ultimately a judgment about the susceptibility to the identified risk (for example, when the risk is understatement a small or omitted account may hold the most potential for the largest misstatement).*

*Significant accounting system(s) are those that contain key controls over significant classes of transactions included in the line item. Control systems identified in this step must match the Significant Account Matrix and have a separate control understanding documented.*

*Talk with the AIC if you identify any changes to the Significant Account Matrix.*

Guidance/Criteria.:

Record of Work Done.:

### **(1) Prior Audit Exceptions:**

The State Board of Community & Technical Colleges (SBCTC) had prior audit exceptions that were included in the FY23 ACFR Management Letter [[ACFR 2023 Management Letter OFM and SBCTC](#)]. See contents of ML below:

### **State Board for Community and Technical Colleges – Reconciliations and Adjustments**

The State Board for Community and Technical Colleges (SBCTC) advocates for, coordinates and directs Washington's system of 34 public community and technical colleges. One of the SBCTC's responsibilities is to collect and consolidate community and technical college financial data for reporting in the state's general ledger accounting system.

The state produces a series of year-end exception reports designed to identify potential errors in financial reporting. Based on our review of these reports, we found several likely errors that should have been investigated and corrected. The SBCTC did not actively work, investigate, and adjust several of the high-risk balances noted in these reports, including:

Unchanged balance sheet accounts (\$10.6 million) that likely needed adjustment

Negative assets (\$56.0 million) that likely needed adjustment

Negative liabilities (\$9.6 million) that likely needed adjustment

In addition, colleges reported their receipts of federal direct student loans as federal revenue, rather than a reduction in expenditures. This resulted in a \$30.4 million overstatement of federal grants in aid revenue, as well as a corresponding overstatement in expenditures within the special revenue higher education fund. These errors were not corrected in the financial statements.

We recommend the SBCTC:

Actively work with colleges to investigate and adjust exception report balances provided by OFM, when appropriate

## State of Washington

Work with OFM in its reconciliation of direct federal assistance to ensure the proper accounting and recording of federal revenues

As we will develop follow-up testing procedures, we did not follow-up with SBCTC staff regarding their response or correction of this issue.

### **(2) Composition & Change Analysis:**

Line Item Leadsheet: [[Line Item Lead Sheet](#)].

There are **nine** material balances selected for audit that contain activity related to the State Board for Community and Technical Colleges (SBCTC). There are a total of 34 Community & Technical Colleges in Washington state. However, for the purposes of reporting in AFRS there are 30 Colleges as the Spokane, Pierce and Seattle Colleges all get rolled into their respective "parent" College. For example, Pierce College's data will include both the Steilacoom and Puyallup campuses. As such, throughout our work on for "Community & Technical Colleges", we will refer to 30 Colleges. The Colleges' data is uploaded to AFRS under the Board's agency number (699) because in AFRS the data is not broken down by College. AFRS shows SBCTC as a single entity, which includes all of the Community Colleges.

The State Board is responsible for reconciling the community college accounting system (subledgers) for reporting in AFRS under one fund (agency 699). This section is to review the reconciliation of the subledger data to AFRS. We test selected individual colleges for accuracy of information and review the reconciliation of the community and technical college system as a whole for completeness and accuracy.

We selected the following specific account balances for review at SBCTC for FY 2024:

- Cash and Cash Equivalents
- Depreciable Assets (Net of Accumulated Depreciation)
- Charges for Services
- Federal Grants-In-Aid
- Education Expenditures

For the purpose of the state ACFR, all of the reconciliations for FY2024 were performed by Sue Willis, System ctcLink Accounting Manager, and reviewed by Teri Sexton, Agency Accounting Manager. There were no major changes to SBCTC's CEMLI (pronounced Kim-lee) process, but they did make minor changes to update some original coding for efficiency. CEMLI stands for Configuration, Extension, Modification, Localization, and Integration; CEMLI is the in-house developed software program used to upload Peoplesoft data directly into AFRS.

Teri Sexton, Director of Accounting and Business Services, indicated that when changes or updates to the CEMLI process are deemed necessary, SBCTC accounting staff identify the needs and reach out to the SBCTC data services team to update the processes. The changes or updates are then tested in a test environment before being put into production. Staff monitor these changes to be sure that they are working as intended.

We identified that the State Board is in the process of completing a ctcLink Accounting manual (CLAM) to replace the legacy accounting manual or

# State of Washington

FAM. It is posted on their [website](#) for College & SBCTC Staff under accounting and business services. The web page states that:

"The purpose of this manual is, in part, to fulfill the Washington State Board for Community and Technical Colleges' (SBCTC) responsibility under RCW 28B.50.090 (7)(b) to "Establish minimum standards to govern the operation of the community and technical colleges with respect to internal budgeting, accounting, auditing, and financial procedures as necessary to supplement the general requirements prescribed pursuant to Chapter 43.88 RCW."

## **(3) Updates to Significant Account Matrix:**

None.

## **J.1.PRG - Community and Technical Colleges**

*Procedure Step:* Controls - ctcLink System Reconciliation

*Prepared By:* DRR, 5/21/2024

*Reviewed By:* BM2, 11/20/2024

Purpose/Conclusion.\*

### **Purpose:**

To gain an understanding of internal controls.

### **Conclusion:**

We gained an understanding of internal controls as documented in the record of work done.

Testing Strategy.\*

### **The following procedures are required for all material systems:**

1. List the financial statement balance(s) and relevant assertion(s) addressed by the understanding.
2. Gain an understanding of the internal control process, identify how transactions are recorded in AFRS, identify key controls over relevant assertion(s), and note any control weaknesses.

## State of Washington

In gaining an understanding of controls, consider the overall understanding of State-Level control elements as documented in the "State-Level Controls" step as they relate to this particular system.

Identify controls systems covering all relevant assertions for all significant classes of transactions.

Standards require the auditor to gain an understanding of the significant accounting system(s) that contain key controls over significant classes of transactions included in the line item.

Control systems identified in this step must match the Material Account Matrix and have a separate control understanding documented.

Talk with the ACFR Specialist or AIC if you identify different systems than the ones anticipated in the Material Account Matrix.

For each material system, auditors must document:

A brief outline of the transaction flow from beginning to end.

An expanded description of key controls.

Business processes relevant to financial reporting of the relevant assertion for the material balance. Processes should encompass automated and manual procedures by which transactions or events are identified or initiated, authorized as needed, recorded, processed and corrected as needed.

Original accounting records and how records are rolled-up to intermediary ledgers and transferred to the general ledger (AFRS) or financial statements.

Detailed descriptions of key controls. Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

The following is information to **consider** when identifying key controls and transaction flow.

"Key controls" refer to the few controls that together provide reasonable assurance that material misstatements will be prevented or detected and corrected. This is contrasted with ancillary or supporting controls, which – although helpful and recommended – would provide less than reasonable assurance by themselves.

The focus of the write-up is on the key controls. Key controls should be specifically identified (as "key controls") in the write-up. This can be done in whatever way the auditor prefers, so long as it is obvious. Details that the auditor should document regarding key controls may include:

Who or what initiates the control

When (or how often) is the control applied

Who performs the control

As needed, the experience, knowledge and attitude of the person applying the control

## State of Washington

Detailed description of the control process or activity. For example, if the control is a review: what exactly is reviewed, what is the reviewer looking at or for and what are the reviewer's criteria?

How the key control is documented or evidenced

If not obvious from the description, how the control prevents or timely detects and corrects misstatements

Any exceptions or alternative processing to the normal process

What happens when misstatements or issues are identified by the control

The "transaction flow" refers to the process by which transactions are initiated, authorized, recorded, processed and reported (as applicable). Outlining the transaction flow gives context to key controls, especially how transactions become subject to controls in the first place. If a control inherently ensures that all applicable transactions are included (ex: bank reconciliation where the assertion is existence), the auditor may decide to just start the write-up with the initiation of the control procedure and go from there.

Elements of the transaction flow are defined informally as follows:

*Initiation:* How are transactions initiated?

*Authorization:* How are transactions and accounting record maintenance authorized?

*Recording:* How are transactions or balances identified and recorded in financial accounting systems?

*Processing:* How are the transactions or balances processed after they are recorded (if at all)? Processing may be manual or automated and may occur at a subsidiary system level or at the general ledger level.

*Reporting:* How are records translated into the financial statements? This part of the transaction flow extends the understanding to the actual financial statements that the audit is opining on. Since we already document an understanding of the financial reporting process in general, it is usually enough to simply reference this overall understanding. However, if there are important steps unique to the covered balances, it may be more appropriate to mention them here.

Although transaction flow is a good way to think about understanding and documenting a control system, auditors should not worry too much about documenting "each element, in order" because often elements may be combined, not noticeable, not applicable or occur in a different order.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

# State of Washington

## Financial Statement Audits Planning Guide

Record of Work Done:

Internal controls in the ctcLink System Reconciliation process address the following balance(s):

### **1. Higher Education - Special Revenue:**

- AC - Cash and Cash Equivalents (Local Portion)
- CG - Federal Grants-In-Aid
- CH - Charges for Services
- FS - Education

### **2. Governmental Activities:**

- 2C - Depreciable Assets (Net of Accumulated Depreciation)
- 2C - Education - Higher Education - Charges for Services
- 3C - Education - Higher Education - Operating Grants & Contributions
- G3 - Education - Higher Education - Expenses

### **3. Higher Education Student Services Fund:**

- AC - Cash and Cash Equivalents (Local Portion)

For the completeness assertion.

### **Gain an Understanding of Internal Controls**

We met with Sue Willis, ctcLink Accounting Manager, on April 29, 2024 to gain an understanding of internal controls for SBCTC's ctcLink to AFRS reconciliations. For documentation purposes, the controls to ensure that all financial data submitted to the State Board of Community and Technical Colleges (SBCTC) from each college is uploaded from the ctcLink (PeopleSoft) to the Agency Financial Reporting System (AFRS) will be called the "Reconciliation Process". We will perform testing at three colleges to ensure that the data received by the State Board is accurate. The selected colleges are:

- Seattle Colleges [Community & Tech College Testing - Seattle]
- Community Colleges of Spokane [Community & Tech College Testing - Spokane]
- Bellevue College [Community & Tech College Testing - Bellevue]

We will gain an understanding of the controls over the reconciliation process to ensure that financial data uploaded from ctcLink is complete, properly valued and recorded into AFRS correctly. We will focus our discussion on the following systems:

## State of Washington

**ctcLink (PeopleSoft)** - The single, centralized system of online functions to give students, faculty and staff a way to do college business. ctcLink is an Oracle PeopleSoft application and is referred to by either ctcLink or just Peoplesoft. As of July 30, 2022, all 30 colleges and the SBCTC were using ctcLink, the centralized online system that replaced the outdated FMS Legacy system. The conversion to ctcLink was rolled out to the colleges and the SBCTC over the last few years.

**CEMLI** - The software that SBCTC developed to convert ctcLink data into AFRS data. See below for more information.

### **How transactions are recorded in AFRS:**

SBCTC is responsible for tracking and recording the financial data that is submitted by all of the Community & Technical Colleges, through the ctcLink system. There are a total of 30 Community & Technical Colleges in Washington state. The Colleges' data is uploaded to AFRS under the Board's agency number (699) because in AFRS the data is not broken down by College. AFRS shows SBCTC as a single entity, which includes all of the Community Colleges.

On November 19, 2024, we met with Sue Willis, ctcLink Accounting Coordinator, Kelly Diaz, Statewide Accounting Supervisor, and Lori Carambot, Associate Director of Accounting, to gain an understanding of how SBCTC converts some college data from full accrual to modified accrual for reporting in the special revenue funds for the ACFR. Lori explained that the transactions that roll up into the special revenue fund focus on the inflows and outflows of current resources such as current assets and current liabilities. As such, long term liabilities and non-current assets are not reported in these funds. She mentioned that grant and tuition revenue is reviewed at fiscal year end to determine which amounts are unearned and when they will be available for use. SBCTC will back out revenue as needed to record as unearned revenue. The college system does not allow pre-paid expenses and in the special revenue fund, SBCTC will only report expenses that have been incurred. SBCTC ensures that non-applicable expenditures such as depreciation are not included.

We also identified all funds in the Higher Education Special Revenue opinion unit (roll up fund FBG) here [[Special Revenue Classification](#)] and related ACFR queries. We used OFM's [fund reference guide](#), associated RCWs, and OFM's fund classification review in excel worksheet "Rest\_FBG\_Sp\_Rev\_fund\_by\_rev\_source\_Final\_FY2024.xlsx" to determine if OFM is properly reporting these funds as special revenue. To assist in our determination, we obtained definitions for [enterprise funds](#) and [special revenue funds](#) from SAO's website which uses GASB definitions.

### **General Ledger information & AFRS crosswalks:**

We documented the crosswalk and converted the material balance accounts in AFRS to ctcLink ledgers accounts on the Line Item Lead Sheet here: [[Line Item Lead Sheet](#)] - See "ctcLink Mat Bal Accts" tab and "COA Crosswalk" tab.

Each sub object and source of revenue has its own general ledger account in the ctcLink system and these are converted back to AFRS GL accounts 6510 and 3210 monthly and at year end during the college data consolidation and upload to AFRS process performed by Sue Willis. ctcLink general ledger accounts are 7 digit numerical accounts grouped by the leading digit as assets, liabilities, expense, revenue, or equity. The system also has budgetary only accounts that correspond to these groupings.

Sub Object or Expense accounts in ctcLink generally begin with "5".

## State of Washington

Source of Revenue or revenue accounts generally begin with "4"

The exception is that object "S" (interagency or inter college reimbursements) which are reported/uploaded to AFRS as GL 6510 expenses were grouped in the revenue category in ctcLink.

Each College's monthly General Ledger data is updated by the manual closing of "submodules" by College finance staff about 5 days before each month end and a few days after year end, June 30, of each fiscal year. Transactions within the submodules post to various general ledger accounts such as student financial tuition and fee revenue, accounts payable expense transactions, payroll expenses, accounts receivable and billing updates, grant revenue and expenditures, and Treasury transactions for cash and cash equivalents. The journals created by the submodules are reviewed at each college by staff responsible, and then posted to the GL.

The submodules are listed below:

<b>Sub Module Code</b>	<b>Sub Module Title</b>
AM	Asset Management
AP	Accounts Payable
AR	Accounts Receivable
BI	Billing
CA	Contracts/Grants
EX	Expenses
GL	General Ledger
HR/HCM	HR Payroll
SF	Student Financials
TR	Treasury

The College General Ledger accounts are also updated with journal entries throughout the month and during the adjusting period 13, typically July 1 through the first week of August each year. No adjusting entries are processed through the sub modules, so any accruals or asset adjustments are done through journal entries to the general ledger during period 13. It is also important to note that not all Colleges are using all of the submodules within ctcLink. Some Colleges are not using the Asset Management (AM) Module and instead update Capital Asset general ledgers using journal entries and track college assets using the DirectLine system as they did during use of the Legacy FMS system. Other Colleges might not utilize the Travel and Expenses (EX) or the PCard system within the Accounts Payable sub module, and instead continue to use travel voucher paper forms and manual entries into to the Accounts Payable system. The reason for this is the College's continue to face challenges coordinating College wide staff training and staff turn-over.

# State of Washington

## **Month & Year End:**

The procedure for closing out the month in ctcLink involves many steps to close the submodules listed above to ensure that submodule journals post to the General Ledger Accounts in the proper order. This involves making any necessary adjustments to the sub modules before they close, viewing general ledger and submodule queries from the system to identify any issues and ensuring all journals are posted to the proper period. SBCTC maintains a "ctcLink Reference Center" website, that contains a [monthly Closing Check list](#), which lists all the required steps in order. The checklist also outlines whether the steps are done by the College, the Enterprise Resource Planning (ERP) support team or by SBCTC accounting staff.

## **Posting College General Ledger Activity to AFRS**

After all of the required month end steps have been completed by the Colleges or the ERP support team at SBCTC, Sue Willis, ctcLink Accounting Manager, performs processes using CEMLI to process the AFRS customization to crosswalk PeopleSoft distributions to AFRS. The CEMLI process maps GL attributes and agency codes using AFRS transaction codes and rules to produce an AFRS GL report to upload to AFRS using the AFRS toolbox utility.

This report is a summarized report of all data from PeopleSoft that has passed through edits for a specific month. The report is the combined table from all TBL tables from each module (as posted to the GL). The AFRS report comes directly from the General Ledger after all submodules have been closed.

The AFRS report is submitted to the Office of Financial Management (OFM) through the Axeway process. The data incorporated in this file contains only valid entries; all others remain in error files.

This report can be run as many times as necessary; but once submitted to OFM it should not be run again unless the file is protected by an archive copy.

## **Reconciliation Between the ctcLink system and AFRS**

SBCTC uses an in-house developed software program called CEMLI (pronounced kim-lee) to upload monthly data from PeopleSoft into AFRS. CEMLI has been continuously updated and improved since 2019 in an effort to make this process more efficient. The CEMLI program automatically converts College ctcLink GL data to AFRS account coding for uploading into the AFRS system **(Key Control #1 Automated - Completeness)**.

The System Accounting Coordinator reviews error reports, which identify discrepancies between the entries in ctcLink and AFRS and follows up on any coding errors and variances identified, to ensure the data reconciles between the two systems **(Key Control #2 Manual - Completeness)**.

Part of the monthly review of the reports process, is to verify that previous exceptions were corrected and all new exceptions were reported to the College involved. Generally, the Colleges will fix the incorrect entries as soon as they receive the Monthly Error Report from Sue. If it is not cleared in the following month when the next Monthly Error Reports are run, SBCTC works with the College to correct the error. Sue will mark "critical" errors she identifies during her reconciliation and follow up with the Colleges directly for some errors, but the

## State of Washington

Colleges are expected to monitor and review their monthly "SMARTER" reports to correct issues throughout the year. The SMARTER Query procedures are posted on the SBCTC [website](#).

The smarter query reports are the ctcLink version of the legacy Standard Monthly Analysis and Review of Transactions reports that were designed to test and analyze accounting data on the college level according to specific criteria. The results indicate errors that need to be corrected such as specific funds not allowed in specific ledgers, overspent capital and operating allocations, depreciation not booked, etc. The colleges are instructed to resolve smarter errors monthly and required to resolve any errors remaining at year end.

### **CEMLI Processes**

The transactions run sequentially from ACT/RVW/RPT/TBL.

Sue Willis, System ctcLink Accounting Coordinator, performs the following procedures each month:

The System ctcLink Accounting Coordinator uses pivot tables and error reports to reconcile and confirm the data input from PeopleSoft made it to AFRS for each college, for each month, without errors or variances between the amounts **(Key Control #2 Manual - Completeness)**.

The System ctcLink Accounting Coordinator, runs the "SAO Query" (also referred to as PS-SAO or SAO Zero Report) and compares it to the ACT table to ensure all of the transactions are processed by CEMLI. The SAO Query grabs all of the transactions that were keyed in PeopleSoft, without looking at the particular sub-module. The ACT table (ctc\_AFRS\_ACT\_Union) contains all of the transactions in debit/credit form, prior to the CEMLI turning them into transaction codes for AFRS. This comparison confirms that all of the transactions are processed by CEMLI.

Next, Sue reviews "Error Report 1", looking for matching errors. Between ACT & RVW, the CEMLI matches debits and credits and if it cannot find the match, it kicks them out to the error report if it is not a one-to-one match. For example, it cannot match two \$500 credits that add up to a \$1,000 debit. Corrections are usually simple and are corrected on the AFRS FT (Financial ToolBox). From RVW to RPT, the CEMLI translates the ctcLink funding source to AFRS funds. Between RPT & TBL the CEMLI verifies a transaction code is present, checks for subsidiary codes, Appropriation Indexes, etc. Anything that does not pass the tests kicks out to "Error Report 2". Sue follows up on each error and makes the necessary updates. TBL is the final table in the CEMLI process. The final data on the TBL file is placed on a server for AFRS to pick up.

One of the updates to the CEMLI process during fiscal year 2023 involved the addition of a "reconciliation balancing tool" to make this process more efficient and helps with matching debits and credits in ctcLink. Sue indicated that she rarely has much on the error reports to review now and is able to complete reconciliations for all the colleges before AFRS closes for the month.

### **Year-End Adjustments**

SBCTC reviews all potential year-end adjustments and supporting documentation to ensure they are reasonable and accurate prior to entry into

## State of Washington

AFRS during periods 132 and 133. Once all the documentation is received and reviewed, Sue Willis, ctcLink Accounting Manager, will update AFRS. After all year-end adjustments have been made, Sue will perform the reconciliation between ctcLink and AFRS, to ensure that the amounts entered in ctcLink by the individual colleges are accurately recorded in AFRS and that the balances are complete (**Key Control #3 Manual - Completeness**). If variances are identified, SBCTC will follow up with the College to ensure that the explanation for the variance is reasonable and that the adjustment in AFRS is appropriate. Any adjustments requested after close of AFRS need to be approved and made through OFM. If OFM does not approve of the adjustment, it's typically due to an error in the adjustment, such as, using incorrect funds or accounts. OFM will notify SBCTC of the error and SBCTC will reach out to the College to make the correction. Once corrected, the Colleges GL will be closed and the data will be uploaded in AFRS.

Although large improvements were made and the PeopleSoft data is being reconciled to AFRS on a regular basis, the Board has not been able to correct all of the GL beginning balances from prior year errors, so some of the information reported is still questionable. Sue Willis, ctcLink Accounting Manager, provided us with an update to the beginning balances correction process:

- Sue has created a spreadsheet to compare the ctcLink balances to the AFRS balances. Sue will identify errors using this spreadsheet.

- Sue is currently working with OFM to determine how they're going to work through the beginning balance adjustments.

- Sue will meet with OFM to propose corrections on the college level. If OFM agrees to the correction, Sue will reach out to the College to request the correction.

- OFM must approve all corrections to the beginning balances; and supporting documentation is required.

- All legacy data is maintained in a database to identify balances from prior years.

- SBCTC and OFM's goal is to have the beginning balances reconciled before the transition to OneWA.

### Key Controls are as Follows:

- Key Control #1 (Automated) - Completeness** - SBCTC uses an in-house developed software program (CEMLI) to upload monthly data from PeopleSoft into AFRS. CEMLI automatically converts ctcLink data to AFRS account coding from the college general ledgers.

- Key Control #2 Manual - Completeness: (Monthly)** - The System ctcLink Accounting Coordinator uses pivot tables and error reports to reconcile and confirm the data input from PeopleSoft made it to AFRS for each college, for each month, without errors or variances between the amounts.

- Key Control #3 Manual - Completeness: (Year end)** - After all year-end adjustments have been made, the System ctcLink Accounting Coordinator will perform the reconciliation between ctcLink and AFRS, to ensure that the amounts entered in ctcLink by the individual colleges are accurately recorded in AFRS and that the balances are complete.

### Noted Weaknesses are as Follows:

None

### J.1.PR.G - Community and Technical Colleges

# State of Washington

**Procedure Step:** Key Control #1 (Automated) - CEMLI conversion of ctcLink data to AFRS account coding  
**Prepared By:** DRR, 7/2/2024  
**Reviewed By:** BM2, 11/20/2024

## Purpose/Conclusion:

### **Purpose:**

To determine whether CEMLI automatically converts ctcLink data to AFRS account coding from the college general ledgers (**Key Control #1 for the ctcLink System Reconciliation**) was in place and operating effectively and to consider related general IT controls in order to assess control risk.

### **Conclusion:**

Based on our understanding and test results, we concluded that the automated control **was** in place and operating effectively.

Based on our understanding, related general IT controls **were** in place and adequately designed to ensure that the control operated consistently during the audit period. However, we did not test the operating effectiveness of general IT controls.

Our understanding and control risk assessment, which incorporates these conclusions, is documented at [\[Risk Assessment\]](#).

## Testing Strategy:

The following procedures are **required** for all automated key controls for financial and single audits:

### **STEP 1: Understand Automated Key Control**

Gain an understanding of the automated key control. The understanding can either be documented in the control system step or could be documented here in this step. Auditors should consider the following aspects of the automated control when gaining an understanding:

#### **Software Calculation:**

Is there written documentation of the calculation, and/or the source rates and factors used in the calculation?

*We would expect written documentation that defines the calculation and is an official, approved source for the formulas, rates and factors. This may be an approved policy or could be system documentation.*

What formulas are used to make the calculation?

## State of Washington

What values or factors are used to make the calculation? For example:

- Rate tables used by the calculation
- Profile fields (i.e., applicable transaction types)
- Programmed/set formulas and/or values
- Constraints (i.e., effective date, minimums/maximums, etc.)

How is the calculation triggered or initiated?

How is the calculation recorded in the accounting system (or used in an end result)?

### Automated Interfaces:

Is data transferred in real time (immediately) or in a batch? If batched, how often does the interface occur (daily, monthly, quarterly, etc.)?

What triggers the data transfer?

*Transfers could be manually initiated, could be hardcoded into either the sending or receiving system's programming, could be controlled by administrative menus (for integrated software modules), or could be run as automated jobs with third party software or programming.*

Could the interface process fail? If so, how would the entity recognize that the process failed?

*This may not be a relevant risk for integrated software, but may be the case for custom interfaces designed outside the software which may be subject to various points of failure.*

Will the interface process reject transactions or batches with errors? If so, who monitors rejections and follows up on rejected transactions to ensure correction (either in the sending or receiving systems) and how are corrections tracked and monitored?

*For example, information that could trigger a rejection or isolated transaction and batch can include: invalid data, duplicate data, or missing factors. If errors are possible, we would expect the isolated data is reviewed, tracked and corrected in a timely manner.*

Are any reconciliations done to provide assurance that data transfer was complete and accurate?

*We would expect the local government to perform a reconciliation between source and destination systems to ensure the interfaced data is complete and accurate. This may be a manual reconciliation or spot-check, a system or dashboard report, or automated edit check. Depending on how often errors (if any) are expected, the reconciliation could be done each time the interface occurs, or on a monitoring basis, like annually.*

### Edit Checks:

## State of Washington

Inquire if the entity has a written policy or documentation describing the approval process and protocols for reviewers?

What is the approval process in the application?

What transactions, data, tasks, or documents are approved?

Who are the preparers? How do preparers submit for approval?

Who are the authorized approvers? Are there backup approvers?

What documents or information are required to make approval judgment?

What is the next step once a transaction/data/ task/document is approved or denied?

Is there any exception situations where approval can be by-passed or waived?

Can the approver make changes to information during the approval stage? If so, is the preparer notified of the changes?

Can anyone make changes to the approved information after the approval stage? If so, are changes captured in an audit trail and is the audit trail (log) regularly reviewed and monitored to detect any unauthorized changes?

Does the application prevent users from approving their own work (self-approval)?

*Some applications have a feature preventing self-approval. If an application does not have a feature preventing self-approval, we would expect manual controls in place to ensure the segregation of duties between preparer and approver, if relevant to the risk.*

Does the application have high-level users that can also approve?

*High-Level Users (aka Users with elevated privileges, system or application "Administrators", "Super Users", etc.) typically have full access to change system settings and may have extensive function rights of software applications. Depending on entity's size and complexity, different high-level users may be responsible for the network vs. application level. High-level users represent a heightened risk for overriding segregation of duties and normal control processes.*

*We would expect entities to have compensating monitoring controls if personnel are responsible for both application settings and transaction processing controls.*

### Computer Generated Reports:

What information or exceptions is the report designed to identify (what is the purpose of the report)?

How is the report used and by whom?

For exception reports, who reviews the report and how do they follow up on exceptions?

*Auditors should consider whether the exception report reviewer has appropriate authority and information to effectively follow-up on report results. For fraud-related risks, also consider whether the review position is appropriately segregated from positions that can initiate transactions. For exception reports that regularly identify many transactions needing multi-step follow-up, the manual review and follow-up may be identified as a separate key control rather than documented and evaluated as an aspect of the automated exception*

## State of Washington

*report control.*

What are the report parameters or criteria? Does the report have any calculated fields? If so, what are the calculations?

*The ideal method of documenting an understanding of a computer generated report is to get a screenshot or printout of the report parameters. If using a report writer, this may be printed with the report, or may be accessed from a design view or intermediary screen. For custom or complex reports, this may be the SQL code.*

*For exception reports, auditors should pay special attention to the definition of an exception embodied in the report parameters.*

*NOTE: observation of the report parameters will also count as a confirmation of the report and could also be used to test the report.*

### Electronic Approvals:

Inquire if the entity has a written policy or documentation describing the approval process and protocols for reviewers?

What is the approval process in the application?

What transactions, data, tasks, or documents are approved?

Who are the preparers? How do preparers submit for approval?

Who are the authorized approvers? Are there backup approvers?

What documents or information are required to make approval judgment?

What is the next step once a transaction/data/ task/document is approved or denied?

Is there any exception situations where approval can be by-passed or waived?

Can the approver make changes to information during the approval stage? If so, is the preparer notified of the changes?

Can anyone make changes to the approved information after the approval stage? If so, are changes captured in an audit trail and is the audit trail (log) regularly reviewed and monitored to detect any unauthorized changes?

Does the application prevent users from approving their own work (self-approval)?

*Some applications have a feature preventing self-approval. If an application does not have a feature preventing self-approval, we would expect manual controls in place to ensure the segregation of duties between preparer and approver, if relevant to the risk.*

Does the application have high-level users that can also approve?

*High-Level Users (aka Users with elevated privileges, system or application "Administrators", "Super Users", etc.) typically have full access to change system settings and may have extensive function rights of software applications. Depending on entity's size and complexity, different high-level users may be responsible for the network vs. application level. High-level users represent a heightened risk for overriding segregation of duties and normal control processes.*

# State of Washington

*We would expect entities to have compensating monitoring controls if personnel are responsible for both application settings and transaction processing controls.*

## **STEP 2: Confirm and Test Automated Key Control**

Confirm and test the automated control. To test the automated control, consider the following procedures:

### **Software Calculation:**

Re-perform the calculation for selected transactions.

*Auditors would NOT normally use sampling for automated controls. Instead, auditors should judgmentally select one instance of each significant variation of the calculation. If the number of potential variations is large, auditors would judgmentally select based on risk factors (for example, the most common scenarios, or scenarios associated with identified risks, or scenarios that are not addressed by the entity's testing procedures).*

*In some cases, it may be possible for the auditor to reperform the calculation for the entire population.*

If any rate tables or values were updated during the period, view the current values (by observing the rate table or values in an admin menu or from a printed system report) and compare to approved sources.

*If no updates were made or there are only a few values, this risk could be addressed by re-performing the calculation. However, if source rate tables or values are large or complex, it may be more efficient to test these values directly than to recalculate a larger number of transactions.*

Consider the use of analytical procedures such as trends or descriptive statistics on the population (like average, minimum and maximum values, or a graph of values across the population) and follow up on any unexpected values or trends. *Analytical procedures would normally also count as a substantive test.*

### **Automated Interfaces:**

Re-perform a reconciliation, comparison or analytical procedure between both systems to determine whether data interfaced completely and accurately. Alternatively, review the entity's reconciliation or comparison if they perform one.

*For example, auditors could perform count totals and summarize the data to determine whether the same number of transactions reside in both systems, or the total amount from the sending system was posted to the receiving system. Whether this takes the form of a comparison (numbers expected to match exactly), reconciliation (when reconciling items are expected) or analytical procedure (if numerous adjustments or reconciling items are expected) will depend on the nature of the interface and client documentation.*

*Note: these procedures would also provide substantive evidence.*

## State of Washington

Observe documentation, such as interface logs or email notifications, to determine whether interfaces complete per expected interval (daily, monthly, quarterly, etc.).

*We would expect the data transfer to be consistent based on the programmed schedule. If data is expected to be transferred on a weekly basis, we would expect to see some form of documentation showing the weekly transfer.*

Observe evidence that batch jobs are monitored such as tracking spreadsheets or emails.

When interfaces did not occur as expected, determine whether procedures were followed to resubmit job or that there was a logical reason no data was received/sent for the interval (for example, it was a holiday so there was no interface for that day).

### Edit Checks:

Re-perform the edit check for selected transactions.

*Auditors would NOT normally use sampling for automated controls. Instead, auditors should judgmentally select one instance of each significant variation of the check. If the number of potential variations is large, auditors would judgmentally select based on risk factors (for example, the most common scenarios, or scenarios associated with identified risks, or scenarios that are not addressed by the entity's testing procedures).*

*In some cases, it may be possible for the auditor to reperform the edit check for the entire population.*

Consider the use of analytical procedures such as trends or descriptive statistics on the population (like average, minimum and maximum values, or a graph of values across the population) and follow up on any unexpected values or trends. Analytical procedures would normally also count as a substantive test.

### Computer Generated Reports:

For exception reports, inquire with the person assigned to review the report how frequently exceptions are noted by the report. Trace identified exceptions to documentation of correction or resolution.

Re-perform the report by either (a) generating it yourself in the entity's system (if the auditor has direct access to the system), (b) recreating the report using CAATS, or (c) by observing the report be generated in your presence. If observing, note any user-entered values or parameters and determine whether entered parameters were appropriate. Compare re-performed report to the one being tested.

### Electronic Approvals:

Observe a transaction to see the approval process and verify any key aspects of the process or limits.

If transaction data or reports include approval information, use CAATS to confirm that all transactions met authorization rules.

# State of Washington

## **STEP 3: Understand General IT Controls**

Gain an understanding of the general IT controls that support the continued proper operation of the automated control. Identify key general IT controls and note any control weaknesses. Auditors should consider the following aspects of general IT controls when gaining an understanding:

### **Software Calculation:**

Inquire if the entity has experienced any errors or irregularities with the calculation. Also how often changes are made to the calculation, and how many changes (if any) were made during the year.

How can the software calculation (formulas, rates/values, settings/configurations) be changed or customized?

*Software calculations will usually have one or more administrative menus that allow the government to modify rate tables or other calculation values, or to configure the calculation or apply settings.*

*In other cases, software calculation formulas and/or values may be hard-coded into the system and require programmers to make the changes. If the government has access to source code, then it needs internal procedures for program changes. If the program is controlled by vendors, we would expect program change procedures and expectations to be included in the contract.*

What are the procedures to authorize and make program changes or configuration/setting changes to the software calculation?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

*If utilizing a test environment, there should be controls to ensure that the live environment is updated and is consistent with the live production environment. As management is responsible for the accuracy of their automated controls (i.e., in the live environment), we would expect there to be a procedure to confirm each key automated control once it is in the live environment. This could be manually re-performing the calculation, reviewing reports against known expectations, etc.*

How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

## State of Washington

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change programming, but they may be responsible for patch management, master table data, and/or configurations.*

### Automated Interfaces:

Inquire if the entity has experienced any errors or irregularities with the interface. Also how often changes are made to the interface, and how many changes (if any) were made during the year.

What are the procedures to authorize and make changes to the interface?

*Except for the most simple situations, we would normally expect update procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

*If the data transfer is already going to be checked or reconciled, then there may be less need for specific test procedures on program changes since any errors will be identified right away.*

How are program changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

*If the program is controlled by a third-party, we would expect a process between the government and vendor that allows the government to make requests and receive communication at the completion of the request.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to vendor developed/supported coding that controls how the system processes the interfaced data, but they may be responsible for working the interface error queues and reconciling the interfaced data.*

# State of Washington

## Edit Checks:

Inquire if the entity has experienced any errors or irregularities with the edit checks. Also how often changes are made to the checks, and how many changes (if any) were made during the year.

How can the edit check be changed or customized?

*Edit checks may be hard-coded into the system and require programmers to make the changes. If the government has access to source code, then it needs internal procedures for program changes. If the program is controlled by vendors, we would expect program change procedures and expectations to be included in the contract.*

*In other cases, edit checks may be established or configured through one or more administrative menus.*

What are the procedures to authorize and make program changes or configuration/setting changes?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

*If utilizing a test environment, there should be controls to ensure that the live environment is updated and is consistent with the live production environment. As management is responsible for the accuracy of their automated controls (i.e., in the live environment), we would expect there to be a procedure to confirm each key automated control once it is in the live environment. This could be manually re-performing the edit check, reviewing reports against known expectations, etc.*

How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change programming, but they may be responsible for patch management,*

## State of Washington

*master table data, and/or configurations.*

### Computer Generated Reports:

Inquire if the entity has experienced any errors or irregularities with the report. Also how often changes are made to the report, and how many changes (if any) were made during the year.

How is the report triggered or initiated?

*For reports that are automatically triggered, the auditor would normally not identify job scheduling or monitoring as a general control since we would expect failure of the report to generate*

Is the report hardcoded into the program, or is it a custom or ad hoc report? Also, what manual inputs (if any) are required to run the report?

*What parameters, criteria (date ranges, fund number, departments) or instructions are entered by the user to generate the exception report. The more options entity personnel have to customize or modify the report, the higher the risk of human error and inaccurate or incomplete reports. Pre-programmed reports provide less flexibility than ad-hoc reports; however, if program change controls are in place, they are more consistent.*

If the report is hardcoded into the system, how are program changes made?

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change vendor developed reports, but they may be responsible for triggering, setting certain parameters, and/or following up on exception report results.*

NOTE: if the auditor cannot identify sufficiently effective general IT controls, the automated control will need to be tested using the same methods as a manual control (ie: sampling throughout the period). For example, if the report is manually generated and highly dependent on a number of manual inputs each time, or if the report does not have formal change controls, such as an ad hoc report or excel-based report. In such cases, the automated report is controlled by limited access and the judgment of the report writer – that is, while the report is an automated component, there is also an integrated manual component to the control.

### Electronic Approvals:

How are users assigned preparer and approver roles? Are user accounts periodically checked for needed changes? See the [User Access](#) step in the Accountability folder for more control considerations.

If configurations or settings relevant to the approval process are controlled by an admin menu, who has access to this menu?

If the entity has access to source coding for approval controls, what are the procedures to authorize and make program changes?

## State of Washington

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?  
How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to vendor developed/supported coding that controls how the electronic approval works, but they may be responsible for approval configurations or settings and/or user account management.*

### **STEP 4: Confirm Key General IT Controls**

Confirm your understanding of key general IT controls to determine whether they have been placed in operation (*whether the entity has actually implemented key controls*).

### **STEP 5: Test Key General IT Controls**

Document whether general IT controls will be tested. Option 1 would result in control risk at MAX for the automated control. Either option 2 or 3 is necessary in order to set control risk at LOW. If general IT controls are tested, consider the following procedures:

#### **Software Calculation:**

If program changes or setting/configuration changes are logged, review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the calculation may also provide this evidence if the re-performance tests address all states of the calculation during the period.

## State of Washington

If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) worksheet in the Store.

### Automated Interfaces:

Review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, reconciling or comparing the data transfer (or reviewing the entity's reconciliation or comparison) may also provide this evidence if tests address all states of the interface during the period.

Inspect job processing error logs/reports. Observe evidence that errors in processing were isolated and resolved. For example, select a sample of rejected transactions and observe evidence to determine whether errors were appropriately corrected and the corrections were timely.

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) worksheet in the Store.

### Edit Checks:

If program changes or setting/configuration changes are logged, review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the edit check may also provide this evidence if the re-performance tests address all states of the edit check during the period.

If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) worksheet in the Store.

### Computer Generated Reports:

## State of Washington

If the report is subject to program change controls (either due to being hardcoded or by being automatically triggered), review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

If the report is subject to program change controls, review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the report may also provide this evidence if the re-performance tests address all states of the report during the period.

If the report relies on manual inputs and report copies saved show the parameters entered, the auditor can check a selection or sample of reports to confirm that the report was run correctly.

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

### Electronic Approvals:

Review user access report to verify that current users are appropriate. Also consider review of user access change logs (if available) to evaluate user account management throughout the period. See the User Access step in the Accountability folder for more testing considerations.

If approvals are governed by significant settings/configurations, and such changes are logged, review the change log to verify the population of changes for the year.

*Verification that no configuration changes were made, along with the auditor's evaluation that no such changes are expected, would normally be sufficient evidence to conclude that no further testing is necessary.*

If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.

If the entity has access to source code, review the change log to verify the population of changes for the year. Then review programming change documentation or the entity's test documentation for selected or sampled changes.

*Verification that no program changes were made, along with the auditor's evaluation that no such changes are expected, would normally be sufficient evidence to conclude that no further testing is necessary.*

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the SOC Report Reliance workpaper in the Store.

# State of Washington

## **STEP 6: Final Control Risk**

Evaluate the results and document a final control risk assessment in the control system step. Consider whether any deficiencies identified with either the automated control or related general IT controls represent material weaknesses or significant deficiencies.

*Note: general IT control deficiencies do not necessarily mean the automated control is not properly functioning. General IT control deficiencies would normally be considered a significant deficiency or material weakness only if it caused an issue with the compliance requirement or assertion.*

## **Recommendation Review Requirement**

IT Security related information is considered category 3 data protected by Public Request Exemption RCW 42.56.420. Issues related to IT Security require the following special handling:

[Instructions](#) are located in Team IT Audit's System's Sharepoint page.

Details of IT Security related issues should NOT be included in any emails or helpdesks.

Exit, ML and Findings should be separately communicated in an IT Security Results Document.

Findings will be referenced, but not included in the audit report.

All IT security-related recommendations must be reviewed by [Team IT Audit](#).

Template language for common IT related recommendations can be found in [ARS Part 5 Chapter 8](#).

## **PUBLIC REQUEST EXEMPTION**

Some IT related information is protected by Public Request Exemption RCW 42.56.420 for cyber security purposes. The details documented in the record of work and support workpapers may qualify for this exemption. If so, auditors must include this statement in the record of work done and any related workpapers: **"This record contains information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited "**.

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Information Technology](#) Planning Guide**

Auditors may contact [Team IT Audit](#) with any testing strategy or control assessment questions or to request assistance from an IT Specialist.

**Software Calculation:** A **software calculation control** exists when the value of a transaction is determined by a software application. This

## State of Washington

process can be a key control when the entity relies on the system to generate calculations correctly to determine the amount of transactions (i.e., summarizing/account code allocation to post to general ledger, calculate student, utility, other charges, etc.).

**Automated Interfaces:** An interface is a process that moves information from one computer application to another. The interface can occur internally between systems maintained by a single agency, or between systems maintained by different agencies or private companies. The interface can also occur between modules within the same computer application.

The data transferred might be a file consisting of one or more records processed at a later time (batch), or it can be a real-time update. Risk associated with interfaces increases as the number of transactions or the number of other services and systems supported by the interfaced data increases.

Poor design or inadequate oversight can affect the transfer of transaction data among the systems. Interface controls are automated and/or manual processes designed to ensure transmission and processing of information is complete and accurate.

### Manual vs. Automated Interfaces

A "manual interface" is the transfer of data from one system or module to another system or module, initiated and controlled by a user. An example of a manual interface is when customer accounts are downloaded from a utility billing system to be used to perform meter readings. When complete, the file with meter readings may be uploaded and posted to the customer accounts.

An "automated interface" is the transfer of data from one system or module to another system or module that happens automatically based on a schedule, or other predefined criteria. A common example of an automated interface is the payroll module of a system. Typically, a payroll batch is created in the payroll module. Once approved, the batch is automatically sent by the system to the general ledger or other applicable modules, such as accounts payable.

Entities should have reconciliation controls between their various applications regardless of the method used for interfacing.

*Auditors should have determined whether system interfaces are automated as part of the Key Software Applications workpaper. **If not**, ask the following question to determine whether the system interface is manual or automated.*

*Is the data transferred from one system/module to another system/module by a user using an uploading and posting technique? For example, data is pulled from one system into a text file or other format, that is then uploaded into a different system or module by posting or in an upload feature of the module. If the answer to this question is yes, the interface would be considered "manual" since it is initiated and controlled by manually rather than through an automated process.*

**Edit Checks:** An **edit check** is a programmed routine designed to check input data or processing results for accuracy, compliance, or reasonableness. Types of edit checks include:

## State of Washington

Range Checks: ensure that numeric values fall within specified ranges, minimums and/or maximums. For example, ensuring that a capital asset can only be entered as a positive amount, or a purchase order can only be submitted without secondary approval for less than a certain threshold.

Consistency Checks: verify that related data fields are consistent with each other. For example, ensuring that a patient's age matches their date of birth.

Format Checks: validate data formats (for example, dates as MM/DD/YYYY or phone numbers as ###-###-####).

Logical Checks: assess logical relationships between data fields. For instance, verifying that total debits equals total credits in a journal entry.

Duplicate Checks: identify duplicate records or entries. For example, preventing the same invoice from being entered twice.

Cross-Field Checks: compare data across different fields. For instance, ensuring that the start date of a project is before the end date.

Required Field Checks: ensure that mandatory fields are filled out. For instance, making sure that a patient's name and date of birth are provided.

Referential Integrity Checks: validate relationships between data tables. For example, confirming that a vendor number exists in the vendor master file as an active entity.

Outlier Checks: detect extreme or unexpected values. For instance, flagging water meter reading values that are extreme outliers for the customer type or account history.

Pattern Checks: look for specific patterns in data. For example, verifying that email addresses follow a valid format.

Edit checks may result in automatic rejection of a transaction, inability to proceed with a transaction, trigger for additional processing or review, or may simply result in a warning message to the user.

Edit checks may be identified as a key control when they are sufficiently relevant (ie: addressing the risk), precise (ie: able to catch all errors, rather than just being only reasonableness or limit check), and sufficiently strong (ie: prevent invalid transactions, rather than just generating a warning messages). Auditors may identify an individual edit or a group of edit checks together as a key control.

**Computer Generated Reports:** A **computer-generated report** is a report that is created by a computer program. The computer program, also referred to as a report generator or tool, takes data from a data source, such as a database, and displays it in a specified format. The process to generate a report often includes performing calculations on the data, such as summarizing, classifying, etc., before displaying, or can display the calculations on the report.

There are two types of computer-generated reports, pre-programmed and ad-hoc or customized reports.

Pre-programmed or canned reports are pre-defined reports where criteria and specifications are hard coded in the system. A canned report may allow limited parameters, (month/year, for example), but in general the information that will be displayed is pre-determined.

Ad-hoc or customized reports allow the user to drill down and customize what information is displayed on the report based on some allowed criteria, such as account codes, dollar amounts minimum, etc).

## State of Washington

In contrast, a **manual report** is one that is created outside the system using data exports or is created ad hoc by a user. An example of a manual report is one that is created by copying data from a data source and pasting the data in an Excel spreadsheet or Word document or Powerpoint presentation where it is then processed further. With manual reports, each time a report is created, the data could be incorrect due to user error, such as not copying all relevant data, or processing errors. Therefore, these types of reports should be understood and tested similar to manual controls.

**Electronic Approvals:** Electronic approvals, electronic signatures and digital signatures are technically different, although often these terms are used interchangeably by entities.

Auditors should have determined whether the electronic approval is an automated control as part of the overall understanding of controls. For automated control purposes, an electronic approval is a software system functionality that:

- Permits a user to approve transaction(s) within the software system

- The system automatically documents, or logs, the data approved by the user and any subsequent manipulation

- The acceptance or rejection of the transaction by the approver will trigger an additional software system process, such as posting of a transaction.

E-mail, scanned-in pictures of signatures, or font-changed signatures, etc. may be part of a control activity but are generally not considered an automated control and are not covered by this testing strategy.

### Electronic Signature vs Digital Signature

An "**electronic signature**" can look like a handwritten signature that has been scanned and then pasted into an electronic document. The reliability of this type of approval is variable. Recommend gaining an understanding of the process used to store and affix the signature to the document and then discuss the process with Team IT Audit before placing reliance on this control.

A "**digital signature**" is a legal signature with a formal certification process that documents who approved the document and ensures the document is not modified after certification. Reliability of this process is very high but has significant technical features. Recommend brainstorm with Team IT Audit before placing reliance on this control.

### **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

**Statements on Auditing Standards [AU-C 315](#) Understanding the Entity and Its Environment and Assessing the Risks of Material Misstatement** - paragraphs .A106-.A109 describe general and application controls and how they relate to audit risks

**Statements on Auditing Standards [AU-C 330](#) Performing Audit Procedures in Response to Assessed Risks and Evaluating the**

# State of Washington

**Audit Evidence Obtained** - paragraphs .10b and .A33-.A34 describe requirements and guidance for testing indirect controls in conjunction with tests of controls, that is, testing key general controls in conjunction with a test of a key automated control

Record of Work Done:

**This record may contain information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited.**

Internal controls in the ctcLink System Reconciliation process address the following balance(s):

**1. Higher Education - Special Revenue:**

- AC - Cash & Cash Equivalents
- CG - Federal Grants-In-Aid
- CH - Charges for Services
- FS - Education

**2. Higher Education - Student Services**

- AC - Cash & Cash Equivalents

**3. Governmental Activities:**

- 2C - Depreciable Assets (Net of Accumulated Depreciation)
- 2C - Education - Higher Education - Charges for Services
- 3C - Education - Higher Education - Operating Grants & Contributions
- G3 - Education - Higher Education - Expenses

For the following assertions:

- Completeness

- SBCTC: Detail roll-up from ctcLink to AFRS may be incorrect

The understanding for this system is documented above in the "Controls - ctcLink System Reconciliation" step.

**STEP 1: Understand Automated Key Control**

SBCTC uses an in-house developed software program called CEMLI to upload monthly data from PeopleSoft into AFRS. The CEMLI program automatically converts College ctcLink GL data to AFRS account coding for uploading into the AFRS system (**Key Control #1 Automated - Completeness**).

**STEP 2: Confirm and Test Automated Key Control:**

We received the data text file that CEMLI produces when converting ctcLink data to AFRS data, the Excel file that SBCTC creates to review the ctcLink transactions that have been converted to AFRS and the error report which has the ctcLink data that could not successfully convert to AFRS data SBCTC used for their February 2024 Reconciliation of peoplesoft/ctcLink data to AFRS accounts and we utilized this data for testing the

## State of Washington

automated control.

We met with Sue Willis, ctcLink Accounting Coordinator, on June 26, 2024 to walk us through the process of converting ctcLink data to AFRS data using CEMLI. Using four different queries from FM08 of FY24 data, which was screenshared via Teams by Sue, we were able to follow the process of a single ctcLink transaction being converted into an AFRS transaction.

In query one (from the ACT process) the data is in ctcLink form which had four rows of data from unit WA140 (Clark College). The first two rows were ctcLink account codes 5010040 (Medical Aid) totaling \$35.17 and the second rows were account code 5010050 (Labor & Industries) totaling \$33.12 for a combined total of \$68.29. Additionally, AFRS GL 6510 included on these lines during the conversion process.

In queries two and three (from the RVW and RPT process), the ctcLink account code is dropped and the rows are combined using the Journal ID into two rows with the first totaling \$34.06 and the second totaling \$34.23 for a combined total of \$68.29.

In query four (from the TBL process), the other AFRS GL is included which is GL 9920, and the OFM agency code is included: 635 (Clark College). Many other columns are added or broken out from prior processes and they include breaking out the fund, class, subobject MJR GRP, MJR SRC, and many more.

Lastly, Sue shared the actual AFRS entry and we noted that there were two rows of data, which included a credit of \$68.29 to GL 9920 and a debit of \$68.29 to GL 6510. Based on this walkthrough, we can confirm that CEMLI is converting ctcLink data to AFRS data. **No issues noted.**

### **STEP 3: Understand General IT Controls**

On June 5, 2024 we met with Tamara Morrill, Data Integration Developer, and Christopher Soran, Applications Support Manager, to gain an understanding of general IT controls related to CEMLI.

The version of CEMLI that is responsible for converting ctcLink data to AFRS data is separate from other versions of CEMLI and has different processes and procedures to update the program. The following information only relates to the CEMLI program responsible for ctcLink to AFRS data conversion. There have been many updates to the CEMLI program since ctcLink was implemented, but according to Christopher, the program is now in a good place and updates have not been needed since the first half of FY24.

If CEMLI program updates are needed, a ticket must be created. These tickets are typically created by Sue Willis, ctcLink Accounting Coordinator, or Teri Sexton, Director of Accounting and Business Services, however, other staff can create tickets. Tickets will be forwarded to Teri, and if she determines the program update is needed, the ticket will be forwarded to Christopher Soran, Applications Support Manager, who will review the ticket and assign a developer with the skills necessary to complete the task. The developer will develop the program changes in the PDV (development) environment. Once their development is complete, Christopher will review the work and approve the changes if it looks correct. If it doesn't look correct, Christopher will deny and send the ticket back to the developer for changes. Once approved, the changes will be migrated

## State of Washington

to the PTS (test) environment. The Quality Assurance team will review the ticket for the requirements of the changes and will test the changes in the PTS environment to ensure the changes function as intended. Once the QA team has tested the changes and determined the changes function as intended, they will forward the ticket to the Director of Application Services, who will review the ticket and will approve the migration to the PQA (Quality Assurance) environment. In the PQA environment, another round of testing will be performed by a different QA team member. If the program changes pass this round of testing, the ticket will be forwarded back to Christopher for approval and if approved, deployment to PROD (production). Once the program changes have been migrated to PROD, another review will be performed by the QA team to ensure the update is functioning as intended (**General IT Key Control #1**).

**Note:** All CEMLI program changes are logged by the system, including the name of the individual making the change and no changes can be made to the system without going through the above procedures.

### **STEP 4: Confirm Key General IT Controls**

**(General IT Key Control #1) All changes to the CEMLI system must go through a standard change process, where changes are tested, reviewed and approved before migrating to production.**

During our meeting with Tamara and Christopher on June 5, 2024 we took screenshots of the most recent CEMLI update (Tracking number - 173729). The ticket was created on August 16, 2023 and was closed on August 17, 2023. This update was to allow the system to select appropriation index by journal line date instead of sysdate within CTC\_STAFFMO2\_VW during the conversion process. We reviewed the "History" section of CEMLI which noted:

Christopher Soran, Applications Support Manager, assigned Maureen Kwant, PeopleSoft Developer & Support Engineer, the ticket on August 16, 2023.

Maureen developed the program changes in the PDV environment and submitted the changes to Christopher for review and deployment to PTS (test) environment. Christopher approved the deployment to PTS.

Joey Froehlich, Testing Coordinator, then tested the changes in PTS and forwarded the ticket to Ray Gartner, Director of Application Services, who approved deployment to the PQA (Quality Assurance) environment.

Larry Deaton performed the QA testing in the PQA and forwarded the ticket to Christopher for approval to deploy the changes to the PROD (production) environment. Christopher approved the deployment to the PROD environment.

Joey performed the last of the QA testing in the PROD environment and the ticket was closed.

**No issues noted.**

### **STEP 5: Test Key General IT Controls**

Not applicable - we are not planning to rely on automated controls and therefore do not need to test general controls; control risk will be assessed at MAX.

### **J.1.PRG - Community and Technical Colleges**

# State of Washington

*Procedure Step:* Key Control #2 (Manual) - Monthly Consolidation & Reconciliation  
*Prepared By:* DRR, 6/10/2024  
*Reviewed By:* BM2, 11/20/2024

## Purpose/Conclusion:

### **Purpose:**

To confirm the System ctcLink Accounting Coordinator uses pivot tables and error reports to reconcile and confirm the data input from PeopleSoft made it to AFRS for each college, for each month, without errors or variances between the amounts to AFRS (**Key Control #2 for the ctcLink System Reconciliation**) in order to assess control risk.

### **Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

## Testing Strategy:

**Step 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

List the financial statement line item(s) and relevant assertion(s) addressed by the understanding.

1. Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

A walk-through of a transaction is considered the most effective way of corroborating your understanding of internal controls .Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.

Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the

## State of Washington

person performing the control.

When a key control is discovered to not actually be placed in operation, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

If a key control is automated, the confirmation of our understanding should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.

A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency.

**All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.**

3. If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

If a key control is not consistently or effectively applied, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.

If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.

If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "Key Control - Automated" step. Auditors should consider contacting Team IT Audit for assistance.

## State of Washington

An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of State-Level control elements. In doing so, all of the following specific determinations must be documented:

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.
- B. Controls are not related to a "significant risk" identified in the audit plan.
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

### **Material Balance(s) and Assertions**

Internal controls in the ctLink System Reconciliation address the following balance(s):

#### **1. Higher Education - Special Revenue:**

- AC - Cash & Cash Equivalents
- CG - Federal Grants-In-Aid
- CH - Charges for Services
- FS - Education

#### **2. Higher Education - Student Services**

# State of Washington

AC - Cash & Cash Equivalents

## **3. Governmental Activities:**

2C - Depreciable Assets (Net of Accumulated Depreciation)

2C - Education - Higher Education - Charges for Services

3C - Education - Higher Education - Operating Grants & Contributions

G3 - Education - Higher Education - Expenses

For the following assertions:

Completeness

SBCTC: Detail roll-up from ctcLink to AFRS may be incorrect

## **Key Control #2 - Manual, Completeness: (Monthly)**

The System ctcLink Accounting Coordinator uses pivot tables and error reports to consolidate, reconcile and confirm that the data input from PeopleSoft made it to AFRS for each college, for each month, without errors or variances between the amounts.

The understanding for this system is documented above in the "Controls - ctcLink System Reconciliation" step.

## **1. Confirmation of Key Manual Control:**

Note: SBCTC uses the terms PeopleSoft and ctcLink interchangeably.

We requested and received SBCTC's February 2024 reconciliation of ctcLink to AFRS data from Sue Willis, ctcLink Accounting Coordinator. During our review of the February 2024 reconciliations, we noted that all corrections had notes to explain why the correction was made. Most of these corrections were due to an invalid GL account/fund combination. There were additional corrections marked as "Correction Returns" or "Ledger Correction" which are errors identified by SBCTC using their exception reports or manual review. These types of errors are sent back to the College for correction.

We noted that all 30 Colleges and SBCTC (total of 31) were included in the February 2024 reconciliation. Additionally, we noted the total revenue (GL32XX) and total expenses (GL65XX) reconciled without exception. We confirmed that SBCTC is consolidating, reconciling and confirming the data input from ctcLink is making it to AFRS without errors or variances between the amounts. **No issues noted.**

## **Noted Weaknesses are as follows:**

None.

## **2. Preliminary Control Risk Assessment**

Based on our understanding and anticipated audit strategy, we assessed preliminary control risk as follows:

# State of Washington

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **3. Control Risk at LOW - Test of Key Manual Control:**

Not applicable - we are not planning to rely on controls and therefore do not need to test controls; control risk will be assessed at maximum.

#### **J.1.PR.G - Community and Technical Colleges**

*Procedure Step:* Key Control #3 (Manual) - Year End Consolidation & Reconciliation

*Prepared By:* DRR, 10/9/2024

*Reviewed By:* BM2, 11/20/2024

#### **Purpose/Conclusion:**

##### **Purpose:**

To confirm after all year-end adjustments have been made, the System ctcLink Accounting Coordinator will perform the reconciliation between ctcLink and AFRS, to ensure that the amounts entered in ctcLink by the individual colleges are accurately recorded in AFRS and that the balances are complete (**Key Control #3 for the ctcLink System Reconciliation**) in order to assess control risk.

##### **Conclusion:**

We noted **no** material weaknesses or significant deficiencies in internal controls.

#### **Testing Strategy:**

##### **PUBLIC REQUEST EXEMPTION**

Some IT related information is protected by Public Request Exemption [RCW 42.56.420](#) for cyber security purposes. The details documented in the record of work and supporting workpapers may qualify for this exemption. Auditors must include this statement in workpapers: **"This record contains information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited."**

## State of Washington

**Steps 1 and 2 are required as part of the auditor's understanding of controls and must be done even if the auditor plans to assess control risk for the system at MAXIMUM. Step 3 is only required if the auditor plans to assess control risk for the system at LOW.**

**Auditors should consider contacting Team IT Audit to discuss any questions or concerns related to the automated control and to determine if the use of an IT Specialist is needed. Team IT Audit can assist in developing a specific testing strategy, performing test of controls, or evaluating results and how they will affect the audit.**

The understanding of the automated control should be documented in the internal control write-up of the system. The write-up should reference this step as the confirmation and testing of the identified automated key control and any relevant General IT Controls.

1. Develop a specific testing strategy to determine if the automated control is in place and operating as designed. The objective of the automated control test is to determine whether the software calculation control correctly values each transaction taking into consideration variations due to situational differences.

An automated control will function consistently unless the program is changed (including the tables, files, or other base data used by the program). Controls over the integrity of the program and data are referred to as "general controls." Because of this inherent difference between computers and people, our audit approach to confirming and testing automated controls is different than for manual controls.

Due to this inherent consistency, confirming an automated control is in place also counts as a test of effectiveness. Also, only one instance of the automated control would need to be tested for each variation of the control. However, to set control risk to LOW, general controls would also need to be tested to provide evidence of the consistent operation of automated controls.

If the expected automated control is not in place or operating effectively, the auditor should consider whether a significant deficiency or material weakness in controls over financial reporting exists.

2. Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls.

A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or

## State of Washington

detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Guidance/Criteria tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency.

**All potential material weaknesses and significant deficiencies must be discussed with the AIC, since they must be reported as findings.**

3. If the auditor plans to set control risk at LOW, develop a specific testing strategy and test general IT controls related to the automated control (otherwise, this step would not need to be performed). The objective of the general IT controls test is to determine whether security and program change controls support consistent implementation of key automated (application-level) controls.

General IT Controls are higher-level controls that maintain the integrity of the automated controls and data storage. Entity size, organizational structure, sensitivity, and importance of the data will affect the types of General IT Controls tested and the level recommendation. Keep the focus of General IT Controls at the application level associated with the automated control.

*Note: general IT control deficiencies do not necessarily mean the automated control is not properly functioning. General IT control deficiencies are deemed a material weakness if it caused an exception with the compliance requirement or assertion. If general IT controls are not effective, we cannot rely on the automated control to reduce control risk to LOW.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Information Technology](#) Planning Guide**

Auditors may contact [Team IT Audit](#) with any testing strategy or control assessment questions or to request assistance from an IT Specialist.

### **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

**Statements on Auditing Standards [AU-C 315](#) Understanding the Entity and Its Environment and Assessing the Risks of Material**

# State of Washington

**Misstatement** - paragraphs .A106-.A109 describe general and application controls and how they relate to audit risks

**Statements on Auditing Standards [AU-C 330](#) Performaing Audit Procedures in Response to Assessed Risks and Evaluating the Audit Evidence Obtained** - paragraphs .10b and .A33-.A34 describe requirements and guidance for testing indirect controls in conjunction with tests of controls, that is, testing key general controls in conjunction with a test of a key automated control

Record of Work Done:

## **Significant Balance(s) and Assertions**

Internal controls in the ctcLink System Reconciliation process address the following balance(s):

### **1. Higher Education - Special Revenue:**

- AC - Cash & Cash Equivalents
- CG - Federal Grants-In-Aid
- CH - Charges for Services
- FS - Education

### **2. Higher Education - Student Services**

- AC - Cash & Cash Equivalents

### **3. Governmental Activities:**

- 2C - Depreciable Assets (Net of Accumulated Depreciation)
- 2C - Education - Higher Education - Charges for Services
- 3C - Education - Higher Education - Operating Grants & Contributions
- G3 - Education - Higher Education - Expenses

For the following assertions:

Completeness

SBCTC: Detail roll-up from ctcLink to AFRS may be incorrect

### **Key Control #3 Manual - Completeness:**

After all year-end adjustments have been made, the System ctcLink Accounting Coordinator will perform the reconciliation between ctcLink and AFRS, to ensure that the amounts entered in ctcLink by the individual colleges are accurately recorded in AFRS and that the balances are complete.

The understanding for this system is documented above in the "Controls - ctcLink System Reconciliation" step.

## **2. Key Manual Control Confirmation:**

# State of Washington

We met with Sue Willis, SBCTC System ctcLink Accounting Coordinator, on October 7, 2024 to walk through her year-end ctcLink to AFRS reconciliation of the consolidated Agency 699 general ledger data for all 30 Colleges and the SBCTC. Sue provided us with several large excel files and a word document that contained notes about the consolidated data and the reconciliation she performed during the month of September 2024. Sue reconciled Consolidated College & SBCTC General ledger data by GL, Fund, and source of revenue and subobjects as outlined below.

## **Year End Data Consolidation & Reconciliation Process:**

### ctcLink Data

Sue Willis, SBCTC System ctcLink Accounting Coordinator, uses query "QFS\_GL\_ACCT\_ANALYSIS\_ATTR" to obtain ctcLink data. Due to the large size of the query, this is query is run six times and each query includes the following units:

- WA000-WA050
- WA060-WA100
- WA110-WA150
- WA160-WA200
- WA210-WA250
- WA260-WAPAY

AFRS reporting periods for the ctcLink data are 1-132. Sue adds a SRC (source) column as a data identifier "PS-LEDGER" to show that this data is from ctcLink. She then filters the sub-object column to exclude blanks, and the appropriation index is filtered from down to blanks. She then filters the fund column to remove any state allocated fund entries, 997 and 999. Next, she creates three pivot tables in each of these spreadsheets. These pivot tables are copied into three additional spreadsheets and will be combined with AFRS data to allow for comparison of GL, GL-Revenue and GL-Sub-Object data.

### AFRS Data

Sue runs a data extract in AFRS to pull batches BE, KC, RC, SW, and X1 as these are the AFRS entries that correspond to the ctcLink reconciliation data. She adds a SRC (source) column as a data identifier "AFRS" to show this data came from AFRS. Agency, PS-Unit, REV columns created to match ctcLink data elements. GL71xx is changed in the "GL\_account" column to GL 1110 to match ctcLink data pull. Three pivot tables are created to match the same data elements as the ctcLink data.

### Combining ctcLink and AFRS data

Sue then creates three data sets (Revenue, Expenditure, Combined GL) by combining the eighteen pivot tables of ctcLink data, and the single AFRS spreadsheet. Sue mentioned that variances in the combined data were limited to the following:

- PS-GL1350 needed to be adjusted to GL1312 in AFRS
- PS-GL5150 needed to be adjusted to GL5111 in AFRS
- PS-Fund 148 GL1440 needed to be adjusted to Fund 148 GL1410 in AFRS
- PS-Fund 790 GL32xx needed to be adjusted to Fund 790 GL5199 in AFRS

## State of Washington

PS-Fund 790 GL65xx needed to be adjusted to Fund 790 GL5199 in AFRS  
PS-Fund 790/840 GL1383 need to be adjusted to Fund 790/840 GL1319 in AFRS  
PS-Fund 790/840 GL5190 need to be adjusted to Fund 790/840 GL5111 in AFRS

Sue mentioned that these variances are expected due to intentional crosswalk of data to AFRS. In the "AFRS v PS combined GL" reconciliation we noted that Sue made the various adjustments noted above and after these adjustments, there were no variances between ctcLink and AFRS data.

*We determined that SBCTC is consolidating and reconciling the ctcLink General Ledger data by fund with AFRS balances at year end, and working directly with OFM to resolve differences before the AFRS adjustment periods close.*

### Noted Weaknesses are as follows:

None.

### **2. Preliminary Control Risk Assessment**

Based on our understanding and anticipated audit strategy, we assessed preliminary control risk as follows:

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **3. Control Risk at LOW - Test of Key Manual Control:**

Not applicable - we are not planning to rely on controls and therefore do not need to test controls; control risk will be assessed at maximum.

### **J.1.PRG - Community and Technical Colleges**

*Procedure Step:* Risk Assessment

*Prepared By:* DRR, 7/19/2024

*Reviewed By:* BM2, 11/20/2024

Purpose/Conclusion:
---------------------

**Purpose / Conclusion:**

# State of Washington

To assess inherent risk, control risk, and the risk of material misstatement in order to design an initial testing strategy for each assertion.

Testing Strategy:

Auditors are **required** to perform the following procedures for each line item:

## **STEP 1: Inherent Risk (IR)**

Assess inherent risk for each relevant assertion. This assessment is based on understanding of the entity and the nature of the account balance or class of transactions.

*Inherent risk is the susceptibility of an assertion to material misstatement. It is our assessment of "total threat", which includes both "natural risk" and identified risk indicators, without any regard to any potential control activities. As inherent risk is fully independent of control risk, any understanding of controls cannot be used to increase/decrease the assessment of inherent risk. Consider the following factors as your basis for this assessment:*

### *General Considerations*

*Does the balance include transactions that are difficult to audit or involve complex accounting issues?*

*Were there significant misstatements identified in previous audits or prior-period adjustments in the account balance or transaction class? If so, analyzing the cause of prior period misstatements will help in analyzing inherent risk.*

*Are there any inherent risk factors at the entity or industry level, such as changes in regulation or accounting rules, unique transactions or accounting practices, use of information technology, etc that affect the balance?*

### *Inherent Risk due to Error*

*How large are the transactions making up the balance? If the balance has only a few large transactions, even a single error may mean a significant misstatement.*

*Have there been changes in the transactions making up the balance that may increase risk? For example, significantly different composition, nature or volume of transactions may inherently disrupt established controls.*

*Are financial events originated or identified by accounting personnel or non-accounting personnel? This consideration is mainly for the completeness assertion.*

*Does the process to account for transactions involve judgment or estimation, complex calculations, numerous steps or significant manual steps?*

*Do transactions have widely varying attributes that need to be manually identified? For example, grant loans that are accounted for in one of several ways depending on the terms of the agreement.*

### *Inherent Risk due to Fraudulent Reporting (intentional misstatements)*

*Are there substantial pressures or motivations to misstate the balance?*

### *Inherent Risk due to Misappropriation*

*Is the account balance or transaction class susceptible to sizable misappropriation?*

# State of Washington

## *Inherent Risk due to Non-Compliance*

*Are there any laws, contracts or grant agreements affecting the balance? If so, would non-compliance lead to sizable misstatements?*

*Are compliance requirements complex, hard to understand, subject to judgment or otherwise difficult to comply with?*

*Are there any motivations or pressures to not comply?*

## **STEP 2: Control Risk (CR)**

Assess control risk by system and assertion. This assessment should be based on the results of the control understanding, confirmation, and (if setting control risk to LOW) testing. If applicable, auditors will evaluate any control deficiencies and determine whether those deficiencies, individually or in combination, are significant deficiencies or material weaknesses.

*Control risk is the risk that material misstatements would not be prevented or detected timely by the system of internal control. Control risk could be thought of as the "vulnerability" of an entity to misstatements. Control risk exists independently of the inherent risk (the level of vulnerability exists independent of the level of threat).*

*Control risk is MAX in both of the following situations: (1) controls aren't tested or (2) controls are problematic and cannot be relied upon. In order to set control risk to LOW, the auditor must test that controls operated effectively throughout the period.*

*A material weakness exists when the design or operation of controls results in a reasonable possibility a material misstatement will not be prevented or detected and corrected in a timely manner. A significant deficiency is less severe than a material weakness, yet important enough to merit the attention of the governing body. **All potential material weaknesses and significant deficiencies should be discussed with the AIC, since they must be reported as findings.***

## **STEP 3: Risk of Material Misstatement (RMM)**

Assess the risk of material misstatement for each relevant assertion for each significant line item. The risk of material misstatement (RMM) is a combination of the auditor's separate assessment of inherent and control risk.

*In practice, the RMM is the amount of substantive evidence that's needed, and the only way to reduce the amount of needed substantive evidence (equal to the inherent risk) is to test controls. As such, when control risk is MAX, the RMM must always equal the inherent risk (IR).*

*When controls are tested & can be relied upon (are determined to be effective) it is a matter of professional judgment how much the RMM should be set lower than inherent risk (1 or 2 steps).*

*Auditors should assess RMM by assertion, if different. For example, if RMM is assessed at MOD for the existence assertion, but LOW for the rights & obligations assertion, then document "MOD – existence and LOW – rights & obligations".*

# State of Washington

## **STEP 4: Design Substantive Testing**

Design a substantive testing strategy that addresses the relevant assertion (identified risk) in the portion of the line item that relates to that risk.

*Planning identifies where to audit (significant balances, classes of transactions & disclosures) what to audit for (relevant assertions), and how much to audit (RMM). The quantity and quality of evidence obtained by substantive tests needs to match the level of risk. The higher the risk of material misstatement, the greater evidence needed. "Greater evidence" could either be greater quantity of evidence, greater quality of evidence, or some combination of greater quality and quantity.*

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6210](#) – Planning Financial Statement Audits**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits Planning Guide](#)**

Record of Work Done:

## **(1) Inherent Risk (IR):**

Based on our understanding of the line item, we assessed inherent risk as follows for each relevant assertion and significant class of transactions:

Completeness – **High**

## **(2) Control Risk (CR):**

We assessed control risk as follows for each system and relevant assertion:

**ctcLink System:** A reconciliation is performed to ensure that consolidated college & SBCTC financial data uploaded from ctcLink is complete, properly valued and recorded into AFRS correctly.

Completeness – **MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

## **(3) Risk of Material Misstatement (RMM):**

## State of Washington

We considered both inherent and control risk and assessed the risk of material misstatement as follows for each relevant assertion and significant class of transactions:

Completeness – **High**

### **(4) Testing Strategy:**

We designed our substantive testing strategy based on our assessment of the risk of material misstatement. We plan to perform the following tests:

We will use SBCTC's reconciliations to ensure that all 30 colleges and all accounting periods are included in the reconciliations.

We will reperform SBCTC's reconciliation by using the ctcLink activity and comparing it to our Access (AFRS) database.

We will use specific college source data and compare it against the SBCTC reconciliation data to determine if it is reasonable.

We will review the Exception Reports for balances specifically related to SBCTC

We anticipate that these tests will provide sufficient appropriate audit evidence to address the assessed risk of material misstatement for relevant assertions in significant classes of transactions.

### **J.1.PR.G - Community and Technical Colleges**

*Procedure Step:* Substantive Test

*Prepared By:* DRR, 11/15/2024

*Reviewed By:* RKM, 11/19/2024

Purpose/Conclusion.*
----------------------

### **Purpose:**

To determine if there are unexplained variances between AFRS and amounts reported by SBCTC from ctcLink Systems (**Completeness**).

### **Conclusion:**

We determined that consolidated year end reconciliation amounts for colleges and the SBCTC agree to AFRS agency 699 totals. No issues with the SBCTC reconciliation amounts were noted, however we identified the following issue:

We identified questionable balances related to SBCTC during exception report review. **See issue here:** [[E: SBCTC Questionable Balances](#)]. **See AOM here:** [[Aggregation of Misstatements \(GAAP\)](#)]

# State of Washington

## Testing Strategy:

The following is a list of **considerations** for testing the occurrence assertion for revenues. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

Confirm intergovernmental revenues with the other government or grantor or by reviewing appropriate correspondence.

*Note: intergovernmental revenues received from the State Treasurer should be addressed as part of the State Treasurer Distributions baseline test.*

If revenue is receipted into a specific clearing account, or if third-party lockbox or receipting services are used, compare recorded revenue to a sum of monthly totals from bank, lockbox or service organization reports.

Trace selected or sampled revenues from the GL to supporting billings or subsequent receipts.

Develop sufficiently precise expectations for a substantive analytical to compare to reported revenue amounts.

Search for manual journal entries that credit (increase) revenues. Consider testing if any risk indicators are noted.

### **Cut-Off / Revenue Recognition**

Test transactions recorded in the current period to verify the revenue occurred during the period.

*Transactions recorded at the beginning and end of the current period would generally be considered at highest risk of being improperly recorded in the current period. Consider scanning and selecting transactions if high risk transactions can be identified by description or date fields.*

If revenue is billed at a constant rate, calculate an expectation based on the average monthly billing or re-calculate the year-end accrual journal entry and compare to the reported receivable.

Evaluate revenue recognition against GAAP criteria for selected transactions or revenue streams.

### **Interfund Revenues**

For internal service fund charges, see testing strategies for internal service funds in the Accountability folder. For other types of internal charges, see testing strategies for Internal Activities.

### **Detail Roll-up**

Compare year-end totals from general ledger to subsidiary software modules for selected revenues.

Review the government's reconciliation of general ledger to subsidiary ledgers.

*Detail roll-up testing is not sufficient audit evidence by itself since it only entails comparing different sets of the entity's own accounting records. However, it may be combined with other substantive tests to address identified risks. For example, if substantive testing is performed at*

## State of Washington

*the subledger level, it may be combined with a test that the subledger detail accurately rolls up to the general ledger or financial statements.*

The following is a list of **considerations** for testing the valuation assertion for revenues. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

### **Calculation**

Recalculate billed revenues on a check (one of each variation), CAATS or sample basis.

For large populations of standard billings, perform CAATS tests to identify unexpected or outlier transactions for further review.

Review related-party transactions to determine whether revenue transactions were correctly calculated.

### **Realizable Value**

Re-calculate a sample or selection of billings. If billings are calculated by software, the auditor could test and substantiate the automated control and also consider any risks associated with manual inputs used by software.

Evaluate the entity's calculation of the allowance amount for reasonableness. This evaluation should include comparing the entity's estimate to the entity's actual historical experience of collecting or writing-off receivables.

Trace the amount of bad debt approved by the governing body (per minutes) to reductions of receivables and bad debt expense to verify it was properly accounted for. *Note: approvals may be slightly more, as customers may pay after the bad debt has been approved but before it is written off.*

### **Estimation / Recognition**

Review calculation and support for assumptions of any estimated revenues.

Accounting research to verify that revenues were reported in conformity with revenue recognition policies reported in the financial statement notes.

### **Property Tax Revenues** - see separate step

Guidance/Criteria:

**Add the Guidance/Criteria for each relevant assertion from the TeamStore. You may also include other resources that you used for testing.**

Record of Work Done:

Note: SBCTC only consolidates and reconciles college activity for the current fiscal year between ctLink and AFRS.

### **Substantive tests performed to meet the Completeness assertion:**

## State of Washington

To test for completeness [[ctcLink to AFRS Data Reconciliation Testing](#)], we used AFRS data that SBCTC used in their ctcLink to AFRS reconciliation, which was provided to us by Sue Willis, ctcLink Accounting Coordinator. We created a pivot table by ctcLink business unit which is how the colleges are identified in ctcLink and noted that there were 30 colleges included in the data. Additionally, we used SBCTC's AFRS data extract file "2\_24.09.18\_AFRS-BE\_KC-RC-SW-X1 Batch.xlsx." to create a pivot table by fiscal months to ensure that SBCTC was including all accounting periods (1-12 & 99) from the fiscal year in their data. **No issues noted.**

Additionally, we reperformed SBCTC's reconciliation [[ctcLink to AFRS Data Reconciliation Testing](#)], and gained an understanding of the various adjustments that SBCTC made to college GL data. Per Sue Willis, ctcLink Accounting Coordinator, she worked with Kelly Diaz, Statewide Accounting Supervisor to determine how to address the various GLs that are used in ctcLink but not in AFRS, and how some funds don't work for recording various transaction types. Sue provided us the following explanations:

- GL1350 and 5150 were used in the legacy system (FMS) to record due to/due from for state funds. It was determined that it would be best to move all balances for these two GL accounts in AFRS to 1312 and 5111. As colleges clear the balances in 1350/5150 that may remain in ctcLink, SBCTC hits either 1312 or 5111 which will zero out any remaining balances in AFRS.

- Fund 148 would not allow for the recording of GL1440. Sue worked with Kelly Diaz at OFM to determine that GL1410 would be the best GL to report these transactions in.

- GL32xx transactions are not permissible in Fund 790. These transaction should be moved to another GL, or refunded within a limited time period. It was determined that these transactions should be moved to GL5199 to avoid the creation of equity entries.

- GL65xx transactions are not permissible in Fund 790. These transaction should be moved to another GL, or refunded within a limited time period. It was determined that these transactions should be moved to GL5199 to avoid the creation of equity entries.

- GL1383 and 5190 transactions are not permissible in Funds 790 or 840. It was determined that moving these transactions to GL 1319 and 5111 would be the best solution to allow for reporting a receivable/payable for these two funds.

During our reperformance of the SBCTC reconciliation, we confirmed that the adjustments SBCTC made were reasonable. **No issues noted.**

We also pulled QFS\_GL\_ACCT\_ANALYSIS reports from ctcLink for two selected colleges (Centralia College [[Centralia Source Data Testing](#)] and Tacoma Community College [[Tacoma CC Source Data Testing](#)]) and Columbia Basin [[Columbia Basin Source Data Testing](#)] (due to an error identified in the FY23 ACFR) to compare source data amounts of various GLs against the SBCTC reconciliation data. To prepare the source data for comparison against SBCTC's data, we used the Vlookup function to add AFRS GLs to the data, removed fund 790 data for revenue and expenditures, which was adjusted to GL5111, and changed ctcLink fund 146 to fund 145. These changes are made so that the ctcLink data, can match how the data is recorded in AFRS.

We created pivot tables of GL1110, 3210, 6510 and capital assets (GL2210-2440) using our source data for each of these colleges and compared it to the data provided in SBCTC's reconciliation. Our GL totals tied to SBCTC's totals without exception. **No issues noted.**

Exception Report Balances for SBCTC [[SBCTC Exception Report Balances](#)]

## State of Washington

We identified exception report balances for SBCTC at N.4.7, N.4.19 and N.4.20. We requested Kennesy Cavanah, Statewide Accountant, provide an explanation of these balances. We identified the following questionable balances related to SBCTC:

### Assets with Credit Balance:

Fund 450 GL 1110 Cash in Bank (\$4,954,749.58). Per Kennesy Cavanah, Statewide Accountant, This balance should have been zeroed out at fiscal year end and should be cleaned up during FY25. **See issue in conclusion.**

Fund 790 GL 1318 Unbilled Receivables (\$1,641,145.88). Per Kennesy Cavanah, Statewide Accountant - Part of beginning balance cleanup that is the focus for FY25. **See issue in conclusion.**

Fund 859 GL 1110 Cash in Bank (\$2,148,656.02). Per Kennesy Cavanah, Statewide Accountant - Part of beginning balance cleanup that is the focus for FY25. **See issue in conclusion.**

### Liabilities with Debit Balance:

Fund 145 GL 5181 Employee Insurance Deductions Payable \$1,922,085.18. Per Kennesy Cavanah, Statewide Accountant - Part of beginning balance cleanup that is the focus for FY25. **See issue in conclusion.**

Fund 846 GL 5190 Unearned Revenues \$1,596,203.80. Per Kennesy Cavanah, Statewide Accountant - Part of beginning balance cleanup that is the focus for FY25. **See issue in conclusion.**

### Comparison of Reconciliation Data to Community College Access Database (AFRS) [[ctcLink to AFRS Data Reconciliation Testing](#)]

We compared SBCTC reconciliation data provided by Sue Willis, ctcLink Accounting Coordinator to our community college Access database (data found here [[Final Planning Community Colleges Selected for Testing](#)]) to determine if the reconciliation data tied to our AFRS data in the database. We determined that we would look at 71% of the balance to ensure we had sufficient coverage of the balances.

We pulled the itemized AFRS data from B.3.2 for the following income statement balances: Charges for Services - Fund Level, Charges for Services - Government Wide, Education Expense - Fund Level, Higher Education Operating Grants and Contributions Government Wide and used the itemized data to filter the reconciliation data provided by SBCTC for our comparison. We determined that the reconciliation data in these balances ties to AFRS. **No issues noted.**

Additionally, we pulled the itemized AFRS balance sheet data for Cash & Cash Equivalents, and Depreciable Capital Assets. As the SBCTC reconciliation data only includes FY24 activity, we also pulled the community college FY23 ACFR data for these balances and subtracted them from the FY24 data. This gave us the AFRS activity for these balances, which we compared to the activity for these balances in SBCTC's reconciliation data. The activity in AFRS tied to the reconciliation activity without exception for Cash & Cash Equivalents and tied with a variance below the floor for Depreciable Capital Assets. **No issues noted.**

### J.1.PRG - Community and Technical Colleges

# State of Washington

*Procedure Step:* Scholarship Allowance Assessment  
*Prepared By:* RKM, 12/6/2024  
*Reviewed By:* SHW, 12/17/2024

Purpose/Conclusion:

Testing Strategy:

Document our assessment related to the scholarship allowance exception.

Guidance/Criteria:

Record of Work Done:

## **Overview:**

Scholarship discounts and allowances are the difference between the stated charge for the goods and services provided by a college or university and the amount that was paid by the students or third parties making payments on the student's behalf. We determined that OFM was not including this allowance in the Statement of Revenues, Expenses and Changes in Net Position and the Statement of Activities. Student tuition and fee revenues and certain other revenues from students, should have been reported net of scholarship discounts and allowances.

We spoke with Anna Quichocho, Financial Reporting Manager, on November 6, 2024 to discuss this issue. She agreed that OFM needed to include this part of the statements and provided us the worksheet adjustment that OFM made to include the allowance. See: [\[RE Scholarship Allowance\]](#). In fiscal year 2024 the Office of Financial Management (OFM) estimates state colleges and universities had \$552 million in scholarship discounts and allowances. We decided to perform analytical procedures over this estimate and determine if there is a potential risk of material misstatement.

We met with Anna on November 19, 2024 to determine the methodology OFM used to estimate the allowance. Anna prepared the estimated by performing the following steps:

Contacted UW and WSU to determine whether there was an estimate posted in AFRS. UW posted the estimate to the incorrect fund and WSU did not post one at all.

## State of Washington

She ran a query to obtain tuition revenue (GL 3205/3210 and source 0424) data. She used this data to determine the allocation between government-wide (93.62%) and proprietary (6.38%) on the financial statements.

Due to time constraints she utilized the most recent estimate the college reported on their financial statements (excluding UW and WSU). She used the percentages to allocate the estimate between government-wide and propriety on the financial statements.

This was the impact before OFM's estimated corrections:

Higher Education Special Revenue Fund - Charges for services were understated and education expenditures were understated by \$189 million.

Higher Education Student Service Fund - Charges for services were overstated and miscellaneous expenses were overstated by \$35 million.

Governmental Activities - Charges for services were overstated and higher education expenses were overstated by \$327 million.

Business-Type Activities - Charges for services were overstated and higher education student services expenses were overstated by \$35 million.

### **Overview:**

Planning analytical procedures for FY24 consisted of updating the multi-year trend analysis with FY23 information (FY24 data is not available at the time of interim planning) and scanning it for unexpected differences. We also scanned the FY23 financial statement and notes for obvious errors, omission or inconsistencies, deviations from general expectations, and transactions or activity that appears inherently high risk.

### **Details:**

OFM developed a spreadsheet to show how they came up with their reported allowance estimated. The spreadsheet showed OFM used the most recent allowance the college or university reported. We utilized this spreadsheet and added a percent change in balance and year over year average percentage change (used 3 years if the amounts were available). During our analytical procedures we assessed the following:

Did OFM include all colleges and universities in the estimate?

We scanned the fluctuations for increases or decreases that would present a potential risk of material misstatement.

Compared 2024 and 2023 allowance estimates reported by colleges and universities to the total estimate reported by OFM.

### **Results:**

See spreadsheet at: [\[Scholarship Allowance Assessment\]](#).

Through our assessment we determined:

OFM included all colleges and universities in the estimate.

Estimates change year over year so the increases or decreases and the year over year averages did not alert us of a potential risk of material misstatement.

48% of the OFM allowance estimate was from amounts reported by colleges and universities in 2024 and 33% of the OFM allowance estimate was from amounts reported by colleges and universities in 2023. 81% of OFM's estimate was from the two most current years.

# State of Washington

See issue and AOM links in conclusion above.

## J.2.PR.G - Community & Tech College Testing - Seattle

*Procedure Step:* Summary & Conclusion

*Prepared By:* EZM, 10/29/2024

*Reviewed By:* RKM, 11/5/2024

Purpose/Conclusion:

**Purpose:**

To evaluate risk assessments and the sufficiency and appropriateness of evidence obtained based on results of substantive work.

**Conclusion:**

We determined that **no** modifications were necessary to inherent risk, control risk or the risk of material misstatement as assessed in planning.

We also determined that evidence obtained was sufficient and appropriate in response to the risk of material misstatement.

Testing Strategy:

Auditors are **required** to evaluate conclusions for substantive testing as follows:

*Auditors may wish to use the optional Lead Sheet available in the Store to summarize testing related to each balance and assertion.*

**1.** Determine whether the results of substantive testing indicate a need to modify the inherent risk assessment (IR), control risk assessment (CR), risk of material misstatement (RMM) or other aspects of planning (such as material balances or assertions). If so, document changes and consider the need for additional testing.

*If the results of substantive testing indicate a need to change control risk, auditors should also update the **Permanent File** by either correcting the documentation or by adding an update section describing changes to the top of the record of work done. For all changes to IR, CR, or RMM the **Significant Balance** spreadsheet should be updated.*

*More significant changes to other aspects of planning (such as material balances or assertions) should be referenced in this step and*

# State of Washington

*documented in detail in the [Changes to FS Audit Plan](#) step.*

**2. Evaluate whether the quality and quantity of evidence obtained is sufficient and appropriate in response to the risk of material misstatement. In making this determination, auditors should evaluate:**

**Information to be used as audit evidence:**

- Does evidence relate to the population, period of time and risk (assertion and “what could go wrong” from the Material Balance Spreadsheet)? If there are any gaps or uncertainties in the logical connection between the evidence and conclusions, is there a documented consideration and explanation?
- Are the sources of information sufficiently reliable and appropriate for the risk (whether internal to the government, external, or auditor developed)? If key information is not from a sufficiently reliable source (for example, inquiry), then is it corroborated by information that is?
- Are there any concerns about accuracy, completeness, authenticity, or bias in information? If so, did the auditor perform sufficient procedures to confirm reliability of that information?
- Is information precise enough to catch if misstatements exceeded the tolerable level?
- Is information detailed enough to conclude on whether or not there were misstatements?
- Was there any information that appeared contradictory or inconsistent? If so, was there a documented response to the inconsistencies or doubts about the reliability of evidence?

**Results:**

- How much misstatement was identified by testing, and the likelihood and magnitude of further potential misstatement?
- How did misstatements occur and how often might they occur again in the population?
- Were misstatements caused by control deficiencies or circumvention of controls?
  - If control deficiencies, is there a need to re-evaluate our understanding of controls in the [Permanent File](#) folder or assessment of control risk?
  - If circumvention, the [Management Override of Controls](#) step should address or reference this area. Auditors should also consider whether a fraud risk has been identified.
- Did tests identify a different level or type of risk than the planned audit response was designed to address?
- If likely misstatements are identified, are further procedures necessary to improve the precision of our estimate?

*To support the overall evaluation of audit risk and provide a basis for concluding on the overall sufficiency and appropriateness of evidence in the [FS Summary & Report](#) step, auditors should conclude in each area whether the auditor continues to believe that the tests performed and quality and quantity of evidence obtained are commensurate with RMM for all relevant risks (the “what could go wrong”, in the [Material Balances](#) spreadsheet).*

# State of Washington

If the auditor determines that evidence is not sufficient or appropriate, additional substantive testing should be done. If sufficient, appropriate evidence is not available for audit, the AIC should discuss the effect on our audit report with the AAM and AM.

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6310](#) – Determining the Nature, Timing and Extent of Substantive Testing**

**SAO Audit Policy [3210](#) – Audit Evidence**

**[Investments](#) area guide**

Record of Work Done:

### **(1) Do the results of substantive tests indicate a need to modify our risk assessment (IR, CR and RMM)?**

We noted no results from our substantive tests which would indicate a need to modify our risk assessment.

### **(2) Was the quality and quantity of evidence obtained sufficient and appropriate?**

We determined that the quality and quantity of evidence obtained was both sufficient and appropriate.

## **J.2.PRG - Community & Tech College Testing - Seattle**

*Procedure Step:* Cash and Cash Equivalents - Controls

*Prepared By:* MRF, 9/12/2024

*Reviewed By:* CJG, 11/6/2024

Purpose/Conclusion:

# State of Washington

## **Purpose:**

To gain an understanding of internal controls and assess control risk in order to help plan the nature, timing and extent of substantive testing.

## **Conclusion:**

We have gained an understanding of internal controls and assessed control risk at **maximum**. Therefore, we **will not** place reliance on controls. Our understanding of internal controls and control risk assessment will be used to help plan the nature, timing and extent of substantive testing.

We noted **no** material weaknesses or significant deficiencies in internal controls. The college had not performed a year end reconciliation of the petty cash/change funds. See issue here [[V: Seattle Colleges Complete and Timely Cash Reconciliations](#)].

## Testing Strategy:

The following procedures are **required** for all relevant systems:

*Optional:* List the financial statement balances and relevant assertions addressed by the understanding.

## **STEP 1: Understanding of Controls**

Gain an understanding of the internal control process, identify key controls over relevant assertion(s), and note any control weaknesses.

*The auditor's understanding should include:*

*Business processes relevant to financial reporting of the relevant assertion for the material balance. Processes should encompass automated and manual procedures by which transactions or events are identified or initiated, authorized as needed, recorded, processed and corrected as needed.*

*Original accounting records and how records are rolled-up to intermediary ledgers and transferred to the general ledger or financial statements.*

*Detailed descriptions of key controls. Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*In gaining an understanding of controls, consider the overall understanding of Entity-Level control elements as documented in the "Entity-Level Controls" step as they relate to this particular system.*

**Expected key control for existence and completeness:** Bank reconciliations are performed timely on at least a monthly basis to ensure the general ledger agrees to bank and investment account records.

# State of Washington

*Documentation should include who performs bank reconciliations, how often they are performed and how reconciliations are aggregated and compared to the general ledger.*

*Note: we would expect additional key controls if the government has any alternative investments or investments subject to significant interest rate or other risks.*

## Expected compensating controls:

An accounting system module or a standard template is used to document reconciliations.

Segregation of duties in that the person performing bank reconciliations does not have cash handling duties or access to initiate disbursements by wire or check.

Timely, independent review of bank reconciliation documentation, including journal entries for adjustments identified from the bank statements (such as fees, NSF checks, etc).

An up-to-date listing of change fund, petty cash and imprest fund accounts is maintained in accordance with BARS 3.8.8.

Zero-balance bank accounts and clearing funds (see BARS 3.8.6) are reconciled to zero on a monthly basis.

If the government has an investment account (that is, other than the State or County LGIP), documented inquiry with their investment service to verify the methodology for determining fair value of investments and the valuation input hierarchy level for purposes of their fair value (GASB 72) disclosures.

*Some investment accounts provide information about its methodology, assumptions, and data in valuing investments at the asset class level. However, brokers often provide no, or only limited, information about the inputs and assumptions used in developing the fair value. Management should either obtain a document with this information or contact the broker/institution to gain an understanding of the information about methods and inputs used in determining the fair value and where the investment should be disclosed in the hierarchy.*

*Contact the Investment Specialist for any questions on expected controls or documentation over fair value disclosures.*

## **STEP 2: Confirm Key Controls**

Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walkthrough of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the*

## State of Washington

*manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency or material weakness likely exists.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "IT Control Testing" step pulled down from the SAOStore and be hyperlinked with this step. Auditors should consider contacting Team IT Audit for assistance.*

*Suggested confirmation for expected key controls are to obtain and scan all year-end bank reconciliations and supporting documentation. This is normally done in conjunction with substantive testing. We would expect that bank reconciliations would clearly show check figures that compare the aggregated adjusted bank balance to the general ledger.*

### **STEP 3: Preliminary Control Risk**

Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls in step 4A. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls. **All potential material weaknesses and significant deficiencies should be discussed with the AIC or AAM, since they must be reported as findings.***

### **STEP 4: Control Testing**

If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency or material weakness likely exists. If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "IT Control Testing" step pulled down from the SAOStore and be hyperlinked with this step. Auditors should consider contacting Team IT Audit for assistance.*

## State of Washington

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of Entity-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

### **STEP 5: Final Control Risk**

Evaluate the results and document a final control risk assessment. Consider whether any internal control issues identified represent material weaknesses or significant deficiencies.

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Policy/Standards tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency. **All potential material weaknesses and significant deficiencies should be discussed with the AIC or AAM, since they must be reported as findings.***

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits](#) Planning Guide**

# State of Washington

Record of Work Done:

## **Significant Balances and Assertions:**

Internal controls in the Community and Technical College System address the following balances:

Higher Education Special Revenue Fund - Cash and Cash Equivalents - Existence

Higher Education Student Services Fund - Cash and Cash Equivalents - Existence

See lead sheet here: [\[Lead Sheet\]](#)

## **STEP 1: Gain an Understanding of Internal Controls**

We met with David Williams (Director of Financial Reporting), Kyoko Connolly (Senior Accountant), and Charlene Rios (Director of Accounting) on September 11, 2024 to discuss the bank, cash, and investment reconciliation process at Seattle Colleges.

We noted the following accounts for cash and investments:

Bank of America. The BOA account holds their main operational flow of revenues and expenditures.

US Bank. The US Bank account only holds the proceeds from a recently matured bond investment.

Local Government Investment Pool. The LGIP statement is separate from other investment accounts.

Petty Cash/Change Fund. Physical cash at several locations used as change funds for college services.

## **Cash & Bank Reconciliation:**

Ctclink has a daily reconciliation process, but a formal review and analysis only happens once a month due to its complexity. Each month the Senior Accountant, Kyoko Connolly, downloads the online bank statement from BOA as an excel document. Kyoko also downloads the Student Financials (SF), Accounts Receivable (AR), and Accounts Payable (AP) modules in ctcLink. Kyoko uses monthly GL Queries filtered by month to compare GL Account 1000070 (cash in bank) to the information in the bank statement transaction by transaction (**Key Control #1 - Existence**). The student financial module has the most transactions to reconcile to and they do this by item type because a single deposit may be broken into multiple smaller parts because there are three colleges to track. Kyoko compares the amount per their records to the amount per the bank for each type, and any variances identified are reported back to the department responsible for adjustments, and to correct the balance. It often takes months to perform the complete reconciliation, but once done, Kyoko sends the support to Davina Fogg, Comptroller, for a review and electronic signature.

## **Investment Reconciliation**

Kyoko Connolly downloads the investment statements from the respective websites for the LGIP investments and the bond investment through US Bank. In FY24, the bond had matured in 2022 and no activity other than interest occurs in the account. At the end of the fiscal year, Kyoko

## State of Washington

compares the statement balances in the cash and investment process to ensure it is continuing as expected (**Key Control #2 - Existence**).

### **Petty Cash Reconciliation:**

Kyoko Connolly requests the cash balance reports annually from each department that has petty cash/change funds on hand. There are eight cash locations across the three campuses. Kyoko will compare these balances to what is recorded in the GL. If there are variances, she will research the cause and make adjustments to correct the differences (**Key Control #3 - Existence**).

### **Key Controls:**

Key Control #1: The finance department confirms the existence and balance of the cash account at Bank of America by performing a monthly reconciliation. This reconciliation is reviewed and signed by the Comptroller.

Key Control #2: The finance department confirms the existence and balance of the investment accounts at US Bank and the LGIP at the end of the fiscal year by reviewing the account statements.

Key Control #3: The finance department confirms the existence of the petty cash/change funds by reviewing the balances of each fund holder across the three colleges at the end of the fiscal year.

### **Identified Weaknesses:**

Due to the length of time needed to perform the monthly reconciliation, Kyoko stated the fiscal year end reconciliation has not been completed. She anticipates it being ready for auditors on October 7th, 2024. Kyoko provided the June reconciliation on October 4th, 2024. We recommend the college ensure timely reconciliations of cash and GL accounts (monthly, as required by SAAM 85.50.40.c).. See issue here [[V: Seattle Colleges Complete and Timely Cash Reconciliations](#)].

## **STEP 2: Confirm Key Controls**

**Key Control #1: The finance department confirms the existence and balance of the cash account at Bank of America by performing a monthly reconciliation. This reconciliation is reviewed and signed by the Comptroller.**

We reviewed the reconciliation for December 2023 and Jan 2024. Due to staff shortages, Kyoko often reconciles two months at a time. Kyoko provided her spreadsheet which detailed the reconciliation from the bank statement, to data pulled in the system and other reconciling items. The "header" tab had a summary of amounts linking to other sheets in the workbook, such as Deposits in Transit. The bank statement had a final balance of \$10,622,338.34. There were -\$1,078,314.55 and +\$13,800.00 in checks outstanding, and -\$55,534.44 in DIT for an adjusted total of \$9,502,289.35. Kyoko also balanced from the GL to the bank by pulling the previous balance per book, and including other reconciling items. There was a variance of \$425,549.74, which linked to the "variance" tab, where each part of the variance was broken down, investigated and resolved. After that, the true difference was listed as \$0.00. Kyoko also provided the PDF of the summary page where she signed attesting to the reconciliation on 08/30/2024 and it was reviewed and approved by the controller Davina Fogg. *No issues noted.*

**Key Control #2: The finance department confirms the existence and balance of the investment accounts at US Bank and the LGIP at the end of the fiscal year by reviewing the account statements.**

## State of Washington

We reviewed the "2024\_12 JUNE REC" workbook provided by Kyoko Connolly. The year end reconciliation packet is an excel workbook with separate tabs breaking down the balance for various types of funds, and tied to the header summary on the first tab. The digital statements were included in the reconciliation packet. The LGIP account information was pulled on 07/16/2024 and had a net ending balance of \$46,052,559.41. We also reviewed the US Bank digital statement which was physically mailed to the college and scanned in for their records. We noted an ending balance of \$2,522,800.32 which included the \$186.10 deposit in interest earned. The college does not sign the individual statements and instead includes them in the reconciliation signature for the entire packet, which was signed by Kyoko Connelly and Davina Fogg (Executive Director of Finance) on 10/03/2024. *No issues noted.*

### **Key Control #3: The finance department confirms the existence of the petty cash/change funds by reviewing the balances of each fund holder across the three colleges at the end of the fiscal year.**

As part of our testing we reviewed the year end "2024 Petty Cash\_QFS\_GL\_ACCOUNT\_ANALYSIS" worksheet, which listed the individual custodians, their college location, and the amount of cash in their care. We also reviewed the year end memorandums which document the cash count for each custodian and noted a difference of \$2,242. We met with Kyoko Connelly, Senior Accountant, and Charlene Rios, Director of Accounting, and reviewed the variance in the petty cash/change funds. Charlene noted it was due to changes in offered cash services on the campus, and multiple locations were returning cash to HQ and either closing or only accepting card payments. Charlene confirmed the variance was due to the GL not being updated with current cash assignments, and that the College was working to update the system. We determined the reported petty cash was overstated by \$2,242.18. The college had not performed a year end reconciliation of the cash and was alerted to the variance in testing. We recommend the college update their system with corrected cash assignments, and perform a year end reconciliation. See issue here [[V: Seattle Colleges Complete and Timely Cash Reconciliations](#)].

### **STEP 3: Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **STEP 4: Control Risk at LOW - Test Key Controls**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

### **STEP 5: Final Control Risk Assessment**

**High** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

# State of Washington

## J.2.PR.G - Community & Tech College Testing - Seattle

*Procedure Step:* Cash and Cash Equivalents - Testing

*Prepared By:* MRF, 10/9/2024

*Reviewed By:* RKM, 10/20/2024

### Purpose/Conclusion:

#### **Purpose:**

To determine whether reported cash and cash equivalents existed as of the end of the period.

#### **Conclusion:**

We determined the reported balances existed at fiscal year end, are on hand and in the name of the college, and agree to actual amounts in existence at the bank.

We noted petty cash was overstated by \$2,242.18. As this is below the floor, we will not take it to the AOM.

### Testing Strategy:

#### **SAO Policy Requirement: Confirming or Verifying Cash & Investment Balances**

Confirmations can either be blind or a positive confirmation. In a blind confirmation (sweep), the auditor requests information on all accounts the bank holds for the entity (by entity name and/or EIN). In a positive confirmation, the auditor lists accounts (or accounts and balances) per the entity and asks the bank to confirm that the information is correct.

Confirm cash and investment account balances with County Treasurer, bank and/or brokerage. Use the template confirmation form provided in the Store when needed.

Confirmations can be mailed to addresses listed on the Bank Confirmation Address List available on the Auditor Reference Guide. If the bank notifies you of a different address, please contact Team Audit Support to update the list.

Banks may confirm incorrect amounts either due to a simple mistake, use of a wrong confirmation date or incorrectly including or excluding accounts. The first step in resolving differences should be to check information against the entity's bank statements and then call the bank to specifically confirm any difference.

Confirming investments may involve physical inspection, confirmation with the issuer, confirmation with the custodian, confirmation of unsettled transactions with the broker/dealer, confirmation with the counterparty, and/or reading

## State of Washington

executed partnership or similar agreements. When confirming investments, ensure investments are held in the entity's name.

*If confirmations are not used*, auditors must at minimum verify balances to the County Treasurer, bank and/or brokerage statements. If this is done, the auditor should consider the risk that the statements were altered and should examine papers for indications of alteration.

The following is a list of **additional considerations** for testing the existence assertion for cash and investments. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

### Bank Reconciliations

If the auditor is comparing reconciled (confirmed) bank or county treasurer balances to the GL (rather than confirmed amounts within an expected variance due to reconciling items), the auditor should consider performing some or all of the following tests to verify the accuracy of the reconciliations. Note that testing the reconciliation will provide evidence of both the existence and completeness of cash and investment balances.

Trace (or compare summed) bank balances per statements to reconciliations.

Trace (or compare summed) book balances per reconciliations to the general ledger or financial statements.

*If a cash account is allocable to a particular fund, the balance in the general ledger should be recorded in the same fund.*

Scan the reconciliation for reasonableness. Look for unusual, unexpected or vaguely described reconciling items, lack of support or detail, very large reconciling items, very old reconciling items, and missing or extra elements that would indicate that the reconciliation was being performed incorrectly.

Foot the reconciliation for accuracy.

Trace deposits in transit to the subsequent month's bank statement, considering reasonableness of the in-transit period.

Trace outstanding checks to cash disbursement journal.

Check that any other reconciling items are valid and have been properly accounted for (ex: large debit or credit memos).

Check reconciliation against prior and/or subsequent reconciliations for reasonableness of amounts and items included and to trace reconciling items from the previous and/or subsequent period.

### Other Tests

Inquire whether any checks or deposits were being held at year end for budget, cash flow or other purposes.

Confirm investments purchased but not received as of year-end

Confirm investments sold but still held as of year-end

Confirm interest due or accrued but not yet received as of year-end

## State of Washington

Search for manual journal entries that debit (increase) cash. Consider testing if risk indicators are noted.

Review reconciliations of clearing and transmittal accounts.

See accountability steps for testing strategies related to petty cash and imprest funds, which are not expected to be material to the financial statements.

*Auditors may perform additional procedures to confirm information in the deposit and investment note disclosure in this step or in the Notes to the Financial Statements step. Auditors should contact the Investment Specialist if they note significant interest rate or other risks with the government's deposits or investments.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**Outstanding Checks and Deposits in Transit** – Per TIS section 1100.08 (AICPA Technical Questions and Answers), outstanding checks should be reported as a reduction of cash and the amount of deposits in transit should be reported as cash. A check is considered outstanding from the time that it is out of the payor's control – when mailed or delivered to the payee – until the time it clears the bank. Cash should represent amounts within the control of the reporting entity, that is, the amount of cash in banks plus cash and checks on hand and deposits in transit minus the amount of outstanding checks.

**SAO Audit Policy [6350](#) – External Confirmations**

### **Investments Area Guide**

Record of Work Done:

### **Significant Balances and Assertions:**

Higher Education Special Revenue Fund - Cash and Cash Equivalents - Existence

Higher Education Student Services Fund - Cash and Cash Equivalents - Existence

Controls are documented in the "Cash and Cash Equivalents - Controls" step.

### **Substantive tests performed to meet the Existence assertion:**

**See testing at** [\[Cash & Investments\]](#). Kyoko Connelly, Senior Accountant, provided us with the June 30, 2024 month-end reconciliation, BOA and US Bank investment/account statements, petty cash spreadsheet GL report and verification memorandums, to verify existence of cash and pooled investments as of 6/30/2024.

# State of Washington

## **Bank and Investment Statements**

We verified the existence of cash in the bank by reviewing the account statements for the Bank of America (main account), US Bank account (investment proceeds), and the LGIP account. We noted no issues.

## **Deposits in Transit**

We verified the existence of the deposits in transit by obtaining the "JUNE DIT" listing within the month end reconciliation. As there were 121 items, we judgementally selected 20 large deposits with different deposit types, which covered 68% of the amount, and traced them to a deposit on the July BOA statement.

There is a timing difference between what ctclink captures as a day's payment vs what the bank captures. As a result, the deposit amounts on the bank are slightly smaller than the deposit amounts on the DIT listing because subpayments are totalled differently. We received the "CC Merchant - June 2024" excel document and additional screenshots of deposit slips from Kyoko Connelly to tie the amount reported on the DIT list, to a deposit with the bank. The deposits tied with no exceptions.

## **Outstanding Checks**

We verified the existence of the outstanding checks by obtaining a list of all checks outstanding as of June 30th, 2024. We used the FS sampling spreadsheet and determined we needed to trace 37 checks for a high level of assurance.

We haphazardly selected 37 checks and traced them either to a deposit on the July BOA account, or the July 31st outstanding check report as generated by the bank. All tested checks tied with no issues.

## **Petty Cash/Change Funds**

Kyoko provided the "Petty Cash\_QFS\_GL\_Account\_Analysis" spreadsheet which listed each of the cash holding locations per the GL, and the year-end cash confirmation memorandums for each custodian and the amount verified.

We compared the amount of petty cash/change funds on the GL, the amount of cash that was physically verified at year end, and noted a difference of \$2,242.

We met with Kyoko Connelly, Senior Accountant, and Charlene Rios, Director of Accounting, and reviewed the variance in the petty cash/change funds. Charlene noted it was due to changes in offered cash services on the campus, and multiple locations were returning cash to HQ and either closing or only accepting card payments. Charlene confirmed the variance was due to the GL not being updated with current cash assignments, and that the College was working to update the system. We determined the reported petty cash was overstated by \$2,242.18. As this is below the floor, we will not take it to the AOM.

## **Comparison:**

We compared our verified cash balance as of June 30th, 2024, to the College's end of June reconciliation. While the college did note, and adjust, almost \$300k in "reconciling items" the College performed a complete year end reconciliation of cash balances. The only variance was due to the petty cash overstatement and was below the floor. We will not take this to the AOM.

## **J.2.PR.G - Community & Tech College Testing - Seattle**

# State of Washington

**Procedure Step:** Depreciable Capital Assets - Controls

**Prepared By:** EZM, 10/7/2024

**Reviewed By:** RKM, 10/8/2024

## Purpose/Conclusion.

### **Purpose:**

To gain an understanding of internal controls and assess control risk in order to help plan the nature, timing and extent of substantive testing.

### **Conclusion:**

We have gained an understanding of internal controls and assessed control risk at **maximum**. Therefore, we **will not** place reliance on controls. Our understanding of internal controls and control risk assessment will be used to help plan the nature, timing and extent of substantive testing.

We noted **no** material weaknesses or significant deficiencies in internal controls.

## Testing Strategy.

The following procedures are **required** for all relevant systems:

*Optional:* List the financial statement balances and relevant assertions addressed by the understanding.

### **STEP 1: Understanding of Controls**

Gain an understanding of the internal control process, identify key controls over relevant assertion(s), and note any control weaknesses.

*The auditor's understanding should include:*

*Business processes relevant to financial reporting of the relevant assertion for the material balance. Processes should encompass automated and manual procedures by which transactions or events are identified or initiated, authorized as needed, recorded, processed and corrected as needed.*

*Original accounting records and how records are rolled-up to intermediary ledgers and transferred to the general ledger or financial statements.*

*Detailed descriptions of key controls. Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

# State of Washington

*In gaining an understanding of controls, consider the overall understanding of Entity-Level control elements as documented in the "Entity-Level Controls" step as they relate to this particular system.*

## **STEP 2: Confirm Key Controls**

Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walkthrough of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency or material weakness likely exists.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "IT Control Testing" step pulled down from the SAOStore and be hyperlinked with this step. Auditors should consider contacting Team IT Audit for assistance.*

## **STEP 3: Preliminary Control Risk**

Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls in step 4A. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls. **All potential material weaknesses and significant deficiencies should be discussed with the AIC or AAM, since they must be reported as findings.***

## **STEP 4: Control Testing**

If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

## State of Washington

*If a key control is not consistently or effectively applied, a significant deficiency or material weakness likely exists. If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "IT Control Testing" step pulled down from the SAOStore and be hyperlinked with this step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of Entity-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

### **STEP 5: Final Control Risk**

Evaluate the results and document a final control risk assessment. Consider whether any internal control issues identified represent material weaknesses or significant deficiencies.

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Policy/Standards tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency. **All potential material weaknesses and significant deficiencies should be discussed with the AIC or AAM, since they must be reported as findings.***

Guidance/Criteria.*
---------------------

# State of Washington

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits](#) Planning Guide**

Record of Work Done:
----------------------

## **Significant Balance and Assertions:**

Internal controls in the Community and Technical College System address the following balance:

Governmental Activities - Depreciable Assets (Net of Accumulated Depreciation) - Existence, Valuation

See lead sheet here: [[Lead Sheet](#)].

## **STEP 1: Gain an Understanding of Internal Controls**

We met with the following individuals on September 11, 2024, to discuss controls over depreciable assets:

Terri Plischke, ctcLink Finance Pillar Lead (Finance Systems Specialist)

Kyoko Connolly, Senior Accountant – G/L

Michelle Nguyen, Senior Financial Analyst,

Miguel Gatmaytan, Purchasing Manager

Charlene Rios, Director of Accounting

David Williams, Director of Financial Reporting

## **Additions:**

### **Equipment/Library Resources**

Equipment/library resources go through the standard purchase requisition process. The process begins with the normal purchase order process that is used for all purchases. In addition to this, the requestor will fill out a fixed asset reporting (FAR) form with the equipment information including PO number, PO date, state tag, equipment description, and commodity code. Once the asset is confirmed as having been received, the equipment acquisition section of the asset reporting form will be filled out by the requester with the date received, custodian name, and asset location. This form is provided to Miguel Gatmaytan, Purchasing Manager, or Michelle Nguyen, Senior Financial Analyst, who will add the asset into the Asset Management Module (AM) in ctcLink using the invoice for asset cost. They review all information on the form for accuracy to ensure

## State of Washington

it has the correct commodity code (**Key Control 1 - Equipment Additions**). When an asset is added to the AM module, the entry also automatically results in a General Ledger Journal that is reviewed by accounting staff and posted to the GL.

### Buildings and Improvements

Buildings and improvements are funded through COP and are usually multi-year budgeted projects. During the construction, Project Managers from each campus approve construction invoices, alongside DES, department capital teams, and VP Administrators, and forward them to Michelle for processing. At the end of the year, Michelle runs a query to pull capitalized building expense accounts to review the expenditures. When a building project is completed, the totality of the relevant expenditures will be capitalized from construction-in-process via a journal entry and buildings still under construction will have expenditures added to CIP in ctcLink.

### Depreciation

The College relies on ctcLink's calculations for depreciation expense. ctcLink automatically calculates an asset's depreciation based upon manual input of a commodity code (provides service life), the cost of the asset, and in-service date (**Key Control 2 - ctcLink Depreciation Calculation**). Miguel manually inputs this information into the Asset Management module and then Terri Plischke, ctcLink Finance Pillar Lead (Finance Systems Specialist), compares Manuel's entry in the AM module to the FAR form to ensure that the commodity code and in-service date are accurate. The service dates uses either the occupied date for buildings or investment date for equipment/resources. The calculation is performed monthly – Terri manually runs the automatic depreciation calculation for all depreciable assets once a month.

### Disposals

Disposals are initiated via a request from campus departments to purchasing, after approval from the department. Assets can either be repurposed for use throughout the college or surplus through DES. Miguel handles DES surplus and submits a request with a listing of assets being sent for surplus. The request is approved by DES and the college is sent a Surplus Authority number. Once the assets are sent and the surplus authority is fulfilled, Miguel will remove the assets from ctcLink. (**Key Control 3 - Depreciable Capital Asset Removals**) Michelle is responsible for removing building assets when a building is demolished. She works with the college and SBCTC or DES when necessary. Library resources are also removed from ctcLink by Michelle when they are fully depreciated.

### Inventory

Per Miguel Gatmaytan, the College performs a physical inventory every two years, broken into two rounds. The first round will have Miguel and custodians identify as many of the assets as they can for District, Central, North, and South campuses. The second round consists of Miguel attempting to locate all assets that were not found during the 1st round. Miguel stated that they have completed the first round for FY2024-25 back in Spring 2024 and they're about to start the second round, starting with the North campus, in Fall 2024. and expect to complete the first round for all campuses by January 2024.

### GL to AM Reconciliation

According to Terri Plischke, during the fiscal year, two reconciliations were performed between the general ledger and the Asset Management

## State of Washington

module. She explained that they did one early in the fiscal year and they did one close to fiscal year end. They could not, however, provide us with any documentation showing who performed/reviewed this reconciliation, or when the reconciliation occurred. When we performed our own comparison between the GL and AM module during testing, we found that the variance between the two was insignificant and below the floor.

### Key Controls:

**Key Control 1: Equipment/Library additions are recorded in ctcLink from invoices and fixed asset reporting forms (Existence, Valuation).**

**Key Control 2: ctcLink automatically calculates an asset's depreciation based upon manual input of a commodity code (provides service life) and in-service date (Valuation).**

**Key Control 3: Depreciable capital asset disposals are initiated via a request from campus departments. The Purchasing Manager submits a surplus request with a listing of assets being sent for surplus to DES, who will then approve the request. Once that request is fulfilled, the Purchasing Manager then removes the assets from ctcLink.**

### Identified Weaknesses:

None.

## **STEP 2: Confirm Key Controls**

**Key Control 1: Equipment/Library additions are recorded in ctcLink from invoices and fixed asset reporting forms (Existence, Valuation).**

We reviewed invoice #75183 sent October 13, 2023 in the amount of \$67,576.64 and the fixed asset reporting forms (FARF) associated with the invoice recording asset 1000205. We noted that the total of \$67,576.64 was for the purchase of 3 separate medical equipment items - one of these items was the Pyxis MedStation ES Main 6 Drawer. We found that the total cost of this item on the invoice tied to the cost amount in ctcLink Asset Management (AM) module and to the FARF without exception. **No issues noted**

**Key Control 2: ctcLink automatically calculates an asset's depreciation based upon manual input of a commodity code (provides service life), the cost of the asset and in-service date (Valuation).**

See confirmation of the automated control at [[IT Control Testing - Depreciation](#)]. **No issues noted.**

**Key Control 3: Depreciable capital asset disposals are initiated via a request from campus departments. The Purchasing Manager submits a surplus request with a listing of assets being sent for surplus to DES, who will then approve the request. Once that request is fulfilled, the Purchasing Manager then removes the assets from ctcLink.**

We inspected a surplus request form for asset #734327, a microfilm reader from the South campus's library. The surplus request form was submitted on 8/17/23 by Seattle Colleges staff, was approved by DES, and was then later removed from the asset listing by Miguel Gatmaytan, Purchasing Manager. We confirmed this by reviewing the asset master log from FY24, and we noted that the asset had a disposal date of 8/18/23, after the surplus request was submitted. We also inspected the "QFS\_AM\_ASSET\_COST" query we received from David Williams,

## State of Washington

Director of Financial Reporting, which listed all of the assets currently in the custody of Seattle Colleegs, and we noted that this asset was not included in the listing, further evidencing that it was properly disposed of. **No issues noted.**

### **STEP 3: Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **STEP 4: Control Risk at LOW - Test Key Controls**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

### **STEP 5: Final Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

#### **J.2.PR.G - Community & Tech College Testing - Seattle**

*Procedure Step:* IT Control Testing - Depreciation

*Prepared By:* EZM, 10/7/2024

*Reviewed By:* RKM, 10/8/2024

Purpose/Conclusion.
---------------------

#### **Purpose:**

To determine whether the automated control was in place and operating effectively and to consider related general IT controls in order to assess control risk.

#### **Conclusion:**

Based on our understanding and test results, we concluded that the automated control **was** in place and operating effectively.

Based on our understanding, related general IT controls **were** in place and adequately designed to ensure that the control operated consistently

# State of Washington

during the audit period. However, we did not test the operating effectiveness of general IT controls.

Our understanding and control risk assessment, which incorporates these conclusions, is documented at [Depreciable Capital Assets - Controls].

Testing Strategy:

The following procedures are **required** for all automated key controls for financial and single audits:

## **STEP 1: Understand Automated Key Control**

Gain an understanding of the automated key control. The understanding can either be documented in the control system step or could be documented here in this step. Auditors should consider the following aspects of the automated control when gaining an understanding:

### **Software Calculation:**

Is there written documentation of the calculation, and/or the source rates and factors used in the calculation?

*We would expect written documentation that defines the calculation and is an official, approved source for the formulas, rates and factors. This may be an approved policy or could be system documentation.*

What formulas are used to make the calculation?

What values or factors are used to make the calculation? For example:

- Rate tables used by the calculation
- Profile fields (i.e., applicable transaction types)
- Programmed/set formulas and/or values
- Constraints (i.e., effective date, minimums/maximums, etc.)

How is the calculation triggered or initiated?

How is the calculation recorded in the accounting system (or used in an end result)?

## **STEP 2: Confirm and Test Automated Key Control**

Confirm and test the automated control. To test the automated control, consider the following procedures:

### **Software Calculation:**

Re-perform the calculation for selected transactions.

*Auditors would NOT normally use sampling for automated controls. Instead, auditors should judgmentally select one instance of each significant variation of the calculation. If the number of potential variations is large, auditors would judgmentally select based on risk factors (for example, the most common scenarios, or scenarios associated with identified risks, or scenarios that are not addressed by the*

## State of Washington

*entity's testing procedures).*

*In some cases, it may be possible for the auditor to reperform the calculation for the entire population.*

If any rate tables or values were updated during the period, view the current values (by observing the rate table or values in an admin menu or from a printed system report) and compare to approved sources.

*If no updates were made or there are only a few values, this risk could be addressed by re-performing the calculation. However, if source rate tables or values are large or complex, it may be more efficient to test these values directly than to recalculate a larger number of transactions.*

Consider the use of analytical procedures such as trends or descriptive statistics on the population (like average, minimum and maximum values, or a graph of values across the population) and follow up on any unexpected values or trends. *Analytical procedures would normally also count as a substantive test.*

### **STEP 3: Understand General IT Controls**

Gain an understanding of the general IT controls that support the continued proper operation of the automated control. Identify key general IT controls and note any control weaknesses. Auditors should consider the following aspects of general IT controls when gaining an understanding:

#### **Software Calculation:**

Inquire if the entity has experienced any errors or irregularities with the calculation. Also how often changes are made to the calculation, and how many changes (if any) were made during the year.

How can the software calculation (formulas, rates/values, settings/configurations) be changed or customized?

*Software calculations will usually have one or more administrative menus that allow the government to modify rate tables or other calculation values, or to configure the calculation or apply settings.*

*In other cases, software calculation formulas and/or values may be hard-coded into the system and require programmers to make the changes. If the government has access to source code, then it needs internal procedures for program changes. If the program is controlled by vendors, we would expect program change procedures and expectations to be included in the contract.*

What are the procedures to authorize and make program changes or configuration/setting changes to the software calculation?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

## State of Washington

What are the procedures to test that program changes are properly working?

*If utilizing a test environment, there should be controls to ensure that the live environment is updated and is consistent with the live production environment. As management is responsible for the accuracy of their automated controls (i.e., in the live environment), we would expect there to be a procedure to confirm each key automated control once it is in the live environment. This could be manually re-performing the calculation, reviewing reports against known expectations, etc.*

How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change programming, but they may be responsible for patch management, master table data, and/or configurations.*

### **STEP 4: Confirm Key General IT Controls**

Confirm your understanding of key general IT controls to determine whether they have been placed in operation (*whether the entity has actually implemented key controls*).

### **STEP 5: Test Key General IT Controls**

Document whether general IT controls will be tested. Option 1 would result in control risk at MAX for the automated control. Either option 2 or 3 is necessary in order to set control risk at LOW. If general IT controls are tested, consider the following procedures:

#### **Software Calculation:**

If program changes or setting/configuration changes are logged, review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the calculation may also provide this evidence if the re-performance tests address all states of the calculation during the period.

## State of Washington

If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

### **STEP 6: Final Control Risk**

Evaluate the results and document a final control risk assessment in the control system step. Consider whether any deficiencies identified with either the automated control or related general IT controls represent material weaknesses or significant deficiencies.

*Note: general IT control deficiencies do not necessarily mean the automated control is not properly functioning. General IT control deficiencies would normally be considered a significant deficiency or material weakness only if it caused an issue with the compliance requirement or assertion.*

### **Recommendation Review Requirement**

IT Security related information is considered category 3 data protected by Public Request Exemption RCW 42.56.420. Issues related to IT Security require the following special handling:

[Instructions](#) are located in Team IT Audit's System's Sharepoint page.

Details of IT Security related issues should NOT be included in any emails or helpdesks.

Exit, ML and Findings should be separately communicated in an IT Security Results Document.

Findings will be referenced, but not included in the audit report.

All IT security-related recommendations must be reviewed by [Team IT Audit](#).

Template language for common IT related recommendations can be found in [ARS Part 5 Chapter 8](#).

### **PUBLIC REQUEST EXEMPTION**

Some IT related information is protected by Public Request Exemption RCW 42.56.420 for cyber security purposes. The details documented in the record of work and support workpapers may qualify for this exemption. If so, auditors must include this statement in the record of work done and any related workpapers: **"This record contains information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited "**.

Guidance/Criteria:
--------------------

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

# State of Washington

## Information Technology Planning Guide

Auditors may contact [Team IT Audit](#) with any testing strategy or control assessment questions or to request assistance from an IT Specialist.

**Software Calculation:** A **software calculation control** exists when the value of a transaction is determined by a software application. This process can be a key control when the entity relies on the system to generate calculations correctly to determine the amount of transactions (i.e., summarizing/account code allocation to post to general ledger, calculate student, utility, other charges, etc.).

### **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

**Statements on Auditing Standards [AU-C 315](#) Understanding the Entity and Its Environment and Assessing the Risks of Material Misstatement** - paragraphs .A106-.A109 describe general and application controls and how they relate to audit risks

**Statements on Auditing Standards [AU-C 330](#) Performaing Audit Procedures in Response to Assessed Risks and Evaluating the Audit Evidence Obtained** - paragraphs .10b and .A33-.A34 describe requirements and guidance for testing indirect controls in conjunction with tests of controls, that is, testing key general controls in conjunction with a test of a key automated control

Record of Work Done.:

**This record may contain information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited.**

### **STEP 1: Understand Automated Key Control**

**Significant System:** ctcLink - Asset Management module

**Key Automated Control:** ctcLink automatically calculates an asset's depreciation based upon manual input of a commodity code (provides service life), the cost of the asset and in-service date.

Our understanding of the overall control is documented as part of our understanding of controls over relevant assertions for Asset Management in the "Depreciable Capital Assets - Controls" step.

### **STEP 2: Confirm and Test Automated Key Control:**

We confirmed and tested the key automated control as follows, to determine whether the software calculation correctly valued each transaction:

We tested the same assets selected in our valuation/existence sample. We used a 7.5% tolerable misstatement and a low assurance to select and recalculate accumulated depreciation on 6 asset additions (and 6 reductions only to determine removal of asset to zero value) to confirm the automated control and determine whether the software correctly valued each transaction. We used a report from Asset Management (AM) called

## State of Washington

"Asset Master Log" showing the fields included in the calculation. The fields used in the calculation are useful life, salvage value, asset cost, and in-service date. We then recalculated the accumulated depreciation and tied the amount back to the amount actually posted in AM. See testing at [Depreciable Capital Assets]. We determined that the system is accurately calculating monthly depreciation based on the date entered for sampled items. **This automated control is in place.**

### **STEP 3: Understand General IT Controls**

The following people have access to the Asset Management module in ctcLink (**Key Control 1 - User Access**):

- Terri Plischke, ctcLink Finance Pillar Lead (Finance Systems Specialist)
- Kyoko Connolly, Senior Accountant – G/L
- Michelle Nguyen, Senior Financial Analyst,
- Miguel Gatmaytan, Purchasing Manager
- Charlene Rios, Director of Accounting
- David Williams, Director of Financial Reporting

Terri informed us, however, that only Miguel and her actually use the system – the other individuals who have access, who were present in the meeting, expressed that they were unable to navigate the system due to its complexity.

David informed us that Seattle Colleges staff were unable to make changes to how the system calculates depreciation. He further explained that college staff that are given access to the module are only able to enter information (such as asset cost, commodity code, and the in-service date) into the system - they cannot change how the system operates. He explained that SBCTC and Oracle, who is the vendor for ctcLink, would work in conjunction with one another to make changes such as that to the system.

If the College identifies an error with how the system operates, College staff would submit a ticket with SBCTC to determine the cause, and SBCTC would then work with the appropriate IT professionals to resolve the issue. If College staff found an error with the data inputs (commodity code, in-service date, total cost, etc.), they have the ability to adjust that in AM by adjusting the record. This would result in both an adjustment to the record in AM and an automatically generated correcting journal entry that would be reviewed and posted to the GL. College staff informed us that they could not recall any errors with how the system operating during FY24.

### **STEP 4: Confirm Key General IT Controls**

**Key Control #1 (User Access) - Only certain individuals have access to the Asset Management module.**

We received a spreadsheet titled "AM.Module.Roles.2024" which listed all of the Seattle Colleges staff members that had access to the Asset Management module, as well as what roles each member was assigned. We reviewed the spreadsheet and confirmed that only the following individuals had access to the Asset Management module:

- Terri Plischke
- Kyoko Connolly
- Michelle Nguyen
- David Williams

# State of Washington

Miguel Gatmaytan  
Charlene Rios

***No issues noted.***

## **STEP 5: Test Key General IT Controls**

Not applicable - we are not planning to rely on automated controls and therefore do not need to test general controls; control risk will be assessed at MAX.

## **J.2.PR.G - Community & Tech College Testing - Seattle**

***Procedure Step:*** Depreciable Capital Assets - Testing

***Prepared By:*** EZM, 10/9/2024

***Reviewed By:*** RKM, 10/10/2024

Purpose/Conclusion:

### **Purpose:**

To determine whether reported capital assets represent real assets, as of the end of the period (Existence).  
To determine whether capital assets are reported at properly valued and calculated amounts (Valuation).

### **Conclusion:**

We determined that reported capital assets represent real assets, as of the end of the period (Existence).  
We determined that capital assets are reported at properly valued and calculated amounts (Valuation).

Testing Strategy:

The following is a list of **considerations** for testing the existence assertion for capital and infrastructure assets. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

### **Nonexistent Assets**

## State of Washington

Review capital asset records to determine whether records meet minimum requirements of BARS [3.3.9.40](#) to positively identify and adequately describe the asset. If asset records are not sufficient, follow up on how the entity is able to identify and track reported assets and consider further audit procedures.

Scan the capital asset list for unusual or unexpected assets or patterns.

*For example: asset descriptions that appear insufficient to identify the asset, asset descriptions that seem strange, assets with a historical cost that doesn't appear to meet the capital asset threshold, assets that are past the end of their service life, assets or asset types that don't appear to belong (based on auditor's understanding of entity activities and area of operation), assets or asset types that the auditor doesn't recognize, attributes that appear unreasonable (historical cost, useful life or scrap value), assets that appear connected to actions noted in planning procedures (impairment, replacement, sale or surplus, transfer), etc.*

Test sampled assets or selected high-risk assets from accounting records for existence by observing them or reviewing documentation.

*Observation for aboveground infrastructure such as roads, bridges or buildings may be by [google maps](#). Documentation for underground assets may consist of maps, system plans approved by regulatory agencies or permits, etc.*

Review the government's records of the latest physical inventory for any identification and follow-up on missing assets or any types of assets or locations that were not covered. Note: review of a government's physical inventory is considered a control test. However, it may be done as a risk assessment procedure to help direct substantive testing, and follow-up on results may result in some substantive evidence.

Trace assets from accounting records to assets listed on the government's insurance policy records. Note: if a complete comparison or reconciliation is made, this test would also provide evidence for the completeness assertion.

Trace assets from accounting records to operational records (ex: Public Works Department typically tracks assets for maintenance or regulatory reporting purposes). Note: if a complete comparison or reconciliation is made, this test would also provide evidence for the completeness assertion.

For land and buildings, trace parcels and historical cost per the land subsidiary schedules to the County's land (GIS) records to verify ownership. Note: this test also provides evidence for the rights & obligations assertion and - if a complete list is obtained from the County - for the completeness assertion as well.

Compare reported public project completed or in process during the period to the L&I [prevailing wage reporting database](#). Note: since reporting is done by contractors, it would be considered a third-party verification of project existence. We would expect capitalized costs (which include costs incurred by the government as well as contractors) to exceed the contractor's reported costs for most projects. This test also provides evidence for the completeness assertion if traced from the L&I database.

### **Cut-off**

Review supporting documentation to verify dates of any transfers, annexations or donations.

# State of Washington

See the Expenditures | Existence step for testing strategies on cut-off for capitalized expenditures.

## Detail Roll-Up

If manual journal entries are required to update the GL, agree figures per the GL to subsidiary schedules or systems.

Search for manual journal entries that debit (increase) capital or infrastructure assets. Consider testing if any risk indicators are noted.

Reconcile (or review the government's reconciliation) capital expenditures for governmental funds to increases in capital assets. The only anticipated reconciling item would be equipment that is below the capitalization threshold.

Reconcile (or review the government's reconciliation) increases in capital assets to capital purchases and sales per the statement of cash flows for proprietary funds. The only anticipated reconciling item would be donated or contributed assets.

**Over/Invalid Capitalization** - See classification step for testing strategies on improper capitalization upon construction or acquisition, or when determining whether an expense is a maintenance or repair expense or a capitalized improvement.

## Unrecorded Disposals or Impairments

Scan capital asset records for fully depreciated assets and inquire as to the status (disposed, no longer in use, etc.) to ensure all retirements and disposals have been recorded. Evaluate appropriate accounting for any fully depreciated assets remaining in service in accordance with [BARS 3.3.10.130](#).

Identify significant disposals, impairments (due to obsolescence or damage) or contributions per review of minutes and trace to asset records to verify these events were accounted for.

Request a list of insurance claims made during the audit period to identify possible impairments or removed assets, then trace to subsidiary records to verify that the event was properly accounted for.

Identify annexations (through minutes, inquiry or OFM's central annexation tracking system) and trace to supporting documents showing the transfer of assets. Note: this test would also provide evidence for the completeness and rights & obligations assertions.

The following is a list of **considerations** for testing the valuation assertion for capital and infrastructure assets. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

## Incorrect Depreciation Calculations

Perform an analytical review of depreciation expense by type of asset for reasonableness.

Re-calculate depreciation expense for a sample of assets or in conjunction with a test of automated controls (if depreciation is automatically calculated by the system). Consider testing the inputs used for the calculation to determine whether they are reasonable and in line with any applicable policies; i.e. useful life, salvage value, etc. Alternatively, test calculations, extensions and footing of subsidiary records if records are maintained on spreadsheets.

Evaluate capital asset policies for componentization or grouping of assets to determine if it has been consistently followed and will result in a rational method of depreciation. See BARS [3.3.10.150](#) for guidance.

## State of Washington

Evaluate estimated useful life and scrap value factors for reasonableness. This test could be done in general (on the government's accounting policies), for selected asset classes or for selected or sampled asset records.

*If testing selected high risk assets, auditors should consider assets that are nearly or fully depreciated (see BARS [3.3.10.130](#)), assets with unusually high or low useful lives for their type, and assets with unusually high scrap values.*

Compare estimated useful lives for assets with replacement schedules / policies and capital budgets.

*We would expect that assets on a regular replacement schedule (such as equipment, vehicles, road surfacing, etc) or that are included for replacement in the capital budget would have estimated useful lives that match the government's replacement plans for the asset.*

Consider whether the date placed in service for assets is reasonable given when the asset begins being used or is substantially complete as this will have an effect on when depreciation begins. See information in BARS [3.3.10.90](#) about when to move a project out of CIP.

### **Impairment**

Check that the measurement method used for write-offs is in accordance with GAAP (GASB 42.12-15). Review or recalculate the portion of historical cost that should be written off for impaired capital assets. *Note: auditor would normally use the same measurement method used by the government unless it the auditor finds it inappropriate for the circumstances or unallowable under GAAP.*

### **Incorrect Historical Cost of Assets**

Trace recorded cost to supporting documentation. *Note: This test would normally be limited to recent additions, since documentation for historical assets has likely passed the records retention period.*

Evaluate the reasonableness of any estimates of the historical cost of capital assets.

Evaluate the reasonableness and support for any estimates of the acquisition value (per GASB 72) of donated capital assets.

### **Conversion to GAAP**

For governments converting to GAAP reporting, examine valuation method for retroactively reported infrastructure assets and verify that the valuation method used is one of the methods prescribed by the County Road Advisory Board.

### **Modified Approach**

Check that infrastructure is being depreciated unless the modified approach is used. If the modified approach is used, verify that the government has met criteria of GASB 34 par 23-26.

### **Allocation**

On the government-wide statement of activities, review allocation of depreciation for capital assets for governmental funds. Depreciation expense

## State of Washington

will be reported as a component of the direct expense shown in the statement of activities. Request spreadsheet for allocation.

Guidance/Criteria:

### **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

GAAP criteria for reporting capital assets

[\*\*GASB Codification Section 1400 Reporting Capital Assets\*\*](#)

[\*\*GASB Comprehensive Implementation Guide Chapter 7 Basic Financial Statements and Management's Discussion and Analysis, sections 7.9-7.21\*\*](#)

Record of Work Done:

### **Significant Balance and Assertions:**

Governmental Activities - Depreciable Assets (Net of Accumulated Depreciation) - Existence, Valuation

Controls are documented in the "Depreciable Capital Assets - Controls" step.

### **Substantive tests performed to meet the Existence assertion:**

We used the small population sampling spreadsheet (7.5% tolerable misstatement, low assurance) to determine our sample size. We haphazardly selected 6 additions and 6 disposals for testing.

### **Additions & Reductions Testing:**

We tested for the following attributes related to **Existence**:

A = The asset meets OFM capitalization criteria (SAAM 30.20)

B = Acquisition date/disposal date was properly recorded, traced to invoice/disposal form and amount reported represents actual costs that exist of as of the report date.

See testing at: [[Depreciable Capital Assets](#)] tab "3 - Existence Valuation". For selected assets, we obtained invoices, fixed asset reporting forms, purchase orders, disposal requests and email documentation from David Williams, Director of Financial Reporting.

Our additions and reductions testing did not note any issues related to existence. **No issues noted.**

### **Substantive tests performed to meet the Valuation assertion:**

# State of Washington

See above for sampling methodology.

## Additions & Reductions Testing:

We tested for the following attributes related to **Valuation**:

C = The asset is recorded at historical cost as compared to original invoice and all ancillary charges necessary to place in intended location or Asset is properly removed from asset listing, equaling zero value at year end.

D = **IT CONTROL** - ctclink automatically calculates straight-line depreciation based on asset information entered: in-service date, commodity code, and asset value.

See testing at: [[Depreciable Capital Assets](#)] tab "3 - Existence Valuation". See attribute E - IT Control Testing Depreciation ROWD here: [[IT Control Testing - Depreciation](#)].

Our additions and reductions testing did not note any issues related to valuation. **No issues noted.**

## J.2.PRG - Community & Tech College Testing - Seattle

*Procedure Step:* Charges for Services - Controls

*Prepared By:* MRF, 9/17/2024

*Reviewed By:* RKM, 10/18/2024

Purpose/Conclusion.

### **Purpose:**

To gain an understanding of internal controls and assess control risk in order to help plan the nature, timing and extent of substantive testing.

### **Conclusion:**

We have gained an understanding of internal controls and assessed control risk at **maximum**. Therefore, we **will not** place reliance on controls. Our understanding of internal controls and control risk assessment will be used to help plan the nature, timing and extent of substantive testing.

We noted **no** material weaknesses or significant deficiencies in internal controls.

# State of Washington

Testing Strategy:

**This workbook template was designed for tuition revenue system control audits at Community Colleges. Contact [Team IT Audit](#) with questions on information or steps contained in this template. The template assumes occurrence and valuation are relevant assertions and that controls over occurrence and valuation will be tested.**

The following procedures are **required** for all relevant systems:

## **PUBLIC REQUEST EXEMPTION**

Some IT related information is protected by Public Request Exemption [RCW 42.56.420](#) for cyber security purposes. The details documented in the record of work and supporting workpapers may qualify for this exemption. Auditors must include this statement in workpapers: "**This record contains information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited**".

## **STEP 1: Control Understanding**

Gain an understanding of the internal control process, identify key controls over relevant assertion(s), and note any control weaknesses.

*See the **Client Resource Tab** to reference query tools and year end adjustment information applicable to community and technical colleges. The following are expected controls for and community technical colleges. If sufficient key controls are not in place, the government may be able to demonstrate compensating controls.*

*Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*In gaining an understanding of controls, consider the overall understanding of COSO elements as documented in the "Entity-wide COSO Evaluation" step as they relate to this particular system.*

When gaining an understanding of a college's tuition revenue system, the following specific steps should be considered:

### Admissions & Class Registration

Discuss admissions and class registration procedures with department representatives or registrars to gain an understanding of admissions and registration processes and policies. Consider the following:

How is a student's status validated?

How do they assure that a student's status has been accurately posted from Campus Solutions Core to Student Finance (SF)?

# State of Washington

## Tuition calculation

The automated tuition calculation processed in the cTcLink system has been identified as an automated control. When gaining an understanding of a college's software calculation controls, the following specific steps should be considered:

Gain an understanding of the college's procedures for updating Term Fees, Tuition Groups, Item Types, and Tuition Schedule tables, including any review they perform to ensure the changes made are correct.

Validation of Tuition Calculation at the College - Inquire with college staff to see if they test tuition calculations prior to rolling over term fees, and if so, whether they used the Production College Development (PCD) environment to do so. If they have saved supporting documentation for testing performed, observe testing results to verify that the respective tuition and fee values were actually calculated correctly for each category of mock student tested.

Identify individuals responsible for updating the tuition rates including any users who are authorized to modify the tables or access the screens which have been deemed critical to the tuition revenue calculation process (Term Fees, Tuition Groups, Tuition Calculation, Item Types, and Tuition Schedule)

Consider obtaining the following from college staff when testing calculation of tuition revenue for a sample students:

Approved tuition rates

**Customer Account** reports showing tuition/fee charges on the student accounts

**Customer Academic Information** and **Career Term** data showing the student's status/tuition group

**Enrollment Summary** showing evidence of the classes the student was enrolled in for the selected quarter.

## Tuition payment

Students typically pay tuition and fees by credit card. Credit cards are processed through CyberSource. State and community technical colleges must reconcile payments received, and each individual college establishes their own frequency to complete it. Each cashier closes out daily using a batch report from the cTcLink system. The daily batch report may not include daily transactions for EFT's and wires. The following steps should be considered when gaining an understanding of tuition payment:

Discuss cash receipting procedures with department staff and document procedures performed tuition payments paid with the following

Cash or check

Credit Card

ACH/Wire

We expect colleges reconcile credit card payments made through CyberSource. Inquire and document the colleges process of tying credit card payments processed through CyberSource to entries made in the cTcLink system.

Inquire regarding how the college would address variances found when performing reconciliations.

# State of Washington

## Posting to the GL

Receipts are posted to the GL through an evening automated batch process. Typically, cash receipts are reconciled daily to bank accounts, and bank account balances reconciled monthly to cTcLink. Consider the following:

Gain an understanding of the GL posting process, and determine how they validate that their postings are accurate and complete.

Inquire regarding how the college would know if the GL did not post accurately or completely. It is likely there will be variances in how each college performs their reconciliations, with some using spreadsheets or running queries or customized reports as tools to validate the GL postings.

## Distribution / Allocation to Revenue accounts

Review the procedures the college uses to assure that all tuition revenue payments from GL fund 840 were completely distributed. Consider the following:

Document the process used by the colleges to update/maintain the values in their Tuition Distribution table.

## Transfer to AFRS

Gain an understanding the college's reconciliation process of their cTcLink balances to those posted to AFRS. Consider the following:

Evaluate the college's procedures regarding the year-end closing entries recommended by the State Board (per their "Year End Closing" binder). While the key control is the reconciliation done by the SBCTC, the college still needs to provide oversight and monitoring of the adjustments that are recommended by the SBCTC (colleges should understand what the adjustments are for, that they are correct and properly supported).

*Note:* SBCTC System Accounting Coordinators handle all ctcLink uploads to AFRS. Every month, on AFRS cutoff date, a staff from SBCTC runs a query in ctcLink of all journal entries created. This is a summary level report that is downloaded into an Excel spreadsheet. Staff create two pivot tables; one by funds and amounts, another by general ledgers and amounts. Staff expects the pivot table by fund and amount to be zero. Staff then compares the second pivot table to another report, which is generated for the State Auditor's Office (SAO). Both reports are queried from the same database, the one for SAO contains a few more fields. When all the amounts agree, staff is ready to prepare the file to be uploaded into AFRS.

Staff then sort the file by fund, general ledger, and amount. The customization now generates the output files (flat files with transaction codes) and sends them to AFRS. There are usually 1600 to 2200 lines for each college each month. This file is saved as a flat file format and is uploaded into AFRS using the OFM's Financial Toolbox. Sue does a test run in what is known as the SUP environment (copy of previous day's production) to check for any major issues. Staff is able to capture a copy of the flat file and uses that to reconcile between what is in ctcLink and what was transmitted to AFRS. Staff makes any necessary corrections to the AFRS batch and releases the output file to AFRS.

# State of Washington

Financial Adjusting Entries – the colleges are directed to use the adjusting entry forms to enter any required cTcLink adjustments, with each suggested adjusting entry denoted in this section. Additional explanations (from the SMARTER system) for each of the suggested adjusting entries are also provided.

SMARTER Queries used to reconcile Finance Sub Modules to the General Ledger. Not all State community and technical colleges use SMARTER Queries, however, use is encouraged by SBCTC.

*Note: Waivers are not included in data reported from cTcLink to AFRS*

Disclosure Forms – Copies of the college's general note disclosures and supporting documentation.

Payable/Receivable reporting reflecting any payables ("due to") and receivable ("due from") transactions with other state agencies.

*Note: Some reports and queries used by colleges may be built in-house and may be used alongside SMARTER queries that have been built by SBCTC. If the college does not have a good understanding of the reconciliation process done by the SBCTC then the auditor may want to consider reviewing the year-end adjustments for material errors. For example, the auditor could request the Year End Closing documentation from the State community or technical college and review it to determine the types of adjusting entries and exception items noted by SBCTC.*

## **STEP 2: Confirm Key Controls**

Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

## **Step 3: Preliminary Control Risk**

Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls in step 4.A. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls. All potential material weaknesses and significant deficiencies should be discussed with the AIC or AAM, since they must be reported as findings.*

## **STEP 4: Test Controls**

If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency or material weakness likely exists. If exceptions are noted,*

## State of Washington

*auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

***Since key controls for Tuition Revenue are automated, Auditors should add the "IT Control Testing - Tuition Calculation" step available in the Store to document automated and general control testing.***

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of COSO elements. In doing so, all of the following specific determinations must be documented:*

- A. Key controls – including personnel who affect the application of the control – have not changed since they were last tested. Automated controls should be tested the first year that colleges use the cTclink system.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2021, this work could potentially be relied upon for both the periods ending 2022 and 2023.*

### **Step 5: Final Control Risk**

Evaluate the results and document a final control risk assessment. Consider whether any internal control issues identified represent material weaknesses or significant deficiencies.

### **Recommendation Review Requirement**

IT Security related information is considered category 3 data protected by Public Request Exemption RCW 42.56.420. Issues related to IT Security require the following special handling:

[Instructions](#) are located in Team IT Audit's System's Sharepoint page.

Details of IT Security related issues should NOT be included in any emails or helpdesks.

Exit, ML and Findings should be separately communicated in an IT Security Results Document.

Findings will be referenced, but not included in the audit report.

All IT security-related recommendations must be reviewed by [Team IT Audit](#).

Template language for common IT related recommendations can be found in [ARS Part 5 Chapter 8](#).

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

# State of Washington

Auditors should consider the following background information and resources when performing work on this area.

## **SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

**This record may contain information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited.**

### **Significant Balances and Assertions:**

Internal controls in the Community and Technical College System address the following balances:

Governmental Activities - Education - Higher Education Charges for Services - Occurrence, Valuation  
Higher Education Special Revenue - Charges for Services - Occurrence, Valuation

See lead sheet here: [\[Lead Sheet\]](#)

### **STEP 1: Gain an Understanding of Internal Controls**

Software used by community colleges to generate tuition revenue is developed and maintained by State Board of Community and Technical Colleges (SBCTC). Student information is captured in the ctcLink system in Campus Solutions Core module. Tuition is automatically calculated and applied to student accounts within Student Financials (SF). The rates and codes used in the tuition calculation process reside within several key system tables, which are maintained in part by SBCTC and by the local colleges.

Seattle Colleges is actually a group of three colleges, each with their own business unit; WA062, WA 063, and WA064. When the three colleges have their data combined and posted to ctcLink, it is under the business unit WA060.

### **Admissions & Class Registration**

Students can register on-line at the Admissions office. Critical information associated with tuition revenue is captured at this point regarding the student's status (i.e. resident, non-resident, veteran, etc.), and this data is posted to the Campus Solutions Core module.

The Admissions office processes the student applications within Campus Solutions module. When the first billing record is generated for the student (i.e., for admissions or testing fees), an account is created for the student in the Campus Solutions Core module.

Students typically register for classes on-line, but they can also do so in person. Classes are defined within the Campus Solutions Core module. The information captured in Campus Solutions Core during registration will be used in calculating the amount of tuition owed by each student.

## State of Washington

A student's tuition and fee liability is recorded in the Campus Solutions Core database when students register for classes, but revenue will not be recognized in the GL until a journal is created in Campus Solutions Core and sent to Student Financials via nightly batch.

At the time of the student enrollment, the Campus Solution module generates the student's class schedule which calculates the tuition and fees to the student's account based on a student's enrollment information (i.e. classes, hours), residency status, and any applicable tuition waivers. An individual student may be enrolled in two different colleges simultaneously.

### Waivers - Admissions Office and Registration

There are three types of waivers:

- Residency Classification – This waiver allows individuals to pay in-state tuition even if they have not resided in Washington State for the prior 12 months (i.e., Active Duty Military and Dependents)
- Mandatory Classification – These waivers are mandatory by RCW or SBCTC policy (i.e., Children and Spouses of Deceased or Disabled Law Enforcement Officers or Firefighters)
- Optional Classification – Colleges have discretion in whether to participate in optional waiver programs and how much to waive (i.e., Athletic waivers, running start).

The College uses all of the SBCTC waivers but has waivers unique to the College. The waivers are created in the PCD environment (testing) in ctcLink. After verifying they have been entered correcting they will be released/input into PRD (production).

### Tuition Calculation

The Campus Solutions (ctcLink) automatically calculates student tuition and fee charges from the student account, student course registration, tuition and fees entered (**Key Control 1 – Automated ctcLink Valuation**). The report will run for students that have made any changes in schedules every day and every week for all students. However, a known weakness exists in ctcLink. The system makes revenue and accounts receivable entries as soon as a student registers. This is incorrect as there has been no exchange of value and the colleges do not have yet a legally enforceable claim on those resources. SBCTC communicated this matter to colleges in a memorandum along with instructions on how to prepare a correcting journal entry. This weakness is addressed by key control #3 noted below.

The tuition revenue calculation processing resides within a third-party vendor application system, which cannot be modified by system users. The only way for college users to affect the calculation is through edits to associated data tables and screens and many of those tables are restricted to modification by State Board at the college level.

### Term Rollover and Tuition Updates

The calculation of student tuition and fees is automated in the ctcLink system based on rate tables and student's demographic information and course load. Our understanding of the automated control is documented as part of our "IT Control Testing" program step. We performed testing of this automated calculation at the IT Control Testing step here [IT Control Testing - Charges for Services].

# State of Washington

## **Tuition payment**

Tuition can be paid on-line, by phone, or in person at the Cashier's office. Payments are captured by the Campus Solutions subledger for ctcLink. This will only hit the GL once a week when they close out the cashiering job. ctcLink generates the files and sends them to the college once a week. Revenue is posted to the GL after the payment is received, the account receivable for the student's tuition is also reversed at the time of payment.

Cashiers receive payments and code receipts by student, which automatically hard codes to fee codes set in the system. The speed type have all coding information that will go to the GL codes. Students can either pay at the office, mail, or at the cashier's office that is collected and entered in the ctcLink system by Cashiers. Payments must be received prior to the posted tuition deadline. If payment is not received the student is dropped. Depending on the timeframe of the deadline they will get 100%, 50%, or no refund. Registration staff identifies dropped students and gives cashiering a dropped students listing.

Cashiers at each College reconcile their drawers each day. The deposits are picked up daily and delivered to the bank. A deposit slip goes with the actual bank deposit and is sent to the Accounting Office. The Accounting Office uses the deposit slips to ensure the information in the bank account is accurate. Bank statements are reconciled to GL activity each month by an Accountant and reviewed to ensure reported revenue activity agrees to the bank statements **(Key Control 2 - Occurrence)**. See cash & pooled investment controls at: [\[Cash and Cash Equivalents - Controls\]](#)

## **Posting to the GL**

Tuition revenue is recognized when a student's enrollment is complete and student status is validated. Upon completion of the student's enrollment, a journal entry is created in Campus Solutions Core and sent to Finance via nightly an automated nightly batch process.

Cash receipts are posted to the GL through a nightly batch process, and if there are posting problems, the system notifies the user that the batch did not post. Corrections are made through a batch edit screen, and the corrected batch is remitted. Tuition payments result in revenue being posted to Fund 840 under the source codes 0424 (tuition) and 0430 & 0431 (supplemental fees). Note that Spring/Summer pre-payments for Fall Quarter tuition are posted to GL account 5192 (deferred revenue).

To ensure only the revenues that occurred during the fiscal year are recorded, the College reviews unearned tuition revenue reports. This report shows them the amount that is unavailable revenues. After fiscal year-end, the unearned tuition revenue report is reviewed for the amount of unearned revenue and the report is used as support for the for the adjustment to move tuition from GL account 2040010 to the correct fiscal year related to when the services will be provided and the revenue earned/recognized **(Key Control 3 - Occurrence)**.

## **Distribution / Allocation to Revenue accounts**

An automated monthly process is run in ctcLink to allocate tuition revenue payments from GL fund 840 to the funds below. With the exception of Service & Activities fees (set by the Local Board of Trustees), the individual fund distribution percentages are determined by the Legislature. The local college manually posts and retains these percentages in the Tuition Schedule.

## State of Washington

060 (Building fee portion; remitted back to the State)  
149 (Operating fee portion)  
522 (Services & Activities portion)  
561 (Comm/Tech College Innovation portion)  
860 (Institutional Financial Aid portion)

An automated monthly process is run in ctcLink to allocate tuition revenue payments from GL fund 840 to the funds below. With the exception of Service & Activities fees (set by the Local Board of Trustees), the individual fund distribution percentages are determined by the Legislature. The local college manually posts and retains these percentages in the Tuition Schedule.

We obtained the tuition and fee schedule from Lee Grubb (FY24-ctc-tuition-and-fee-detail.pdf).

### **Transfer to AFRS**

The process continues to be a manual, although SBCTC is working on an automated interface to transfer financial data to AFRS. The System Accounting Coordinator handles all ctcLink uploads to AFRS. Every month, on the AFRS cutoff date, the Coordinator runs a query in ctcLink of all journal entries created. This is a summary level report that is downloaded into an Excel spreadsheet. The Coordinator then creates two pivot tables; one by funds and amounts, another by general ledgers and amounts. Staff expects the pivot table by fund and amount to be zero. Staff then compare the second pivot table to another report, which is generated for the State Auditor's Office (SAO). Both reports are queried from the same database, the one for SAO contains a few more fields. When all the amounts agree, staff prepare the file to be uploaded into AFRS.

Staff then sorts the file by fund, general ledger, and amount. The customization now generates the output files (flat files with transaction codes) and sends them to AFRS similar to how it is done in the Legacy system. There are usually 1600 to 2200 lines for each college each month. This file is saved as a flat file format and is uploaded into AFRS using the OFM's Financial Toolbox. A test run in what is known as the SUP environment (copy of previous day's production) is then used to check for any major issues. Staff is then able to capture a copy of the flat file and uses that to reconcile between what is in ctcLink and what was transmitted to AFRS. Staff makes any necessary corrections to the AFRS batch and releases the output file to AFRS.

ctcLink automatically posts to the Agency Financial Reporting System (AFRS) on a monthly basis. Colleges utilize a web-based tool called SMART (Standard Monthly Analysis and Review of Transactions) to identify transaction posting problems and make correcting entries in the college's accounting system. After ctcLink closes at year-end, they use SMART to enter adjustments which are posted to AFRS by the State Board (SBCTC).

SBCTC is responsible for the reconciliation between the ctcLink data to the AFRS data. The reconciliation is performed on a monthly basis and exception reports are produced that are researched and corrected. SBCTC sends the college monthly error reports that have to do with AFRS coding issues.

## State of Washington

At the end of the year when the College prepares their financial statements, they perform a *Tuition Waiver* calculation in compliance with NACUBO (National Association of College and University Business Officers) standards. SBCTC provides the template to the College as an excel workbook. David Williams, Director of Financial Reporting, fills in the various tabs of the calculator workbook with the financial data of the college as pulled from ctclink. The total "tuition waiver" is meant to represent the total amount of discounts provided to students throughout the year from both federal sources and state sources such as the College itself. Many of these discounts are monetary scholarships or fee waivers, but some discounts are non monetary and must be assigned an estimated value. The summary amounts of each type of waiver/discount is applied to the worksheet and the calculation page, which currently follows the "alternative method" of NACUBO advised in 2000. This amount will reduce the reported revenue from student tuition and fees on the financial statements. David noted that the annual amount of discount is related to the needs of the student population and will fluctuate from year to year, but estimated the typical amount to be between \$10-14M.

We followed up with David on 10/10/2024 and discussed how the adjustment is reported. David explained that the adjustment isn't performed until the year end financial statements are developed up to 15 months after fiscal year end. The financial statements are reported on a full accrual basis as opposed to the statewide modified accrual basis. As a result, this discount adjustment is not reported in the AFRS database and is not considered in the reported tuition revenue for higher education. We will follow up on this with OFM and SBCTC to determine if the allowance is included in the statement of activities.

### **Key Controls:**

**Key Control 1 – AUTOMATED (ctcLink) Valuation** - The College's ctcLink subledger, Campus Solutions, creates student's class schedules which then automatically calculates tuition and fees, based on student data, tuition codes, and tuition rates set up within the system to ensure tuition and fees due are properly calculated.

**Key Control 2 - (Occurrence)** - Bank statements are reconciled to GL activity each month by an Accountant and reviewed to ensure reported revenue activity for tuition payments agrees to the bank statements and general ledger.

**Key Control 3 - (Occurrence)** - After fiscal year-end, the unearned tuition revenue report is reviewed for the amount of unearned revenue and the report is used as support for the for the adjustment to move tuition from GL account 2040010 to the correct fiscal year related to when the services will be provided and the revenue earned/recognized.

### **STEP 2: Confirm Key Controls**

**Key Control #1- Automated (ctclink) Valuation** - We confirmed the automated key control at [[IT Control Testing - Charges for Services](#)].

**Key Control 2 - (Occurrence)** - We reviewed the June 2024 month end reconciliation of the student financials module to the general ledger to ensure amounts collected were correctly posted. Lee Grubb (Assistant Director of Student Financials) provided us with the "June 2024 SF to GL.xlsx" spreadsheet which detailed all transactions reconciled for the month of June. The "GL data" tab listed each transaction through the month, the amounts, the accounts and a description/coding of the revenue/expense type. The "combined" tab was all three college's student financials data combined into one listing. The "Analysis" tab imported the data from the other two tabs in a pivot table and sub totaled each

## State of Washington

account by fund and comparing the SF to the GL. We noted the column which calculated the variance between the two had occasional small amounts of variance and each variance had a comment stating the source and how it was corrected. The final totals at the bottom which included the corrections had a \$0.00 variance. **No issues noted.**

**Key Control 3 - (Occurrence)** - We reviewed the year end adjustment for unearned revenue due to pre-registration of summer and fall quarters. Lee Grubb provided us with the "2024 Unearned Revenue Entry 2024-07-17" spreadsheet detailing the calculations and support for the year end adjustment. The spreadsheet had each college broken down with totals moving (Debit Revenue, Credit 2040010) to record the revenue as unearned as of June 30th. The "Upload 7.1.2024" tab detailed the total for all three which balanced to \$0.00 as the credits equaled the debits. The total amount moved was \$19,554,089.95, which we confirmed by reviewing JV0000487933 in ctclink, which was processed for that amount on 07/01/2024 with the description of "2024 Unearned Revenue Entry". **No issues noted.**

### **STEP 3: Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **STEP 4: Control Risk at LOW - Test Key Controls**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

### **STEP 5: Final Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **J.2.PR.G - Community & Tech College Testing - Seattle**

*Procedure Step:* IT Control Testing - Charges for Services

*Prepared By:* MRF, 10/17/2024

*Reviewed By:* RKM, 10/28/2024

# State of Washington

## Purpose/Conclusion:

### **Purpose:**

To determine whether automated tuition calculation (**key control 1 for ctclink**) was in place and operating effectively and to consider related general IT controls in order to assess control risk.

### **Conclusion:**

Based on our understanding and test results, we concluded that the automated control **was** in place and operating effectively.

Based on our understanding, related general IT controls **were** in place and adequately designed to ensure that the control operated consistently during the audit period. However, we did not test the operating effectiveness of general IT controls. We also noted the following issue: [V: Seattle Colleges Lack of Documentation for General IT Control].

Our understanding and control risk assessment, which incorporates these conclusions, is documented at [Charges for Services - Controls].

## Testing Strategy:

The following procedures are **required** for all automated key controls for financial and single audits:

### **STEP 1: Understand Automated Key Control**

Gain an understanding of the automated key control. The understanding can either be documented in the control system step or could be documented here in this step. Auditors should consider the following aspects of the automated control when gaining an understanding:

### **Software Calculation:**

Is there written documentation of the calculation, and/or the source rates and factors used in the calculation?

*We would expect written documentation that defines the calculation and is an official, approved source for the formulas, rates and factors. This may be an approved policy or could be system documentation.*

What formulas are used to make the calculation?

What values or factors are used to make the calculation? For example:

- Rate tables used by the calculation
- Profile fields (i.e., applicable transaction types)
- Programmed/set formulas and/or values
- Constraints (i.e., effective date, minimums/maximums, etc.)

How is the calculation triggered or initiated?

# State of Washington

How is the calculation recorded in the accounting system (or used in an end result)?

## **STEP 2: Confirm and Test Automated Key Control**

Confirm and test the automated control. To test the automated control, consider the following procedures:

### **Software Calculation:**

Re-perform the calculation for selected transactions.

*Auditors would NOT normally use sampling for automated controls. Instead, auditors should judgmentally select one instance of each significant variation of the calculation. If the number of potential variations is large, auditors would judgmentally select based on risk factors (for example, the most common scenarios, or scenarios associated with identified risks, or scenarios that are not addressed by the entity's testing procedures).*

*In some cases, it may be possible for the auditor to reperform the calculation for the entire population.*

If any rate tables or values were updated during the period, view the current values (by observing the rate table or values in an admin menu or from a printed system report) and compare to approved sources.

*If no updates were made or there are only a few values, this risk could be addressed by re-performing the calculation. However, if source rate tables or values are large or complex, it may be more efficient to test these values directly than to recalculate a larger number of transactions.*

Consider the use of analytical procedures such as trends or descriptive statistics on the population (like average, minimum and maximum values, or a graph of values across the population) and follow up on any unexpected values or trends. *Analytical procedures would normally also count as a substantive test.*

## **STEP 3: Understand General IT Controls**

Gain an understanding of the general IT controls that support the continued proper operation of the automated control. Identify key general IT controls and note any control weaknesses. Auditors should consider the following aspects of general IT controls when gaining an understanding:

### **Software Calculation:**

Inquire if the entity has experienced any errors or irregularities with the calculation. Also how often changes are made to the calculation, and how many changes (if any) were made during the year.

How can the software calculation (formulas, rates/values, settings/configurations) be changed or customized?

*Software calculations will usually have one or more administrative menus that allow the government to modify rate tables or other calculation values, or to configure the calculation or apply settings.*

## State of Washington

*In other cases, software calculation formulas and/or values may be hard-coded into the system and require programmers to make the changes. If the government has access to source code, then it needs internal procedures for program changes. If the program is controlled by vendors, we would expect program change procedures and expectations to be included in the contract.*

What are the procedures to authorize and make program changes or configuration/setting changes to the software calculation?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

*If utilizing a test environment, there should be controls to ensure that the live environment is updated and is consistent with the live production environment. As management is responsible for the accuracy of their automated controls (i.e., in the live environment), we would expect there to be a procedure to confirm each key automated control once it is in the live environment. This could be manually re-performing the calculation, reviewing reports against known expectations, etc.*

How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change programming, but they may be responsible for patch management, master table data, and/or configurations.*

### **STEP 4: Confirm Key General IT Controls**

Confirm your understanding of key general IT controls to determine whether they have been placed in operation (*whether the entity has actually implemented key controls*).

### **STEP 5: Test Key General IT Controls**

Document whether general IT controls will be tested. Option 1 would result in control risk at MAX for the automated control. Either option 2 or 3

# State of Washington

is necessary in order to set control risk at LOW. If general IT controls are tested, consider the following procedures:

## Software Calculation:

If program changes or setting/configuration changes are logged, review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the calculation may also provide this evidence if the re-performance tests address all states of the calculation during the period.

If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

## STEP 6: Final Control Risk

Evaluate the results and document a final control risk assessment in the control system step. Consider whether any deficiencies identified with either the automated control or related general IT controls represent material weaknesses or significant deficiencies.

*Note: general IT control deficiencies do not necessarily mean the automated control is not properly functioning. General IT control deficiencies would normally be considered a significant deficiency or material weakness only if it caused an issue with the compliance requirement or assertion.*

## Recommendation Review Requirement

IT Security related information is considered category 3 data protected by Public Request Exemption RCW 42.56.420. Issues related to IT Security require the following special handling:

[Instructions](#) are located in Team IT Audit's System's Sharepoint page.

Details of IT Security related issues should NOT be included in any emails or helpdesks.

Exit, ML and Findings should be separately communicated in an IT Security Results Document.

Findings will be referenced, but not included in the audit report.

All IT security-related recommendations must be reviewed by [Team IT Audit](#).

Template language for common IT related recommendations can be found in [ARS Part 5 Chapter 8](#).

## PUBLIC REQUEST EXEMPTION

Some IT related information is protected by Public Request Exemption RCW 42.56.420 for cyber security purposes. The details documented in the record of work and support workpapers may qualify for this exemption. If so, auditors must include this statement in the record of work done and any related workpapers: **"This record contains information considered exempt from public disclosure under RCW 42.56.420 of the**

# State of Washington

**Public Records Act. As such, distribution of this record is limited ".**

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

## **Information Technology Planning Guide**

Auditors may contact [Team IT Audit](#) with any testing strategy or control assessment questions or to request assistance from an IT Specialist.

**Software Calculation:** A **software calculation control** exists when the value of a transaction is determined by a software application. This process can be a key control when the entity relies on the system to generate calculations correctly to determine the amount of transactions (i.e., summarizing/account code allocation to post to general ledger, calculate student, utility, other charges, etc.).

## **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

**Statements on Auditing Standards [AU-C 315](#) Understanding the Entity and Its Environment and Assessing the Risks of Material Misstatement** - paragraphs .A106-.A109 describe general and application controls and how they relate to audit risks

**Statements on Auditing Standards [AU-C 330](#) Performing Audit Procedures in Response to Assessed Risks and Evaluating the Audit Evidence Obtained** - paragraphs .10b and .A33-.A34 describe requirements and guidance for testing indirect controls in conjunction with tests of controls, that is, testing key general controls in conjunction with a test of a key automated control

Record of Work Done:

**This record may contain information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited.**

## **STEP 1: Understand Automated Key Control**

**Significant System:** Charges for Services- Tuition Revenue

**Key Automated Control:** The College's ctcLink subledger, Campus Solutions, creates student's class schedules which then automatically

# State of Washington

calculates tuition and fees, based on student data, tuition codes, and tuition rates set up within the system to ensure tuition and fees due are properly calculated.

Our understanding of the overall control is documented as part of our understanding of controls over relevant assertions for ctcLink in the "Charges for Services - Controls" step.

## Term Rollover and Tuition Updates

The calculation of student tuition and fees is automated in the ctcLink system based on rate tables. There are two types of rate tables that need to be updated and manually reviewed; SBCTC tuition rates and college specific fees. SBCTC updates the statewide tuition and required fees for students. SBCTC updates these rates each year in a programmed upload and performs their own verification of the data adjustments. SBCTC will provide the verification spreadsheets to the Colleges based on academic year and the college retains a copy for their own verification purposes. The College specific fees may get updated on an annual and term basis, so the implementation and review process is called "term rollover". At the end of each fiscal year, the departments work to create their operating budget, which includes a discussion if fees or charges need to change (increase or decrease) or if there are any new charges. These fees include the College wide charges, such as the technology fee charged to every student, as well as course specific fees, such as charges for art classes or science lab materials. The departments submit their budget and fee adjustments to the board each year, where the board votes to approve or deny by July 1st.

## **STEP 2: Confirm and Test Automated Key Control:**

We confirmed and tested the key automated control as follows, to determine whether the automated controls can be relied upon:

To confirm the automated control we recalculated the ctcLink calculated student tuition & fees amounts on a sample of student accounts at: [Charges for Services - Testing]. *No issues noted.*

## **STEP 3: Understand General IT Controls**

The tuition revenue calculation processing resides within a third-party vendor application system, which cannot be modified by system users. The only way for college users to affect the calculation is through edits to associated data tables and screens, and many of those tables are restricted to modification by State Board at the college level.

After it is determined fees need to be adjusted, the departments work with Mark Baumann, Campus Solutions Data Manager, to get the correct amounts into the ctcLink system. Mark is responsible for ensuring that each term, any/all changes have been correctly implemented. He and his team perform judgmental recalculations using ctcLink queries for a variety of scenarios to ensure all the fees and charges are working together correctly, and are being pulled accurately from the updated tables, from both the College specific charges and the statewide SBCTC tuition charges (**Key General IT Control**).

## **STEP 4: Confirm Key General IT Controls**

**Key General IT Control:** Mark Baumann, Campus Solutions Data Manager, and his team perform judgmental recalculations using ctcLink

## State of Washington

queries for a variety of scenarios to ensure all the fees and charges are working together correctly, and are being pulled accurately from the updated tables, from both the College specific charges and the statewide SBCTC tuition charges. We received a walk through of their process on 09/16/2024 via Teams.

At this time, the process is informally recorded as chats in Teams and documentation of review and approval was unavailable for review. We will recommend the College retain specific documentation of this review process. See issue here [[V: Seattle Colleges\\_Lack of Documentation for General IT Control](#)].

### **STEP 5: Test Key General IT Controls**

Not applicable - we are not planning to rely on automated controls and therefore do not need to test general controls; control risk will be assessed at **MAX**.

### **J.2.PRQ - Community & Tech College Testing - Seattle**

*Procedure Step:* Charges for Services - Testing

*Prepared By:* MRF, 10/16/2024

*Reviewed By:* RKM, 10/18/2024

Purpose/Conclusion:

#### **Purpose:**

To determine whether reported revenues represent actual amounts relating to the period (Occurrence).

To determine whether revenues were reported at properly valued or calculated amounts (Valuation).

#### **Conclusion:**

We determined the revenues were calculated correctly, and reported correctly in the applicable period. *No issues noted.*

Testing Strategy:

The following is a list of **considerations** for testing the occurrence assertion for revenues. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

# State of Washington

For revenues received from the State Treasurer, trace reported amounts to the State Treasurer confirmations available in LGCS.

Confirm intergovernmental revenues with the other government or grantor or by reviewing appropriate correspondence.

Trace selected or sampled revenues from the GL to supporting billings or subsequent receipts.

If revenue is receipted into a specific clearing account, or if third-party lockbox or receipting services are used, compare recorded revenue to a sum of monthly totals from bank, lockbox or service organization reports.

Develop sufficiently precise expectations for a substantive analytical to compare to reported revenue amounts.

Search for manual journal entries that credit (increase) revenues. Consider testing if any risk indicators are noted.

## **Cut-Off / Revenue Recognition**

Test a sample of underlying transactions to verify the revenue was recorded for the proper period. Note: transactions at the beginning and end of the period would generally be considered at highest risk of being improperly recorded in the current period.

If revenue is billed at a constant rate, calculate an expectation based on the average monthly billing or re-calculate the year-end accrual journal entry and compare to the reported receivable.

Evaluate revenue recognition against GAAP criteria for selected transactions or revenue streams.

## **Interfund Revenues**

For internal service fund charges, see testing strategies for internal service funds in the Accountability folder. For other types of internal charges, see testing strategies for Internal Activities.

## **Detail Roll-up**

Compare year-end totals from general ledger to subsidiary software modules for selected revenues.

Review the government's reconciliation of general ledger to subsidiary ledgers.

*Detail roll-up testing is not sufficient audit evidence by itself since it only entails comparing different sets of the entity's own accounting records. However, it may be combined with other substantive tests to address identified risks. For example, if substantive testing is performed at the subledger level, it may be combined with a test that the subledger detail accurately rolls up to the general ledger or financial statements.*

The following is a list of **considerations** for testing the valuation assertion for revenues. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

## **Calculation**

Recalculate billed revenues on a check (one of each variation), CAATS or sample basis.

For large populations of standard billings, perform CAATS tests to identify unexpected or outlier transactions for further review.

Review related-party transactions to determine whether revenue transactions were correctly calculated.

## **Realizable Value**

## State of Washington

Re-calculate a sample or selection of billings. If billings are calculated by software, the auditor could test and substantiate the automated control and also consider any risks associated with manual inputs used by software.

Evaluate the entity's calculation of the allowance amount for reasonableness. This evaluation should include comparing the entity's estimate to the entity's actual historical experience of collecting or writing-off receivables.

Trace the amount of bad debt approved by the governing body (per minutes) to reductions of receivables and bad debt expense to verify it was properly accounted for. *Note: approvals may be slightly more, as customers may pay after the bad debt has been approved but before it is written off.*

### **Estimation / Recognition**

Review calculation and support for assumptions of any estimated revenues.

Accounting research to verify that revenues were reported in conformity with revenue recognition policies reported in the financial statement notes.

Guidance/Criteria:

Record of Work Done:

### **Significant Balances and Assertions:**

Governmental Activities - Education - Higher Education Charges for Services - Occurrence, Valuation

Higher Education Special Revenue - Charges for Services - Occurrence, Valuation

Controls are documented in the "Charges for Services - Controls" step.

### **Selection Methodology:**

Lee Grubb, Assistant Director of Financial Services, provided a "FY24 SF to GL Tuition Revenue Tie-out 2024-09-30" spreadsheet. The pivot table on the first tab listed every account and summarized amount and tied to the reported total by ctclink. Lee also provided a listing of all registered students by ID number and their associated tuition, fee and misc charges in each quarter in the period. Because not all registered students enrolled in classes or paid fees, we filtered the listing to include only students who were charged tuition in at least one quarter and excluded non-academic fees charged to students. See "Pop Completeness" tab, orange highlighted section here [[Confidential Charges for Services](#)]. We used a random number generator to select active students from this population in accordance with the sampling spreadsheet.

### **Substantive tests performed to meet the Occurrence assertion:**

See testing here [[Confidential Charges for Services](#)] on the "Charges for Services" tab.

## State of Washington

We reviewed the account statement for each student and noted the quarter and date paid for tuition and fee charges were recorded in the correct period. ***No issues noted.***

### **Substantive tests performed to meet the Valuation assertion:**

See testing here [[Confidential Charges for Services](#)] on the "Charges for Services" tab.

For each of the selected students/quarters, Lee Grubb (Associate Director of Student Financials) provided us an excel document with pivot table breaking down the fees. She also provided screenshots of the students Bio/Demo data with their ID number, resident status, and path of study (undergrad etc). The enrollment summary for each student listed what classes they took (or dropped) and the number of credits. Screenshots of course-specific sub fees showed if enrolled classes had any additional charges.

International students are charged tuition and fees in ctclink, but all international contract fees are *recorded* as International Contract Revenue (account 4021065). In the support workbook, we were provided with the fee coding for international students through the period and were able to filter the data to see the charges. We confirmed international students were charged the correct amounts, paid the charges, then the amounts were converted to Contracted International revenue. This results in only the fees being reported as standard tuition in the population and on the testing spreadsheet. We traced tuition charges for international students with no issues noted.

We recalculated the charges made to each student using the WA State CC Tuition and Fee rate tables and the provided information (Valuation). ***No issues noted.***

### **J.2.PRG - Community & Tech College Testing - Seattle**

***Procedure Step:*** Education Expenses - Controls

***Prepared By:*** EZM, 10/28/2024

***Reviewed By:*** RKM, 10/28/2024

Purpose/Conclusion.*
----------------------

#### **Purpose:**

To gain an understanding of internal controls and assess control risk in order to help plan the nature, timing and extent of substantive testing.

#### **Conclusion:**

We have gained an understanding of internal controls and assessed control risk at **maximum**. Therefore, we **will not** place reliance on controls.

# State of Washington

Our understanding of internal controls and control risk assessment will be used to help plan the nature, timing and extent of substantive testing.

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

The following procedures are **required** for all relevant systems:

*Optional:* List the financial statement balances and relevant assertions addressed by the understanding.

## **STEP 1: Understanding of Controls**

Gain an understanding of the internal control process, identify key controls over relevant assertion(s), and note any control weaknesses.

*The auditor's understanding should include:*

*Business processes relevant to financial reporting of the relevant assertion for the material balance. Processes should encompass automated and manual procedures by which transactions or events are identified or initiated, authorized as needed, recorded, processed and corrected as needed.*

*Original accounting records and how records are rolled-up to intermediary ledgers and transferred to the general ledger or financial statements.*

*Detailed descriptions of key controls. Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*In gaining an understanding of controls, consider the overall understanding of Entity-Level control elements as documented in the "Entity-Level Controls" step as they relate to this particular system.*

## **STEP 2: Confirm Key Controls**

Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walkthrough of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

## State of Washington

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency or material weakness likely exists.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "IT Control Testing" step pulled down from the SAOStore and be hyperlinked with this step. Auditors should consider contacting Team IT Audit for assistance.*

### **STEP 3: Preliminary Control Risk**

Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls in step 4A. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls. **All potential material weaknesses and significant deficiencies should be discussed with the AIC or AAM, since they must be reported as findings.***

### **STEP 4: Control Testing**

If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency or material weakness likely exists. If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "IT Control Testing" step pulled down from the SAOStore and be hyperlinked with this step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of Entity-Level control elements. In doing so, all of the following specific determinations must be documented:*

## State of Washington

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

### **STEP 5: Final Control Risk**

Evaluate the results and document a final control risk assessment. Consider whether any internal control issues identified represent material weaknesses or significant deficiencies.

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Policy/Standards tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency. **All potential material weaknesses and significant deficiencies should be discussed with the AIC or AAM, since they must be reported as findings.***

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits](#) Planning Guide**

Record of Work Done:

# State of Washington

## **Significant Balances and Assertions:**

Internal controls in the Community and Technical College System address the following balances:

Governmental Activities- Education - Higher Education Expenses- Occurrence, Classification

Higher Education Special Revenue - Charges for Expenses- Occurrence, Classification

See lead sheet at: [[Lead Sheet](#)]

## **STEP 1: Gain an Understanding of Internal Controls**

### **Payroll:**

On September 10, 2024, we met with Petrina Sims, Payroll Manager, to gain an understanding of internal controls over payroll expenses at the College. The College utilizes the Human Capital Management Pillar in the ctcLink system to process bimonthly payroll transactions. The system has automated approval levels for employee timecards and changes to payroll such as modifications to existing salary or positions. The college also utilizes an internal district wide shared spreadsheet titled "District Wide New Hire Additional Assignment Spreadsheet" to also track any updates and capture all payroll changes, new positions requested, combo code or budget account coding updates, notes, and payroll related requests. It is shared by management in human resources, payroll and benefits, departments, and the business office. Contracts for regular salaried employees, and faculty are entered into the system by Petrina Sims, Payroll Manager, and approved by college department managers and the employee.

Stipend amounts are processed differently depending on whether the individual is part-time faculty or not. If the individual is a part-time faculty member, the stipend is processed through the Faculty Workbook system in ctcLink and approved by the dean of the department or the department manager. If the individual is a student, exempt staff, or full-time faculty, their stipend is processed through OnBase, which the College switched to in February of 2024. With this system, the stipend amounts are approved by the same individuals, and then sent to the business office to check the combo code budget, and then once the business office approves it, it's sent over to payroll and entered into the system **(Key Control #1 - Occurrence, Classification)**.

New hourly, student, and part time positions such as faculty must be submitted by the program manager or hiring manager for the department using a new hire request form specific to each campus location, and any changes in the system must be supported by approved documentation, such as salary placement forms and documented approval by the supervisor or dean.

Time sheets are filled out in the ctcLink system by employees each pay period. Use of paid time off must be requested through employee self-service and approved by the employee's supervisor in management self-service. Once the employee submits the time sheet, it is automatically routed to the supervisor for approval. Once the supervisor electronically approves the time sheet it is routed to payroll **(Key Control #2 - Occurrence)**.

SBCTC has provided the colleges with a 67-step checklist for processing payroll. Petrina Sims confirmed that the checklist is utilized each pay

# State of Washington

period to ensure complete processing and resolve errors.

## **Initial Setup (steps 1-2)**

## **Process Absence and Time & Labor (steps 3-14)**

## **Process Payroll (steps 15-53)**

## **Confirm Payroll (steps 54-57)**

## **Post-Confirm Tasks (steps 58-67)**

Petrina Sims and Michelle Large, Benefits Specialist, prepare reconciliations each pay period for gross earnings, total deductions, and earnings by pay type using system reports. Annie Butler, Director of Compensation and Benefits, reviews these reconciliations to ensure there are no errors. Accounting also performs a review of these reconciliations and will send them back to payroll if they discover any errors. The college is not currently able to restrict overtime due to staffing levels, but the system will automatically calculate over time rates based on the employee's timecard, which is approved by the employee's supervisor.

## **Accounts Payable:**

On September 11, 2024, we met with Ulrike Lopez, Accounts Payable (A/P) Supervisor, Charlene Rios, Director of Accounting, and David Williams, Director of Financial Reporting, to gain an understanding of the disbursement processes and internal controls over accounts payable at Seattle Colleges.

The A/P department processes various types of disbursements such as vendor payments, student refunds, payroll vendor payments, and travel reimbursements in the form of checks, ACHs, and wires. Vouchers are entered into the accounts payable module of ctcLink based off original invoices or A19s for capital projects or state agency payments.

Original invoices and A19s are scanned and uploaded into the system by A/P staff and attached to each voucher (**Key Control #3 - Occurrence**). Any item ordered from vendors that is over \$3,500 must go through the purchase requisition and purchase order process. All vouchers and purchase orders must go through the ctcLink Approval WorkFlow Engine (AWE) for review and approval and budget check before they can be paid (**Key Control #4 - Classification**).

If receiving is set to be required in the system for items on a PO then an A/P staff member will enter the receipt documentation into ctcLink once the item has been received. If a PO is not in place, such as for items under \$3,500, then the invoice is not entered until the department sends it to A/P. Departments do not send invoices to A/P unless the item has been received.

The college has an internal form titled "Seattle Colleges ACH Request Form" they send to vendors requesting ACH payments instead of checks. The vendor fills it out and returns it to the college. This information is entered into ctcLink by Ulrike Lopez. Ulrike verifies that the vendor's information is accurate by calling the vendor's Accounts Receivable department and cross checking the information on the invoice.

## State of Washington

Duplicate payments are prevented by ctcLink based on invoice numbers - if a duplicate invoice is entered into the voucher entry system, the system will flag it and not let staff go past that point, alerting the user that the invoice number has already been entered into the system. However, the invoice number can be overridden. Ulrike stated that happens when they need to enter a credit for an invoice already in the system - they put the letters "CR" next to the original invoice number to document that the transaction is a credit to the original invoice.

Checks and ACH's that are approved and ready for payment go through a pay cycle that will only pick up payments in approved and/or matched with PO and receipt if required status. Ulrike Lopez then reviews a check register report to verify the list of checks and ACHs to be processed that day - she goes through the report and looks at each check that was printed to make sure they were all accurately printed and that all addresses are appropriate and all checks are accounted for. The A/R staff receives this report from A/P and then the checks are printed in the A/R department. Check stock is stored in a locked cabinet.

All payments are reconciled using the daily and monthly reconciliation processes.

The supplier and vendor lists in PeopleSoft are maintained by the SBCTC and each individual college. They all share this list and can enter vendors and location updates. Once a supplier is entered or updated, it is set to unapproved, and it goes through an approval process by a system support staff member at SBCTC. W-9s are required to be attached, and TINs must match the W-9 from the vendor.

### Key Controls:

**Key Control #1 (Occurrence, Classification)** - Modifications to employment, which affect payroll combo code budgets, are supported in ctcLink and an E-form as necessary and all changes are required to be approved in the system. These modifications include the effective date and payment dates and combo code strings, which ensure that expenses are properly recognized in the correct period and fund.

**Key Control #2 (Occurrence)** - Timecards are created by employees and approved by their supervisors, verifying time worked during the pay period.

**Key Control #3 (Occurrence)** - Original invoices or A-19s are attached to the voucher so the approver can view before approving.

**Key Control #4 (Classification)** - If a voucher is created from a Purchase Order, the approver can review the budget account coding prior to approval. If the voucher is not created from a PO, then the budget account coding is determined by the department submitting the invoice to A/P. All vouchers and POs are required to pass budget check before payment can be made.

### Identified Weaknesses:

None.

## **STEP 2: Confirm Key Controls**

**Key Control #1 (Occurrence, Classification)**- Modifications to employment, which affect payroll combo code budgets, are supported in ctcLink and an E-form as necessary and all changes are required to be approved in the system. These modifications

## State of Washington

**include the effective date and payment dates and combo code strings, which ensure that expenses are properly recognized in the correct period and fund.**

We reviewed the contract audit history for employee ID#101025345 for contract 0632237161 to teach a Physics course during the Fall Term 2023. The total contract amount was \$12,198.67 paid out in 6 payments. The contract was generated in the Faculty workload module of the CTCLink system on September 25, 2023 by Star Conrad at 2:40 p.m. The contract was approved by Vashti Bryant on September 26, 2023 at 2:00 p.m. and also on October 3, 2023 at 10:08 a.m. by Timothy Lorentz. The employee, Azita Seyed Fadaei, accepted the contract on October 3, 2023 at 10:14 a.m. Per the contract, payments were to be made from 10/10/2023 through 12/22/2023. We inspected the paycheck detail report for this employee, and we confirmed that all of these payments occurred during the period.

We also reviewed an EForm for deliverables for grant 21-CDG-597, for FT Faculty, employee ID#201972250. The stipend was the semi-monthly amount of \$2,200 (total contract amount was also \$2,200). The form noted the budget account coding: Operating unit: 7060, Account: 5000070, Fund: 149, Class: 045, Department: 11125. The percentage was 100% and there was a combocode of 000210756. Approval was noted in the signature log at the bottom as follows:

**Key Control 2 (Occurrence) - Timecards are created by employees and approved by their supervisors in the system, verifying time worked during the pay period.**

*No issues noted.*

We reviewed the time cards for employee ID 202553267 and a pay stub, for 10/1/2023 - 10/15/2023 in the amount of \$2,457.75. We recalculated the employee's gross wages by hours paid to the employee using the rate on the pay stub for each time sheet. We noted during our review of the pay stub that the employee was paid on 10/25/23, and we therefore determined that the expense occurred during the proper period. *No issues noted.*

**Key Control #3 (Occurrence) - Original invoices or A-19s are attached to the voucher so the approver can view before approving.**

We reviewed voucher #00042604 (11/27/23) in the ctclink system and verified that original invoices (11/27/23) were attached and shown to the approver (11/29/22). We noted that the payment on the invoice occurred on 12/2/2023, and therefore determined that it occurred in the proper period. **No issues noted.**

**Key Control #4 (Classification) - If a voucher is created from a Purchase Order, the approver can review the budget account coding prior to approval. If the voucher is not created from a PO, then the budget account coding is determined by the department submitting the invoice to A/P. All vouchers and POs are required to pass budget check before payment can be made.**

We reviewed voucher #00042604 created from approved purchase order #3064 for produce from Charlie's Produce and verified that the budget account coding was imported directly from the purchase order and that the budget was valid. The voucher was approved and the budget status was valid at the time of payment. The expenditure was charged to fund 148 (Dedicated Local) in ctclink, on the "Voucher" page, and we found

## State of Washington

that this expenditure was charged to the same fund in the Voucher Accounting Line ctcLink query that was pulled for us by David Williams, Director of Financial Reporting. Per OFM's website, fund 148 rolls up into the Higher Education fund, which is the proper fund that this expense should be rolled up into. **No issues noted.**

### **STEP 3: Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **STEP 4: Control Risk at LOW - Test Key Controls**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

### **STEP 5: Final Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

#### **J.2.PRГ - Community & Tech College Testing - Seattle**

*Procedure Step:* Education Expenses - Testing

*Prepared By:* EZM, 10/28/2024

*Reviewed By:* SHW, 11/6/2024

Purpose/Conclusion.*
----------------------

#### **Purpose:**

To determine whether reported expenses/expenditures represent real obligations incurred during the period (Occurrence).

To determine whether reported expenses/expenditures allocated to the proper fund and period (Classification).

#### **Conclusion:**

We determined not all reported expenses/expenditures represent real obligation incurred during the period. **See issue here:** [\[E: Seattle](#)

# State of Washington

Colleges Misstatement of Education Expenses (Payroll)]. **See AOM here:** [Aggregation of Misstatements (GAAP)].

We determined that reported expenses/expenditures allocated to the proper fund and period (Classification).

## Testing Strategy:

The following is a list of **considerations** for testing the occurrence assertion for expenses/expenditures. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

### **Detail Roll-up**

Compare totals from general ledger to accounts payable, payroll or other subsidiary software modules.

Review the government's reconciliation of general ledger to subsidiary systems.

### **Fictitious expenses**

Search for manual journal entries that debit (increase) expenditures. Consider testing if any risk indicators are noted.

Evaluate liabilities directly related to expenses for existence. See the existence steps for current and non-current liabilities for testing considerations.

*For example, if the entity reports a self-insurance liability, the auditor might evaluate whether the change in the liability (and associated expense) occurred. Similarly, if a new liability was reported, evaluate whether that liability (and associated expense) actually exists.*

If the entity reconciles recorded revenues and expenses to bank activity, then review monthly reconciliations and evaluate or test reconciling items.

If entity uses a warrant clearing account or payroll clearing account, review the entity's year-end reconciliation of recorded vendor payments and/or payroll payments with disbursements from the clearing account(s).

Test a sample of expenses/expenditures to determine whether the transaction was valid.

Perform analytical procedures on payroll expenses/expenditures. The analysis should include development of an expectation of what payroll should be in the current year due to changes in employees, COLAs, benefits, etc.

Test payroll to see if transactions are properly charged

### **Invalid, Unallowable or Fraudulent Expenses**

*See the testing strategy considerations in the Rights & Obligations step.*

### **Improper Expense Recognition**

Test selected or sampled expenditures recorded in the current period to verify the expense was recorded for the proper period.

# State of Washington

*Transactions at the beginning and end of the period would generally be considered at highest risk of being improperly recorded in the current period. Auditors should consider scanning transactions recorded during these timeframes to identify high risk transactions.*

## **Incorrectly recording expenses that do not meet GAAP criteria**

Review the entity's schedule cross-walking the financial statements to the general ledger and check that any transactions among consolidated funds are eliminated.

Check that transactions among governmental funds and transactions among proprietary funds are eliminated on the government-wide statements.

## **Interfund Expenses**

For internal service fund charges, see testing strategies for internal service funds in the Accountability folder. For other types of internal charges, see testing strategies for Internal Activities.

The following is a list of **considerations** for testing the classification assertion for expenses/expenditures. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

Sample transactions for correct classification. *Use the "Sampling for FS Substantive Testing" spreadsheet available in the Store to calculate sample size and make any projection of likely misstatement to the population.*

If planning has identified a limited population that is high risk (ex: certain transaction types and/or line items within an opinion unit), scan these populations and test selected transactions.

## **Journal Vouchers**

Search for manual journal entries that reclassify expenses/expenditures from one opinion unit to another without recording a balance sheet transaction, other than a direct charge to fund balance (debit and credit to expenditure and fund balance for each opinion unit, respectively). Test selected journal entries based on risk.

Search for manual journal entries that reclassify expenses/expenditures from one line item to another. Test selected journal entries based on risk.

## **Vendor Payments**

Review the top vendors paid by opinion unit or line item (preferably as a multi-year trend) and evaluate whether the vendor meets expectations in relation to the activities of the fund. Test transactions for each unexpected vendor based on risk.

Test selected or sampled transactions for correct classification.

*NOTE: this test may be combined with expenditure tests for other attributes. For example, expenditure testing for accountability or single audit purposes may also be used for classification testing.*

# State of Washington

## Payroll

Scan totals charged to each opinion unit by employee (preferably as a multi-year trend) and evaluate whether the allocation of employee's time to that opinion unit meets expectations based on job titles, organization charts, observation or the phone list. Follow up on unexpected allocations by review of timesheets or employee interviews.

Perform an expected payroll test by opinion unit.

Test a sample of pay periods for salaried and hourly employees to ensure that expenditures are being classified to the correct opinion unit. This test should verify both the correct allocation of direct charges and that leave and benefit costs are allocated in the same proportion as direct charges.

## Cost Allocation Plans / Internal Service Fund Allocations

Review cost allocation plans or internal service fund charges to confirm that the classification of joint costs to different opinion units is supported. *See example testing strategies for these areas located in the Accountability cabinet .*

Guidance/Criteria:

Record of Work Done:

## **Material Balances and Assertions:**

Governmental Activities- Education - Higher Education Expenses- Occurrence, Classification  
Higher Education Special Revenue - Charges for Expenses- Occurrence, Classification

Controls are documented in the Education Expenses\_Controls step.

## **Substantive tests performed to meet the Occurrence and Classification assertion:**

### **Payroll:**

See testing here:[CONFIDENTIAL - Education Expenses]

We tested payroll disbursement transactions to determine whether reported expenses/expenditures represent real obligations incurred during the period and if reported expenses/expenditures were allocated to the proper fund (Occurrence and Classification). During testing we determined if expenses were supported by valid documentation, earn type amounts agreed to the supporting documentation, and that expenses were recorded to the proper fund.

We randomly selected 30 employees from the ctcLink Query CTC\_PY\_PAY\_CHECK\_DETAIL that we obtained from Petrina Sims, Payroll Manager. There were 3,036 employees listed representing a total of \$135,086,442 in gross wages on the report for fiscal year 2024, so we utilized the

## State of Washington

random number generator to select our sampling population.

We requested documentation from the Pertrina such as Faculty Workload Appointment forms, Earnings Account Mapping ctclink screenshots, Stipend Request forms, QHC\_TL\_PAYABLE\_TIME\_STATUS ctclink queries, Employee Compensation History ctclink screenshots, timesheets, and QHC\_AB\_ALL\_LEAVE\_TAKEN ctclink queries to support the gross wages paid to the 30 selected employees at Seattle Colleges. We traced amounts in the supporting documentation to amounts by earn-type for each employee to verify occurrence. We also compared the combocodes found in the Earnings Account Mapping to confirm that wages were properly classified to the correct fund. We also verified gross wages for each employee by earn type using the ctclink query QHC\_PY\_EMPL\_WAGES (one was provided for each employee tested), provided by David Williams, Director of Financial Reporting. We did not receive full support for 7 of our 30 testing selections, resulting in a known misstatement of \$(69,121), and a total misstatement (known + likely) of \$6,869,128. **See issue and AOM linked above in conclusion.**

### **Accounts Payable:**

See testing here:[[CONFIDENTIAL - Education Expenses](#)]

We tested accounts payable disbursement transactions to determine whether reported expenses/expenditures represent real obligations incurred during the period and if reported expenses/expenditures were allocated to the proper fund (Occurrence and Classification). During testing we determined if expenses were supported by valid documentation, amounts agreed to the supporting documentation and that expenses were recorded to the proper fund.

We obtained a query from Ulrike Lopez, Accounts Payable Supervisor: QFS\_AP\_VCHR\_ACCTG\_LINE. The query was a detailed listing of transactions for Objects E - J. We randomly selected 30 transactions to test.

Since we had access to the ctclink system, we were able to utilize the accounts payable module to search for each voucher identification number on our transaction sample list. In the system, we were able to review and verify the approval history for the vouchers, view attached original invoices and A-19s, and review the budget account coding or chart string for each voucher line to ensure it correlated with the associated approved purchase order or the attached A-19. If applicable, we were also able to see receiving information. We were able to verify that the attachment was shown to the approver(s) to indicate that the cost was approved to pay before they approved the payment.

Our selection included some vouchers for US Bank National Association, that did not have approvals and documentation attached. We inquired with David Williams and he let us know that this was actually a Purchasing Card transaction. These transactions also go through the Accounts payable module, however they do not have the documentation attached or the approvals viewable within the accounts payable module. David provided us with additional documentation for these purchase card transactions, and we were able to see that the transactions were properly approved and supported by documentation, and they were properly classified to the correct fund. **No issues noted.**

### **J.2.PRG - Community & Tech College Testing - Seattle**

# State of Washington

*Procedure Step:* Federal Grants in-Aid - Controls  
*Prepared By:* MRF, 9/12/2024  
*Reviewed By:* RKM, 10/18/2024

## Purpose/Conclusion:

### **Purpose:**

To gain an understanding of internal controls and assess control risk in order to help plan the nature, timing and extent of substantive testing.

### **Conclusion:**

We have gained an understanding of internal controls and assessed control risk at **maximum**. Therefore, we **will not** place reliance on controls. Our understanding of internal controls and control risk assessment will be used to help plan the nature, timing and extent of substantive testing.

We noted **no** material weaknesses or significant deficiencies in internal controls.

## Testing Strategy:

The following procedures are **required** for all relevant systems:

*Optional:* List the financial statement balances and relevant assertions addressed by the understanding.

### **STEP 1: Understanding of Controls**

Gain an understanding of the internal control process, identify key controls over relevant assertion(s), and note any control weaknesses.

*The auditor's understanding should include:*

*Business processes relevant to financial reporting of the relevant assertion for the material balance. Processes should encompass automated and manual procedures by which transactions or events are identified or initiated, authorized as needed, recorded, processed and corrected as needed.*

*Original accounting records and how records are rolled-up to intermediary ledgers and transferred to the general ledger or financial statements.*

*Detailed descriptions of key controls. Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a significant*

## State of Washington

*deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*In gaining an understanding of controls, consider the overall understanding of Entity-Level control elements as documented in the "Entity-Level Controls" step as they relate to this particular system.*

### **STEP 2: Confirm Key Controls**

Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walkthrough of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency or material weakness likely exists.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "IT Control Testing" step pulled down from the SAOStore and be hyperlinked with this step. Auditors should consider contacting Team IT Audit for assistance.*

### **STEP 3: Preliminary Control Risk**

Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls in step 4A. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls. All potential material weaknesses and significant deficiencies should be discussed with the AIC or AAM, since they must be reported as findings.*

### **STEP 4: Control Testing**

## State of Washington

If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency or material weakness likely exists. If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "IT Control Testing" step pulled down from the SAOStore and be hyperlinked with this step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of Entity-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

### **STEP 5: Final Control Risk**

Evaluate the results and document a final control risk assessment. Consider whether any internal control issues identified represent material weaknesses or significant deficiencies.

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Policy/Standards tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency. **All potential material weaknesses and significant deficiencies should be discussed with the AIC or AAM, since they must be reported as findings.***

# State of Washington

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits](#) Planning Guide**

Record of Work Done:

## **Significant Balances and Assertions:**

Internal controls in the Community and Technical College System address the following balances:

Governmental Activities - Education - Higher Education Operating Grants and Contributions - Occurrence  
Higher Education Special Revenue - Federal Grants-In-Aid - Occurrence

See lead sheet here: [[Lead Sheet](#)]

For fiscal year 2024 we noted Department of Education grants and contracts revenue made up approximately 93 percent of the total Federal grants-in-aid balance. Our control understanding and testing will focus on these revenues. We met with David Williams (Director of Financial Reporting), Charlene Rios (Director of Accounting), and Lee Grub (Associate Director of Student Services) on 09/11/2024 to gain an understanding of controls and procedures related to federal grants in aid. We noted that Lee was recently promoted to her position and had previously been the grant manager.

## **STEP 1: Gain an Understanding of Internal Controls**

There are two main types of grant expenditures related to Department of Education (DoE); Financial Aid for students through Pell grants and direct loans and Grants and Contracts for other educational expenses like classroom equipment. Lee estimates that Financial Aid is the far larger expense and revenue.

**Financial Aid:** Financial aid is awarded to students each quarter in packages based on FAFSA (Free Application for Federal Student Aid), the amounts flow through the Student Financials (SF) module in ctclink, and gets posted to student accounts. On a monthly basis, Lee (or her

## State of Washington

replacement Trinity) will pull the GL data and reconcile between the SF module and the ledger.

**Grants and Contracts:** Each grant or contract has a Primary Investigator (PI) who is the point of contact for the grant, conducts funding requests, and authorizes expenditures. When expenditures are entered into the accounts payable module in ctclink, the system requires information about if the expense is related to a grant. If it is, ctclink automatically books the revenue to match the expenditure. Expenditures could be for any related part of the grant such as equipment, scholarships, or staff payroll.

### **Making the Drawdown:**

Each fiscal month end, Lee runs the "QFS\_GL\_JRNL\_ACCT\_ANALYSIS", Program/Organization Trial Balance report for each campus and org index within CTCLink. Each Org index corresponds to a different grant type, with the program/org title describing the specific award. The reports are related to a program/organization trial balance for that month and provide expenditure and revenue amounts. The Grants team creates an invoice to match the expenditures and sends the package of support to the PI (or SF) for approval.

For each grant, revenues and expenses are also tracked in Excel spreadsheets that tracks the YTD expenditures and revenues requested. The generated invoice is approved when the amount reconciles to the calculated monthly drawn-down amount (**Key Control 1 - Occurrence**). When the invoice is approved, the request is sent to the district. For Department of Education funds, the G5/6 portal is used to request funds, for other sources the grant is requested from the source itself. For example, grants from State Agencies are requested through the agency itself. As a district, the college confirms that ACH payments are received as a deposit. In ctclink, approval is required before any funds can be drawn-down.

Lee verifies that the draw-down is received in full by reviewing the daily ACH report from Bank of America. After verifying the receipt, she creates a journal entry to record the revenue in ctclink. She provides the documentation above, including a screenshot of the draw request and ACH statement to Davina Fogg, Executive Director of Finance/Controller, for approval of the batch transactions to record the revenue (**Key Control 2 - Occurrence**).

### **Key Controls:**

**Key Control #1: The grant invoice is generated by the grant team based on true expenditures related to an authorized grant and is approved for available funding each month.**

**Key Control #2: The batch for revenue processing is approved after a secondary review by the Controller, with the screenshot of the draw request, the excel worksheet, and ACH statement showing the expense occurred and was authorized.**

### **Identified Weaknesses:**

None

## **STEP 2: Confirm Key Controls**

**Key Control #1: The grant invoice is generated by the grant team based on true expenditures related to an authorized grant and is approved for available funding each month.**

## State of Washington

We reviewed the grant revenue invoice for Pell financial aid issued in FY 24. Lee Grubb provided the "WA062 Pell Recon" spreadsheet. The "data" tab listed all expenditures through the year, we noted there were 113 rows of data totalling \$5,493,704.09 in expenditures. The "total analysis" tab contained a pivot table of the data with some adjustments, for a total of \$5,493,088.09. It also contained a screenshot from the Department of Education grant website G5/6 showing that the completed payments of Pell grants was \$4,396,256.99. The difference between the total amount expended and total revenue returned (completed payments) was \$765,023.25. However, the tab also showed a screenshot detailing that the only available funding as of that date (because there are frequent timing differences) was \$193,146.01. Since the amount expended is greater than the available funds for drawdown revenue, the total amount of available funds was requested. We reviewed the PDF document "WA062 FY2324 Pell Drawdown Backup" which detailed the request for the full available amount, the generated invoice numbered DRA-0000000705 and confirmation of deposit to the college's BOA account on May 30, 2024. *No issues noted.*

**Key Control #2: The batch for revenue processing is approved after a secondary review by the Controller, with the screenshot of the draw request, the excel worksheet, and ACH statement showing the expense occurred and was authorized.**

We reviewed a screenshot of the approval for the draw down credit Invoice in the billing system. The invoice number matched the workbook of support of DRA-0000000705. We noted it was approved by the central billing approver, Julie Larmore, on 05/30/2024, and by Charlene Rios, approver for expenditures in business unit WA060 if over \$50K on 05/30/2024 two hours later. *No issues noted.*

### **STEP 3: Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **STEP 4: Control Risk at LOW - Test Key Controls**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

### **STEP 5: Final Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **J.2.PR.G - Community & Tech College Testing - Seattle**

*Procedure Step:* Federal Grants in-Aid - Testing

# State of Washington

*Prepared By:* MRF, 10/4/2024

*Reviewed By:* RKM, 10/18/2024

Purpose/Conclusion:

**Purpose:**

To determine whether reported revenues represent actual amounts relating to the period (Occurrence).

**Conclusion:**

We determined reported revenues represent actual amounts relating to the period (Occurrence).

Testing Strategy:

The following is a list of **considerations** for testing the occurrence assertion for revenues. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

For revenues received from the State Treasurer, trace reported amounts to the State Treasurer confirmations available in LGCS.

Confirm intergovernmental revenues with the other government or grantor or by reviewing appropriate correspondence.

Trace selected or sampled revenues from the GL to supporting billings or subsequent receipts.

If revenue is receipted into a specific clearing account, or if third-party lockbox or receipting services are used, compare recorded revenue to a sum of monthly totals from bank, lockbox or service organization reports.

Develop sufficiently precise expectations for a substantive analytical to compare to reported revenue amounts.

Search for manual journal entries that credit (increase) revenues. Consider testing if any risk indicators are noted.

**Cut-Off / Revenue Recognition**

Test a sample of underlying transactions to verify the revenue was recorded for the proper period. Note: transactions at the beginning and end of the period would generally be considered at highest risk of being improperly recorded in the current period.

If revenue is billed at a constant rate, calculate an expectation based on the average monthly billing or re-calculate the year-end accrual journal entry and compare to the reported receivable.

Evaluate revenue recognition against GAAP criteria for selected transactions or revenue streams.

**Interfund Revenues**

For internal service fund charges, see testing strategies for internal service funds in the Accountability folder. For other types of internal charges, see testing strategies for Internal Activities.

**Detail Roll-up**

Compare year-end totals from general ledger to subsidiary software modules for selected revenues.

## State of Washington

Review the government's reconciliation of general ledger to subsidiary ledgers.

*Detail roll-up testing is not sufficient audit evidence by itself since it only entails comparing different sets of the entity's own accounting records. However, it may be combined with other substantive tests to address identified risks. For example, if substantive testing is performed at the subledger level, it may be combined with a test that the subledger detail accurately rolls up to the general ledger or financial statements.*

Guidance/Criteria:

### **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

### **BARS [3.6.9](#) Revenue Accruals in Governmental Funds**

Record of Work Done:

### **Significant Balances and Assertions:**

Governmental Activities - Education - Higher Education Operating Grants and Contributions - Occurrence  
Higher Education Special Revenue - Federal Grants-In-Aid - Occurrence

Controls are documented in the "Federal Grants-In-Aid - Controls" step.

### **Substantive tests performed to meet the Occurrence assertion:**

We reviewed AFRS data to determine what revenue sources were significant for testing. We determined source 384 made up 84% of the Federal Grant-In-Aid balance and decided to focus our testing on source 384 (Department of Education). Lee Grubb, Associate Director of Student Financial Services, provided the testing population in the spreadsheet "FY24 Federal Grant Revenue QFS\_GL\_ACCOUNT\_ANALYSIS". We tied the EIS reported amounts for Federal Grants in Aid to the totals of the population query with no variance. See our summary at: [\[Federal Grants In Aid\]](#) tab, "Population Completeness".

We used the FS Substantive Sample spreadsheet with tolerable misstatement and assurance levels dictated by the material balance workpaper for a planned sample size of 30. We selected 1 individually significant item and randomly selected 30 samples throughout FY24. Lee Grubb provided support for each of the grant revenue amounts. Because the selected amounts were per project for a single day, we used the population spreadsheet to filter and find the total amount of the project for the month (period).

We tied the total of the period to the College's monthly grant reconciliation (tied the expenditures to the revenue recorded). Any variances of

## State of Washington

things like overstated expenses were investigated and reversed as appropriate to ensure all revenue tied to expenses. We reviewed email chains between staff members that outlined the identified variances and followed the included screenshots of adjustments and resubmitted workbooks to confirm the adjustment occurred. If multiple projects have the same funding source then the draw amounts were requested in a batch. Lee also provided the draw requests for the totals and bank statements to show the subsequent deposits.

By tying the daily revenue recorded to the monthly batch and confirming dates, we determined reported revenues represent actual amounts relating to the period (Occurrence). See testing at [\[Federal Grants In Aid\]](#), tab, "Grant Revenue Testing". ***No issues noted.***

### J.3.PR.G - Community & Tech College Testing - Spokane

*Procedure Step:* Summary & Conclusion

*Prepared By:* JAG, 10/18/2024

*Reviewed By:* RKM, 11/5/2024

Purpose/Conclusion:

#### **Purpose:**

To evaluate risk assessments and the sufficiency and appropriateness of evidence obtained based on results of substantive work.

#### **Conclusion:**

We determined that **no modifications** were necessary to inherent risk, control risk or the risk of material misstatement as assessed in planning.

We also determined that evidence obtained was sufficient and appropriate in response to the risk of material misstatement.

Testing Strategy:

Auditors are **required** to evaluate conclusions for substantive testing as follows:

*Auditors may wish to use the optional Lead Sheet available in the Store to summarize testing related to each balance and assertion.*

**1.** Determine whether the results of substantive testing indicate a need to modify the inherent risk assessment (IR), control risk assessment (CR), risk of material misstatement (RMM) or other aspects of planning (such as material balances or assertions). If so, document changes and consider the need for additional testing.

## State of Washington

*If the results of substantive testing indicate a need to change control risk, auditors should also update the [Permanent File](#) by either correcting the documentation or by adding an update section describing changes to the top of the record of work done. For all changes to IR, CR, or RMM the [Material Balances](#) spreadsheet should be updated.*

*More significant changes to other aspects of planning (such as material balances or assertions) should be referenced in this step and documented in detail in the [Changes to FS Audit Plan](#) step.*

**2. Evaluate whether the quality and quantity of evidence obtained is sufficient and appropriate in response to the risk of material misstatement. In making this determination, auditors should evaluate:**

Information to be used as audit evidence:

- Does evidence relate to the population, period of time and risk (assertion and “what could go wrong” from the Material Balance Spreadsheet)? If there are any gaps or uncertainties in the logical connection between the evidence and conclusions, is there a documented consideration and explanation?
- Are the sources of information sufficiently reliable and appropriate for the risk (whether internal to the government, external, or auditor developed)? If key information is not from a sufficiently reliable source (for example, inquiry), then is it corroborated by information that is?
- Are there any concerns about accuracy, completeness, authenticity, or bias in information? If so, did the auditor perform sufficient procedures to confirm reliability of that information?
- Is information precise enough to catch if misstatements exceeded the tolerable level?
- Is information detailed enough to conclude on whether or not there were misstatements?
- Was there any information that appeared contradictory or inconsistent? If so, was there a documented response to the inconsistencies or doubts about the reliability of evidence?

Results:

- How much misstatement was identified by testing, and the likelihood and magnitude of further potential misstatement?
- How did misstatements occur and how often might they occur again in the population?
- Were misstatements caused by control deficiencies or circumvention of controls?
  - If control deficiencies, is there a need to re-evaluate our understanding of controls in the [Permanent File](#) folder or assessment of control risk?
  - If circumvention, the [Management Override of Controls](#) step should address or reference this area. Auditors should also consider whether a fraud risk has been identified.
- Did tests identify a different level or type of risk than the planned audit response was designed to address?
- If likely misstatements are identified, are further procedures necessary to improve the precision of our estimate?

## State of Washington

*To support the overall evaluation of audit risk and provide a basis for concluding on the overall sufficiency and appropriateness of evidence in the [FS Summary & Report](#) step, auditors should conclude in each area whether the auditor continues to believe that the tests performed and quality and quantity of evidence obtained are commensurate with RMM for all relevant risks (the "what could go wrong", in the [Material Balances](#) spreadsheet).*

If the auditor determines that evidence is not sufficient or appropriate, additional substantive testing should be done. If sufficient, appropriate evidence is not available for audit, the AIC should discuss the effect on our audit report with the AAM and AM.

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6310](#) – Determining the Nature, Timing and Extent of Substantive Testing**

**SAO Audit Policy [3210](#) – Audit Evidence**

**[Investments](#) area guide**

Record of Work Done:

### **(1) Do the results of substantive tests indicate a need to modify our risk assessment (IR, CR and RMM)?**

We noted no results from our substantive tests which would indicate a need to modify our risk assessment.

### **(2) Was the quality and quantity of evidence obtained sufficient and appropriate?**

We determined that the quality and quantity of evidence obtained was both sufficient and appropriate.

### **J.3.PR.G - Community & Tech College Testing - Spokane**

*Procedure Step:* Cash and Pooled Investments - Controls

*Prepared By:* JAG, 10/7/2024

# State of Washington

*Reviewed By:* RKM, 11/5/2024

Purpose/Conclusion:

**Purpose:**

To gain an understanding of internal controls and assess control risk in order to help plan the nature, timing and extent of substantive testing.

**Conclusion:**

We have gained an understanding of internal controls and assessed control risk at **maximum**. Therefore, we **will not** place reliance on controls. Our understanding of internal controls and control risk assessment will be used to help plan the nature, timing and extent of substantive testing.

We noted **no** material weaknesses or significant deficiencies in internal controls. We noted one issue related to a lack of evidenced review and approval of the investment reconciliations. See issue here: [\[V: CCS Lack of Documented Review and Approval of Investment Reconciliations\]](#)

Testing Strategy:

The following procedures are **required** for all relevant systems:

*Optional:* List the financial statement balances and relevant assertions addressed by the understanding.

**STEP 1: Understanding of Controls**

Gain an understanding of the internal control process, identify key controls over relevant assertion(s), and note any control weaknesses.

*The auditor's understanding should include:*

*Business processes relevant to financial reporting of the relevant assertion for the material balance. Processes should encompass automated and manual procedures by which transactions or events are identified or initiated, authorized as needed, recorded, processed and corrected as needed.*

*Original accounting records and how records are rolled-up to intermediary ledgers and transferred to the general ledger or financial statements.*

*Detailed descriptions of key controls. Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

# State of Washington

*In gaining an understanding of controls, consider the overall understanding of Entity-Level control elements as documented in the "Entity-Level Controls" step as they relate to this particular system.*

**Expected key control for existence and completeness:** Bank reconciliations are performed timely on at least a monthly basis to ensure the general ledger agrees to bank and investment account records.

*Documentation should include who performs bank reconciliations, how often they are performed and how reconciliations are aggregated and compared to the general ledger.*

*Note: we would expect additional key controls if the government has any alternative investments or investments subject to significant interest rate or other risks.*

Expected compensating controls:

- An accounting system module or a standard template is used to document reconciliations.

- Segregation of duties in that the person performing bank reconciliations does not have cash handling duties or access to initiate disbursements by wire or check.

- Timely, independent review of bank reconciliation documentation, including journal entries for adjustments identified from the bank statements (such as fees, NSF checks, etc).

- An up-to-date listing of change fund, petty cash and imprest fund accounts is maintained in accordance with BARS 3.8.8.

- Zero-balance bank accounts and clearing funds (see BARS 3.8.6) are reconciled to zero on a monthly basis.

- If the government has an investment account (that is, other than the State or County LGIP), documented inquiry with their investment service to verify the methodology for determining fair value of investments and the valuation input hierarchy level for purposes of their fair value (GASB 72) disclosures.

*Some investment accounts provide information about its methodology, assumptions, and data in valuing investments at the asset class level. However, brokers often provide no, or only limited, information about the inputs and assumptions used in developing the fair value. Management should either obtain a document with this information or contact the broker/institution to gain an understanding of the information about methods and inputs used in determining the fair value and where the investment should be disclosed in the hierarchy.*

*Contact the Investment Specialist for any questions on expected controls or documentation over fair value disclosures.*

## **STEP 2: Confirm Key Controls**

Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

# State of Washington

*A walkthrough of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency or material weakness likely exists.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "IT Control Testing" step pulled down from the SAOStore and be hyperlinked with this step. Auditors should consider contacting Team IT Audit for assistance.*

*Suggested confirmation for expected key controls are to obtain and scan all year-end bank reconciliations and supporting documentation. This is normally done in conjunction with substantive testing. We would expect that bank reconciliations would clearly show check figures that compare the aggregated adjusted bank balance to the general ledger.*

## **STEP 3: Preliminary Control Risk**

Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls in step 4A. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls. **All potential material weaknesses and significant deficiencies should be discussed with the AIC or AAM, since they must be reported as findings.***

## **STEP 4: Control Testing**

If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency or material weakness likely exists. If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the*

## State of Washington

*audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "IT Control Testing" step pulled down from the SAOStore and be hyperlinked with this step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of Entity-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

### **STEP 5: Final Control Risk**

Evaluate the results and document a final control risk assessment. Consider whether any internal control issues identified represent material weaknesses or significant deficiencies.

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Policy/Standards tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency. **All potential material weaknesses and significant deficiencies should be discussed with the AIC or AAM, since they must be reported as findings.***

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

# State of Washington

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits](#) Planning Guide**

Record of Work Done:

**Significant Balances and Assertions:**

Internal controls in the Community and Technical College System address the following balances:

Higher Education Special Revenue Fund - Cash and Cash Equivalents - Existence

Higher Education Student Services Fund - Cash and Cash Equivalents - Existence

See lead sheet here: [[Lead Sheet](#)]

**1. Gain an Understanding of Internal Controls**

On 9/12/2024 we met with the following people to discuss internal controls over cash and investments:

Tiffany Henderson, Director of Financial Reporting

Laurice May, Fiscal Analyst 2

Clint McGregor, Fiscal Services Account Manager

**Cash**

CCS has had no changes in FY24 to their list of cash bank accounts, which are:

Bank of America Checking

Bank of America Sweep

Washington Federal Bank (Checking)

Mount West/Glacier (Savings)

USBank Business Silver (Money Market)

The BoA accounts are CCS' main accounts with the most daily activity. Daily, Laurice (FA2) will download account information (daily deposits, ACH, checks, adjustments, EFTs, etc.) from the BoA's website using the CashPro tool in order to reconcile the day's transactions. She imports the file from BoA into ctcLink. SBCTC also goes to the BoA website and imports the transaction file into ctcLink so Laurice can compare her version, to SBCTC's version, then to the GL in ctcLink. As the data in ctcLink does not give a lot of specific detail about each transaction, Laurice uses the information from BoA to create detailed entries called "Treasury journal entries" to post to the GL. To ensure proper segregation of duties, staff who receipt cash have no access/input to the bank reconciliation process.

## State of Washington

At month end, Laurice performs the reconciliation for all cash counts except for Bank of America Checking. A separate reconciliation is prepared for the Bank of America checking account and this reconciliation is prepared by Clint McGregor, Fiscal Services Account Manager, and reviewed and approved by Tiffany Henderson. Typically, there are multiple bank activities that need to be reconciled. CCS has found that reconciling the journals by type has helped them to complete more accurate bank reconciliations. After Laurice prepares the reconciliation then Clint reviews and approves it to ensure it is accurate **(Key Control 1)**. At year end, a similar process is performed as with month end, but Tiffany also performs a review of the entire year's reconciliations.

For petty cash, approximately once a month Clint prepares a tracking spreadsheet based on petty cash counts from each of the cash receipting locations. This information is compiled by Tiffany. Clint will compare this data to what is in the GL in ctcLink to ensure amounts are recorded correctly in the system.

### Investments:

CCS has the following investment accounts:

LGIP

Banner Bank (Tiffany noted during the control meeting that the two CD accounts with Banner Bank matured in February so they were moved to a money market account.)

USBank Safekeeping (Money Market)

Once a month Clint prepares a monthly reconciliation of investment accounts. He receives investment account statements from Tiffany and LGIP statements from the CFO. Once his reconciliation is complete, showing CCS' monthly position, he sends the reconciliation to Tiffany for review and approval **(Key Control 2)**. Once approved, Clint prepares the journal entries to post to the GL. These entries are reviewed and approved by the CFO prior to posting.

At year end, Clint takes the investment statements from the entire year and compares the actual statements to the GL to make sure that all activity has been accounted for in the GL. Once the year end reconciliation is prepared, Tiffany reviews and approves it to ensure it is accurate.

### Historical Information:

During 2019, the State Board force closed each FY from 2016 through 2019. In order to bring the balances back to current for the start of 2020, the College performed several entries to write off cash balances which were growing due to the issues in ctcLink. In FY19 we were shown a CASH spreadsheet which showed the adjustments made in 2019 that were applicable for 2016, 2017, 2018 and 2019. In order to do this, the College created a summary of amounts to be adjusted, and then took amounts out of the cash accounts (101150, 101151, 101160), into 342700 and then out of 342700 and into 603372 for prior period adjustments. The total amount of adjustments made were:

2016 - \$5,318,010.03

2017 - \$6,143,096.53

## State of Washington

2018 - \$9,001,754.39

2019 - \$14,277,483.62

Total adjustments made in 2019 = \$34,740,344.57

There were no write offs for 2020, 2021, 2022, 2023, or 2024. For controls to ensure that the GL is reconciled to AFRS see: [[Controls - ctcLink System Reconciliation](#)]. This is done at the state level.

### Key Controls:

**Key Control #1 (Cash - Existence):** Monthly, the Fiscal Analyst 2 prepares a reconciliation of cash bank accounts between bank statements and the GL to ensure recorded cash amounts represent actual assets. The Fiscal Services Account Manager reviews and approves the reconciliation to ensure its accuracy.

**Key Control #2 (Investments - Existence):** Monthly, the Fiscal Services Account Manager prepares a reconciliation of investment account balances to ensure all account activity from the statements is accounted for in the GL. The Director of Financial Reporting reviews and approves the reconciliation to ensure its accuracy.

### Identified Weaknesses:

**None.**

### **STEP 2: Confirm Key Controls**

**Key Control #1 (Cash - Existence):** Monthly, the fiscal analyst 2 prepares a reconciliation of cash bank accounts between bank statements and the GL to ensure recorded cash amounts represent actual assets. The Fiscal Services Account Manager reviews and approves the reconciliation to ensure its accuracy.

We reviewed the June 2024 reconciliations for all bank accounts. We noted the following:

Washington Federal 1000080: Prepared by Laurice May, Fiscal Analyst 2 on 7/11/2024. Reviewed by Clint McGregor, Fiscal Services Account Manager on 7/11/2024.

Mountain West 1000090: Prepared by Laurice May, Fiscal Analyst 2 on 11/8/2023. Reviewed by Clint McGregor, Fiscal Services Account Manager on 11/10/23. The reconciliation states that this account was closed on 10/17/23 and we reviewed the closure documents to confirm.

Bank of America Sweep 1000100: Prepared by Laurice May, Fiscal Analyst 2 on 7/11/2024. Reviewed by Clint McGregor, Fiscal Services Account Manager on 7/11/2024.

US Business Silver 1000110: Prepared by Laurice May, Fiscal Analyst 2 on 7/11/2024. Reviewed by Clint McGregor, Fiscal Services Account Manager on 7/11/2024.

Bank of America Checking: 1000070: Prepared by Clint McGregor, Fiscal Services Account Manager on 7/22/2024. Reviewed by Tiffany Henderson, Director of Financial Reporting on 8/2/2024.

**No issues noted.**

# State of Washington

**Key Control #2 (Investments - Existence):** Monthly, the Fiscal Services Account Manager prepares a reconciliation of investment account balances to ensure all account activity from the statements is accounted for in the GL. The Director of Financial Reporting reviews and approves the reconciliation to ensure its accuracy.

We reviewed the "FY24\_Investment\_Workbook.xlsx" which included the June 2024 Investment Reconciliation. We noted the reconciliation included activity for all investment accounts. There was evidence of Clint McGregor, Fiscal Services Account Manager, preparing the report on 7/2/2024. The reconciliation did not contain evidence of a review.

**We recommend CCS ensure all reconciliations include a signature and date of review to evidence that the review and approval has taken place and in a timely manner as required by SAAM 85.50.40.c. See issue here: [\[V: CCS Lack of Documented Review and Approval of Investment Reconciliations\]](#).**

## **STEP 3: Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

## **STEP 4: Control Risk at LOW - Test Key Controls**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

## **STEP 5: Final Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

## **J.3.PR.G - Community & Tech College Testing - Spokane**

*Procedure Step:* Cash and Pooled Investments - Testing

*Prepared By:* JAG, 10/16/2024

*Reviewed By:* RKM, 12/10/2024

# State of Washington

Purpose/Conclusion:

**Purpose:**

To determine whether reported cash and pooled investments existed as of the end of the period (Existence).

**Conclusion:**

We determined reported cash and pooled investments existed as of the end of the period.

Testing Strategy:

**SAO Policy Requirement: Confirming or Verifying Cash & Investment Balances**

Confirmations can either be blind or a positive confirmation. In a blind confirmation (sweep), the auditor requests information on all accounts the bank holds for the entity (by entity name and/or EIN). In a positive confirmation, the auditor lists accounts (or accounts and balances) per the entity and asks the bank to confirm that the information is correct.

Confirm cash and investment account balances with County Treasurer, bank and/or brokerage. Use the template confirmation form provided in the Store when needed.

Confirmations can be mailed to addresses listed on the Bank Confirmation Address List available on the Auditor Reference Guide. If the bank notifies you of a different address, please contact Team Audit Support to update the list.

Banks may confirm incorrect amounts either due to a simple mistake, use of a wrong confirmation date or incorrectly including or excluding accounts. The first step in resolving differences should be to check information against the entity's bank statements and then call the bank to specifically confirm any difference.

Confirming investments may involve physical inspection, confirmation with the issuer, confirmation with the custodian, confirmation of unsettled transactions with the broker/dealer, confirmation with the counterparty, and/or reading executed partnership or similar agreements. When confirming investments, ensure investments are held in the entity's name.

*If confirmations are not used*, auditors must at minimum verify balances to the County Treasurer, bank and/or brokerage statements. If this is done, the auditor should consider the risk that the statements were altered and should examine papers for indications of alteration.

The following is a list of **additional considerations** for testing the existence assertion for cash and investments. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

**Bank Reconciliations**

If the auditor is comparing reconciled (confirmed) bank or county treasurer balances to the GL (rather than confirmed amounts within an

## State of Washington

expected variance due to reconciling items), the auditor should consider performing some or all of the following tests to verify the accuracy of the reconciliations. Note that testing the reconciliation will provide evidence of both the existence and completeness of cash and investment balances.

Trace (or compare summed) bank balances per statements to reconciliations.

Trace (or compare summed) book balances per reconciliations to the general ledger or financial statements.

*If a cash account is allocable to a particular fund, the balance in the general ledger should be recorded in the same fund.*

Scan the reconciliation for reasonableness. Look for unusual, unexpected or vaguely described reconciling items, lack of support or detail, very large reconciling items, very old reconciling items, and missing or extra elements that would indicate that the reconciliation was being performed incorrectly.

Foot the reconciliation for accuracy.

Trace deposits in transit to the subsequent month's bank statement, considering reasonableness of the in-transit period.

Trace outstanding checks to cash disbursement journal.

Check that any other reconciling items are valid and have been properly accounted for (ex: large debit or credit memos).

Check reconciliation against prior and/or subsequent reconciliations for reasonableness of amounts and items included and to trace reconciling items from the previous and/or subsequent period.

### Other Tests

Inquire whether any checks or deposits were being held at year end for budget, cash flow or other purposes.

Confirm investments purchased but not received as of year-end

Confirm investments sold but still held as of year-end

Confirm interest due or accrued but not yet received as of year-end

Search for manual journal entries that debit (increase) cash. Consider testing if risk indicators are noted.

Review reconciliations of clearing and transmittal accounts.

See accountability steps for testing strategies related to petty cash and imprest funds, which are not expected to be material to the financial statements.

*Auditors may perform additional procedures to confirm information in the deposit and investment note disclosure in this step or in the Notes to the Financial Statements step. Auditors should contact the Investment Specialist if they note significant interest rate or other risks with the government's deposits or investments.*

Guidance/Criteria:
--------------------

# State of Washington

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**Outstanding Checks and Deposits in Transit** – Per TIS section 1100.08 (AICPA Technical Questions and Answers), outstanding checks should be reported as a reduction of cash and the amount of deposits in transit should be reported as cash. A check is considered outstanding from the time that it is out of the payor's control – when mailed or delivered to the payee – until the time it clears the bank. Cash should represent amounts within the control of the reporting entity, that is, the amount of cash in banks plus cash and checks on hand and deposits in transit minus the amount of outstanding checks.

Record of Work Done.
----------------------

## **Significant Balances and Assertions:**

Higher Education Special Revenue Fund - Cash and Cash Equivalents - Existence  
Higher Education Student Services Fund - Cash and Cash Equivalents - Existence

Controls are documented in the "Cash and Cash Equivalents - Controls" step.

## **Substantive tests performed to meet the Existence assertion:**

See testing here: [[Cash and Investments Testing](#)]

AFRS to ctcLink:

We obtained ctcLink data using the query QFS\_GL\_SNP\_DETAIL, filtered for cash and investments and AFRS data from here: [[Final Planning Community Colleges Selected for Testing](#)]. We determined that the AFRS balances tie to ctcLink without exception. However, due to the complexity

## State of Washington

of testing the AFRS amounts individually we decided to test the College's entire cash and pooled investments balance to determine if it existed as of June 30, 2024. The main focus of testing is GL titled, "Cash - Bank 1" since this GL consisted of most of the AFRS balances we selected. This GL account is the College's main Bank of America checking account. See tab, "AFRS & ctcLink" at: [\[Cash and Investments Testing\]](#).

### Cash & Investments Summary:

We obtained June 30, 2024 month-end reconciliations, bank/investment statements, and petty cash reports from Tiffany Henderson, Director of Financial Reporting, to verify existence of cash and pooled investments as of 6/30/2024. Additionally, we obtained the July and August 2024 bank statements to verify reconciling items and outstanding checks. See summary on tab, "Cash & Investment Summary" at: [\[Cash and Investments Testing\]](#).

### Outstanding Checks:

For outstanding checks, we obtained the Bank of America outstanding check report (ctcLink). We noted the balance of outstanding checks on the outstanding checks report tied to the Bank of America reconciliation prepared by the College. Additionally, we used the Financial Audit Substantive Sample testing spreadsheet to randomly selected 38 outstanding checks and reviewed either the July outstanding check report or July 2024 bank statement to ensure the checks were either still outstanding or were paid in July 2024. See tab, "Outstanding Checks Testing" at: [\[Cash and Investments Testing\]](#). We determined outstanding checks at fiscal year end either cleared the following month or were still documented as outstanding. ***No issues noted.***

### Deposits in Transit:

We traced all of the deposits in transit to the July 2024 bank statement and determined the bank statements and what was documented in the college's bank reconciliation for deposits in transit align. ***No issues noted.***

### Reconciling Items/Adjustments:

We traced the following two adjustments to the July 2024 bank statement and an AR items spreadsheet, and determined what was documented in the college's bank reconciliation aligns:

Pay cycle in transit: \$133,450.79

AR Reconciling Items: (\$326,967)

The College had two other reconciling items that could not be traced to the GL or bank statements. After follow up with Tiffany Henderson, we found that one item was an ongoing issue due to the amount being an off book audited balance adjustment from FY23 related to cash over/short entries from previous fiscal years that were reported incorrectly to the GL. The other item was also an ongoing issue related to the VPA process for state allocation. The College is currently unable to reconcile and complete a draw because SBCTC isn't allowing any draws due to their process change. The College is currently working with SBCTC to resolve these issues. ***The error is below the floor.***

# State of Washington

## J.3.PR.G - Community & Tech College Testing - Spokane

*Procedure Step:* Depreciable Capital Assets - Controls

*Prepared By:* NJH, 9/23/2024

*Reviewed By:* RKM, 10/10/2024

Purpose/Conclusion:

**Purpose:**

To gain an understanding of internal controls and assess control risk in order to help plan the nature, timing and extent of substantive testing.

**Conclusion:**

We have gained an understanding of internal controls and assessed control risk at **maximum**. Therefore, we **will not** place reliance on controls. Our understanding of internal controls and control risk assessment will be used to help plan the nature, timing and extent of substantive testing.

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

The following procedures are **required** for all relevant systems:

*Optional:* List the financial statement balances and relevant assertions addressed by the understanding.

**STEP 1: Understanding of Controls**

Gain an understanding of the internal control process, identify key controls over relevant assertion(s), and note any control weaknesses.

*The auditor's understanding should include:*

*Business processes relevant to financial reporting of the relevant assertion for the material balance. Processes should encompass automated and manual procedures by which transactions or events are identified or initiated, authorized as needed, recorded, processed and corrected as needed.*

*Original accounting records and how records are rolled-up to intermediary ledgers and transferred to the general ledger or financial statements.*

## State of Washington

*Detailed descriptions of key controls. Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*In gaining an understanding of controls, consider the overall understanding of Entity-Level control elements as documented in the "Entity-Level Controls" step as they relate to this particular system.*

### **STEP 2: Confirm Key Controls**

Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walkthrough of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency or material weakness likely exists.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "IT Control Testing" step pulled down from the SAOStore and be hyperlinked with this step. Auditors should consider contacting Team IT Audit for assistance.*

### **STEP 3: Preliminary Control Risk**

Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls in step 4A. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls. **All potential material weaknesses and significant deficiencies should be discussed with the AIC or AAM, since they must be reported as findings.***

# State of Washington

## **STEP 4: Control Testing**

If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency or material weakness likely exists. If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "IT Control Testing" step pulled down from the SAOStore and be hyperlinked with this step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of Entity-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

## **STEP 5: Final Control Risk**

Evaluate the results and document a final control risk assessment. Consider whether any internal control issues identified represent material weaknesses or significant deficiencies.

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Policy/Standards tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency. **All potential material weaknesses and significant deficiencies should be discussed with***

# State of Washington

*the AIC or AAM, since they must be reported as findings.*

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits](#) Planning Guide**

Record of Work Done:

## **Significant Balances and Assertions:**

Internal controls in the Community and Technical College System address the following balances:

Governmental Activities - Depreciable Assets (Net of Accumulated Depreciation) - Existence, Valuation

See lead sheet here: [[Lead Sheet](#)]

## **STEP 1: Gain an Understanding of Internal Controls**

On September 16, 2023, we met with Yabing Fisher, Expense Senior Accountant, and Tiffany Henderson, Director of Financial Reporting, to gain an understanding of internal controls over depreciable capital assets.

CCS follows the SAAM, Chapter 30, for guidelines on what to capitalize and determining appropriate useful lives. We reviewed the SAAM at <https://www.ofm.wa.gov/sites/default/files/public/legacy/policy/30.20.htm> and noted the following:

Threshold for capitalizing assets is \$5,000 for furniture/equipment and library resources.

Buildings, building improvements, improvements other than buildings, and leasehold improvements with a cost of \$100,000 or greater are capitalized, however, land and construction in progress are non-depreciable capital assets.

The Community Colleges of Spokane mainly uses the ctLink Asset Management (AM) Module for asset tracking and automatically calculating straight line depreciation.

## State of Washington

### Additions:

For small and attractive assets, CCS uses an inventory control system called TME, which is software that is used in tandem with AM in ctcLink to track assets. TME does not calculate depreciation, but is rather a way of keeping tabs on small assets that the college owns. Most new assets are added by Debra Griffin, Surplus/Inventory Control Specialist, to the TME and AM module, with information gained from communication between Debra and the purchasing department. When a department decides to purchase a new capital asset, it begins similar to all expenditures/purchases with a Purchase Requisition in ctcLink. Purchasing contacts Debra and requests a profile ID and state tag number for the asset to add to the purchase requisition. The profile ID is what designates the asset's useful life as determined by the SAAM for that asset category. Debra reviews the information on the requisition for accuracy and sends it back to purchasing for them to turn the requisition into a purchase order. Once the purchase order is complete, it is routed back to Debra for review and approval. Debra maintains a list of all pending purchase orders with state tags and as they are received by Central Services or delivered on site, she tags the asset for inventory. Then Debra adds the asset to AM and also to TME if applicable. Information added includes the profile ID, item description, serial number, location, cost (per invoice), date of acquisition and other pertinent information about the item (**Key Control #1 - Manual - Existence / Valuation**). Yabing receives an email that includes a list of all additions and retirements every month. Although there are no secondary checks/reviews when Debra is entering asset information into AM (or TME), Yabing reviews this list to ensure that everything ties to what is in the AM module system. Yabing reviews information from an accounting perspective and she is authorized to go into the systems and make corrections if necessary.

### Disposals:

When a department decides to dispose of equipment, the manager of the department submits a "Property Disposal Request" form to Debra at the Central Services Office. The Central Services department then processes the request by putting the item in their queue for pick-up. Once surplus equipment arrives at the Central Services warehouse, Debra will determine what the disposition will be:

- Online Auction with Department of Enterprise Services for general and some specialized equipment

- Reinland Auctions for vehicles, heavy equipment, specialized industrial trades equipment

- Recycle for salvage

- Disposal for items with no sale or salvage value

Debra is responsible for the tracking of tagged assets. Once the determination is made to remove the asset from service, she gives it a general authority number to track it and retires the asset in ctcLink AM module using the "RET" transaction type. Jeff Stradley, The Logistics Manager, approves all retirements by signing the Property Disposal Request form. All documentation is stored at Central Services. Debra will also send a fixed asset retirement report to Yabing every month. Yabing reconciles disposals on a monthly basis (as mentioned above in additions, she is included on a monthly email that includes the list of that month's additions and retirements). She verifies the asset was appropriately removed from the TME and AM systems and processes a JV in the GL to reflect the activity. Within ctcLink AM module, the movement of the asset to retirement ("RET") creates a system-generated JV, which is processed (reviewed and posted) by Yabing. JVs for additions, retirements, and depreciation are a monthly, system generated process and SBCTC discourages colleges from making manual modifications to these system generated JVs.

# State of Washington

## Capital Facilities - Buildings & CIP:

Building additions/disposals are initiated within CCS' Capital Facilities department who is responsible for creating purchase requisitions and working with the budget department to determine the overall plan of construction for a new building. The building is tracked in the AM module and listed as CIP until finished when it is placed in service. When construction begins and payments are made to vouchers, the capital facilities team will assess payments and approve them for expenditures to be capitalized and added to AM. Expenditures for capital assets are flagged as a capitalizable asset upon purchase and based on construction phase. CIP is capitalized at fiscal year end. Yabing works with the capital projects team to determine which projects have been completed and which are still in progress. Yabing performs a detailed reconciliation by project ID using data from the GL to determine amounts to report as CIP at FYE.

## Depreciation:

The College relies on the depreciation calculated by the ctclink system. The straight line method using no salvage value is used for all asset depreciation calculations. The ctclink system automatically calculates depreciation based on profile types and the asset information entered within the Asset Management module: in-service date and asset value/cost (**Key Control #2 - Automated - Valuation**). An entry is created and posted when CCS runs the closing process at month end and is reviewed for reasonableness. David reconciles all capital asset types, including depreciation balances, between the AM and GL at year end. Periodically, he also performs testing of sampled assets to validate depreciation calculations.

## Key Controls:

**Key Control #1 (Manual: Existence / Valuation):** The Inventory Control Specialist adds asset information such as Profile ID and acquisition cost to the Asset Management Module in ctclink using source documentation such as invoices and receiving reports to ensure the system reflects an asset that actually exists and one that is appropriately valued.

**Key Control #2 (Automated: Valuation):** The College relies on the depreciation calculated by ctclink. The system automatically calculates depreciation based on the asset profile type and information entered: in-service date, commodity code, and asset value.

## Identified Weaknesses:

**None**

## **STEP 2: Confirm Key Controls**

**Key Control #1 (Manual: Existence / Valuation):** The Inventory Control Specialist adds asset information such as Profile ID and acquisition cost to the Asset Management Module in ctclink using source documentation such as invoices and receiving reports to ensure the system reflects an asset that actually exists and one that is appropriately valued.

To confirm this key control we reviewed *Voucher ID* 00047505 and *Invoice No. INV\_69119* for the asset "Anatomage Cadaver Table". We inspected the A/P module in ctclink that contained the PO information that was input by The Inventory Control Specialist and reviewed by Yabing Fisher, Senior Expense Accountant, that included asset information such as Profile ID, acquisition cost, and date. We noted that the

## State of Washington

"Invoice Total" field in ctcLink was \$91,560 added on 9/11/23. We reconciled this by reviewing the actual actual vendor invoice from "Anatomage Inc." for the total amount of \$91,560, with an invoice date of 9/11/23. We were able to confirm that the details entered from the original invoice matched the purchase order that was in ctcLink. ***No issues noted.***

**Key Control #2 (Automated: Valuation):** The College relies on the depreciation calculated by cTcLink. The system automatically calculates depreciation based on the asset profile type and information entered: in-service date, commodity code, and asset value.

The confirmation of this key control and the understanding of the related general IT control is documented at [[IT Control Testing - Depreciation](#)].

### **STEP 3: Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **STEP 4: Control Risk at LOW - Test Key Controls**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

### **STEP 5: Final Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **J.3.PR.G - Community & Tech College Testing - Spokane**

*Procedure Step:* IT Control Testing - Depreciation

*Prepared By:* NJH, 10/2/2024

*Reviewed By:* RKM, 10/7/2024

Purpose/Conclusion:
---------------------

**Purpose:**

## State of Washington

To determine whether the College relies on the depreciation calculated by ctcLink and whether the system automatically calculates depreciation based on the asset profile type and information entered: in-service date, commodity code, and asset value (**key control #3 - Depreciable Capital Assets**) was in place and operating effectively and to consider related general IT controls in order to assess control risk.

### **Conclusion:**

Based on our understanding and test results, we concluded that the automated control **was** in place and operating effectively.

Based on our understanding, related general IT controls **were** in place and adequately designed to ensure that the control operated consistently during the audit period. However, we did not test the operating effectiveness of general IT controls.

Our understanding and control risk assessment, which incorporates these conclusions, is documented at [[Depreciable Capital Assets - Controls](#)].

Testing Strategy:

The following procedures are **required** for all automated key controls for financial and single audits:

### **STEP 1: Understand Automated Key Control**

Gain an understanding of the automated key control. The understanding can either be documented in the control system step or could be documented here in this step. Auditors should consider the following aspects of the automated control when gaining an understanding:

#### **Software Calculation:**

Is there written documentation of the calculation, and/or the source rates and factors used in the calculation?

*We would expect written documentation that defines the calculation and is an official, approved source for the formulas, rates and factors. This may be an approved policy or could be system documentation.*

What formulas are used to make the calculation?

What values or factors are used to make the calculation? For example:

- Rate tables used by the calculation
- Profile fields (i.e., applicable transaction types)
- Programmed/set formulas and/or values
- Constraints (i.e., effective date, minimums/maximums, etc.)

How is the calculation triggered or initiated?

How is the calculation recorded in the accounting system (or used in an end result)?

# State of Washington

## **STEP 2: Confirm and Test Automated Key Control**

Confirm and test the automated control. To test the automated control, consider the following procedures:

### **Software Calculation:**

Re-perform the calculation for selected transactions.

*Auditors would NOT normally use sampling for automated controls. Instead, auditors should judgmentally select one instance of each significant variation of the calculation. If the number of potential variations is large, auditors would judgmentally select based on risk factors (for example, the most common scenarios, or scenarios associated with identified risks, or scenarios that are not addressed by the entity's testing procedures).*

*In some cases, it may be possible for the auditor to reperform the calculation for the entire population.*

If any rate tables or values were updated during the period, view the current values (by observing the rate table or values in an admin menu or from a printed system report) and compare to approved sources.

*If no updates were made or there are only a few values, this risk could be addressed by re-performing the calculation. However, if source rate tables or values are large or complex, it may be more efficient to test these values directly than to recalculate a larger number of transactions.*

Consider the use of analytical procedures such as trends or descriptive statistics on the population (like average, minimum and maximum values, or a graph of values across the population) and follow up on any unexpected values or trends. *Analytical procedures would normally also count as a substantive test.*

## **STEP 3: Understand General IT Controls**

Gain an understanding of the general IT controls that support the continued proper operation of the automated control. Identify key general IT controls and note any control weaknesses. Auditors should consider the following aspects of general IT controls when gaining an understanding:

### **Software Calculation:**

Inquire if the entity has experienced any errors or irregularities with the calculation. Also how often changes are made to the calculation, and how many changes (if any) were made during the year.

How can the software calculation (formulas, rates/values, settings/configurations) be changed or customized?

*Software calculations will usually have one or more administrative menus that allow the government to modify rate tables or other calculation values, or to configure the calculation or apply settings.*

*In other cases, software calculation formulas and/or values may be hard-coded into the system and require programmers to make the changes. If the government has access to source code, then it needs internal procedures for program changes. If the program is*

## State of Washington

*controlled by vendors, we would expect program change procedures and expectations to be included in the contract.*

What are the procedures to authorize and make program changes or configuration/setting changes to the software calculation?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

*If utilizing a test environment, there should be controls to ensure that the live environment is updated and is consistent with the live production environment. As management is responsible for the accuracy of their automated controls (i.e., in the live environment), we would expect there to be a procedure to confirm each key automated control once it is in the live environment. This could be manually re-performing the calculation, reviewing reports against known expectations, etc.*

How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change programming, but they may be responsible for patch management, master table data, and/or configurations.*

### **STEP 4: Confirm Key General IT Controls**

Confirm your understanding of key general IT controls to determine whether they have been placed in operation (*whether the entity has actually implemented key controls*).

### **STEP 5: Test Key General IT Controls**

Document whether general IT controls will be tested. Option 1 would result in control risk at MAX for the automated control. Either option 2 or 3 is necessary in order to set control risk at LOW. If general IT controls are tested, consider the following procedures:

# State of Washington

## Software Calculation:

If program changes or setting/configuration changes are logged, review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the calculation may also provide this evidence if the re-performance tests address all states of the calculation during the period.

If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

## **STEP 6: Final Control Risk**

Evaluate the results and document a final control risk assessment in the control system step. Consider whether any deficiencies identified with either the automated control or related general IT controls represent material weaknesses or significant deficiencies.

*Note: general IT control deficiencies do not necessarily mean the automated control is not properly functioning. General IT control deficiencies would normally be considered a significant deficiency or material weakness only if it caused an issue with the compliance requirement or assertion.*

## **Recommendation Review Requirement**

IT Security related information is considered category 3 data protected by Public Request Exemption RCW 42.56.420. Issues related to IT Security require the following special handling:

[Instructions](#) are located in Team IT Audit's System's Sharepoint page.

Details of IT Security related issues should NOT be included in any emails or helpdesks.

Exit, ML and Findings should be separately communicated in an IT Security Results Document.

Findings will be referenced, but not included in the audit report.

All IT security-related recommendations must be reviewed by [Team IT Audit](#).

Template language for common IT related recommendations can be found in [ARS Part 5 Chapter 8](#).

## **PUBLIC REQUEST EXEMPTION**

Some IT related information is protected by Public Request Exemption RCW 42.56.420 for cyber security purposes. The details documented in the record of work and support workpapers may qualify for this exemption. If so, auditors must include this statement in the record of work done and any related workpapers: **"This record contains information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited "**.

# State of Washington

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

## **Information Technology Planning Guide**

Auditors may contact [Team IT Audit](#) with any testing strategy or control assessment questions or to request assistance from an IT Specialist.

**Software Calculation:** A **software calculation control** exists when the value of a transaction is determined by a software application. This process can be a key control when the entity relies on the system to generate calculations correctly to determine the amount of transactions (i.e., summarizing/account code allocation to post to general ledger, calculate student, utility, other charges, etc.).

## **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

**Statements on Auditing Standards [AU-C 315](#) Understanding the Entity and Its Environment and Assessing the Risks of Material Misstatement** - paragraphs .A106-.A109 describe general and application controls and how they relate to audit risks

**Statements on Auditing Standards [AU-C 330](#) Performing Audit Procedures in Response to Assessed Risks and Evaluating the Audit Evidence Obtained** - paragraphs .10b and .A33-.A34 describe requirements and guidance for testing indirect controls in conjunction with tests of controls, that is, testing key general controls in conjunction with a test of a key automated control

Record of Work Done:

**This record may contain information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited.**

## **STEP 1: Understand Automated Key Control**

**Significant System:** Asset Management (AM) Module - ctcLink

**Key Automated Control:** The College relies on the depreciation calculated by ctcLink. The system automatically calculates depreciation based on the asset profile type and information entered: in-service date, commodity code, and asset value.

## State of Washington

Our understanding of the overall control is documented as part of our understanding of controls over relevant assertions for Asset Management at [\[Depreciable Capital Assets - Controls\]](#).

### **STEP 2: Confirm and Test Automated Key Control:**

See IT Control Testing at [\[Depreciable Assets Testing\]](#) on tab "IT Control Testing".

To confirm and test this key control, we haphazardly selected an asset that was a new FY24 addition placed in service during the fiscal year listed within the AM module provided to us by Tiffany Henderson, Dir. of Financial Reporting, on 9/17/24. We then re-performed depreciation calculations based on the listed useful life, cost, and acquisition date as listed in AM. We first analyzed the asset class and compared it with the useful lives listed in [SAAM 30.50](#). We noted no variances in useful life. We then recalculated monthly depreciation and A/D for all of the selected assets and compared these amounts with the A/D amount listed in AM. We noted no variances. From our testing, we are able to confirm that the automated control accurately calculated depreciation based on the in-service date, commodity code, and asset value and that it was in place during the current fiscal year. *No issues noted.*

### **STEP 3: Understand General IT Controls**

To gain an understanding of general IT controls, we met with Brandy Browning, Director of Budgeting and Account, who is the Subject Matter Expert (SME) for the Financial Management (FIN) pillar within ctcLink for CCS along with Stephanie Beaulieu, IT Customer & Services Manager, and Tiffany Henderson, Dir. of Financial Reporting, on 9/18/24. We inquired about how access is assigned to certain individuals and the process for allowing and changing user access roles within different modules of the ctcLink Pillars. Someone is first assigned access by a SME based on the users position, duties, and responsibilities within the college, who will then review if the user needs to have access to the specific pillar. When someone needs to access or make changes in a module or pillar of ctcLink that they were not originally given access to, they must first discuss this with their direct supervisor. If the supervisor agrees that an individual needs additional access, they will submit an internal IT help ticket requesting access to a certain module or pillar and will select from a drop-down menu from the list of applicable SME's at the college. This ticket will be sent to the IT team who then automatically routes it to the appropriate SME. The SME will then determine based on their knowledge of the pillar, business need case for access and qualitative factors based on experience, role, etc. to determine if the user should be given permission to access the pillar (**General IT Control #1**). Once decided, the SME will route the IT ticket back to the IT team on behalf of the original sender (user) and the IT team will correspondingly make the change on their end by updating the user access list within the respective ctcLink pillar/module. Both SME and IT personnel can run reports at any time to view who currently has access to which pillars/modules, and can identify and investigate any further changes that need to be made.

For the Asset Management module within the Financial pillar of ctcLink, we inquired about how the AM module determines the logic needed to run the necessary code that is responsible for calculating the depreciation based on other chart string user inputs by Yabing Fisher (Expense Senior Accountant) such as useful life, commodity code, etc. Stephanie informed us that if someone within the AM module identifies a potential issue, all module related code changes are processed by SBCTC through a separate help center online and will work with the user to address the issue via email updates about the ticket's status (**General IT Control #2**). SBCTC is responsible for managing the system level logic that runs on each

## State of Washington

module at all colleges using ctcLink, which is why no changes can be made from the IT team at the individual college level.

### **STEP 4: Confirm Key General IT Controls**

**Key General IT Control #1:** The SME will determine based on their knowledge of the pillar, business need case for access, and qualitative factors based on experience, role, etc. to determine if a user should be given permission to access the pillar.

To confirm this general IT control we obtained and inspected a copy of the user access list for the AM module as of 10/2/24. We noted only four individuals who have roles/access to the "ZZ AM Mass Transactions (N)". We were able to note that all users have current "@ccs.spokane.edu" email addresses, and only one user, Yabing Fisher, Expense Senior Accountant, has full access. The other individuals listed have read only, action, and correction actions available. We verified that there did not appear to be an unreasonable number of employees who have access to make full changes in the AM system. *No issues noted.*

**Key General IT Control #2:** If someone within the AM module identifies a potential issue, all module related code changes are processed by SBCTC through a separate help center online and will work with the user to address the issue via email updates about the ticket's status.

To confirm this general IT control we obtained and inspected a copy of an SBCTC service help desk ticket #181342 created on 11/30/23 by Yabing Figher, Expense Senior Accountant. We noted that the error was regarding an issue with the "Combo Edit Error" when trying to retire certain assets during month end close within the AM module. We then analyzed the thread of communication with Kim Cook, the assigned technician, and several other SBCTC IT technicians with Yabing and noted that the ticket was set to "resolved" as of 12/12/23 and was "closed" on that same day. *No issues noted.*

### **STEP 5: Test Key General IT Controls**

Not applicable - we are not planning to rely on automated controls and therefore do not need to test general controls; control risk will be assessed at MAX.

### **J.3.PR.G - Community & Tech College Testing - Spokane**

*Procedure Step:* Depreciable Capital Assets - Testing

*Prepared By:* NJH, 10/4/2024

*Reviewed By:* RKM, 10/10/2024

Purpose/Conclusion:
---------------------

# State of Washington

## **Purpose:**

To determine whether reported capital assets represent real assets, as of the end of the period (Existence).

To determine whether capital assets are reported at properly valued and calculated amounts (Valuation).

## **Conclusion:**

We were able to determine that the reported capital assets represent real assets, as of the end of the period.

We were able to determine that the reported capital assets are reported at properly valued and calculated amounts.

## Testing Strategy:

The following is a list of **considerations** for testing the existence assertion for capital and infrastructure assets. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

### **Nonexistent Assets**

Review capital asset records to determine whether records meet minimum requirements of BARS [3.3.9.40](#) to positively identify and adequately describe the asset. If asset records are not sufficient, follow up on how the entity is able to identify and track reported assets and consider further audit procedures.

Scan the capital asset list for unusual or unexpected assets or patterns.

*For example: asset descriptions that appear insufficient to identify the asset, asset descriptions that seem strange, assets with a historical cost that doesn't appear to meet the capital asset threshold, assets that are past the end of their service life, assets or asset types that don't appear to belong (based on auditor's understanding of entity activities and area of operation), assets or asset types that the auditor doesn't recognize, attributes that appear unreasonable (historical cost, useful life or scrap value), assets that appear connected to actions noted in planning procedures (impairment, replacement, sale or surplus, transfer), etc.*

Test sampled assets or selected high-risk assets from accounting records for existence by observing them or reviewing documentation.

*Observation for aboveground infrastructure such as roads, bridges or buildings may be by [google maps](#). Documentation for underground assets may consist of maps, system plans approved by regulatory agencies or permits, etc.*

Review the government's records of the latest physical inventory for any identification and follow-up on missing assets or any types of assets or locations that were not covered. Note: review of a government's physical inventory is considered a control test. However, it may be done as a risk assessment procedure to help direct substantive testing, and follow-up on results may result in some substantive evidence.

Trace assets from accounting records to assets listed on the government's insurance policy records. Note: if a complete comparison or reconciliation is made, this test would also provide evidence for the completeness assertion.

## State of Washington

Trace assets from accounting records to operational records (ex: Public Works Department typically tracks assets for maintenance or regulatory reporting purposes). Note: if a complete comparison or reconciliation is made, this test would also provide evidence for the completeness assertion.

For land and buildings, trace parcels and historical cost per the land subsidiary schedules to the County's land (GIS) records to verify ownership. Note: this test also provides evidence for the rights & obligations assertion and - if a complete list is obtained from the County - for the completeness assertion as well.

Compare reported public project completed or in process during the period to the L&I [prevailing wage reporting database](#). Note: since reporting is done by contractors, it would be considered a third-party verification of project existence. We would expect capitalized costs (which include costs incurred by the government as well as contractors) to exceed the contractor's reported costs for most projects. This test also provides evidence for the completeness assertion if traced from the L&I database.

### **Cut-off**

Review supporting documentation to verify dates of any transfers, annexations or donations.

See the Expenditures | Existence step for testing strategies on cut-off for capitalized expenditures.

### **Detail Roll-Up**

If manual journal entries are required to update the GL, agree figures per the GL to subsidiary schedules or systems.

Search for manual journal entries that debit (increase) capital or infrastructure assets. Consider testing if any risk indicators are noted.

Reconcile (or review the government's reconciliation) capital expenditures for governmental funds to increases in capital assets. The only anticipated reconciling item would be equipment that is below the capitalization threshold.

Reconcile (or review the government's reconciliation) increases in capital assets to capital purchases and sales per the statement of cash flows for proprietary funds. The only anticipated reconciling item would be donated or contributed assets.

**Over/Invalid Capitalization** - See classification step for testing strategies on improper capitalization upon construction or acquisition, or when determining whether an expense is a maintenance or repair expense or a capitalized improvement.

### **Unrecorded Disposals or Impairments**

Scan capital asset records for fully depreciated assets and inquire as to the status (disposed, no longer in use, etc.) to ensure all retirements and disposals have been recorded. Evaluate appropriate accounting for any fully depreciated assets remaining in service in accordance with [BARS 3.3.10.130](#).

Identify significant disposals, impairments (due to obsolescence or damage) or contributions per review of minutes and trace to asset records to verify these events were accounted for.

Request a list of insurance claims made during the audit period to identify possible impairments or removed assets, then trace to subsidiary records to verify that the event was properly accounted for.

## State of Washington

Identify annexations (through minutes, inquiry or OFM's central annexation tracking system) and trace to supporting documents showing the transfer of assets. Note: this test would also provide evidence for the completeness and rights & obligations assertions.

The following is a list of **considerations** for testing the valuation assertion for capital and infrastructure assets. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

### **Incorrect Depreciation Calculations**

Perform an analytical review of depreciation expense by type of asset for reasonableness.

Re-calculate depreciation expense for a sample of assets or in conjunction with a test of automated controls (if depreciation is automatically calculated by the system). Consider testing the inputs used for the calculation to determine whether they are reasonable and in line with any applicable policies; i.e. useful life, salvage value, etc. Alternatively, test calculations, extensions and footing of subsidiary records if records are maintained on spreadsheets.

Evaluate capital asset policies for componentization or grouping of assets to determine if it has been consistently followed and will result in a rational method of depreciation. See BARS [3.3.10.150](#) for guidance.

Evaluate estimated useful life and scrap value factors for reasonableness. This test could be done in general (on the government's accounting policies), for selected asset classes or for selected or sampled asset records.

*If testing selected high risk assets, auditors should consider assets that are nearly or fully depreciated (see BARS [3.3.10.130](#)), assets with unusually high or low useful lives for their type, and assets with unusually high scrap values.*

Compare estimated useful lives for assets with replacement schedules / policies and capital budgets.

*We would expect that assets on a regular replacement schedule (such as equipment, vehicles, road surfacing, etc) or that are included for replacement in the capital budget would have estimated useful lives that match the government's replacement plans for the asset.*

Consider whether the date placed in service for assets is reasonable given when the asset begins being used or is substantially complete as this will have an effect on when depreciation begins. See information in BARS [3.3.10.90](#) about when to move a project out of CIP.

### **Impairment**

Check that the measurement method used for write-offs is in accordance with GAAP (GASB 42.12-15). Review or recalculate the portion of historical cost that should be written off for impaired capital assets. *Note: auditor would normally use the same measurement method used by the government unless it the auditor finds it inappropriate for the circumstances or unallowable under GAAP.*

### **Incorrect Historical Cost of Assets**

# State of Washington

Trace recorded cost to supporting documentation. *Note: This test would normally be limited to recent additions, since documentation for historical assets has likely passed the records retention period.*

Evaluate the reasonableness of any estimates of the historical cost of capital assets.

Evaluate the reasonableness and support for any estimates of the acquisition value (per GASB 72) of donated capital assets.

## Conversion to GAAP

For governments converting to GAAP reporting, examine valuation method for retroactively reported infrastructure assets and verify that the valuation method used is one of the methods prescribed by the County Road Advisory Board.

## Modified Approach

Check that infrastructure is being depreciated unless the modified approach is used. If the modified approach is used, verify that the government has met criteria of GASB 34 par 23-26.

## Allocation

On the government-wide statement of activities, review allocation of depreciation for capital assets for governmental funds. Depreciation expense will be reported as a component of the direct expense shown in the statement of activities. Request spreadsheet for allocation.

Guidance/Criteria:

## **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

GAAP criteria for reporting capital assets

[\*\*GASB Codification Section 1400 Reporting Capital Assets\*\*](#)

[\*\*GASB Comprehensive Implementation Guide Chapter 7 Basic Financial Statements and Management's Discussion and Analysis, sections 7.9-7.21\*\*](#)

Record of Work Done:

## **Significant Balance and Assertions:**

Governmental Activities - Depreciable Assets (Net of Accumulated Depreciation) - Existence, Valuation

Controls are documented at [[Depreciable Capital Assets - Controls](#)].

## **Auditor note on substantive testing for FY24:**

## State of Washington

Due to prior unresolved issues in prior audits regarding variances between the GL and data from Asset Management (AM) module in ctcLink, we performed an updated reconciliation between the two systems for FY24 to identify and determine which data set appeared to be more reliable to use for substantive testing purposes. We also met with Tiffany Henderson on 9/23/24 to address these concerns. From our updated understanding and data provided from our reconciliation, we have determined that substantive testing will rely on different aspects of each data set as it appears reliable to us based on qualitative and quantitative factors, and based on what data is available and needed for particular testing strategies. The following areas used from each data set are as follows:

### G/L Data:

- Additions samples
- Additions costs
- Additions placed in service date

### AM Data:

- Buildings (existence) beginning balance cost
- Buildings (existence) asset ID number
- Additions description, class life, accumulated depreciation

The variance between the GL and AM is shown in our reconciliation here [[Depreciable Assets Testing](#)] under the "*GL to AM Recon*" tab. We originally noted a NBV variance of \$23,751,018.75 between the two accounting systems. We addressed this issue with Tiffany Henderson on 9/23/24, whereby on 9/30/24, Yabing Fisher, Senior Expense Accountant, provided us with an updated and corrected reconciliation which noted a variance below the floor. Note that our substantive testing was already in process when the updated reconciliation was provided, and we relied on the original data provided. The variance did not impact our testing strategy or overall variances. ***No issues noted.***

### **Substantive tests performed to meet the Existence assertion:**

See substantive testing at [[Depreciable Assets Testing](#)].

### Additions:

To test the existence assertion for FY24 asset additions, we selected a sample of new assets placed in service during the FY from the G/L by identifying journal ID's with "Add" in the description. We then used the sampling spreadsheet with a tolerable misstatement set at 7.5% and the assurance set at moderate to have a sample size of 10 assets. We then used the following testing attributes on each of the selected assets in our sample:

D - There was appropriate supporting documentation via invoices, receipts, or purchase orders to verify the asset addition existed.

We noted no variances or exceptions during our substantive testing. We are able to determine that the reported capital represent real assets.

# State of Washington

*No issues noted.*

## **Substantive tests performed to meet the Valuation assertion:**

### **Additions:**

To test the valuation assertion for FY24 asset additions, we selected a sample of new assets placed in service during the FY from the G/L by identifying journal ID's with "Add" in the description. We then used the sampling spreadsheet with a tolerable misstatement set at 7.5% and the assurance set at moderate to have a sample size of 10 assets. We then used the following testing attributes on each of the selected assets in our sample:

- A - Auditor recalculation of accumulated depreciation does not deviate from system calculated depreciation.
- B - The historical cost of the asset ties to supporting documentation including all costs as mentioned in GASB Codification 1400.
- C - The asset SAAM life is reasonable and consistent with the assets' description and the nature of the asset.

We noted an overall variance below the floor and no issues during testing. We were able to determine that the reported capital assets are reported at properly valued and calculated amounts. *No issues noted.*

## **J.3.PR.G - Community & Tech College Testing - Spokane**

*Procedure Step:* Charges for Services - Controls

*Prepared By:* JAG, 10/7/2024

*Reviewed By:* RKM, 11/5/2024

Purpose/Conclusion.*
----------------------

### **Purpose:**

To gain an understanding of internal controls and assess control risk in order to help plan the nature, timing and extent of substantive testing.

### **Conclusion:**

We have gained an understanding of internal controls and assessed control risk at **maximum**. Therefore, we **will not** place reliance on controls. Our understanding of internal controls and control risk assessment will be used to help plan the nature, timing and extent of substantive

# State of Washington

testing.

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

**This workpaper template was designed for tuition revenue system control audits at Community Colleges. Contact [Team IT Audit](#) with questions on information or steps contained in this template. The template assumes occurrence and valuation are relevant assertions and that controls over occurrence and valuation will be tested.**

The following procedures are **required** for all relevant systems:

## **PUBLIC REQUEST EXEMPTION**

Some IT related information is protected by Public Request Exemption [RCW 42.56.420](#) for cyber security purposes. The details documented in the record of work and supporting workpapers may qualify for this exemption. Auditors must include this statement in workpapers: "**This record contains information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited**".

## **STEP 1: Control Understanding**

Gain an understanding of the internal control process, identify key controls over relevant assertion(s), and note any control weaknesses.

*See the **Client Resource Tab** to reference query tools and year end adjustment information applicable to community and technical colleges. The following are expected controls for and community technical colleges. If sufficient key controls are not in place, the government may be able to demonstrate compensating controls.*

*Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*In gaining an understanding of controls, consider the overall understanding of COSO elements as documented in the "Entity-wide COSO Evaluation" step as they relate to this particular system.*

When gaining an understanding of a college's tuition revenue system, the following specific steps should be considered:

### **Admissions & Class Registration**

Discuss admissions and class registration procedures with department representatives or registrars to gain an understanding of admissions and registration processes and policies. Consider the following:

## State of Washington

How is a student's status validated?

How do they assure that a student's status has been accurately posted from Campus Solutions Core to Student Finance (SF)?

### Tuition calculation

The automated tuition calculation processed in the cTcLink system has been identified as an automated control. When gaining an understanding of a college's software calculation controls, the following specific steps should be considered:

Gain an understanding of the college's procedures for updating Term Fees, Tuition Groups, Item Types, and Tuition Schedule tables, including any review they perform to ensure the changes made are correct.

Validation of Tuition Calculation at the College - Inquire with college staff to see if they test tuition calculations prior to rolling over term fees, and if so, whether they used the Production College Development (PCD) environment to do so. If they have saved supporting documentation for testing performed, observe testing results to verify that the respective tuition and fee values were actually calculated correctly for each category of mock student tested.

Identify individuals responsible for updating the tuition rates including any users who are authorized to modify the tables or access the screens which have been deemed critical to the tuition revenue calculation process (Term Fees, Tuition Groups, Tuition Calculation, Item Types, and Tuition Schedule)

Consider obtaining the following from college staff when testing calculation of tuition revenue for a sample students:

Approved tuition rates

**Customer Account** reports showing tuition/fee charges on the student accounts

**Customer Academic Information** and **Career Term** data showing the student's status/tuition group

**Enrollment Summary** showing evidence of the classes the student was enrolled in for the selected quarter.

### Tuition payment

Students typically pay tuition and fees by credit card. Credit cards are processed through CyberSource. State and community technical colleges must reconcile payments received, and each individual college establishes their own frequency to complete it. Each cashier closes out daily using a batch report from the cTcLink system. The daily batch report may not include daily transactions for EFT's and wires. The following steps should be considered when gaining an understanding of tuition payment:

Discuss cash receipting procedures with department staff and document procedures performed tuition payments paid with the following

Cash or check

Credit Card

ACH/Wire

## State of Washington

We expect colleges reconcile credit card payments made through CyberSource. Inquire and document the colleges process of tying credit card payments processed through CyberSource to entries made in the cTcLink system.

Inquire regarding how the college would address variances found when performing reconciliations.

### Posting to the GL

Receipts are posted to the GL through an evening automated batch process. Typically, cash receipts are reconciled daily to bank accounts, and bank account balances reconciled monthly to cTcLink. Consider the following:

Gain an understanding of the GL posting process, and determine how they validate that their postings are accurate and complete.

Inquire regarding how the college would know if the GL did not post accurately or completely. It is likely there will be variances in how each college performs their reconciliations, with some using spreadsheets or running queries or customized reports as tools to validate the GL postings.

### Distribution / Allocation to Revenue accounts

Review the procedures the college uses to assure that all tuition revenue payments from GL fund 840 were completely distributed. Consider the following:

Document the process used by the colleges to update/maintain the values in their Tuition Distribution table.

### Transfer to AFRS

Gain an understanding the college's reconciliation process of their cTcLink balances to those posted to AFRS. Consider the following:

Evaluate the college's procedures regarding the year-end closing entries recommended by the State Board (per their "Year End Closing" binder). While the key control is the reconciliation done by the SBCTC, the college still needs to provide oversight and monitoring of the adjustments that are recommended by the SBCTC (colleges should understand what the adjustments are for, that they are correct and properly supported).

*Note:* SBCTC System Accounting Coordinators handle all ctcLink uploads to AFRS. Every month, on AFRS cutoff date, a staff from SBCTC runs a query in ctcLink of all journal entries created. This is a summary level report that is downloaded into an Excel spreadsheet. Staff create two pivot tables; one by funds and amounts, another by general ledgers and amounts. Staff expects the pivot table by fund and amount to be zero. Staff then compares the second pivot table to another report, which is generated for the State Auditor's Office (SAO). Both reports are queried from the same database, the one for SAO contains a few more fields. When all the amounts agree, staff is ready to prepare the file to be uploaded into AFRS.

Staff then sort the file by fund, general ledger, and amount. The customization now generates the output files (flat files with transaction codes) and sends them to AFRS. There are usually 1600 to 2200 lines for each college each month. This file is saved as a flat file format and is uploaded into AFRS using the OFM's Financial Toolbox. Sue does a test run in what is known as the SUP

## State of Washington

environment (copy of previous day's production) to check for any major issues. Staff is able to capture a copy of the flat file and uses that to reconcile between what is in cTcLink and what was transmitted to AFRS. Staff makes any necessary corrections to the AFRS batch and releases the output file to AFRS.

Financial Adjusting Entries – the colleges are directed to use the adjusting entry forms to enter any required cTcLink adjustments, with each suggested adjusting entry denoted in this section. Additional explanations (from the SMARTER system) for each of the suggested adjusting entries are also provided.

SMARTER Queries used to reconcile Finance Sub Modules to the General Ledger. Not all State community and technical colleges use SMARTER Queries, however, use is encouraged by SBCTC.

*Note: Waivers are not included in data reported from cTcLink to AFRS*

Disclosure Forms – Copies of the college's general note disclosures and supporting documentation.

Payable/Receivable reporting reflecting any payables ("due to") and receivable ("due from") transactions with other state agencies.

*Note: Some reports and queries used by colleges may be built in-house and may be used alongside SMARTER queries that have been built by SBCTC. If the college does not have a good understanding of the reconciliation process done by the SBCTC then the auditor may want to consider reviewing the year-end adjustments for material errors. For example, the auditor could request the Year End Closing documentation from the State community or technical college and review it to determine the types of adjusting entries and exception items noted by SBCTC.*

### **STEP 2: Confirm Key Controls**

Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

### **Step 3: Preliminary Control Risk**

Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls in step 4.A. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls. All potential material weaknesses and significant deficiencies should be discussed with the AIC or AAM, since they must be reported as findings.*

### **STEP 4: Test Controls**

If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were*

## State of Washington

*consistently and effectively applied).*

*If a key control is not consistently or effectively applied, a significant deficiency or material weakness likely exists. If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

***Since key controls for Tuition Revenue are automated, Auditors should add the "IT Control Testing - Tuition Calculation" step available in the Store to document automated and general control testing.***

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of COSO elements. In doing so, all of the following specific determinations must be documented:*

- A. Key controls – including personnel who affect the application of the control – have not changed since they were last tested. Automated controls should be tested the first year that colleges use the cTclink system.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2021, this work could potentially be relied upon for both the periods ending 2022 and 2023.*

### **Step 5: Final Control Risk**

Evaluate the results and document a final control risk assessment. Consider whether any internal control issues identified represent material weaknesses or significant deficiencies.

### **Recommendation Review Requirement**

IT Security related information is considered category 3 data protected by Public Request Exemption RCW 42.56.420. Issues related to IT Security require the following special handling:

[Instructions](#) are located in Team IT Audit's System's Sharepoint page.

Details of IT Security related issues should NOT be included in any emails or helpdesks.

Exit, ML and Findings should be separately communicated in an IT Security Results Document.

Findings will be referenced, but not included in the audit report.

All IT security-related recommendations must be reviewed by [Team IT Audit](#).

Template language for common IT related recommendations can be found in [ARS Part 5 Chapter 8](#).

# State of Washington

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

## **SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

**This record may contain information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited.**

## **Significant Balances and Assertions:**

Internal controls in the Community and Technical College System address the following balances:

Governmental Activities - Education - Higher Education Charges for Services - Occurrence, Valuation  
Higher Education Special Revenue - Charges for Services - Occurrence, Valuation

See lead sheet here: [[Lead Sheet](#)]

## **STEP 1: Gain an Understanding of Internal Controls**

On 9/17/24, we met with Tiffany Henderson (Director of Financial Reporting), and Diana Plum (Student Finance Accounting Manager), to gain an understanding of controls over Charges for Services.

Software used by community colleges to generate tuition revenue is developed and maintained by State Board of Community and Technical Colleges (SBCTC). Student information is captured in the ctcLink system, within the Campus Solutions Core module (CS). Tuition is automatically calculated and applied to student accounts within the Student Financials module (SF). The rates and codes used in the tuition calculation process reside within several key system tables, which are maintained in part by SBCTC, and by the local colleges.

## **Admissions & Class Registration**

Students can register on-line at the Admissions office, where the student application is processed within the CS module. Critical information associated with tuition revenue is captured at this point regarding the student's status (i.e. resident, non-resident, veteran, etc.), and this data is then posted to CS. When the first billing record is generated for the student (i.e., for admissions or testing fees), a billing account is then created for the student in CS.

Students typically register for classes on-line, but they can also do so in person. Classes are defined within CS. The information captured in CS during registration is then used in calculating the amount of tuition owed by each student. (i.e., residency, waiver, and credit load information is

# State of Washington

used in conjunction with rates defined in the SF tuition tables, to generate an owed tuition amount).

A student's tuition and fee liability is recorded in the Campus Solutions Core database when students register for classes, but revenue will not be recognized in the GL until a journal is created in CS and sent to SF via nightly batch.

## **Tuition and Fees Calculation**

Tuition and fees are automatically calculated by the ctcLink system (**Key Control 1 - Valuation**), based on the following factors:

- Residency - in state versus out of state rates, student status as determined by student assertion and FAFSA information.

- Division - rates vary for lower (freshman and sophomore) versus upper (junior and senior) level classes.

- Credit Load - a student's amount of registered credits, as determined by their registration schedule within the CS module.

- Waivers or Special Programs - there are a plethora of tuition waivers which students may qualify for, such as 'children or spouses of deceased or disabled law enforcement officers/firefighters', and 'high school completion'. There are also available programs such as 'Running Start'.

These programs and waivers reduce or completely waive the overall tuition amount owed by the student.

We performed IT Control testing of this automated calculation at the IT Control Testing step here: [[IT Control Testing - Charges for Services](#)]

## **Tuition Payment**

Tuition can be paid on-line or in person at the Cashier's office. Payments are captured by the ctcLink receipting module and recorded Student Financials (SF). Each college may use a tuition installment program allowing designated students to pay tuition in several installments.

Outstanding balances are retained only in Student Financials (SF) and posted to the GL when payment is made.

### **Cash**

There are always two staff (cashiers) in a cash receipting location. When cash is receipted, funds are immediately counted by a cashier, who then processes the posting of the payment to the student's account, and provides a receipt. The cashier also stamps checks for endorsement. Cashiers keep endorsement stamps and deposit-ready material in a safe. Access to the safe combination is restricted to necessary individuals, and is granted by internal audit. Cash which is received throughout the day remains in a locked till. At the end of day, the till is balanced and reconciled. Each cashier is responsible for their own reconciliation. The reconciliation process includes comparing receipts from the credit card terminal and cash in the till to the ctcLink 'review tender' screen within the cashiering module. Once these amounts balance, the cashier completes an Excel tracking document and prints this document. At this point, each cashier reviews, counts, verifies, and signs off on each other's work. All cashiering documentation backup (the Excel tracker, 'review tender' screen information, and receipts) are bundled and retained. Deposit-ready cash items are placed in the safe to await secure transport. Loomis Security Transport trucks come and pick up funds 3x a week.

### **Online Credit Card Payments**

Payments made through CyberSource are automatically linked into system (online credit card payments). CyberSource automatically posts to ctcLink, which flows through to the GL via the SF journal (posted in a daily SF batch).

# State of Washington

## ACH/Wire Transfer

This payment method is mainly used by international students. The software 'PayMyTuition' is utilized, which functions similarly to CyberSource. A confirmation of the wire is provided to CCS, and once funds are received, CCS manually inputs the payments into ctcLink.

## Payment Plans

Nelnet offers a payment plan which spreads the total payment amount for a term in equal installments over the length of the term. Students who wish to enroll may elect to do so within 30 days of term start. Similarly to CyberSource, Nelnet payments are automatically linked into the system as they are received.

Laurice May (Fiscal Analyst 2) performs a daily bank reconciliation to ctcLink, by running an electronic data download from the Bank of America, and reviewing each individual transaction, tying it to the ctcLink journals. Variances are investigated, corrected, and communicated up to Clint (Fiscal Services Account Manager), and then to Tiffany. At month end, Laurice performs the bank statement to GL activity reconciliation for all cash counts. Typically, there are multiple bank activities that need to be reconciled.

CCS has found that reconciling the journals by type has helped them to complete more accurate bank reconciliations. After Laurice prepares the reconciliation then Clint (Fiscal Services Account Manager) reviews and approves it to ensure accuracy (**Key Control 2 - Occurrence**). At year-end, a similar process is performed as with month end.

## **Scholarship Allowance/Tuition Discount**

We received the 'Scholarship Allowance Calculation FY 2024' spreadsheet from Tiffany Henderson, detailing the steps to calculate the amount to reduce scholarship expense. The college computes the total postings to students' accounts receivable that could potentially generate a refund and then they compute the proportion of institutional resources that represent scholarship allowances and student aid expenses that could generate a refund. Next they compute the amount of scholarship allowances and lastly calculate amount by which to reduce scholarship expense by taking the total scholarship allowance per NACUBO calculation, less tuition waivers already booked as a reduction of tuition, less housing room waivers netted against auxiliary revenue. The estimate of the amount to reduce scholarship expense for FY24 is \$5,000,000.

## **Posting to the GL**

Tuition revenue is recognized when a student's enrollment is complete and student status is validated. Upon completion of the student's enrollment, a journal entry is created in Campus Solutions Core and sent to Finance via nightly an automated nightly batch process.

Cash receipts are posted to the GL through a nightly batch process, and if there are posting problems, the system notifies the user that the batch did not post. Corrections are made through a batch edit screen and the corrected batch is remitted. Tuition payments result in revenue being posted to Fund 840 under the source codes 0424 (tuition) and 0430 & 0431 (supplemental fees). Note that Spring/Summer pre-payments for Fall Quarter tuition are posted to GL account 5192 (deferred revenue).

## State of Washington

In order to validate that GL postings are accurate and complete, CCS has designated Clint McGregor (Fiscal Services Accounting Manager), as responsible for a daily check of which system generated journal entries (as described above) were generated during overnight processing. He reviews these journal entries that will post automatically as long as there are no errors. Part of Clint's review includes ensuring that expenses can be covered by a valid budget within the system and that revenues are expected (**Key Control 2 - Occurrence**). For custom journal entries, Clint is the first reviewer, and Tiffany is the second. Custom journal entries are denoted by a 000 prefix. Custom journal entries are required to include backup attachment information explaining the purpose of the journal entry.

To additionally ensure completeness and accuracy, system-generated GLs are set up to not allow any adjustments. For custom journal entries, in addition to undergoing multiple rounds of review, the person who requested the entry will also re-run data after the adjustment is made, functioning as a third level of review.

### **Distribution / Allocation to Revenue accounts**

An automated monthly process is run in ctcLink to allocate tuition revenue payments from GL fund 840 to the funds below. With the exception of Service & Activities fees (set by the Local Board of Trustees), the individual fund distribution percentages are determined by the Legislature. The local college manually posts and retains these percentages in the Tuition Schedule.

- 060 (Building fee portion; remitted back to the State)
- 149 (Operating fee portion)
- 522 (Services & Activities portion)
- 561 (Comm/Tech College Innovation portion)
- 860 (Institutional Financial Aid portion)

We obtained the tuition and fee schedule from Tiffany as part of our PBC requests at the start of the audit.

### **Transfer to AFRS**

The process continues to be a manual, although SBCTC is working on an automated interface to transfer financial data to AFRS. System Accounting Coordinator handles all ctcLink uploads to AFRS. Every month, on the AFRS cutoff date, runs a query in ctcLink of all journal entries created. This is a summary level report that is downloaded into an Excel spreadsheet. The Coordinator then creates two pivot tables; one by funds and amounts, another by general ledgers and amounts. Staff expects the pivot table by fund and amount to be zero. Staff then compare the second pivot table to another report, which is generated for the State Auditor's Office (SAO). Both reports are queried from the same database, the one for SAO contains a few more fields. When all the amounts agree, staff prepare the file to be uploaded into AFRS.

Staff then sorts the file by fund, general ledger, and amount. The customization now generates the output files (flat files with transaction codes) and sends them to AFRS similar to how it is done in the Legacy system. There are usually 1600 to 2200 lines for each college each month. This

## State of Washington

file is saved as a flat file format and is uploaded into AFRS using the OFM's Financial Toolbox. A test run in what is known as the SUP environment (copy of previous day's production) is then used to check for any major issues. Staff is then able to capture a copy of the flat file and uses that to reconcile between what is in ctcLink and what was transmitted to AFRS. Staff makes any necessary corrections to the AFRS batch and releases the output file to AFRS.

In addition to the SBCTC-provided checklists and steps listed above, CCS follows their own internal check list at year-end close. The checklist assigns various staff members responsibilities for making end of year closing entries. Tiffany Henderson and Brandy (Budget Director) review all year-end closing work.

### **Key Controls:**

**Key Control #1 (AUTOMATED - Valuation):** The ctcLink system automatically calculates tuition and fees for all students based on residency, division, and credit load status.

**Key Control #2 (Occurrence):** Cash receipt records are reconciled to electronic bank statements on a daily basis, and the bank statements are reconciled to GL activity on a monthly basis, ensuring reported revenue activity occurred in the correct period. This reconciliation is prepared by the Fiscal Analyst 2, and reviewed and approved by the Fiscal Services Account Manager. Financial Reporting staff reviews the system-generated journal entries, ensuring they are accurate and complete.

### **Identified Weaknesses:**

**None.**

### **STEP 2: Confirm Key Controls**

**Key Control #1 (AUTOMATED - Valuation):** The ctcLink system automatically calculates tuition and fees for all students based on residency, division, and credit load status.

The confirmation of this key control and the understanding of the related general IT control is documented at: [[IT Control Testing - Charges for Services](#)]

**Key Control #2 (Occurrence):** Cash receipt records are reconciled to electronic bank statements on a daily basis, and the bank statements are reconciled to GL activity on a monthly basis, ensuring reported revenue activity occurred in the correct period. This reconciliation is prepared by the Fiscal Analyst 2, and reviewed and approved by the Fiscal Services Account Manager. Financial Reporting staff reviews the system-generated journal entries, ensuring they are accurate and complete.

We reviewed the June 2024 reconciliations for each bank account and noted that each one was prepared by Laurice May and approved by Clint McGregor except for the Bank of America checking that was prepared by Clint McGregor and approved by Tiffany Henderson. See our detailed confirmation of bank reconciliation understanding at the 'Cash and Pooled Investment - Controls' program step at [[Cash and Pooled Investments - Controls](#)]. We also reviewed screenshots of a system-generated journal entry from 10/2/2024 and noted that Clint reviewed the

## State of Washington

transactional data to ensure it made sense and was accurate. We also noted a "P" under journal status showing the journal was posted and that it is valid meaning all of the chart strings balance. **No issues noted.**

### **STEP 3: Preliminary Control Risk Assessment**

**MAX - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.**

### **STEP 4: Control Risk at LOW - Test Key Controls**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

### **STEP 5: Final Control Risk Assessment**

**MAX - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.**

### **J.3.PR.G - Community & Tech College Testing - Spokane**

*Procedure Step:* IT Control Testing - Charges for Services

*Prepared By:* JAG, 10/16/2024

*Reviewed By:* RKM, 11/5/2024

Purpose/Conclusion:

#### **Purpose:**

To determine whether the ctcLink SF module automatically calculates tuition and fees for all students based on student profiles (residency, division, and credit load) **(key control #1 - Charges for Services)** was in place and operating effectively and to consider related general IT controls in order to assess control risk.

#### **Conclusion:**

Based on our understanding and test results, we concluded that the automated control **was** in place and operating effectively.

Based on our understanding, related general IT controls **were** in place and adequately designed to ensure that the control operated consistently

## State of Washington

during the audit period. However, we did not test the operating effectiveness of general IT controls.

Our understanding and control risk assessment, which incorporates these conclusions, is documented at [\[Charges for Services - Controls\]](#)

Testing Strategy:

The following procedures are **required** for all automated key controls for financial and single audits:

### **STEP 1: Understand Automated Key Control**

Gain an understanding of the automated key control. The understanding can either be documented in the control system step or could be documented here in this step. Auditors should consider the following aspects of the automated control when gaining an understanding:

#### **Software Calculation:**

Is there written documentation of the calculation, and/or the source rates and factors used in the calculation?

*We would expect written documentation that defines the calculation and is an official, approved source for the formulas, rates and factors. This may be an approved policy or could be system documentation.*

What formulas are used to make the calculation?

What values or factors are used to make the calculation? For example:

- Rate tables used by the calculation
- Profile fields (i.e., applicable transaction types)
- Programmed/set formulas and/or values
- Constraints (i.e., effective date, minimums/maximums, etc.)

How is the calculation triggered or initiated?

How is the calculation recorded in the accounting system (or used in an end result)?

#### **Automated Interfaces:**

Is data transferred in real time (immediately) or in a batch? If batched, how often does the interface occur (daily, monthly, quarterly, etc.)?

What triggers the data transfer?

*Transfers could be manually initiated, could be hardcoded into either the sending or receiving system's programming, could be controlled by administrative menus (for integrated software modules), or could be run as automated jobs with third party software or programming.*

Could the interface process fail? If so, how would the entity recognize that the process failed?

## State of Washington

*This may not be a relevant risk for integrated software, but may be the case for custom interfaces designed outside the software which may be subject to various points of failure.*

Will the interface process reject transactions or batches with errors? If so, who monitors rejections and follows up on rejected transactions to ensure correction (either in the sending or receiving systems) and how are corrections tracked and monitored?

*For example, information that could trigger a rejection or isolated transaction and batch can include: invalid data, duplicate data, or missing factors. If errors are possible, we would expect the isolated data is reviewed, tracked and corrected in a timely manner.*

Are any reconciliations done to provide assurance that data transfer was complete and accurate?

*We would expect the local government to perform a reconciliation between source and destination systems to ensure the interfaced data is complete and accurate. This may be a manual reconciliation or spot-check, a system or dashboard report, or automated edit check. Depending on how often errors (if any) are expected, the reconciliation could be done each time the interface occurs, or on a monitoring basis, like annually.*

### Edit Checks:

Inquire if the entity has a written policy or documentation describing the approval process and protocols for reviewers?

What is the approval process in the application?

What transactions, data, tasks, or documents are approved?

Who are the preparers? How do preparers submit for approval?

Who are the authorized approvers? Are there backup approvers?

What documents or information are required to make approval judgment?

What is the next step once a transaction/data/ task/document is approved or denied?

Is there any exception situations where approval can be by-passed or waived?

Can the approver make changes to information during the approval stage? If so, is the preparer notified of the changes?

Can anyone make changes to the approved information after the approval stage? If so, are changes captured in an audit trail and is the audit trail (log) regularly reviewed and monitored to detect any unauthorized changes?

Does the application prevent users from approving their own work (self-approval)?

*Some applications have a feature preventing self-approval. If an application does not have a feature preventing self-approval, we would expect manual controls in place to ensure the segregation of duties between preparer and approver, if relevant to the risk.*

Does the application have high-level users that can also approve?

## State of Washington

*High-Level Users (aka Users with elevated privileges, system or application "Administrators", "Super Users", etc.) typically have full access to change system settings and may have extensive function rights of software applications. Depending on entity's size and complexity, different high-level users may be responsible for the network vs. application level. High-level users represent a heightened risk for overriding segregation of duties and normal control processes.*

*We would expect entities to have compensating monitoring controls if personnel are responsible for both application settings and transaction processing controls.*

### Computer Generated Reports:

What information or exceptions is the report designed to identify (what is the purpose of the report)?

How is the report used and by whom?

For exception reports, who reviews the report and how do they follow up on exceptions?

*Auditors should consider whether the exception report reviewer has appropriate authority and information to effectively follow-up on report results. For fraud-related risks, also consider whether the review position is appropriately segregated from positions that can initiate transactions. For exception reports that regularly identify many transactions needing multi-step follow-up, the manual review and follow-up may be identified as a separate key control rather than documented and evaluated as an aspect of the automated exception report control.*

What are the report parameters or criteria? Does the report have any calculated fields? If so, what are the calculations?

*The ideal method of documenting an understanding of a computer generated report is to get a screenshot or printout of the report parameters. If using a report writer, this may be printed with the report, or may be accessed from a design view or intermediary screen. For custom or complex reports, this may be the SQL code.*

*For exception reports, auditors should pay special attention to the definition of an exception embodied in the report parameters.*

*NOTE: observation of the report parameters will also count as a confirmation of the report and could also be used to test the report.*

### Electronic Approvals:

Inquire if the entity has a written policy or documentation describing the approval process and protocols for reviewers?

What is the approval process in the application?

What transactions, data, tasks, or documents are approved?

Who are the preparers? How do preparers submit for approval?

## State of Washington

Who are the authorized approvers? Are there backup approvers?

What documents or information are required to make approval judgment?

What is the next step once a transaction/data/ task/document is approved or denied?

Is there any exception situations where approval can be by-passed or waived?

Can the approver make changes to information during the approval stage? If so, is the preparer notified of the changes?

Can anyone make changes to the approved information after the approval stage? If so, are changes captured in an audit trail and is the audit trail (log) regularly reviewed and monitored to detect any unauthorized changes?

Does the application prevent users from approving their own work (self-approval)?

*Some applications have a feature preventing self-approval. If an application does not have a feature preventing self-approval, we would expect manual controls in place to ensure the segregation of duties between preparer and approver, if relevant to the risk.*

Does the application have high-level users that can also approve?

*High-Level Users (aka Users with elevated privileges, system or application "Administrators", "Super Users", etc.) typically have full access to change system settings and may have extensive function rights of software applications. Depending on entity's size and complexity, different high-level users may be responsible for the network vs. application level. High-level users represent a heightened risk for overriding segregation of duties and normal control processes.*

*We would expect entities to have compensating monitoring controls if personnel are responsible for both application settings and transaction processing controls.*

### **STEP 2: Confirm and Test Automated Key Control**

Confirm and test the automated control. To test the automated control, consider the following procedures:

#### **Software Calculation:**

Re-perform the calculation for selected transactions.

*Auditors would NOT normally use sampling for automated controls. Instead, auditors should judgmentally select one instance of each significant variation of the calculation. If the number of potential variations is large, auditors would judgmentally select based on risk factors (for example, the most common scenarios, or scenarios associated with identified risks, or scenarios that are not addressed by the entity's testing procedures).*

*In some cases, it may be possible for the auditor to reperform the calculation for the entire population.*

If any rate tables or values were updated during the period, view the current values (by observing the rate table or values in an admin menu or from a printed system report) and compare to approved sources.

## State of Washington

*If no updates were made or there are only a few values, this risk could be addressed by re-performing the calculation. However, if source rate tables or values are large or complex, it may be more efficient to test these values directly than to recalculate a larger number of transactions.*

Consider the use of analytical procedures such as trends or descriptive statistics on the population (like average, minimum and maximum values, or a graph of values across the population) and follow up on any unexpected values or trends. *Analytical procedures would normally also count as a substantive test.*

### Automated Interfaces:

Re-perform a reconciliation, comparison or analytical procedure between both systems to determine whether data interfaced completely and accurately. Alternatively, review the entity's reconciliation or comparison if they perform one.

*For example, auditors could perform count totals and summarize the data to determine whether the same number of transactions reside in both systems, or the total amount from the sending system was posted to the receiving system. Whether this takes the form of a comparison (numbers expected to match exactly), reconciliation (when reconciling items are expected) or analytical procedure (if numerous adjustments or reconciling items are expected) will depend on the nature of the interface and client documentation.*

*Note: these procedures would also provide substantive evidence.*

Observe documentation, such as interface logs or email notifications, to determine whether interfaces complete per expected interval (daily, monthly, quarterly, etc.).

*We would expect the data transfer to be consistent based on the programmed schedule. If data is expected to be transferred on a weekly basis, we would expect to see some form of documentation showing the weekly transfer.*

Observe evidence that batch jobs are monitored such as tracking spreadsheets or emails.

When interfaces did not occur as expected, determine whether procedures were followed to resubmit job or that there was a logical reason no data was received/sent for the interval (for example, it was a holiday so there was no interface for that day).

### Edit Checks:

Re-perform the edit check for selected transactions.

*Auditors would NOT normally use sampling for automated controls. Instead, auditors should judgmentally select one instance of each significant variation of the check. If the number of potential variations is large, auditors would judgmentally select based on risk factors (for example, the most common scenarios, or scenarios associated with identified risks, or scenarios that are not addressed by the entity's*

# State of Washington

*testing procedures).*

*In some cases, it may be possible for the auditor to reperform the edit check for the entire population.*

Consider the use of analytical procedures such as trends or descriptive statistics on the population (like average, minimum and maximum values, or a graph of values across the population) and follow up on any unexpected values or trends. Analytical procedures would normally also count as a substantive test.

## **Computer Generated Reports:**

For exception reports, inquire with the person assigned to review the report how frequently exceptions are noted by the report. Trace identified exceptions to documentation of correction or resolution.

Re-perform the report by either (a) generating it yourself in the entity's system (if the auditor has direct access to the system), (b) recreating the report using CAATS, or (c) by observing the report be generated in your presence. If observing, note any user-entered values or parameters and determine whether entered parameters were appropriate. Compare re-performed report to the one being tested.

## **Electronic Approvals:**

Observe a transaction to see the approval process and verify any key aspects of the process or limits.

If transaction data or reports include approval information, use CAATS to confirm that all transactions met authorization rules.

## **STEP 3: Understand General IT Controls**

Gain an understanding of the general IT controls that support the continued proper operation of the automated control. Identify key general IT controls and note any control weaknesses. Auditors should consider the following aspects of general IT controls when gaining an understanding:

### **Software Calculation:**

Inquire if the entity has experienced any errors or irregularities with the calculation. Also how often changes are made to the calculation, and how many changes (if any) were made during the year.

How can the software calculation (formulas, rates/values, settings/configurations) be changed or customized?

*Software calculations will usually have one or more administrative menus that allow the government to modify rate tables or other calculation values, or to configure the calculation or apply settings.*

*In other cases, software calculation formulas and/or values may be hard-coded into the system and require programmers to make the changes. If the government has access to source code, then it needs internal procedures for program changes. If the program is controlled by vendors, we would expect program change procedures and expectations to be included in the contract.*

## State of Washington

What are the procedures to authorize and make program changes or configuration/setting changes to the software calculation?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

*If utilizing a test environment, there should be controls to ensure that the live environment is updated and is consistent with the live production environment. As management is responsible for the accuracy of their automated controls (i.e., in the live environment), we would expect there to be a procedure to confirm each key automated control once it is in the live environment. This could be manually re-performing the calculation, reviewing reports against known expectations, etc.*

How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change programming, but they may be responsible for patch management, master table data, and/or configurations.*

### Automated Interfaces:

Inquire if the entity has experienced any errors or irregularities with the interface. Also how often changes are made to the interface, and how many changes (if any) were made during the year.

What are the procedures to authorize and make changes to the interface?

*Except for the most simple situations, we would normally expect update procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

## State of Washington

*If the data transfer is already going to be checked or reconciled, then there may be less need for specific test procedures on program changes since any errors will be identified right away.*

How are program changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

*If the program is controlled by a third-party, we would expect a process between the government and vendor that allows the government to make requests and receive communication at the completion of the request.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to vendor developed/supported coding that controls how the system processes the interfaced data, but they may be responsible for working the interface error queues and reconciling the interfaced data.*

### Edit Checks:

Inquire if the entity has experienced any errors or irregularities with the edit checks. Also how often changes are made to the checks, and how many changes (if any) were made during the year.

How can the edit check be changed or customized?

*Edit checks may be hard-coded into the system and require programmers to make the changes. If the government has access to source code, then it needs internal procedures for program changes. If the program is controlled by vendors, we would expect program change procedures and expectations to be included in the contract.*

*In other cases, edit checks may be established or configured through one or more administrative menus.*

What are the procedures to authorize and make program changes or configuration/setting changes?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

## State of Washington

What are the procedures to test that program changes are properly working?

*If utilizing a test environment, there should be controls to ensure that the live environment is updated and is consistent with the live production environment. As management is responsible for the accuracy of their automated controls (i.e., in the live environment), we would expect there to be a procedure to confirm each key automated control once it is in the live environment. This could be manually re-performing the edit check, reviewing reports against known expectations, etc.*

How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change programming, but they may be responsible for patch management, master table data, and/or configurations.*

### Computer Generated Reports:

Inquire if the entity has experienced any errors or irregularities with the report. Also how often changes are made to the report, and how many changes (if any) were made during the year.

How is the report triggered or initiated?

*For reports that are automatically triggered, the auditor would normally not identify job scheduling or monitoring as a general control since we would expect failure of the report to generate*

Is the report hardcoded into the program, or is it a custom or ad hoc report? Also, what manual inputs (if any) are required to run the report?

*What parameters, criteria (date ranges, fund number, departments) or instructions are entered by the user to generate the exception report. The more options entity personnel have to customize or modify the report, the higher the risk of human error and inaccurate or incomplete reports. Pre-programmed reports provide less flexibility than ad-hoc reports; however, if program change controls are in place, they are more consistent.*

## State of Washington

If the report is hardcoded into the system, how are program changes made?

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change vendor developed reports, but they may be responsible for triggering, setting certain parameters, and/or following up on exception report results.*

NOTE: if the auditor cannot identify sufficiently effective general IT controls, the automated control will need to be tested using the same methods as a manual control (ie: sampling throughout the period). For example, if the report is manually generated and highly dependent on a number of manual inputs each time, or if the report does not have formal change controls, such as an ad hoc report or excel-based report. In such cases, the automated report is controlled by limited access and the judgment of the report writer – that is, while the report is an automated component, there is also an integrated manual component to the control.

### Electronic Approvals:

How are users assigned preparer and approver roles? Are user accounts periodically checked for needed changes? See the [User Access](#) step in the Accountability folder for more control considerations.

If configurations or settings relevant to the approval process are controlled by an admin menu, who has access to this menu?

If the entity has access to source coding for approval controls, what are the procedures to authorize and make program changes?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to vendor developed/supported coding that controls how the electronic approval works, but they may be responsible for approval configurations or settings and/or user account management.*

# State of Washington

## **STEP**

Confirm your understanding of key general IT controls to determine whether they have been placed in operation (*whether the entity has actually implemented key controls*).

## **STEP 5: Test Key General IT Controls**

Document whether general IT controls will be tested. Option 1 would result in control risk at MAX for the automated control. Either option 2 or 3 is necessary in order to set control risk at LOW. If general IT controls are tested, consider the following procedures:

### **Software Calculation:**

If program changes or setting/configuration changes are logged, review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the calculation may also provide this evidence if the re-performance tests address all states of the calculation during the period.

If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the **SOC Report Reliance** workpaper in the Store.

### **Automated Interfaces:**

Review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, reconciling or comparing the data transfer (or reviewing the entity's reconciliation or comparison) may also provide this evidence if tests address all states of the interface during the period.

Inspect job processing error logs/reports. Observe evidence that errors in processing were isolated and resolved. For example, select a sample of rejected transactions and observe evidence to determine whether errors were appropriately corrected and the corrections were timely.

## State of Washington

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

### Edit Checks:

If program changes or setting/configuration changes are logged, review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the edit check may also provide this evidence if the re-performance tests address all states of the edit check during the period.

If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

### Computer Generated Reports:

If the report is subject to program change controls (either due to being hardcoded or by being automatically triggered), review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

If the report is subject to program change controls, review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the report may also provide this evidence if the re-performance tests address all states of the report during the period.

If the report relies on manual inputs and report copies saved show the parameters entered, the auditor can check a selection or sample of reports to confirm that the report was run correctly.

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

### Electronic Approvals:

Review user access report to verify that current users are appropriate. Also consider review of user access change logs (if available) to evaluate user account management throughout the period. See the User Access step in the Accountability folder for more testing considerations.

## State of Washington

If approvals are governed by significant settings/configurations, and such changes are logged, review the change log to verify the population of changes for the year.

*Verification that no configuration changes were made, along with the auditor's evaluation that no such changes are expected, would normally be sufficient evidence to conclude that no further testing is necessary.*

If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.

If the entity has access to source code, review the change log to verify the population of changes for the year. Then review programming change documentation or the entity's test documentation for selected or sampled changes.

*Verification that no program changes were made, along with the auditor's evaluation that no such changes are expected, would normally be sufficient evidence to conclude that no further testing is necessary.*

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the SOC Report Reliance worksheet in the Store.

### **STEP 6: Final Control Risk**

Evaluate the results and document a final control risk assessment in the control system step. Consider whether any deficiencies identified with either the automated control or related general IT controls represent material weaknesses or significant deficiencies.

*Note: general IT control deficiencies do not necessarily mean the automated control is not properly functioning. General IT control deficiencies would normally be considered a significant deficiency or material weakness only if it caused an issue with the compliance requirement or assertion.*

### **Recommendation Review Requirement**

IT Security related information is considered category 3 data protected by Public Request Exemption RCW 42.56.420. Issues related to IT Security require the following special handling:

[Instructions](#) are located in Team IT Audit's System's Sharepoint page.

Details of IT Security related issues should NOT be included in any emails or helpdesks.

Exit, ML and Findings should be separately communicated in an IT Security Results Document.

Findings will be referenced, but not included in the audit report.

All IT security-related recommendations must be reviewed by [Team IT Audit](#).

Template language for common IT related recommendations can be found in [ARS Part 5 Chapter 8](#).

### **PUBLIC REQUEST EXEMPTION**

Some IT related information is protected by Public Request Exemption RCW 42.56.420 for cyber security purposes. The details documented in the

# State of Washington

record of work and support workpapers may qualify for this exemption. If so, auditors must include this statement in the record of work done and any related workpapers: **"This record contains information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited "**.

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

## **Information Technology Planning Guide**

Auditors may contact [Team IT Audit](#) with any testing strategy or control assessment questions or to request assistance from an IT Specialist.

**Software Calculation:** A **software calculation control** exists when the value of a transaction is determined by a software application. This process can be a key control when the entity relies on the system to generate calculations correctly to determine the amount of transactions (i.e., summarizing/account code allocation to post to general ledger, calculate student, utility, other charges, etc.).

**Automated Interfaces:** An interface is a process that moves information from one computer application to another. The interface can occur internally between systems maintained by a single agency, or between systems maintained by different agencies or private companies. The interface can also occur between modules within the same computer application.

The data transferred might be a file consisting of one or more records processed at a later time (batch), or it can be a real-time update. Risk associated with interfaces increases as the number of transactions or the number of other services and systems supported by the interfaced data increases.

Poor design or inadequate oversight can affect the transfer of transaction data among the systems. Interface controls are automated and/or manual processes designed to ensure transmission and processing of information is complete and accurate.

## **Manual vs. Automated Interfaces**

A "manual interface" is the transfer of data from one system or module to another system or module, initiated and controlled by a user. An example of a manual interface is when customer accounts are downloaded from a utility billing system to be used to perform meter readings. When complete, the file with meter readings may be uploaded and posted to the customer accounts.

## State of Washington

An “automated interface” is the transfer of data from one system or module to another system or module that happens automatically based on a schedule, or other predefined criteria. A common example of an automated interface is the payroll module of a system. Typically, a payroll batch is created in the payroll module. Once approved, the batch is automatically sent by the system to the general ledger or other applicable modules, such as accounts payable.

Entities should have reconciliation controls between their various applications regardless of the method used for interfacing.

*Auditors should have determined whether system interfaces are automated as part of the Key Software Applications workpaper. **If not**, ask the following question to determine whether the system interface is manual or automated.*

*Is the data transferred from one system/module to another system/module by a user using an uploading and posting technique? For example, data is pulled from one system into a text file or other format, that is then uploaded into a different system or module by posting or in an upload feature of the module. If the answer to this question is yes, the interface would be considered “manual” since it is initiated and controlled by manually rather than through an automated process.*

**Edit Checks:** An **edit check** is a programmed routine designed to check input data or processing results for accuracy, compliance, or reasonableness. Types of edit checks include:

Range Checks: ensure that numeric values fall within specified ranges, minimums and/or maximums. For example, ensuring that a capital asset can only be entered as a positive amount, or a purchase order can only be submitted without secondary approval for less than a certain threshold.

Consistency Checks: verify that related data fields are consistent with each other. For example, ensuring that a patient’s age matches their date of birth.

Format Checks: validate data formats (for example, dates as MM/DD/YYYY or phone numbers as ###-###-####).

Logical Checks: assess logical relationships between data fields. For instance, verifying that total debits equals total credits in a journal entry.

Duplicate Checks: identify duplicate records or entries. For example, preventing the same invoice from being entered twice.

Cross-Field Checks: compare data across different fields. For instance, ensuring that the start date of a project is before the end date.

Required Field Checks: ensure that mandatory fields are filled out. For instance, making sure that a patient’s name and date of birth are provided.

Referential Integrity Checks: validate relationships between data tables. For example, confirming that a vendor number exists in the vendor master file as an active entity.

Outlier Checks: detect extreme or unexpected values. For instance, flagging water meter reading values that are extreme outliers for the customer type or account history.

Pattern Checks: look for specific patterns in data. For example, verifying that email addresses follow a valid format.

Edit checks may result in automatic rejection of a transaction, inability to proceed with a transaction, trigger for additional processing or review, or

## State of Washington

may simply result in a warning message to the user.

Edit checks may be identified as a key control when they are sufficiently relevant (ie: addressing the risk), precise (ie: able to catch all errors, rather than just being only reasonableness or limit check), and sufficiently strong (ie: prevent invalid transactions, rather than just generating a warning messages). Auditors may identify an individual edit or a group of edit checks together as a key control.

**Computer Generated Reports:** A **computer-generated report** is a report that is created by a computer program. The computer program, also referred to as a report generator or tool, takes data from a data source, such as a database, and displays it in a specified format. The process to generate a report often includes performing calculations on the data, such as summarizing, classifying, etc., before displaying, or can display the calculations on the report.

There are two types of computer-generated reports, pre-programmed and ad-hoc or customized reports.

- Pre-programmed or canned reports are pre-defined reports where criteria and specifications are hard coded in the system. A canned report may allow limited parameters, (month/year, for example), but in general the information that will be displayed is pre-determined.

- Ad-hoc or customized reports allow the user to drill down and customize what information is displayed on the report based on some allowed criteria, such as account codes, dollar amounts minimum, etc).

In contrast, a **manual report** is one that is created outside the system using data exports or is created ad hoc by a user. An example of a manual report is one that is created by copying data from a data source and pasting the data in an Excel spreadsheet or Word document or Powerpoint presentation where it is then processed further. With manual reports, each time a report is created, the data could be incorrect due to user error, such as not copying all relevant data, or processing errors. Therefore, these types of reports should be understood and tested similar to manual controls.

**Electronic Approvals:** Electronic approvals, electronic signatures and digital signatures are technically different, although often these terms are used interchangeably by entities.

Auditors should have determined whether the electronic approval is an automated control as part of the overall understanding of controls. For automated control purposes, an electronic approval is a software system functionality that:

- Permits a user to approve transaction(s) within the software system

- The system automatically documents, or logs, the data approved by the user and any subsequent manipulation

- The acceptance or rejection of the transaction by the approver will trigger an additional software system process, such as posting of a transaction.

E-mail, scanned-in pictures of signatures, or font-changed signatures, etc. may be part of a control activity but are generally not considered an automated control and are not covered by this testing strategy.

# State of Washington

## Electronic Signature vs Digital Signature

An “**electronic signature**” can look like a handwritten signature that has been scanned and then pasted into an electronic document. The reliability of this type of approval is variable. Recommend gaining an understanding of the process used to store and affix the signature to the document and then discuss the process with Team IT Audit before placing reliance on this control.

A “**digital signature**” is a legal signature with a formal certification process that documents who approved the document and ensures the document is not modified after certification. Reliability of this process is very high but has significant technical features. Recommend brainstorm with Team IT Audit before placing reliance on this control.

## **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

**Statements on Auditing Standards [AU-C 315](#) Understanding the Entity and Its Environment and Assessing the Risks of Material Misstatement** - paragraphs .A106-.A109 describe general and application controls and how they relate to audit risks

**Statements on Auditing Standards [AU-C 330](#) Performaing Audit Procedures in Response to Assessed Risks and Evaluating the Audit Evidence Obtained** - paragraphs .10b and .A33-.A34 describe requirements and guidance for testing indirect controls in conjunction with tests of controls, that is, testing key general controls in conjunction with a test of a key automated control

Record of Work Done.:

**This record may contain information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited.**

## **STEP 1: Understand Automated Key Control**

**Significant System:** ctcLink Tuition Revenue System (Campus Solutions Student Finance module)

**Key Automated Control:** The ctcLink SF module automatically calculates tuition and fees for all students based on student profiles (residency, division, and credit load) and tabled tuition information (Valuation).

Our understanding of the automated control is documented as part of our overall understanding of controls over relevant assertions for Charges for Services at: [[Charges for Services - Controls](#)].

The tuition revenue calculation processing resides within a third-party vendor application system, which cannot be modified by system users. The only way for college users to affect the calculation is through edits to associated data tables and screens, and at the College-level, many of those tables are restricted to modification by the State Board.

# State of Washington

## **STEP 2: Confirm and Test Automated Key Control:**

We confirmed and tested the key automated control as follows, to determine whether the automated controls can be relied upon:

To confirm and test the automated control we recalculated the ctcLink calculated student tuition & fees amounts on student accounts. See tab 'Recalculation': [[Charges for Services Testing](#)]. We performed a recalculation of the student tuition and fees amounts billed to student accounts based on credit load, residency status, and division, and we noted no variances. From this testing, we are able to confirm that the automated control accurately calculated tuition based on student profiles and tabled tuition information, and that it was in place during the current fiscal year. *No issues noted.*

## **STEP 3: Understand General IT Controls**

To gain an understanding of general IT controls, we met with Brandy Browning, Director of Budgeting and Account, who is the Subject Matter Expert (SME) for the Financial Management (FIN) pillar within ctcLink for CCS along with Stephanie Beaulieu, IT Customer & Services Manager, and Tiffany Henderson, Dir. of Financial Reporting, on 9/18/24. We inquired about how access is assigned to certain individuals and the process for allowing and changing user access roles within different modules of the ctcLink Pillars. Someone is first assigned access by an SME based on the users position, duties, and responsibilities within the college, who will then review if the user needs to have access to the specific pillar. When someone needs to access or make changes in a module or pillar of ctcLink that they were not originally given access to, they must first discuss this with their direct supervisor. If the supervisor agrees that an individual needs additional access, they will submit an internal IT help ticket requesting access to a certain module or pillar, and will select from a drop-down menu from the list of applicable SME's at the college. This ticket will be sent to the IT team who then automatically routes it to the appropriate SME. The SME will then determine based on their knowledge of the pillar, business need case for access, and qualitative factors based on experience, role, etc. to determine if the user should be given permission to access the pillar (**General IT Control #1**). Once decided, the SME will route the IT ticket back to the IT team on behalf of the original sender (user) and the IT team will correspondingly make the change on their end by updating the user access list within the respective ctcLink pillar/module. Both SME's and IT personnel can run reports at any time to view who currently has access to which pillars/modules, and can identify and investigate any further changes that need to be made.

Tuition rates and fees are calculated based on information in Tuition Tables. The majority of these tables are maintained by SBCTC. For those tables and screens which are subject to CCS Board of Trustees (BOT) approval, the SF Accounting Manager (Diana Plum) is responsible for updating tuition and fee table rate information within ctcLink as necessary, as determined by BOT action. There are two types of rate tables that need to be updated and manually reviewed; SBCTC tuition rates and college specific fees. SBCTC updates the statewide tuition and required fees for students each year. The college specific fees may get updated on an annual and term basis. At the end of the year, the departments work together to determine if fees or charges need to change (increase or decrease), or add any new charges. These fees include the College wide charges such as the technology fee charged to every student, and course specific fees.

After it is determined that fees need to be adjusted, Scott, Program Specialist 3, and Holly, Instructional Service Manager, make the changes for the colleges. Once the adjustments to the fees are made, Tiffany, Director of Financial Reporting and staff in the Business office will pull a report

## State of Washington

to review these changes to ensure they are correctly implemented. After each update to tuition table rate information, the SF Accounting Manager haphazardly selects small samples of students and performs a re-calculation, to ensure that the ctcLink auto-calculation is functioning correctly (**General IT Control #2**).

### **STEP 4: Confirm Key General IT Controls**

**Key General IT Control #1:** The SME will determine based on their knowledge of the pillar, business need case for access, and qualitative factors based on experience, role, etc. to determine if the user should be given permission to access the pillar.

To confirm this general IT control we obtained and inspected a copy of the user access list for the SF module as of 10/7/24. We noted there are many individuals that have viewing acces to the SF module but only 14 individuals have access to edit tuition and fees. Their role access is titled 'SF Tuition and Fees Update'. We were able to note that all users have current "@ccs.spokane.edu" email addresses. We verified that there did not appear to be an unreasonable number of employees who have access to make full changes in the SF system. ***No issues noted.***

**Key General IT Control #2:** After each update to tuition table rate information, the SF Accounting Manager haphazardly selects small samples of students and performs a recalculation, to ensure that the ctcLink auto-calculation is functioning correctly.

To confirm this general IT control, we obtained screenshots of the recalculation process that Diana Plum, SF Account Manager, performs. We first reviewed the following amounts shown prior to the recalculation: tuition building fee \$163.76, tuition operating fee \$1,147.05, and tuition S&A fee \$153.97 totaling \$1,464.78. We then reviewed the screen that shows student tuition calculation details like the term, primary program, tuition residency, tuition group, and tuition calc date and time. From there, Diana clicks the calculate tuition and fees button that recalculates tuition from that screen. We noted after the recalculation, those three tuition charges aligned exactly with the original amounts listed in the student account totaling \$1,464.78. We then reviewed a screenshot of the student account details showing the term (Fall 2024), residency (in-state), and credits (13) that we tied to the current tuition schedule to ensure tuition was calculated correctly. ***No issues noted.***

### **STEP 5: Test Key General IT Controls**

Not applicable - we are not planning to rely on automated controls and therefore do not need to test general controls; control risk will be assessed at MAX.

### **J.3.PRГ - Community & Tech College Testing - Spokane**

*Procedure Step:* Charges for Services - Testing

*Prepared By:* JAG, 10/16/2024

*Reviewed By:* RKM, 10/21/2024

# State of Washington

Purpose/Conclusion:

**Purpose:**

To determine whether reported revenues represent actual amounts relating to the period (Occurrence).

To determine whether revenues were reported at properly valued or calculated amounts (Valuation).

**Conclusion:**

We determined that reported revenues represented actual amounts relating to the period (Occurrence) and were properly calculated (Valuation).

**No issues noted.**

Testing Strategy:

The following is a list of **considerations** for testing the occurrence assertion for revenues. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

For revenues received from the State Treasurer, trace reported amounts to the State Treasurer confirmations available in LGCS.

Confirm intergovernmental revenues with the other government or grantor or by reviewing appropriate correspondence.

Trace selected or sampled revenues from the GL to supporting billings or subsequent receipts.

If revenue is receipted into a specific clearing account, or if third-party lockbox or receipting services are used, compare recorded revenue to a sum of monthly totals from bank, lockbox or service organization reports.

Develop sufficiently precise expectations for a substantive analytical to compare to reported revenue amounts.

Search for manual journal entries that credit (increase) revenues. Consider testing if any risk indicators are noted.

**Cut-Off / Revenue Recognition**

Test a sample of underlying transactions to verify the revenue was recorded for the proper period. Note: transactions at the beginning and end of the period would generally be considered at highest risk of being improperly recorded in the current period.

If revenue is billed at a constant rate, calculate an expectation based on the average monthly billing or re-calculate the year-end accrual journal entry and compare to the reported receivable.

Evaluate revenue recognition against GAAP criteria for selected transactions or revenue streams.

**Interfund Revenues**

For internal service fund charges, see testing strategies for internal service funds in the Accountability folder. For other types of internal charges, see testing strategies for Internal Activities.

**Detail Roll-up**

Compare year-end totals from general ledger to subsidiary software modules for selected revenues.

Review the government's reconciliation of general ledger to subsidiary ledgers.

## State of Washington

*Detail roll-up testing is not sufficient audit evidence by itself since it only entails comparing different sets of the entity's own accounting records. However, it may be combined with other substantive tests to address identified risks. For example, if substantive testing is performed at the subledger level, it may be combined with a test that the subledger detail accurately rolls up to the general ledger or financial statements.*

The following is a list of **considerations** for testing the valuation assertion for revenues. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

### **Calculation**

Recalculate billed revenues on a check (one of each variation), CAATS or sample basis.

For large populations of standard billings, perform CAATS tests to identify unexpected or outlier transactions for further review.

Review related-party transactions to determine whether revenue transactions were correctly calculated.

### **Realizable Value**

Re-calculate a sample or selection of billings. If billings are calculated by software, the auditor could test and substantiate the automated control and also consider any risks associated with manual inputs used by software.

Evaluate the entity's calculation of the allowance amount for reasonableness. This evaluation should include comparing the entity's estimate to the entity's actual historical experience of collecting or writing-off receivables.

Trace the amount of bad debt approved by the governing body (per minutes) to reductions of receivables and bad debt expense to verify it was properly accounted for. *Note: approvals may be slightly more, as customers may pay after the bad debt has been approved but before it is written off.*

### **Estimation / Recognition**

Review calculation and support for assumptions of any estimated revenues.

Accounting research to verify that revenues were reported in conformity with revenue recognition policies reported in the financial statement notes.

Guidance/Criteria:

Record of Work Done:

### **Significant Balances and Assertions:**

Governmental Activities - Education - Higher Education Charges for Services - Occurrence, Valuation

# State of Washington

## Higher Education Special Revenue - Charges for Services - Occurrence, Valuation

Controls are documented in the "Charges for Services - Controls".

We agreed our testing population and college-reported GL data to that which was reported in EIS and in AFRS queries found at: [\[Final Planning Community Colleges Selected for Testing\]](#). **No issues noted.**

Using the TeamStore sampling spreadsheet, we randomly selected 30 students for testing. Our testing selections were made from a report obtained from Tiffany Henderson (Director of Financial Reporting) titled 'SF Accounting Line - Revenue'. We pivoted this report to show the breakdown of total tuition charges by term for each student. See testing at: [\[Charges for Services Testing\]](#).

We requested billing statements and ctclink Campus Solutions (CS) student account information, as well as the FY24 Board-approved tuition rate tables. These were provided by Tiffany Henderson.

### **Substantive Tests Performed to Meet the Occurrence and Valuation assertion:**

See testing here: [\[Charges for Services Testing\]](#)

In order to determine whether reported revenue information occurred, we traced student ID numbers to GL data, billing statements, and CS student account information, noting that information was consistent across these three sources. We also verified that the reported revenue occurred during the correct term (spring, summer, fall, winter) and fiscal year (2024).

In order to determine whether reported revenue information was reported at the correct valuation, we re-calculated the amount billed to students, using the following data from the student profile: residency status, credit division, and credit load. This input data was used to find the tuition rate and fees which should have been assessed per the FY24 Board-approved tuition rate tables. We then adjusted for various waivers, dropped classes, etc.

We determined that reported revenues represented actual amounts relating to the period (occurrence), and were properly calculated (valuation). **No issues noted.**

### **J.3.PR.G - Community & Tech College Testing - Spokane**

*Procedure Step:* Education Expenses - Controls

*Prepared By:* NJH, 10/14/2024

# State of Washington

Reviewed By: RKM, 10/14/2024

Purpose/Conclusion:

**Purpose:**

To gain an understanding of internal controls and assess control risk in order to help plan the nature, timing and extent of substantive testing.

**Conclusion:**

We have gained an understanding of internal controls and assessed control risk at **maximum**. Therefore, we **will not** place reliance on controls. Our understanding of internal controls and control risk assessment will be used to help plan the nature, timing and extent of substantive testing.

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

The following procedures are **required** for all relevant systems:

*Optional:* List the financial statement balances and relevant assertions addressed by the understanding.

**STEP 1: Understanding of Controls**

Gain an understanding of the internal control process, identify key controls over relevant assertion(s), and note any control weaknesses.

*The auditor's understanding should include:*

*Business processes relevant to financial reporting of the relevant assertion for the material balance. Processes should encompass automated and manual procedures by which transactions or events are identified or initiated, authorized as needed, recorded, processed and corrected as needed.*

*Original accounting records and how records are rolled-up to intermediary ledgers and transferred to the general ledger or financial statements.*

*Detailed descriptions of key controls. Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*In gaining an understanding of controls, consider the overall understanding of Entity-Level control elements as documented in the "Entity-*

# State of Washington

*Level Controls" step as they relate to this particular system.*

## **STEP 2: Confirm Key Controls**

Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walkthrough of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency or material weakness likely exists.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "IT Control Testing" step pulled down from the SAOStore and be hyperlinked with this step. Auditors should consider contacting Team IT Audit for assistance.*

## **STEP 3: Preliminary Control Risk**

Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls in step 4A. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls. **All potential material weaknesses and significant deficiencies should be discussed with the AIC or AAM, since they must be reported as findings.***

## **STEP 4: Control Testing**

If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency or material weakness likely exists. If exceptions are noted,*

## State of Washington

*auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "IT Control Testing" step pulled down from the SAOStore and be hyperlinked with this step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of Entity-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

### **STEP 5: Final Control Risk**

Evaluate the results and document a final control risk assessment. Consider whether any internal control issues identified represent material weaknesses or significant deficiencies.

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Policy/Standards tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency. **All potential material weaknesses and significant deficiencies should be discussed with the AIC or AAM, since they must be reported as findings.***

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

# State of Washington

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits](#) Planning Guide**

Record of Work Done:

**Significant Balances and Assertions:**

Internal controls in the Community and Technical College System address the following balances:

Governmental Activities- Education- Higher Education Expenses - Completeness, Classification

Higher Education Special Revenue- Charges for Expenses - Completeness, Classification

See lead sheet at: [[Lead Sheet](#)]

**STEP 1: Gain an Understanding of Internal Controls**

**Payroll Expenditures:**

On 9/12/24, we met with Melody Matthews (Director of Human Resources Information Systems), Peter Lubetich (Manager of Payroll & Benefits) & Tiffany Henderson (Director of Financial Reporting) to gain an understanding of internal controls for payroll expenditures at CCS. We inquired and confirmed that there were no notable changes to the processes or staff as it relates to the payroll process for CCS.

**Onboarding/New Hires/Employee Set Up (No change from prior year):**

Prior to recruitment, all position requests are entered into the CCSnet PROS (position request online system). The input fields include position title, position control number, position description, expected hours, full-time vs part-time, and classification. These factors drive the rate of pay (such as hourly, exempt, etc.). This system tracks and shows all approval chains related to the position (including budgetary approval). These approvals include the originator, their immediate supervisor, executive approval, budgetary approval, and finally Melody's approval. Any new, full-time permanent positions require a 2nd staffing review after all other approvals have been signed off on. Prior to signing her approval, Melody reviews the Position Request to determine that all information is completed and correct, with no missing fields. She ensures that vacant positions are not being filled twice. After approving, Melody changes the status to 'recruiting', and the system then automatically posts the open position on the College webpage. At this point, a screening committee is responsible for conducting interviews and extending job offers. Once the committee decides to move forward with an applicant, they change the position request status to 'hired', which pushes a notification to Melody's HR team. HR is responsible for ensuring that the new employee completes the new hire application packet. Once the paperwork is complete, it's entered

## State of Washington

into ctcLink, and HR proceeds with employee 'set-up' in the system, including payroll set-up. On the ctcLink Payroll and Compensation screens, HR sets the appropriate job code, status (exempt vs. non-exempt), and salary information (range and step), ensuring that the information entered matches the approved Position Request. ctcLink then automatically calculates the salary from tables, based on these inputs. The Classified salary schedules are maintained by OFM, sent to SBCTC, and then uploaded on behalf of CCS. For professional exempt and faculty schedules, Melody is the individual designated to update these salary lookup tables, based on Board approvals. Budget changes are only allowed on the 1st or the 15th of the month. There are no mid-pay period changes allowed. Every time that an employee change is made (new employee, promotion, reclassification), then HR checks to ensure that ctcLink is correctly calculating the wage for that employee. Spot-checks are also done whenever salary schedules are updated. ctcLink has certain built-in security features to prevent undesirable access to payroll information. The only individuals with system access to update payroll lookup tables are Melody Mathews and Tiffany Henderson. As another example, an individual cannot update their own payroll information, such as giving themselves a promotion or changing their job class. ctcLink also disallows retroactive payments.

### Promotions, COLAs, & Separations:

An Employee Action Notice (EAN) is required for any job location change, supervisor change, stipend, pay increase, or re-allocation. Each EAN goes through the same approval process as Position Requests. A justification also has to be provided with each EAN, showing the original letter for reallocation analysis and a new job description. EAN's contains the chart string/fund information used to correctly classify payroll depending on the employee's assigned exemption status, and is reviewed by budget managers, department managers and HR (**Key Control #1 - Manual - Classification**). Once the EAN and justification are approved, the HR team accordingly adjusts the employee's ctcLink inputs for the Payroll and Compensation screens. Promotions are handled slightly differently - all promotions require a Position Request form for the open position, and the process is then very similar to that of adding a new employee. When an employee separates, an EAN is required, and the letter of resignation or notice of termination must be attached. Separations are not allowed to be backdated. Once an EAN is submitted, HR makes the necessary adjustments in the ctcLink Payroll and Compensation screens. These screens include certain check boxes, such as 'forward to payroll', which pushes out a notification to the payroll team responsible for auditing leave balances. The notification is also forwarded to IT, who removes all ctcLink permissions for the separating employee.

### Processing Payroll:

CCS maintains a 'Payroll' sub folder on their Share Drive, where HR maintains a spreadsheet for new hires and separations, including employee type, start/end dates, etc. This ensures that Peter's team in payroll and benefits is aware of personnel changes where action is needed on their end. Payroll begins processing for each cycle the day prior to the state cut-off date. The payroll team reviews the electronically-submitted time cards, ensuring that all employees have loaded in their time for the correct period, and that it was properly approved (**Key Control #2 - Manual - Completeness**). Leave is tracked manually by the payroll department, and is entered as needed into the system. Once the payroll team has verified that time and leave entries are correct, then they use the 'create pay sheet' ctcLink feature, which pulls in time, leave, and pay rate data for each employee, creating each paycheck. The Department compares job data information to the generated pay processing data. They verify that no employees are missed, and that separated staff are properly excluded, using VLookup formulas. Payroll then follows a Department Task List, Payroll Cycle Timeline, and a Payroll Coordinator Checklist, which requires them to run various queries, perform reconciliations, and follow-up

## State of Washington

on any unusual situations (**Key Control #3 - Manual - Completeness**). Once completed, the system is asked to validate the information, and it is subsequently forwarded to SBCTC. When processed and approved by SBCTC, it is then automatically posted to the GL in ctcLink as a credit to the proper A/P account (Wages Payable), and a debit to the related expense account (Payroll Expense), and another JV is then posted by Peter's team after a review of what checks need to be issued to debit the liability and record a credit to cash paid out.

### **Purchases & A/P:**

On 9/13/23, we met with Heather Pedersen (Account Expensing Supervisor), Tiffany Henderson (Director of Financial Reporting), and Yabing Fisher (Expense Accountant), to gain an understanding of internal controls for general expenditures at CCS.

#### Purchasing/Expense Process:

All new purchase requests are entered into ctcLink through an AP module. Departments create requisitions within ctcLink for the purchase of a service or supply they are requesting. For routine purchases, or those made within pre-determined buying limits (which vary by Department), the purchaser creates a Purchase Order. This includes information such as the supplier number, dollar amount, how the expenses should be charged (budgetary information), signatures (from the originator and the approving supervisor), as well as any comments for the specific purchase. For larger purchases, after gaining budgetary approval from the Budget Department, the request is sent to the purchasing order supervisor, who reviews the Purchase Order request, verifying that all needed information is complete, and that policies and state law are being followed, including review for whether there are any existing contracts affecting the request, if the request can process as a direct buy, or if the process needs to be put on hold until a bid takes place. After Purchase Orders are approved, the Department and originator are able to proceed with the purchase. Once the purchase is complete, the invoice is added to the documentation, and the packet is then sent to the 'AP inbox'. The invoice or receipt is attached as supporting paperwork, and the packet is sent to an 'AP inbox', which captures all submitted payment requests.

#### Purchase Cards (No change from prior year):

Each card has its own limits, which are determined by the requesting supervisor. Heather is responsible for setting up the card with the requested limits. Limit increases, whether temporary or permanent, require a supervisory request be sent to Heather, who will review the request and either authorize or deny the increase. Pre-approval is not required for purchases made within the purchasing limits. Card users are trained on appropriate practices, and then each purchase is reviewed prior to ultimate payment. Staff accountants are responsible for reviewing and auditing purchase card transactions on a daily basis. Once staff marks transactions as 'verified', Heather performs a secondary review of these transactions. Daily, Heather runs a ctcLink cycle which pushes the approved transactions to AP. This creates vouchers, which show up in the twice-weekly pay cycle. When the pay cycle is run, payment is remitted to JP Morgan.

#### Recording Purchases to GL:

On a daily basis, Heather and her team of AP staff sort through the "AP Inbox" to begin manually inputting the relevant purchasing information and the request for payment in the AP module in ctcLink. Once submitted, ctcLink automatically generates a JV that posts the liability and expense entry to the GL. Two times a week, the AP department runs pay cycles, which generate the actual payment (either ACH or physical check). Prior to final batching and processing of the pay cycle, Yabing Fisher (Expense Accountant) reviews and approves all payment vouchers

## State of Washington

and their supporting documentation that was input by the AP staff to ensure that all supporting documentation is complete and is properly approved, that submitted invoice dates are current and reasonable, and that purchases are allocated to the correct fund. For fund classification Yabing noted that she specifically relies on the OFM SAAM Manual to ensure that the fund is classified correctly based on the nature of the purchases (**Key Control #4 - Manual - Classification/Completeness**). Once reviewed, the voucher is submitted as part of the pay cycle, which generates the actual payment (either ACH or physical check) and debits the liability which was previously generated, and credits cash.

### A/P Accruals:

We inquired about the year-end accrual process as it relates to purchase orders or vouchers that might be outstanding after FYE as of June 30th, 2024. At the close of the end of the year, Tiffany will download an export from ctcLink for the month of July showing all of the A/P vouchers that have been submitted at or near the end of the year. She will then route this spreadsheet to the accruals team within the budgeting department, where they will review each voucher separately and make an adjusting JV for any liability or expense that should be recorded or reversed as of the year end date (**Key Control #5 - Manual - Completeness**).

### **Key Controls:**

**Key Control #1 (Manual - Classification):** EAN contains the chart string/fund information used to correctly classify payroll depending on the employee's assigned exemption status and is reviewed by budget managers, department managers and HR.

**Key Control #2 (Manual - Completeness):** Payroll begins processing for each cycle the day prior to the state cut-off date. The payroll team reviews the electronically-submitted time cards, ensuring that all employees have loaded in their time for the correct period, and that it was properly approved.

**Key Control #3 (Manual - Completeness):** The Department compares job data information to the generated pay processing data. They verify that no employees are missed, and that separated staff are properly excluded, using VLookup formulas. Payroll then follows a Department Task List, Payroll Cycle Timeline, and a Payroll Coordinator Checklist, which requires them to run various queries, perform reconciliations, and follow-up on any unusual situations.

**Key Control #4 (Manual - Classification / Completeness):** Yabing Fisher (Expense Accountant) reviews and approves all payment vouchers and their invoices, purchase orders, & receipts that were input by the AP staff to ensure that all supporting documentation (invoices, purchase orders, & receipts) that make up the purchase is complete and is properly approved, that submitted invoice dates are current and reasonable, and that purchases are allocated to the correct fund. For fund classification Yabing noted that she specifically relies on the OFM SAAM Manual to ensure that the fund is classified correctly based on the nature of the purchases.

**Key Control #5 (Manual - Completeness):** Tiffany Henderson, Director of Financial Reporting, will download an export from ctcLink for the month of July showing all of the A/P vouchers that have been submitted at or near the end of the year. She will then route this spreadsheet to the accruals team within the budgeting department, where they will review each voucher separately and make an adjusting JV for any liability or expense that should be recorded or reversed as of the year end date.

### Identified Weaknesses:

**None**

# State of Washington

## **STEP 2: Confirm Key Controls**

**Key Control #1 (Manual - Classification):** EAN contains the chart string/fund information used to correctly classify payroll depending on the employee's assigned exemption status, and is reviewed by budget mangers, department managers and HR.

To confirm this key control, Melody Matthews (Director of Human Resources Information Systems), performed a walkthrough on 9/12/24 of an "EAN *ctcLink ID 101058751*" which showed the the effective date for this EAN in the comments of 7/1/23. We noted that the budget field had the following information: 7170-001-101-083-14200-14201 which we determined contained the the operating unit, the fund, the class, the department and the program numbers. For this particular payroll EAN change we noted the fund to be correctly classified under 001. We then reviewed the chain of sign-offs for this EAN and noted 4 separate sign off's, the last one taking place after fiscal year end on 8/16/24 by Kaitlyn G. Kepner, HRO. No issues noted.

**Key Control #2 (Manual - Completeness / Classification):** Payroll begins processing for each cycle the day prior to the state cut-off date. The payroll team reviews the electronically-submitted time cards, ensuring that all employees have loaded in their time for the correct period, and that it was properly approved.

To confirm this key control we obtained and inspected copies of the following reports provided by Tiffany Henderson, Dir. of Financial Reporting, on 10/14/24 on behalf of Peter Lubetich, Manager of Payroll & Benefits:

06B Confirm Timeline

06B Payroll Task List

06B CTC\_TL\_PAY\_TIME\_BY\_PERIOD.xlsx

We first analyzed the *06B CTC\_TL\_PAY\_TIME\_BY\_PERIOD* spreadsheet showing all of the submitted time sheets and hours for the payroll period of 6/16/24 to 6/30/24. To verify no time sheets were submitted after the cut-off date identified in the *06B Timeline* of 7/1/24, we created a pivot table to analyze the payroll data based on dates provided in the spreadsheet, and noted no dates outside of the acceptable pay range (6/16 - 6/30). We then reviewed the corresponding pay period task list and identified the following steps that were signed off on by "All" on 7/1/24 and 7/2/24 marking them as completed:

*"The morning that time sheets are due to be approved by the supervisor, run the REQUEST TIME ADMIN every half hour to push the submitted hours to the supervisor for approval."*

*"Run the Exception Query periodically to stay on top of the exception errors that have been reported. "*

After reviewing these processes regarding the 06B payroll cycle, we can confirm that the timecards were submitted in the correct period, and that it was properly approved by appropriate staff. ***No issues noted.***

**Key Control #3 (Manual - Completeness):** The Department compares job data information to the generated pay processing data. They verify

## State of Washington

that no employees are missed, and that separated staff are properly excluded, using VLookup formulas. Payroll then follows a Department Task List, Payroll Cycle Timeline, and a Payroll Coordinator Checklist, which requires them to run various queries, perform reconciliations, and follow-up on any unusual situations.

To confirm this key control, Peter Lubetich, Manager of Payroll & Benefits, performed a walkthrough of the payroll process on 9/12/24 for the payroll period of *Payroll Cycle 06A* (the first payroll cycle for June, of FY24). He showed us the payroll timeline spreadsheet for this pay cycle, and we were able to identify that on Friday, 6/14/24, supervisors and managers from each department must submit their time sheets for approval by EOD. ***No issues noted.***

Additionally, Peter showed us the completed Coordinator Processing Checklist, where we were able to identify three steps that were marked as checked off (indicated by an "X") for the following payroll processes for this pay cycle:

Run Pre-Sheet Audit Report (PAY034)

Create Paysheets (PSPPYBLD)

Review Pay Calendar

***No issues noted.***

We also reviewed the *Payroll Department Task List for the Pay Cycle 06A*, and identified a pre-payroll task of "Review leave types taken vs pay groups, etc." by running the "OHC\_AB\_LEAVE\_TYPE\_REASON" ctcLink query. This checklist step was marked completed on 6/18/24 with initial "PLG" which we confirmed was Peter. ***No issues noted.***

**Key Control #4 (Manual - Classification / Completeness):** Yabing Fisher (Expense Accountant) reviews and approves all payment vouchers and their supporting documentation that was input by the AP staff to ensure that all supporting documentation is complete and is properly approved, that submitted invoice dates are current and reasonable, and that purchases are allocated to the correct fund. For fund classification Yabing noted that she specifically relies on the OFM SAAM Manual to ensure that the fund is classified correctly based on the nature of the purchases.

To confirm this key control, Yabing Fisher performed a walkthrough of her review process for *A/P Voucher 00052387* from an invoice on 8/13/24. She showed us the Voucher attachments (supporting documentation) that was uploaded by the A/P team on 9/13/24 which included the Purchase Order from the purchasing department for the supplier *Community PlayThings*, the actual invoice from the supplier, and the purchase approval message thread. Yabing's review included scanning these supporting documents for all necessary information in the ctcLink chartstrings to verify that they were accurate and complete. Additionally, she made sure that the Fund Code and GL Account (Fund 145 and Acct. 5030070) were reasonable based on the purchase by comparing it with the corresponding SAAM manual. We were able to verify that this voucher was thoroughly reviewed prior to being approved by Yabing and being posted to the GL. ***No issues noted.***

**Key Control #5 (Manual - Completeness):** Tiffany Henderson, Director of Financial Reporting, will download an export from ctcLink for the

## State of Washington

month of July showing all of the A/P vouchers that have been submitted at or near the end of the year. She will then route this spreadsheet to the accruals team within the budgeting department, where they will review each voucher separately and make an adjusting JV for any liability or expense that should be recorded or reversed as of the year end date.

To confirm this key control, we obtained and inspected the following documents pertaining to the AP accrual process received by Tiffany Henderson, Dir. of Financial Reporting on 9/19/24:

Accrual List.png

AP Invoices for FY24 needing accruals email thread

Voucher for Adjusting JV

AP Invoice

We first identified that there were services billed to Spokane Falls CC in the amount of \$10,905.44 from the vendor "GoJoePatrol" with an invoice date of 6/30/24. Per the Accrual List report, we identified Journal ID AP00490030 for the posted voucher of \$10,905.44 to record the liability with an invoice date of 6/30/24 and an accounting date of 7/22/24. We then reviewed the email thread sent from Tiffany Henderson to multiple recipients of the budget and fiscal team at CCS with the subject "AP Invoices for FY24 needing accruals" whereby we confirmed that she explained the process the budget team must follow to properly record and post adjusting JV's by creating pivot tables and analyzing invoice dates with 6/30/24 or earlier and accounting dates of 7/1/24 or later. We then reviewed the adjusting JV for this transaction with Journal ID "0000488443" dated for 6/30/24 and posted to period 13 (adjusting period after year end) to post the accrual. We confirmed that the accrual adjustment process is currently in place for FY24. *No issues noted.*

### **STEP 3: Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **STEP 4: Control Risk at LOW - Test Key Controls**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

### **STEP 5: Final Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **J.3.PR.G - Community & Tech College Testing - Spokane**

# State of Washington

*Procedure Step:* Education Expenses - Testing  
*Prepared By:* NJH, 10/15/2024  
*Reviewed By:* RKM, 10/22/2024

## Purpose/Conclusion:

### **Purpose:**

To determine whether reported payable expenditures represent transactions relating to the proper period and to determine whether all payroll expenditures were recorded throughout the fiscal year (Completeness).

To determine whether reported expenses/expenditures were properly allocated in the correct AFRS roll-up funds (Classification).

### **Conclusion:**

We determined that the reported payable expenditures represent transactions relating to the proper period and that all payroll expenditures were recorded throughout the fiscal year (Completeness).

We determined that the reported expenses/expenditures were properly allocated in the correct AFRS roll-up funds (Classification).

## Testing Strategy:

The following is a list of **considerations** for testing the completeness assertion for expenses/expenditures. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

### **Detail Roll-Up**

Compare totals from general ledger to accounts payable, payroll or other subsidiary software modules.

Review the government's reconciliation of general ledger to subsidiary systems.

*Detail roll-up testing is not sufficient audit evidence by itself since it only entails comparing different sets of the entity's own accounting records. However, it may be combined with other substantive tests to address identified risks. For example, if substantive testing is performed at the subledger level, it may be combined with a test that the subledger detail accurately rolls up to the general ledger or financial statements.*

### **Cut off / Improper Expense Recognition**

Scan expenditures recorded 1-3 months before and/or after fiscal year end (expenditures not charged to the current period). Based on the scan, test selected or sampled expenditures to determine if the expense should have been reported in the current period.

Inquire with AP clerks regarding invoices held, but not entered as of year-end (ie: due to pending litigation or disputes).

# State of Washington

## **Unrecorded Expenses**

If the entity reconciles recorded revenues and expenses to bank activity, then reviewing monthly reconciliations and evaluating or testing reconciling items.

## **Accounts Payable**

If entity uses a warrant clearing account for vendor payments, review the entity's year-end reconciliation of recorded vendor payments with disbursements from the clearing account.

Review edit check reports from the AP system that might indicate missing payments.

## **Payroll**

If entity uses a payroll clearing account, review the entity's year-end reconciliation of recorded payroll with disbursements from the payroll clearing account.

Perform an expected payroll test by taking the prior audited payroll amount and adjusting it for expected changes.

*The analysis should consider changes in employees, COLA increases, salary scale increases if automatic, changes wages or benefits due to changes in policy or union negotiations changes, etc. Sources for these expectations should be obtained apart from the payroll records that are being tested. Since the auditor would not expect to be able to precisely predict payroll, the auditor should document a reasonable range within which actual payroll is expected to vary from the auditor's prediction.*

If the board directly approves salaries for a significant amount of employees, verify whether the actual salaries for these employees is within an expected reasonable range of the approved salary.

For small entities, compare payroll by employee to known employees per observation, organization charts or a phone list.

Review edit check reports from the payroll system that might indicate missing payments.

## **Unrecorded Liabilities**

Evaluate liabilities directly related to expenses for completeness. See the completeness steps for current and non-current liabilities for testing considerations.

*For example, if the entity reports a self-insurance liability, the auditor might evaluate whether the change in the liability (and related expense) was determined and recorded. If no liability was reported, then the auditor might determine whether such a liability (and associated expense) should have been reported.*

**OPEB** - auditors should use the OPEB Testing Strategy workpaper available in the Store for auditing OPEB expenses.

# State of Washington

**Pollution Remediation** - auditors should use the Pollution Liability Testing Strategy workpaper available in the Store for auditing pollution remediation expenses.

## **Removing Expenses from Accounting Records**

Search for manual journal entries that credit (decrease) expenditures. Consider testing selected transactions.

Identify transactions that void, cancel, or manually adjust transactions in subsidiary AP or payroll systems. Auditors may conclude that the total amount of such transactions are trivial or otherwise reasonably small. Or auditors may sample or select transactions for testing.

*Also see considerations under the "Not recording expenses" section.*

## **Interfund Expenses**

For internal service fund charges, see testing strategies for internal service funds in the Accountability folder. For other types of internal charges, see testing strategies for Internal Activities.

The following is a list of **considerations** for testing the classification assertion for expenses/expenditures. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

Sample transactions for correct classification. *Use the "Sampling for FS Substantive Testing" spreadsheet available in the Store to calculate sample size and make any projection of likely misstatement to the population.*

If planning has identified a limited population that is high risk (ex: certain transaction types and/or line items within an opinion unit), scan these populations and test selected transactions.

## **Journal Vouchers**

Search for manual journal entries that reclassify expenses/expenditures from one opinion unit to another without recording a balance sheet transaction, other than a direct charge to fund balance (debit and credit to expenditure and fund balance for each opinion unit, respectively). Test selected journal entries based on risk.

Search for manual journal entries that reclassify expenses/expenditures from one line item to another. Test selected journal entries based on risk.

## **Vendor Payments**

Review the top vendors paid by opinion unit or line item (preferably as a multi-year trend) and evaluate whether the vendor meets expectations in relation to the activities of the fund. Test transactions for each unexpected vendor based on risk.

Test selected or sampled transactions for correct classification.

*NOTE: this test may be combined with expenditure tests for other attributes. For example, expenditure testing for accountability or single*

# State of Washington

*audit purposes may also be used for classification testing.*

## **Payroll**

Scan totals charged to each opinion unit by employee (preferably as a multi-year trend) and evaluate whether the allocation of employee's time to that opinion unit meets expectations based on job titles, organization charts, observation or the phone list. Follow up on unexpected allocations by review of timesheets or employee interviews.

Perform an expected payroll test by opinion unit.

Test a sample of pay periods for salaried and hourly employees to ensure that expenditures are being classified to the correct opinion unit. This test should verify both the correct allocation of direct charges and that leave and benefit costs are allocated in the same proportion as direct charges.

## **Cost Allocation Plans / Internal Service Fund Allocations**

Review cost allocation plans or internal service fund charges to confirm that the classification of joint costs to different opinion units is supported. *See example testing strategies for these areas located in the Accountability cabinet .*

Guidance/Criteria:

Record of Work Done:

## **Significant Balances and Assertions:**

Governmental Activities- Education- Higher Education Expenses - Completeness, Classification  
Higher Education Special Revenue- Charges for Expenses - Completeness, Classification

Controls are documented at [[Education Expenses - Controls](#)].

## **Substantive tests performed to meet the Completeness assertion:**

### Accounts Payable

See testing documented at [[CONFIDENTIAL - Education Expenses Testing](#)].

To test the completeness assertion for education expenses (accounts payable), we used the FS sampling spreadsheet set at low assurance to test 30 sampled AP voucher transactions for Q1 in FY25 by running the "QFS\_AP\_VCHR\_ACCTG\_LINE" query in ctcLink. We confirmed population completeness under the "Population Completeness" tab, with no issues noted. We selected a sample containing AP vouchers for accounts 5030010 to 5120030 which represent the majority of Sub object E expenses "Goods & Other Services", and filtered by those accounts within the relevant Higher Education Special Revenue Funds. For each AP sample selected, we analyzed the recorded accounting date as shown in ctcLink compared to the date on the supporting documentation/invoice for each purchase. We also analyzed the description

## State of Washington

and nature of what item/service was purchased to determine if the expense should have been accrued and recorded as an expense during FY24. We obtained a list of all AP Voucher accruals after FYE obtained by Tiffany Henderson, Dir. of Financial Reporting, and cross references these vouchers with our selected sample to determine if any were already reversed and adjusted for during year-end close process.

We identified a total misstatement which is below the floor. ***No issues noted.***

### Payroll

See testing documented at [\[CONFIDENTIAL - Education Expenses Testing\]](#).

To test the completeness assertion for payroll expenses, we used the FS sampling spreadsheet set at low assurance to test 29 sampled payroll employees paid throughout the fiscal year by obtaining the Gross-Net Payroll Spreadsheet from Peter Lubetich (Manager of Payroll & Benefits) showing all payroll activity throughout the year. We confirmed population completeness under the "Population Completeness" tab with no issues noted. For each employee selected, we evaluated the total number of paychecks received throughout the year and compared this with the amount they should have received based on their start / end employment date as provided by HR. Additionally, we reviewed all time sheets and paystubs to ensure that all recorded hours and amounts were properly recorded for the selected pay period.

We determined that payroll expenses were complete throughout the year, and noted no variances. ***No issues noted.***

### **Substantive tests performed to meet the Classification assertion:**

#### Accounts Payable

See testing documented at [\[CONFIDENTIAL - Education Expenses Testing\]](#).

To test the classification assertion for education expenses (accounts payable), we used the FS sampling spreadsheet set at low assurance to test 30 sampled AP voucher transactions for FY24 by running the "QFS\_AP\_VCHR\_ACCTG\_LINE" query in ctcLink. We confirmed population completeness under the "Population Completeness" tab, with no issues noted that would impact our testing. We selected a sample containing AP vouchers for accounts 5030010 to 5120030 which represent the majority of Sub object E expenses "Goods & Other Services", and filtered by those accounts within the relevant Higher Education Special Revenue Funds. We then analyzed invoices, receipts, and purchase orders for each AP Voucher (as applicable) selected for testing to determine if the AP expenditure represented education-related expenses and was classified correctly based on the amount, the vendor, and the nature of the expense.

We determined AP expenditures rolled up to the Higher Education Special Revenue Fund appropriately represent education-type expenses. ***No issues noted.***

### Payroll

See testing documented at [\[CONFIDENTIAL - Education Expenses Testing\]](#).

## State of Washington

To test the classification assertion for payroll expenses, we used the FS sampling spreadsheet set at low assurance to test 29 sampled payroll employees paid throughout the fiscal year by obtaining the Gross-Net Payroll Spreadsheet from Peter Lubetich (Manager of Payroll & Benefits) showing all payroll activity throughout the year. We confirmed population completeness under the "Population Completeness" tab with no issues noted. For each employee selected, we evaluated if the amount of pay received corresponded with education-related services, employment, or temporary contracts as it pertains to payroll expenditures by reviewing supporting HR documentation and knowledge of the college operations regarding payroll.

We determined payroll expenditures rolled up to the Higher Education Special Revenue Fund appropriately represent education-type expenses. ***No issues noted.***

### J.3.PRG - Community & Tech College Testing - Spokane

*Procedure Step:* Federal Grants in-Aid - Controls

*Prepared By:* JAG, 10/7/2024

*Reviewed By:* RKM, 10/8/2024

Purpose/Conclusion.:

**Purpose:**

To gain an understanding of internal controls and assess control risk in order to help plan the nature, timing and extent of substantive testing.

**Conclusion:**

We have gained an understanding of internal controls and assessed control risk at **maximum**. Therefore, we **will not** place reliance on controls. Our understanding of internal controls and control risk assessment will be used to help plan the nature, timing and extent of substantive testing.

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy.:

The following procedures are **required** for all relevant systems:

# State of Washington

*Optional:* List the financial statement balances and relevant assertions addressed by the understanding.

## **STEP 1: Understanding of Controls**

Gain an understanding of the internal control process, identify key controls over relevant assertion(s), and note any control weaknesses.

*The auditor's understanding should include:*

*Business processes relevant to financial reporting of the relevant assertion for the material balance. Processes should encompass automated and manual procedures by which transactions or events are identified or initiated, authorized as needed, recorded, processed and corrected as needed.*

*Original accounting records and how records are rolled-up to intermediary ledgers and transferred to the general ledger or financial statements.*

*Detailed descriptions of key controls. Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*In gaining an understanding of controls, consider the overall understanding of Entity-Level control elements as documented in the "Entity-Level Controls" step as they relate to this particular system.*

## **STEP 2: Confirm Key Controls**

Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walkthrough of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency or material weakness likely exists.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "IT Control Testing" step pulled*

## State of Washington

*down from the SAOStore and be hyperlinked with this step. Auditors should consider contacting Team IT Audit for assistance.*

### **STEP 3: Preliminary Control Risk**

Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls in step 4A. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls. **All potential material weaknesses and significant deficiencies should be discussed with the AIC or AAM, since they must be reported as findings.***

### **STEP 4: Control Testing**

If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency or material weakness likely exists. If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "IT Control Testing" step pulled down from the SAOStore and be hyperlinked with this step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of Entity-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*

## State of Washington

*D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

### **STEP 5: Final Control Risk**

Evaluate the results and document a final control risk assessment. Consider whether any internal control issues identified represent material weaknesses or significant deficiencies.

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Policy/Standards tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency. **All potential material weaknesses and significant deficiencies should be discussed with the AIC or AAM, since they must be reported as findings.***

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits](#) Planning Guide**

Record of Work Done:

### **Significant Balances and Assertions:**

Internal controls in the Community and Technical College System address the following balances:

Governmental Activities - Education - Higher Education Operating Grants and Contributions - Occurrence  
Higher Education Special Revenue - Federal Grants-In-Aid - Occurrence

See lead sheet here: [[Lead Sheet](#)]

# State of Washington

## **STEP 1: Gain an Understanding of Internal Controls**

We met with the following people on 9/16/24 to update our understanding over federal grants-in-aid:

Tiffany Henderson, Director of Financial Reporting  
Brandy Browning, Director of Accounting and Budget  
Diana Biddison, Budget Analyst 3 (Non-Financial Aid Grants)

There are several types of federal grants received at Community Colleges of Spokane (CCS) which require separate processes. We have categorized these into two basic grant types: Financial Aid Related (DOE), and Non-Financial Aid Related (DOA, DOL, HHS, etc.)

### Financial Aid Grants:

The financial aid related grants are through the Department of Education (DOE) including, Pell Grants, Federal Supplemental Educational Opportunity Grant (SEOG), and Federal Work Study Program (FWS).

### Expenses:

To be eligible for federal awards, students fill out the FAFSA and DOE determines eligibility based on different criteria for each grant. Review of eligibility and awarding is determined on campus in the Financial Aid Office (FAO). Once the amount of federal aid has been determined, the FAO sends students award letters and lets them know the dollar amounts of their awards. In the disbursement phase of the process, federal regulations allow them to disburse funds up to 10 days in advance, but CCS does not disburse funds in advance and students don't have access to the funding until the first day of the quarter. CCS has an established disbursement process where they work together with the student finance office to separate the duties of award and disbursement. CCS staff in the FAO, normally the Associate Director or a Disbursement Specialist, runs a predefined disbursement process which is a query that checks for enrollment, if any factors have changed, and continued eligibility within the system. The FAO then sends the Manager of Student Accounting, Diana Plum, a file containing a list of all student accounts and the amounts that are to be disbursed. Diana uploads it as a batch to Bank Mobile to apply the awarded amounts to those student's accounts. The file from the FAO contains item types that have a string of coding to the chart of accounts so they post to the correct grant.

DOE grants also allow for a certain percentage of indirect costs to be included for reimbursement. CCS has an approved indirect cost rate plan, but if there is a determined rate inside the grant agreement itself, then the rate in the agreement will be used. The FAO calculates the expenditure amount with the correct indirect cost rate with the Manager of Student Accounting's assistance.

### Reimbursement:

Once the awards to student accounts have been posted, the Manager of Student Accounting runs queries out of the accounting software to determine how much has been applied to each type of grant. The Manager of Student Accounting pulls the reports for the entire grant award period to date (which is the start of the FY) from the Student Management subledger. These reports contain lists of student accounts in which the funds were applied. The Manager of Student Accounting performs a reconciliation, taking the total revenue already received and subtracting it from total expenditures to obtain the total draw amount and to ensure all applicable expenditures are included in the draw request and are for the

## State of Washington

correct period **(Key Control 1)**.

In order to avoid overdrawing and having to return funds, the Manager of Student Accounting will draw slightly less (depending on the grant, average of \$50k) than the actual calculation. The amount is determined based on experience with the grants and professional judgement. Draw downs from the online G5 system are based on actual expenditures. G5 is the DOE's grants management system designed to track grant awards and issue reimbursement. Draw downs are submitted approximately 3 days prior to the start of each school quarter and then another around two weeks after the quarter starts. Then approximately once a month for the rest of the term. This allows for students to have had a chance to finalize their schedules with any classes added or dropped. Because tuition expenses are constantly a moving target, at the end of the FY the Manager of Student Accounting does a true-up reconciliation (with Financial Aid and G5) by running detailed expenditure reports from the CCS accounting system and balancing to the total expenditures tracked in G5. The Manager of Student Accounting ensures that only the transactions related to the applicable grant year are included by running expenditure reports by student term (winter, spring, summer, fall).

Tiffany stated that they do occasionally need to make corrections for recording expenses or revenues in the wrong period. This is especially true for activity on the last day of the month or at the end of the fiscal year. Errors are caught during reconciliations and in order to make the correction, fiscal analysts create accrual entries to move the revenues and expenses to the correct fiscal period.

### Revenue Recognition:

The Manager of Student Accounting sets up an AR and revenue when funds are requested. Once the draw from the G5 system has been approved, funds are electronically transferred into the College's bank account. A verification email is received from the grantor/agency documenting the EFT transmission which is used to apply funds to the appropriate invoices (A/R). The FA2 who performs the daily cash reconciliations, Laurice May, clears the receivable to recognize the revenue.

### Non-Financial Aid Grants:

Non-financial aid related grants are through the Department of Labor (DOL), Health and Human Services (HHS), etc.

### Expenses:

At each of the colleges, program managers are responsible for approving purchases (generally using P-Cards) for allowable activities as well as reviewing and approving the payroll/travel in which employees charge time to various grants. Billings are reviewed again at the District Office for reasonableness and are then approved for payment through the normal AP process. All receipts and backup documentation are attached in the billing system to support transactions. Once the expenditures have been paid, the Fiscal and Budget Analysts are able to review the supporting documents for reasonableness (based on the specific grant) and to ensure the expense are properly valued and recorded in the appropriate period prior to requesting reimbursement. As mentioned above, the college has an approved indirect cost rate plan and costs for the period are calculated and entered by Diana prior to requesting reimbursement using the rate from this plan, or the rate from the grant agreement if specified to do so. Credits are recorded as reducing the correlating expenditure and are picked up in the expenditure detail report. Additionally, when billings are recorded at fiscal year end, they are accrued back into the appropriate period so that when the revenue is recognized, it is being

## State of Washington

accrued back and applied to the correlating expenditure.

### Reimbursement:

For state board grants, OBIS (Online Budget & Invoicing System) is billed first and then the billing is done in the grant module to calculate the revenue for reimbursement; non state board grants require the creation and submission of a pre-approved reimbursement request template. At the end of the month (or quarterly depending on the grant agreement) the Fiscal or Budget Analyst runs expenditure reports from the GL and balance these reports to the Colleges billing module to ensure that all expenditures are included and are for the correct period. The Fiscal and Budget Analyst use the GL actual expenditures report to prepare the reimbursements (**Key Control 2**). For grants requiring a template, the reimbursement request is given to the Manager of Student Accounting to review and submit. The Fiscal and Budget Analyst review expenditure detail and monitor grant budgets to ensure that the expenditures are for the correct fiscal year. Diana stated that the college uses the fixed price billing method to bill all their grants in ctclink so that no CAPC journals are produced. They do have grants that are cost reimbursable and grants that are fixed price grants. For cost reimbursable grants, the calculation of revenue for reimbursement is determined by the amount of expenditures charged to the grant for the month. For fixed price grants, the calculation of revenue for reimbursement is determined by the grant contract, which either specifies how much to bill each month or specifies how to determine how much to bill each month/quarter. CCS bills both types of grants under the fixed price billing method in ctclink. All grants are recorded in the GL and grant bills are picked up by running a GL report. The GL grant report is balanced and expenditures are reviewed by the Fiscal and Budget Analyst to ensure all bills were reconciled for the period.

### Revenue Recognition:

As all grants are processed under the fixed price billing method, CCS avoids creating excess revenue entries through unbilled receivable (CAPC) journals. OBIS is manually billed where a JE is created to debit AR control and credit revenue. Upon EFT of the funds from the granting agency, the receivable amount is reduced by the treasury clerk using the EFT detail to apply to the correct AR invoice.

Note: The information in the accounting system, which is a result of the processes above, is gathered for reporting at the state level.

### Key Controls:

**Key Control #1 (Occurrence - Financial Aid):** The Manager of Student Accounting performs a reconciliation, taking the total revenue already received and subtracting it from total expenditures to obtain the total draw amount and to ensure all applicable expenditures are included in the draw request and are for the correct period.

**Key Control #2 (Occurrence - Non-Financial Aid):** The Fiscal and Budget Analyst, use expenditure reports for the grant period to date and balances these reports to the College's billing module to ensure that all expenditures are included and are for the correct period. Once determined, the correct entry is made - (DR) receivable / (CR) revenue.

### Identified Weaknesses:

**None.**

# State of Washington

## **STEP 2: Confirm Key Controls**

**Key Control #1 (Occurrence - Financial Aid):** The Manager of Student Accounting performs a reconciliation, taking the total revenue already received and subtracting it from total expenditures to obtain the total draw amount and to ensure all applicable expenditures are included in the draw request and are for the correct period.

We obtained two reconciliation spreadsheets "Workpapers - SP24 3.15 Draw" and "23-24 Master Recon - t. March 2024 - SCC Federal" from Tiffany Henderson, Director of Financial Reporting. The spreadsheet was prepared by Brooke Sackman, Manager of Student Accounting. The spreadsheet shows disbursements for the period 3/1/24-3/30/24 for CARES, SEOG, DL and Pell. The reconciliation includes tabs with detailed expenditure data, including payment dates, from ctLink to support the amounts reported as disbursed for the period. The reconciliation also includes a calculation of the amount to draw, which was underdrawn to keep a buffer. The reconciliation notes a draw of the following amounts:

WA171 and WA172 CARES - \$0  
WA171 SEOG - \$13,080  
WA172 SEOG - \$7,335  
WA171 DL - \$154,652  
WA172 DL - \$79,145  
WA171 Pell - \$295,312.95  
WA172 Pell - \$1,575,794.94  
Total \$2,125,319.89

We viewed a screenshot showing the G5 draw confirmation that tied to amounts from the recon, with a deposit date of April 30, 2024. We traced these to the April Bank of America bank statement, showing deposits made on 4/30/24 in the total amount of \$2,125,319.89. We also obtained the related invoices (MSC-0000028015 & MSC-0000027986) and the portal funds request email sent from Brooke Sackman to WSAC dated 4/29/24. We noted that the draws on the spreadsheet, invoice, bank statement, and the portal funds request email tied without exception. ***No issues noted.***

**Key Control #2 (Occurrence - Non-Financial Aid):** The Fiscal and Budget Analyst, use expenditure reports for the grant period to date and balances these reports to the College's billing module to ensure that all expenditures are included and are for the correct period.

We obtained the June 2024 Head Start draw back up documentation "SMARTLK #710" dated 7/23/24. The total for this draw per the billing module was \$883,805.31. We saw email communication noting the draw was prepared by Brandy Browning, and approved and submitted by Diana Biddison. The packet included a screen shot from the Department of Health and Human Services' Payment Management System and two invoices CA-0000019493 and that tied to the same amount. We viewed detailed expenditure activity that tied to the draw amount. ***No issues***

# State of Washington

*noted.*

## **STEP 3: Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

## **STEP 4: Control Risk at LOW - Test Key Controls**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

## **STEP 5: Final Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

## **J.3.PR.G - Community & Tech College Testing - Spokane**

*Procedure Step:* Federal Grants in-Aid - Testing

*Prepared By:* JAG, 10/16/2024

*Reviewed By:* RKM, 10/21/2024

Purpose/Conclusion.:

### **Purpose:**

To determine whether reported revenues represent actual amounts relating to the period (Occurrence).

### **Conclusion:**

We determined that reported revenues represent actual amounts relating to the period (Occurrence). **No issues noted.**

Testing Strategy.:

The following is a list of **considerations** for testing the occurrence assertion for revenues. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

# State of Washington

For revenues received from the State Treasurer, trace reported amounts to the State Treasurer confirmations available in LGCS.

Confirm intergovernmental revenues with the other government or grantor or by reviewing appropriate correspondence.

Trace selected or sampled revenues from the GL to supporting billings or subsequent receipts.

If revenue is receipted into a specific clearing account, or if third-party lockbox or receipting services are used, compare recorded revenue to a sum of monthly totals from bank, lockbox or service organization reports.

Develop sufficiently precise expectations for a substantive analytical to compare to reported revenue amounts.

Search for manual journal entries that credit (increase) revenues. Consider testing if any risk indicators are noted.

## **Cut-Off / Revenue Recognition**

Test a sample of underlying transactions to verify the revenue was recorded for the proper period. Note: transactions at the beginning and end of the period would generally be considered at highest risk of being improperly recorded in the current period.

If revenue is billed at a constant rate, calculate an expectation based on the average monthly billing or re-calculate the year-end accrual journal entry and compare to the reported receivable.

Evaluate revenue recognition against GAAP criteria for selected transactions or revenue streams.

## **Interfund Revenues**

For internal service fund charges, see testing strategies for internal service funds in the Accountability folder. For other types of internal charges, see testing strategies for Internal Activities.

## **Detail Roll-up**

Compare year-end totals from general ledger to subsidiary software modules for selected revenues.

Review the government's reconciliation of general ledger to subsidiary ledgers.

*Detail roll-up testing is not sufficient audit evidence by itself since it only entails comparing different sets of the entity's own accounting records. However, it may be combined with other substantive tests to address identified risks. For example, if substantive testing is performed at the subledger level, it may be combined with a test that the subledger detail accurately rolls up to the general ledger or financial statements.*

Guidance/Criteria:

## **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

## **BARS [3.6.9](#) Revenue Accruals in Governmental Funds**

# State of Washington

Record of Work Done:

## **Significant Balances and Assertions:**

Governmental Activities - Education - Higher Education Operating Grants and Contributions - Occurrence  
Higher Education Special Revenue - Federal Grants-In-Aid - Occurrence

Controls are documented in the "Federal Grants-In-Aid - Controls" step.

## **Substantive tests performed to meet the Occurrence assertion:**

Reconciliation: [Federal Grants In Aid Testing]

We obtained AFRS data for CCS Federal Grants in Aid and Higher Education Operating Grants and Contributions from the ACFR database, as shown here: [Final Planning Community Colleges Selected for Testing]. We analyzed the data and determined 100% of the federal grants in aid balance and 66% of the higher education operating grants and contributions balance were comprised of revenue from the Department of Education and the Department of Health and Human Services (funds 145 and 846 for sources 384 and 393). We determined to focus our testing on these two sources as they provide sufficient coverage of the balances.

We utilized the ctcLink crosswalk to determine that these AFRS revenue source codes translate to ctcLink accounts 4022280 and 4022290. We obtained FY24 Grant revenue for funds 145 and 846 from Tiffany Henderson, Director of Financial Reporting. We determined amounts tied without exception between AFRS/ctcLink.

Sample Selection and Testing: DOE [Federal Grants In Aid Testing] and HHS [Federal Grants In Aid Testing]

We utilized the sampling spreadsheet for populations of 365 or less to determine sample sizes (13 for DOE and 11 for HHS). We noted no individually significant items. To test that reported revenue occurred during the fiscal period and was supported by adequate documentation, we received the following for each sample from Tiffany Henderson, Director of Financial Reporting:

- GL data showing expenditures and the reconciliation performed to determine the amount of funds to draw

- Invoices showing the amount requested for reimbursement

- Screen shots from the G5 system showing confirmation of the payment request

- Email confirmations from G5 showing the payment request has been processed and will be deposited in the college's bank account

- For HHS Head Start samples, we received invoices, SMARTLK billings showing a breakdown of the amount to draw along with expenditure reports that tied to the draw amount, and screen shots from the HHS Payment Management System showing the ACH payment

We traced sampled revenues from the GL to GL data, supporting billings or subsequent receipts to verify recorded revenue occurred during the period and was adequately supported. ***No issues noted.***

# State of Washington

## J.4.PR.G - Community & Tech College Testing - Bellevue

*Procedure Step:* Summary & Conclusion

*Prepared By:* JLE, 10/17/2024

*Reviewed By:* RKM, 10/28/2024

Purpose/Conclusion:

### **Purpose**

To evaluate risk assessments and the sufficiency and appropriateness of evidence obtained based on results of substantive work.

### **Conclusion**

We determined that **no modifications** were necessary to inherent risk, control risk or the risk of material misstatement as assessed in planning.

We also determined that evidence obtained was sufficient and appropriate in response to the risk of material misstatement.

Testing Strategy:

Auditors are **required** to evaluate conclusions for substantive testing as follows:

*Auditors may wish to use the optional Lead Sheet available in the Store to summarize testing related to each balance and assertion.*

**1.** Determine whether the results of substantive testing indicate a need to modify the inherent risk assessment (IR), control risk assessment (CR), risk of material misstatement (RMM) or other aspects of planning (such as material balances or assertions). If so, document changes and consider the need for additional testing.

*If the results of substantive testing indicate a need to change control risk, auditors should also update the **Permanent File** by either correcting the documentation or by adding an update section describing changes to the top of the record of work done. For all changes to IR, CR, or RMM the **Material Balances** spreadsheet should be updated.*

*More significant changes to other aspects of planning (such as material balances or assertions) should be referenced in this step and documented in detail in the **Changes to FS Audit Plan** step.*

**2.** Evaluate whether the quality and quantity of evidence obtained is sufficient and appropriate in response to the risk of material

# State of Washington

misstatement. In making this determination, auditors should evaluate:

## Information to be used as audit evidence:

- Does evidence relate to the population, period of time and risk (assertion and “what could go wrong” from the Material Balance Spreadsheet)? If there are any gaps or uncertainties in the logical connection between the evidence and conclusions, is there a documented consideration and explanation?
- Are the sources of information sufficiently reliable and appropriate for the risk (whether internal to the government, external, or auditor developed)? If key information is not from a sufficiently reliable source (for example, inquiry), then is it corroborated by information that is?
- Are there any concerns about accuracy, completeness, authenticity, or bias in information? If so, did the auditor perform sufficient procedures to confirm reliability of that information?
- Is information precise enough to catch if misstatements exceeded the tolerable level?
- Is information detailed enough to conclude on whether or not there were misstatements?
- Was there any information that appeared contradictory or inconsistent? If so, was there a documented response to the inconsistencies or doubts about the reliability of evidence?

## Results:

- How much misstatement was identified by testing, and the likelihood and magnitude of further potential misstatement?
- How did misstatements occur and how often might they occur again in the population?
- Were misstatements caused by control deficiencies or circumvention of controls?
  - If control deficiencies, is there a need to re-evaluate our understanding of controls in the [Permanent File](#) folder or assessment of control risk?
  - If circumvention, the [Management Override of Controls](#) step should address or reference this area. Auditors should also consider whether a fraud risk has been identified.
- Did tests identify a different level or type of risk than the planned audit response was designed to address?
- If likely misstatements are identified, are further procedures necessary to improve the precision of our estimate?

*To support the overall evaluation of audit risk and provide a basis for concluding on the overall sufficiency and appropriateness of evidence in the [FS Summary & Report](#) step, auditors should conclude in each area whether the auditor continues to believe that the tests performed and quality and quantity of evidence obtained are commensurate with RMM for all relevant risks (the “what could go wrong”, in the [Material Balances](#) spreadsheet).*

If the auditor determines that evidence is not sufficient or appropriate, additional substantive testing should be done. If sufficient, appropriate evidence is not available for audit, the AIC should discuss the effect on our audit report with the AAM and AM.

# State of Washington

Guidance/Criteria.:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6310](#) – Determining the Nature, Timing and Extent of Substantive Testing**

**SAO Audit Policy [3210](#) – Audit Evidence**

**[Investments](#) area guide**

Record of Work Done.:

Based on test results, we re-evaluated risk assessments, procedures, evidence obtained and conclusions as follows:

### **(1) Do the results of substantive tests indicate a need to modify our risk assessment (IR, CR and RMM)?**

The results of substantive tests do not indicate a need to modify our risk assessment.

### **(2) Was the quality and quantity of evidence obtained sufficient and appropriate?**

The quality and quantity of evidence obtained was sufficient and appropriate.

## **J.4.PRG - Community & Tech College Testing - Bellevue**

*Procedure Step:* Cash and Cash Equivalents - Controls

*Prepared By:* SRC, 10/9/2024

*Reviewed By:* CJG, 11/1/2024

Purpose/Conclusion.:

### **Purpose:**

To gain an understanding of internal controls over cash and investment reconciliations and assess control risk in order to help plan the nature, timing and extent of substantive testing.

# State of Washington

## **Conclusion:**

We have gained an understanding of internal controls and assessed control risk at **maximum**. Therefore, we **will not** place reliance on controls. Our understanding of internal controls and control risk assessment will be used to help plan the nature, timing and extent of substantive testing.

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

The following procedures are **required** for all relevant systems:

*Optional:* List the financial statement balances and relevant assertions addressed by the understanding.

## **STEP 1: Understanding of Controls**

Gain an understanding of the internal control process, identify key controls over relevant assertion(s), and note any control weaknesses.

*The auditor's understanding should include:*

*Business processes relevant to financial reporting of the relevant assertion for the material balance. Processes should encompass automated and manual procedures by which transactions or events are identified or initiated, authorized as needed, recorded, processed and corrected as needed.*

*Original accounting records and how records are rolled-up to intermediary ledgers and transferred to the general ledger or financial statements.*

*Detailed descriptions of key controls. Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*In gaining an understanding of controls, consider the overall understanding of Entity-Level control elements as documented in the "Entity-Level Controls" step as they relate to this particular system.*

**Expected key control for existence and completeness:** Bank reconciliations are performed timely on at least a monthly basis to ensure the general ledger agrees to bank and investment account records.

*Documentation should include who performs bank reconciliations, how often they are performed and how reconciliations are aggregated and compared to the general ledger.*

# State of Washington

*Note: we would expect additional key controls if the government has any alternative investments or investments subject to significant interest rate or other risks.*

## Expected compensating controls:

An accounting system module or a standard template is used to document reconciliations.

Segregation of duties in that the person performing bank reconciliations does not have cash handling duties or access to initiate disbursements by wire or check.

Timely, independent review of bank reconciliation documentation, including journal entries for adjustments identified from the bank statements (such as fees, NSF checks, etc).

An up-to-date listing of change fund, petty cash and imprest fund accounts is maintained in accordance with BARS 3.8.8.

Zero-balance bank accounts and clearing funds (see BARS 3.8.6) are reconciled to zero on a monthly basis.

If the government has an investment account (that is, other than the State or County LGIP), documented inquiry with their investment service to verify the methodology for determining fair value of investments and the valuation input hierarchy level for purposes of their fair value (GASB 72) disclosures.

*Some investment accounts provide information about its methodology, assumptions, and data in valuing investments at the asset class level. However, brokers often provide no, or only limited, information about the inputs and assumptions used in developing the fair value. Management should either obtain a document with this information or contact the broker/institution to gain an understanding of the information about methods and inputs used in determining the fair value and where the investment should be disclosed in the hierarchy.*

*Contact the Investment Specialist for any questions on expected controls or documentation over fair value disclosures.*

## **STEP 2: Confirm Key Controls**

Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walkthrough of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person*

## State of Washington

*performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency or material weakness likely exists.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "IT Control Testing" step pulled down from the SAOStore and be hyperlinked with this step. Auditors should consider contacting Team IT Audit for assistance.*

*Suggested confirmation for expected key controls are to obtain and scan all year-end bank reconciliations and supporting documentation. This is normally done in conjunction with substantive testing. We would expect that bank reconciliations would clearly show check figures that compare the aggregated adjusted bank balance to the general ledger.*

### **STEP 3: Preliminary Control Risk**

Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls in step 4A. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls. **All potential material weaknesses and significant deficiencies should be discussed with the AIC or AAM, since they must be reported as findings.***

### **STEP 4: Control Testing**

If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency or material weakness likely exists. If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "IT Control Testing" step pulled down from the SAOStore and be hyperlinked with this step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it*

## State of Washington

*would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of Entity-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

### **STEP 5: Final Control Risk**

Evaluate the results and document a final control risk assessment. Consider whether any internal control issues identified represent material weaknesses or significant deficiencies.

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Policy/Standards tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency. **All potential material weaknesses and significant deficiencies should be discussed with the AIC or AAM, since they must be reported as findings.***

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits](#) Planning Guide**

Record of Work Done:

# State of Washington

## **Significant Balance(s) and Assertion(s):**

Internal controls in the Community and Technical College System address the following balances:

Higher Education Special Revenue Fund - Cash and Cash Equivalents - Existence

Higher Education Student Services Fund - Cash and Cash Equivalents - Existence

See lead sheet here: [[Lead Sheet](#)]

## **1. Gain an Understanding of Internal Controls**

We met with Jennifer McMillan, Finance Manager, via Teams on September 18, 2024 to discuss Bank and Investment Reconciliations at Bellevue College.

### **Cash & Bank Reconciliation**

There are 2 levels of reconciliations done. The first one is done daily within Peoplesoft with a FA5 downloading the bank statement in excel format into the system. This is matched up with AP and AR transactions and it automatically matches up the transactions. There is a screen within the system that shows unreconciled transactions. The second level is a monthly book to bank focusing on cash and GL balances. Jennifer prepares it using eight different queries and reports which are listed in a standard written procedure the College provides for reconciliations. Once the reconciliation is done, it is sent to Ty Bergstrom, Director, for review and approval (**Key Control #1- Existence**). Normally, this process is performed by a FA5 and reviewed by the Finance Manager, but the FA5 position is currently vacant, so Jennifer is preparing the reconciliation and the director is approving.

### **Investments Reconciliation**

The College currently has 8 investment accounts totaling about \$77 million, which change periodically based on maturities and reinvestments.

Jennifer explained she uses a detailed workbook to track investments. The workbook has a tab for each investment which holds all the fundamental data associated with that investment and tracks all anticipated transactions for the life of the investment. There is also a tab with a full schedule of events expected for each investment, such as anticipated accrued interest. Jennifer uses these figures in conjunction with the bank statement to reconcile monthly to the GL and ensure transactions are occurring as they should. The monthly reconciliation is reviewed by the FA5 or Accounting Manager (**Key Control #2 - Existence**)

### **Petty Cash and Change Funds**

The college currently has six departments which utilize change funds: Library Copier, Printing Services, Student Financial Services (SFS), PAL's Center, and Food Services. Each department has a Custodian who is in charge of daily cash counts. The Accounting Manager puts together a monthly Change Fund Balance Sheet to confirm that the amount of cash on hand matches the GL Balance.

## State of Washington

There was a Petty Cash Fund for Student Financial Services, but it was rarely used. The account was closed as of 7/25/24.

### **Summary of Key Control(s):**

**Key Control 1 (Existence):** Jennifer McMillan, Finance Manager, reconciles the GL to bank statements, noting all reconciling items on the reconciliation spreadsheet, then signs the reconciliation form which the Finance Director subsequently reviews for completeness and accuracy.

**Key Control 2 (Existence):** Jennifer McMillan, Finance Manager, performs monthly reconciliations between the workbooks and GL to ensure interest payments, amortizations, balances, and maturities are as expected.

### **Noted Weaknesses are as follows:**

None noted

## **2. Confirm Understanding**

**Key Control 1 (Existence): Jennifer McMillan, Finance Manager, reconciles the GL to bank statements, noting all reconciling items on the reconciliation spreadsheet, then signs the reconciliation form which the Finance Director subsequently reviews for completeness and accuracy.**

We obtained the July 2024 bank to GL reconciliation. We noted reconciling items and it was prepared by Jennifer McMillan, Finance Manager, on 9/18/2024 and signed as reviewed by Tyrell Bergstrom, Executive Director, on 9/18/2024. **No issues noted.**

**Key Control 2 (Existence): Jennifer McMillan, Finance Manager, performs monthly reconciliations between the workbooks and GL to ensure interest payments, amortizations, balances, and maturities are as expected.**

We obtained the 2024 FYE investment reconciliations performed by Jennifer McMillan, Finance Manager, and reviewed by Ty Bergstrom, Executive Director. We noted it was separated by section as follows: Actuals, Should be, Adjust for Prior Year Interest Rev, Final Difference, and Total Current Year Revenue. The Final Difference came out to \$0. **No issues noted.**

## **STEP 3: Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

## **STEP 4: Control Risk at LOW - Test Key Controls**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

## **STEP 5: Final Control Risk Assessment**

# State of Washington

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

## J.4.PR.G - Community & Tech College Testing - Bellevue

*Procedure Step:* Cash and Cash Equivalents - Testing

*Prepared By:* SHW, 10/28/2024

*Reviewed By:* CJG, 11/1/2024

Purpose/Conclusion:

**Purpose:**

To determine whether reported cash and investments existed as of the end of the period.

**Conclusion:**

We determined reported cash and investments existed at the end of the period. *No issues noted.*

Testing Strategy:

**SAO Policy Requirement: Confirming or Verifying Cash & Investment Balances**

Confirmations can either be blind or a positive confirmation. In a blind confirmation (sweep), the auditor requests information on all accounts the bank holds for the entity (by entity name and/or EIN). In a positive confirmation, the auditor lists accounts (or accounts and balances) per the entity and asks the bank to confirm that the information is correct.

Confirm cash and investment account balances with County Treasurer, bank and/or brokerage. Use the template confirmation form provided in the Store when needed.

Confirmations can be mailed to addresses listed on the Bank Confirmation Address List available on the Auditor Reference Guide. If the bank notifies you of a different address, please contact Team Audit Support to update the list.

Banks may confirm incorrect amounts either due to a simple mistake, use of a wrong confirmation date or incorrectly including or excluding accounts. The first step in resolving differences should be to check information against the entity's bank statements and then call the bank to specifically confirm any difference.

## State of Washington

Confirming investments may involve physical inspection, confirmation with the issuer, confirmation with the custodian, confirmation of unsettled transactions with the broker/dealer, confirmation with the counterparty, and/or reading executed partnership or similar agreements. When confirming investments, ensure investments are held in the entity's name.

*If confirmations are not used*, auditors must at minimum verify balances to the County Treasurer, bank and/or brokerage statements. If this is done, the auditor should consider the risk that the statements were altered and should examine papers for indications of alteration.

The following is a list of **additional considerations** for testing the existence assertion for cash and investments. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

### Bank Reconciliations

If the auditor is comparing reconciled (confirmed) bank or county treasurer balances to the GL (rather than confirmed amounts within an expected variance due to reconciling items), the auditor should consider performing some or all of the following tests to verify the accuracy of the reconciliations. Note that testing the reconciliation will provide evidence of both the existence and completeness of cash and investment balances.

Trace (or compare summed) bank balances per statements to reconciliations.

Trace (or compare summed) book balances per reconciliations to the general ledger or financial statements.

*If a cash account is allocable to a particular fund, the balance in the general ledger should be recorded in the same fund.*

Scan the reconciliation for reasonableness. Look for unusual, unexpected or vaguely described reconciling items, lack of support or detail, very large reconciling items, very old reconciling items, and missing or extra elements that would indicate that the reconciliation was being performed incorrectly.

Foot the reconciliation for accuracy.

Trace deposits in transit to the subsequent month's bank statement, considering reasonableness of the in-transit period.

Trace outstanding checks to cash disbursement journal.

Check that any other reconciling items are valid and have been properly accounted for (ex: large debit or credit memos).

Check reconciliation against prior and/or subsequent reconciliations for reasonableness of amounts and items included and to trace reconciling items from the previous and/or subsequent period.

### Other Tests

Inquire whether any checks or deposits were being held at year end for budget, cash flow or other purposes.

Confirm investments purchased but not received as of year-end

## State of Washington

Confirm investments sold but still held as of year-end

Confirm interest due or accrued but not yet received as of year-end

Search for manual journal entries that debit (increase) cash. Consider testing if risk indicators are noted.

Review reconciliations of clearing and transmittal accounts.

See accountability steps for testing strategies related to petty cash and imprest funds, which are not expected to be material to the financial statements.

*Auditors may perform additional procedures to confirm information in the deposit and investment note disclosure in this step or in the Notes to the Financial Statements step. Auditors should contact the Investment Specialist if they note significant interest rate or other risks with the government's deposits or investments.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**Outstanding Checks and Deposits in Transit** – Per TIS section 1100.08 (AICPA Technical Questions and Answers), outstanding checks should be reported as a reduction of cash and the amount of deposits in transit should be reported as cash. A check is considered outstanding from the time that it is out of the payor's control – when mailed or delivered to the payee – until the time it clears the bank. Cash should represent amounts within the control of the reporting entity, that is, the amount of cash in banks plus cash and checks on hand and deposits in transit minus the amount of outstanding checks.

**SAO Audit Policy [6350](#) – External Confirmations**

**[Investments](#) Area Guide**

**[LGIP Fund Summary Reports](#)** - includes a list of local government accounts and balances in the Local Government Investment Pool

### **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

**BARS [3.8.6](#) Use of Payroll and Claims Funds**

# State of Washington

Record of Work Done:

## **Significant Balance(s) and Assertion(s):**

Internal controls in the Community and Technical College System address the following balances:

Higher Education Special Revenue Fund - Cash and Cash Equivalents - Existence

Higher Education Student Services Fund - Cash and Cash Equivalents - Existence

Controls are documented in the "Cash and Cash Equivalents - Controls" step.

## **Substantive tests performed to meet the Existence assertion:**

We obtained ctcLink data using the query QFS\_GL\_SNP\_DETAIL, filtered for cash and investments. We obtained AFRS data from the "Trial Balance-Cash and Investments" DARS report. We determined that the AFRS balances tie to ctcLink without exception. See "Balance Breakdown" tab here: [[Cash and Equivalents Testing](#)]. **No issues noted.**

We obtained the June 30, 2024 month-end reconciliation, bank and investment statements, and petty cash counts from Jennifer McMillan, Finance Manager, to verify existence of cash at 6/30/2024. We also obtained the July 2024 ARP Detail Reports to verify reconciling items and outstanding checks. We traced 100% of deposits in transit to the July 2024 bank statement and tied a sample of outstanding checks to the July 2024 ARP Report. See testing in the "Summary" tab at: [[Cash and Equivalents Testing](#)]. We noted an understatement of \$423,702 between the bank reconciliation and the GL. Since this is below the floor, we not take to the aggregation of misstatements.

For outstanding checks, we obtained the US Bank reconciliation report (ARP) and tested a random sample of 38 outstanding checks and two individually significant items. We noted all checks were either cleared in July 2024 or listed as Outstanding or Canceled on the July 2024 ARP Report. See "OS Checks" tab: [[Cash and Equivalents Testing](#)]. **No issues noted.**

Additionally, we obtained the petty cash reconciliation and tied petty cash to GL 1130 in DARS without exception. See "Petty Cash" tab: [[Cash and Equivalents Testing](#)]. **No issues noted.**

## **J.4.PRG - Community & Tech College Testing - Bellevue**

*Procedure Step:* Depreciable Capital Assets - Controls

# State of Washington

*Prepared By:* JLE, 10/14/2024

*Reviewed By:* CJG, 11/1/2024

Purpose/Conclusion:

## **Purpose**

To gain an understanding of internal controls and assess control risk in order to help plan the nature, timing and extent of substantive testing.

## **Conclusion**

We have gained an understanding of internal controls and assessed control risk at '**MAX**'. Therefore, we **will not** place reliance on controls. Our understanding of internal controls and control risk assessment will be used to help plan the nature, timing and extent of substantive testing.

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

The following procedures are **required** for all relevant systems:

*Optional:* List the financial statement balances and relevant assertions addressed by the understanding.

## **STEP 1: Understanding of Controls**

Gain an understanding of the internal control process, identify key controls over relevant assertion(s), and note any control weaknesses.

*The auditor's understanding should include:*

*Business processes relevant to financial reporting of the relevant assertion for the material balance. Processes should encompass automated and manual procedures by which transactions or events are identified or initiated, authorized as needed, recorded, processed and corrected as needed.*

*Original accounting records and how records are rolled-up to intermediary ledgers and transferred to the general ledger or financial statements.*

*Detailed descriptions of key controls. Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*In gaining an understanding of controls, consider the overall understanding of Entity-Level control elements as documented in the "Entity-*

# State of Washington

*Level Controls" step as they relate to this particular system.*

## **STEP 2: Confirm Key Controls**

Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walkthrough of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency or material weakness likely exists.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "IT Control Testing" step pulled down from the SAOStore and be hyperlinked with this step. Auditors should consider contacting Team IT Audit for assistance.*

## **STEP 3: Preliminary Control Risk**

Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls in step 4A. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls. **All potential material weaknesses and significant deficiencies should be discussed with the AIC or AAM, since they must be reported as findings.***

## **STEP 4: Control Testing**

If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency or material weakness likely exists. If exceptions are noted,*

## State of Washington

*auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "IT Control Testing" step pulled down from the SAOStore and be hyperlinked with this step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of Entity-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

### **STEP 5: Final Control Risk**

Evaluate the results and document a final control risk assessment. Consider whether any internal control issues identified represent material weaknesses or significant deficiencies.

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Policy/Standards tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency. **All potential material weaknesses and significant deficiencies should be discussed with the AIC or AAM, since they must be reported as findings.***

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

# State of Washington

## SAO Audit Policy [2310](#) - Reporting Identified Audit Issues

## SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk

## [Financial Statement Audits](#) Planning Guide

Record of Work Done:

### **Significant Balances and Assertions**

Internal controls in the Community and Technical College System address the following balances:

Governmental Activities - Depreciable Assets (Net of Accumulated Depreciation) - Existence, Valuation

See lead sheet here: [[Lead Sheet](#)]

### **STEP 1: Gain an Understanding of Internal Controls**

We gained an understanding of internal controls over depreciable assets via Teams meeting on 9/10/2024 with the following individuals:

Jennifer McMillan (Fiscal Reporting & Student Financial Services Manager)

Sharon Liang (Fiscal Analyst)

### **Asset Additions**

The majority of the College's asset additions fall into two broad categories: buildings (i.e., construction in progress / repairs) and equipment. For buildings, the College has a 'Capital' team tasked with ensuring that costs are appropriately tracked and monitored. This team works directly with contractors to ensure that projects are developed within budget, and adhere to the contract agreement. On a monthly basis, the Capital team submits invoices to the Accounts Payable (AP) department to record costs associated with the projects.

Equipment additions are normally initiated by decentralized departments across the College. Each department has its own budget and procurement needs, and is responsible for submitting Purchase Orders (PO) or Purchase Card requests to the centralized AP department via ctcLink. The main AP accountant is a longstanding experienced employee of the College, and has received frequent internal trainings; as such, they are well-versed in capital asset identification and reporting requirements. When AP recognizes that a PO or invoice represents a capital asset, they ensure that the expense is coded to appropriate accounts (asset expense accounts begin with '504'), and they additionally fill out the 'Profile ID' field (a 4-digit field for SAAM-based commodity codes, which is used to identify the asset's useful life). By updating the Profile ID field, ctcLink is triggered to notify Sharon of the new depreciable asset addition (in some cases, AP will also notify Sharon directly). Sharon then creates an asset within the Asset Management (AM) sub-module of ctcLink, reviewing to ensure that the correct cost and useful life is recorded based applicable POs and invoices (**Key Control 1 - Existence, Valuation**).

## State of Washington

AP also notifies the Receiving team within the warehouse that they will be receiving an order requiring asset ID tags. After the Receiving team confirms receipt of the asset and assigns a tag number, Sharon updates the asset ID field within AM, and also adjusts asset cost for any ancillary costs which weren't already captured (shipping, tax, etc.). On a quarterly basis, Sharon performs a query against expense accounts (primarily focusing on accounts beginning with '503'), reviewing for invoices exceeding the \$5k capitalization threshold, to ensure that there were no expenses representing capital assets which may have been missed by the AP department.

### Asset Inventory and Disposals

The College performs an annual inventory count toward year-end on a rotating basis, tracking half of their recorded inventory in one year, and the remaining half in the subsequent year. The majority of assets which require disposal are identified through the inventory process. The College also identifies disposals via direct notification from various decentralized departments throughout the year. When an asset is identified for disposal, Sharon is tasked with removing the asset from AM, and ensuring that this change was also captured in the general ledger. The vast majority of assets requiring disposal have reached the end of their useful life, and are fully depreciated. Sharon also ensures that any accumulated depreciation for a disposed asset is appropriately removed from the College's records.

### Depreciation Expense

Once an asset is recorded in AM, ctcLink automatically calculates straight-line depreciation for all assets, based on cost and useful life (**Key Control 2 - AUTOMATED - Valuation**).

### Identified Weaknesses

None.

## **STEP 2: Confirm Key Controls**

**Key Control 1 (Existence, Valuation) - Prior to recording asset information within ctcLink, Sharon Liang (Fiscal Analyst) reviews applicable depreciable asset Purchase Orders and invoices for accuracy.**

We selected Asset ID 10056 for control confirmation, noting that the asset was recorded in ctcLink's Asset Management sub-module (AM) as follows: \$33,057.30, in-service date of 10/17/2023, useful life of 12 years. We obtained invoice 524761 from Jennifer McMillan (Fiscal Reporting Manager). The invoice was dated 9/8/2023, for 1 item (a thyroid uptake system) totaling \$25,650 from vendor Pinestar Technology Inc. Using the invoice, we re-calculated recorded cost for this asset (including ancillary charges of shipping, installation, and tax) to be \$33,057.30; this agrees to amounts per AM without exception. We additionally obtained receiving slips from Jennifer, noting that the equipment was received and installed on 10/17/2023. Finally, we noted that the useful life recorded per AM was 12 years, which is an appropriate designation for medical equipment per SAAM 30.50.10. **No issues noted.**

**Key Control 2 (AUTOMATED - Valuation) - The ctcLink system automatically calculates straight-line depreciation for all assets entered in the Asset Management sub-module, based on cost and useful life.**

## State of Washington

See confirmation of key control at the 'IT Control Testing - Depreciation' step below: [[IT Control Testing - Depreciation](#)].

### **STEP 3: Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at '**MAX**' because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **STEP 4: Control Risk at LOW - Test Key Controls**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at '**MAX**'.

### **STEP 5: Final Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at '**MAX**' because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **J.4.PR.G - Community & Tech College Testing - Bellevue**

*Procedure Step:* IT Control Testing - Depreciation

*Prepared By:* JLE, 10/17/2024

*Reviewed By:* CJG, 11/1/2024

Purpose/Conclusion:
---------------------

#### **Purpose**

To determine whether ctcLink automatically calculates straight-line depreciation for all assets entered in the Asset Management sub-module, based on cost and useful life (**Key Control 2 for ctcLink - Valuation**) was in place and operating effectively and to consider related general IT controls in order to assess control risk.

#### **Conclusion**

Based on our understanding and test results, we concluded that the automated control **was** in place and operating effectively.

Based on our understanding, related general IT controls **were** in place and adequately designed to ensure that the control operated consistently during the audit period. However, we did not test the operating effectiveness of general IT controls.

# State of Washington

Our understanding and control risk assessment, which incorporates these conclusions, is documented above at: [[Depreciable Capital Assets - Controls](#)].

Testing Strategy:

The following procedures are **required** for all automated key controls for financial and single audits:

## **STEP 1: Understand Automated Key Control**

Gain an understanding of the automated key control. The understanding can either be documented in the control system step or could be documented here in this step. Auditors should consider the following aspects of the automated control when gaining an understanding:

### **Software Calculation:**

Is there written documentation of the calculation, and/or the source rates and factors used in the calculation?

*We would expect written documentation that defines the calculation and is an official, approved source for the formulas, rates and factors. This may be an approved policy or could be system documentation.*

What formulas are used to make the calculation?

What values or factors are used to make the calculation? For example:

- Rate tables used by the calculation
- Profile fields (i.e., applicable transaction types)
- Programmed/set formulas and/or values
- Constraints (i.e., effective date, minimums/maximums, etc.)

How is the calculation triggered or initiated?

How is the calculation recorded in the accounting system (or used in an end result)?

## **STEP 2: Confirm and Test Automated Key Control**

Confirm and test the automated control. To test the automated control, consider the following procedures:

### **Software Calculation:**

Re-perform the calculation for selected transactions.

*Auditors would NOT normally use sampling for automated controls. Instead, auditors should judgmentally select one instance of each significant variation of the calculation. If the number of potential variations is large, auditors would judgmentally select based on risk factors (for example, the most common scenarios, or scenarios associated with identified risks, or scenarios that are not addressed by the*

## State of Washington

*entity's testing procedures).*

*In some cases, it may be possible for the auditor to reperform the calculation for the entire population.*

If any rate tables or values were updated during the period, view the current values (by observing the rate table or values in an admin menu or from a printed system report) and compare to approved sources.

*If no updates were made or there are only a few values, this risk could be addressed by re-performing the calculation. However, if source rate tables or values are large or complex, it may be more efficient to test these values directly than to recalculate a larger number of transactions.*

Consider the use of analytical procedures such as trends or descriptive statistics on the population (like average, minimum and maximum values, or a graph of values across the population) and follow up on any unexpected values or trends. *Analytical procedures would normally also count as a substantive test.*

### **STEP 3: Understand General IT Controls**

Gain an understanding of the general IT controls that support the continued proper operation of the automated control. Identify key general IT controls and note any control weaknesses. Auditors should consider the following aspects of general IT controls when gaining an understanding:

#### **Software Calculation:**

Inquire if the entity has experienced any errors or irregularities with the calculation. Also how often changes are made to the calculation, and how many changes (if any) were made during the year.

How can the software calculation (formulas, rates/values, settings/configurations) be changed or customized?

*Software calculations will usually have one or more administrative menus that allow the government to modify rate tables or other calculation values, or to configure the calculation or apply settings.*

*In other cases, software calculation formulas and/or values may be hard-coded into the system and require programmers to make the changes. If the government has access to source code, then it needs internal procedures for program changes. If the program is controlled by vendors, we would expect program change procedures and expectations to be included in the contract.*

What are the procedures to authorize and make program changes or configuration/setting changes to the software calculation?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

## State of Washington

What are the procedures to test that program changes are properly working?

*If utilizing a test environment, there should be controls to ensure that the live environment is updated and is consistent with the live production environment. As management is responsible for the accuracy of their automated controls (i.e., in the live environment), we would expect there to be a procedure to confirm each key automated control once it is in the live environment. This could be manually re-performing the calculation, reviewing reports against known expectations, etc.*

How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change programming, but they may be responsible for patch management, master table data, and/or configurations.*

### **STEP 4: Confirm Key General IT Controls**

Confirm your understanding of key general IT controls to determine whether they have been placed in operation (*whether the entity has actually implemented key controls*).

### **STEP 5: Test Key General IT Controls**

Document whether general IT controls will be tested. Option 1 would result in control risk at MAX for the automated control. Either option 2 or 3 is necessary in order to set control risk at LOW. If general IT controls are tested, consider the following procedures:

#### **Software Calculation:**

If program changes or setting/configuration changes are logged, review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the calculation may also provide this evidence if the re-performance tests address all states of the calculation during the period.

## State of Washington

If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

### **STEP 6: Final Control Risk**

Evaluate the results and document a final control risk assessment in the control system step. Consider whether any deficiencies identified with either the automated control or related general IT controls represent material weaknesses or significant deficiencies.

*Note: general IT control deficiencies do not necessarily mean the automated control is not properly functioning. General IT control deficiencies would normally be considered a significant deficiency or material weakness only if it caused an issue with the compliance requirement or assertion.*

### **Recommendation Review Requirement**

IT Security related information is considered category 3 data protected by Public Request Exemption RCW 42.56.420. Issues related to IT Security require the following special handling:

[Instructions](#) are located in Team IT Audit's System's Sharepoint page.

Details of IT Security related issues should NOT be included in any emails or helpdesks.

Exit, ML and Findings should be separately communicated in an IT Security Results Document.

Findings will be referenced, but not included in the audit report.

All IT security-related recommendations must be reviewed by [Team IT Audit](#).

Template language for common IT related recommendations can be found in [ARS Part 5 Chapter 8](#).

### **PUBLIC REQUEST EXEMPTION**

Some IT related information is protected by Public Request Exemption RCW 42.56.420 for cyber security purposes. The details documented in the record of work and support workpapers may qualify for this exemption. If so, auditors must include this statement in the record of work done and any related workpapers: **"This record contains information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited "**.

Guidance/Criteria:
--------------------

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

# State of Washington

## Information Technology Planning Guide

Auditors may contact [Team IT Audit](#) with any testing strategy or control assessment questions or to request assistance from an IT Specialist.

**Software Calculation:** A **software calculation control** exists when the value of a transaction is determined by a software application. This process can be a key control when the entity relies on the system to generate calculations correctly to determine the amount of transactions (i.e., summarizing/account code allocation to post to general ledger, calculate student, utility, other charges, etc.).

**Automated Interfaces:** An interface is a process that moves information from one computer application to another. The interface can occur internally between systems maintained by a single agency, or between systems maintained by different agencies or private companies. The interface can also occur between modules within the same computer application.

The data transferred might be a file consisting of one or more records processed at a later time (batch), or it can be a real-time update. Risk associated with interfaces increases as the number of transactions or the number of other services and systems supported by the interfaced data increases.

Poor design or inadequate oversight can affect the transfer of transaction data among the systems. Interface controls are automated and/or manual processes designed to ensure transmission and processing of information is complete and accurate.

### Manual vs. Automated Interfaces

A "manual interface" is the transfer of data from one system or module to another system or module, initiated and controlled by a user. An example of a manual interface is when customer accounts are downloaded from a utility billing system to be used to perform meter readings. When complete, the file with meter readings may be uploaded and posted to the customer accounts.

An "automated interface" is the transfer of data from one system or module to another system or module that happens automatically based on a schedule, or other predefined criteria. A common example of an automated interface is the payroll module of a system. Typically, a payroll batch is created in the payroll module. Once approved, the batch is automatically sent by the system to the general ledger or other applicable modules, such as accounts payable.

Entities should have reconciliation controls between their various applications regardless of the method used for interfacing.

*Auditors should have determined whether system interfaces are automated as part of the Key Software Applications workpaper. **If not**, ask the following question to determine whether the system interface is manual or automated.*

*Is the data transferred from one system/module to another system/module by a user using an uploading and posting technique? For example, data is pulled from one system into a text file or other format, that is then uploaded into a different system or module by*

## State of Washington

*posting or in an upload feature of the module. If the answer to this question is yes, the interface would be considered "manual" since it is initiated and controlled by manually rather than through an automated process.*

**Edit Checks:** An **edit check** is a programmed routine designed to check input data or processing results for accuracy, compliance, or reasonableness. Types of edit checks include:

Range Checks: ensure that numeric values fall within specified ranges, minimums and/or maximums. For example, ensuring that a capital asset can only be entered as a positive amount, or a purchase order can only be submitted without secondary approval for less than a certain threshold.

Consistency Checks: verify that related data fields are consistent with each other. For example, ensuring that a patient's age matches their date of birth.

Format Checks: validate data formats (for example, dates as MM/DD/YYYY or phone numbers as ###-###-####).

Logical Checks: assess logical relationships between data fields. For instance, verifying that total debits equals total credits in a journal entry.

Duplicate Checks: identify duplicate records or entries. For example, preventing the same invoice from being entered twice.

Cross-Field Checks: compare data across different fields. For instance, ensuring that the start date of a project is before the end date.

Required Field Checks: ensure that mandatory fields are filled out. For instance, making sure that a patient's name and date of birth are provided.

Referential Integrity Checks: validate relationships between data tables. For example, confirming that a vendor number exists in the vendor master file as an active entity.

Outlier Checks: detect extreme or unexpected values. For instance, flagging water meter reading values that are extreme outliers for the customer type or account history.

Pattern Checks: look for specific patterns in data. For example, verifying that email addresses follow a valid format.

Edit checks may result in automatic rejection of a transaction, inability to proceed with a transaction, trigger for additional processing or review, or may simply result in a warning message to the user.

Edit checks may be identified as a key control when they are sufficiently relevant (ie: addressing the risk), precise (ie: able to catch all errors, rather than just being only reasonableness or limit check), and sufficiently strong (ie: prevent invalid transactions, rather than just generating a warning messages). Auditors may identify an individual edit or a group of edit checks together as a key control.

**Computer Generated Reports:** A **computer-generated report** is a report that is created by a computer program. The computer program, also referred to as a report generator or tool, takes data from a data source, such as a database, and displays it in a specified format. The process to generate a report often includes performing calculations on the data, such as summarizing, classifying, etc., before displaying, or can display the calculations on the report.

There are two types of computer-generated reports, pre-programmed and ad-hoc or customized reports.

## State of Washington

Pre-programmed or canned reports are pre-defined reports where criteria and specifications are hard coded in the system. A canned report may allow limited parameters, (month/year, for example), but in general the information that will be displayed is pre-determined. Ad-hoc or customized reports allow the user to drill down and customize what information is displayed on the report based on some allowed criteria, such as account codes, dollar amounts minimum, etc).

In contrast, a **manual report** is one that is created outside the system using data exports or is created ad hoc by a user. An example of a manual report is one that is created by copying data from a data source and pasting the data in an Excel spreadsheet or Word document or Powerpoint presentation where it is then processed further. With manual reports, each time a report is created, the data could be incorrect due to user error, such as not copying all relevant data, or processing errors. Therefore, these types of reports should be understood and tested similar to manual controls.

**Electronic Approvals:** Electronic approvals, electronic signatures and digital signatures are technically different, although often these terms are used interchangeably by entities.

Auditors should have determined whether the electronic approval is an automated control as part of the overall understanding of controls. For automated control purposes, an electronic approval is a software system functionality that:

- Permits a user to approve transaction(s) within the software system

- The system automatically documents, or logs, the data approved by the user and any subsequent manipulation

- The acceptance or rejection of the transaction by the approver will trigger an additional software system process, such as posting of a transaction.

E-mail, scanned-in pictures of signatures, or font-changed signatures, etc. may be part of a control activity but are generally not considered an automated control and are not covered by this testing strategy.

### Electronic Signature vs Digital Signature

An “**electronic signature**” can look like a handwritten signature that has been scanned and then pasted into an electronic document. The reliability of this type of approval is variable. Recommend gaining an understanding of the process used to store and affix the signature to the document and then discuss the process with Team IT Audit before placing reliance on this control.

A “**digital signature**” is a legal signature with a formal certification process that documents who approved the document and ensures the document is not modified after certification. Reliability of this process is very high but has significant technical features. Recommend brainstorm with Team IT Audit before placing reliance on this control.

### **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

# State of Washington

**Statements on Auditing Standards AU-C 315 Understanding the Entity and Its Environment and Assessing the Risks of Material Misstatement** - paragraphs .A106-.A109 describe general and application controls and how they relate to audit risks

**Statements on Auditing Standards AU-C 330 Performaing Audit Procedures in Response to Assessed Risks and Evaluating the Audit Evidence Obtained** - paragraphs .10b and .A33-.A34 describe requirements and guidance for testing indirect controls in conjunction with tests of controls, that is, testing key general controls in conjunction with a test of a key automated control

Record of Work Done.

**This record may contain information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited.**

## **STEP 1: Understand Automated Key Control**

**Significant System:** ctcLink

**Key Automated Control:** The ctcLink system automatically calculates straight-line depreciation for all assets entered in the Asset Management sub-module, based on cost and useful life (Valuation).

Our understanding of the overall control is documented as part of our understanding of controls over relevant assertions for Asset Management at the 'Depreciable Capital Assets - Controls' step above: [[Depreciable Capital Assets - Controls](#)].

## **STEP 2: Confirm and Test Automated Key Control**

We confirmed FY24 automated depreciation expense calculation for asset ID 000000010012 (B-Bldg). We obtained the following asset information from Jennifer McMillan (Fiscal Reporting Manager): historical cost (\$450,659.92), useful life (50 years), and acquisition date (6/30/2022). Using this information, we re-calculated FY24 depreciation as follows:  $\$450,659.92 / 50 = \$9,013.20$  annual depreciation. The asset was in service the entirety of FY24, as such, we'd expect that FY24 depreciation expense = \$9,013.20. We ran the following ctcLink query: 'QFS\_AM\_ASSET\_DEPRECIATION' for Bellevue for FY24. We searched the results for asset ID 000000010012, and found that FY24 depreciation was recorded as \$9,013.20 for this asset. Depreciation expense amounts agree without exception, and match auditor expectations. **No issues noted.**

We are not planning to rely on automated controls and therefore do not need to test automated controls; control risk will be assessed at '**MAX**'.

## **STEP 3: Understand General IT Controls**

The College has restricted user access to the Asset Management (AM) ctcLink sub-module; the only individuals which can make changes to depreciation calculations within the system are Jennifer McMillan (Fiscal Reporting & Student Financial Services Manager) and Sharon Liang (Fiscal Analyst) (**General IT Control 1**).

# State of Washington

## **STEP 4: Confirm Key General IT Controls**

### **General IT Control 1 - User access to Asset Management depreciation calculations are restricted to Jennifer McMillan (Fiscal Reporting & Student Financial Services Manager) and Sharon Liang (Fiscal Analyst).**

We reviewed the user role listing ('QFS\_SE\_LISTUSERNAMES\_BY\_ROLE') on 10/17/2024 for depreciation processing and asset entry, noting that user access is restricted to 3 individuals: Jennifer McMillan, Sharon Liang, and Viorika Kazachenko. We specifically note that depreciation processing roles are restricted to Jennifer and Sharon. Viorika has access to asset entry due to her involvement in physical inventory processes.

**No issues noted.**

## **STEP 5: Test Key General IT Controls**

Not applicable - we are not planning to rely on automated controls and therefore do not need to test general controls; control risk will be assessed at 'MAX'.

## **J.4.PR.G - Community & Tech College Testing - Bellevue**

*Procedure Step:* Depreciable Capital Assets - Testing

*Prepared By:* JLE, 10/14/2024

*Reviewed By:* CJG, 11/1/2024

Purpose/Conclusion:

### **Purpose**

To determine whether reported capital and infrastructure assets represent real assets, as of the end of the period (Existence).

To determine whether capital and infrastructure assets are reported at properly valued and calculated amounts (Valuation).

### **Conclusion**

We determined that capital and infrastructure assets represent real assets and were reported at properly valued and calculated amounts. **No issues noted.**

Testing Strategy:

The following is a list of **considerations** for testing the existence assertion for capital and infrastructure assets. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

### **Nonexistent Assets**

## State of Washington

Review capital asset records to determine whether records meet minimum requirements of BARS [3.3.9.40](#) to positively identify and adequately describe the asset. If asset records are not sufficient, follow up on how the entity is able to identify and track reported assets and consider further audit procedures.

Scan the capital asset list for unusual or unexpected assets or patterns.

*For example: asset descriptions that appear insufficient to identify the asset, asset descriptions that seem strange, assets with a historical cost that doesn't appear to meet the capital asset threshold, assets that are past the end of their service life, assets or asset types that don't appear to belong (based on auditor's understanding of entity activities and area of operation), assets or asset types that the auditor doesn't recognize, attributes that appear unreasonable (historical cost, useful life or scrap value), assets that appear connected to actions noted in planning procedures (impairment, replacement, sale or surplus, transfer), etc.*

Test sampled assets or selected high-risk assets from accounting records for existence by observing them or reviewing documentation.

*Observation for aboveground infrastructure such as roads, bridges or buildings may be by [google maps](#). Documentation for underground assets may consist of maps, system plans approved by regulatory agencies or permits, etc.*

Review the government's records of the latest physical inventory for any identification and follow-up on missing assets or any types of assets or locations that were not covered. Note: review of a government's physical inventory is considered a control test. However, it may be done as a risk assessment procedure to help direct substantive testing, and follow-up on results may result in some substantive evidence.

Trace assets from accounting records to assets listed on the government's insurance policy records. Note: if a complete comparison or reconciliation is made, this test would also provide evidence for the completeness assertion.

Trace assets from accounting records to operational records (ex: Public Works Department typically tracks assets for maintenance or regulatory reporting purposes). Note: if a complete comparison or reconciliation is made, this test would also provide evidence for the completeness assertion.

For land and buildings, trace parcels and historical cost per the land subsidiary schedules to the County's land (GIS) records to verify ownership. Note: this test also provides evidence for the rights & obligations assertion and - if a complete list is obtained from the County - for the completeness assertion as well.

Compare reported public project completed or in process during the period to the L&I [prevailing wage reporting database](#). Note: since reporting is done by contractors, it would be considered a third-party verification of project existence. We would expect capitalized costs (which include costs incurred by the government as well as contractors) to exceed the contractor's reported costs for most projects. This test also provides evidence for the completeness assertion if traced from the L&I database.

### **Cut-off**

Review supporting documentation to verify dates of any transfers, annexations or donations.

# State of Washington

See the Expenditures | Existence step for testing strategies on cut-off for capitalized expenditures.

## Detail Roll-Up

If manual journal entries are required to update the GL, agree figures per the GL to subsidiary schedules or systems.

Search for manual journal entries that debit (increase) capital or infrastructure assets. Consider testing if any risk indicators are noted.

Reconcile (or review the government's reconciliation) capital expenditures for governmental funds to increases in capital assets. The only anticipated reconciling item would be equipment that is below the capitalization threshold.

Reconcile (or review the government's reconciliation) increases in capital assets to capital purchases and sales per the statement of cash flows for proprietary funds. The only anticipated reconciling item would be donated or contributed assets.

**Over/Invalid Capitalization** - See classification step for testing strategies on improper capitalization upon construction or acquisition, or when determining whether an expense is a maintenance or repair expense or a capitalized improvement.

## Unrecorded Disposals or Impairments

Scan capital asset records for fully depreciated assets and inquire as to the status (disposed, no longer in use, etc.) to ensure all retirements and disposals have been recorded. Evaluate appropriate accounting for any fully depreciated assets remaining in service in accordance with [BARS 3.3.10.130](#).

Identify significant disposals, impairments (due to obsolescence or damage) or contributions per review of minutes and trace to asset records to verify these events were accounted for.

Request a list of insurance claims made during the audit period to identify possible impairments or removed assets, then trace to subsidiary records to verify that the event was properly accounted for.

Identify annexations (through minutes, inquiry or OFM's central annexation tracking system) and trace to supporting documents showing the transfer of assets. Note: this test would also provide evidence for the completeness and rights & obligations assertions.

The following is a list of **considerations** for testing the valuation assertion for capital and infrastructure assets. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

## Incorrect Depreciation Calculations

Perform an analytical review of depreciation expense by type of asset for reasonableness.

Re-calculate depreciation expense for a sample of assets or in conjunction with a test of automated controls (if depreciation is automatically calculated by the system). Consider testing the inputs used for the calculation to determine whether they are reasonable and in line with any applicable policies; i.e. useful life, salvage value, etc. Alternatively, test calculations, extensions and footing of subsidiary records if records are maintained on spreadsheets.

Evaluate capital asset policies for componentization or grouping of assets to determine if it has been consistently followed and will result in a rational method of depreciation. See BARS [3.3.10.150](#) for guidance.

## State of Washington

Evaluate estimated useful life and scrap value factors for reasonableness. This test could be done in general (on the government's accounting policies), for selected asset classes or for selected or sampled asset records.

*If testing selected high risk assets, auditors should consider assets that are nearly or fully depreciated (see BARS [3.3.10.130](#)), assets with unusually high or low useful lives for their type, and assets with unusually high scrap values.*

Compare estimated useful lives for assets with replacement schedules / policies and capital budgets.

*We would expect that assets on a regular replacement schedule (such as equipment, vehicles, road surfacing, etc) or that are included for replacement in the capital budget would have estimated useful lives that match the government's replacement plans for the asset.*

Consider whether the date placed in service for assets is reasonable given when the asset begins being used or is substantially complete as this will have an effect on when depreciation begins. See information in BARS [3.3.10.90](#) about when to move a project out of CIP.

### **Impairment**

Check that the measurement method used for write-offs is in accordance with GAAP (GASB 42.12-15). Review or recalculate the portion of historical cost that should be written off for impaired capital assets. *Note: auditor would normally use the same measurement method used by the government unless it the auditor finds it inappropriate for the circumstances or unallowable under GAAP.*

### **Incorrect Historical Cost of Assets**

Trace recorded cost to supporting documentation. *Note: This test would normally be limited to recent additions, since documentation for historical assets has likely passed the records retention period.*

Evaluate the reasonableness of any estimates of the historical cost of capital assets.

Evaluate the reasonableness and support for any estimates of the acquisition value (per GASB 72) of donated capital assets.

### **Conversion to GAAP**

For governments converting to GAAP reporting, examine valuation method for retroactively reported infrastructure assets and verify that the valuation method used is one of the methods prescribed by the County Road Advisory Board.

### **Modified Approach**

Check that infrastructure is being depreciated unless the modified approach is used. If the modified approach is used, verify that the government has met criteria of GASB 34 par 23-26.

### **Allocation**

On the government-wide statement of activities, review allocation of depreciation for capital assets for governmental funds. Depreciation expense

# State of Washington

will be reported as a component of the direct expense shown in the statement of activities. Request spreadsheet for allocation.

Guidance/Criteria:

## **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

GAAP criteria for reporting capital assets

**[GASB Codification Section 1400 Reporting Capital Assets](#)**

**[GASB Comprehensive Implementation Guide Chapter 7 Basic Financial Statements and Management's Discussion and Analysis, sections 7.9-7.21](#)**

Record of Work Done:

## **Significant Balance and Assertions:**

Governmental Activities - Depreciable Assets (Net of Accumulated Depreciation) - Existence, Valuation

Controls are documented in the "Depreciable Capital Assets - Controls" step. See testing at: [[Depreciable Assets Testing](#)].

## **Substantive tests performed to meet the Existence assertion:**

### *FY24 Asset Additions*

We obtained a workbook titled 'FY24 Summary Capital Asset Report' from Jennifer McMillan (Fiscal Reporting Manager). The workbook tab titled "AM Cost Transactions by BU" detailed all capital asset additions during the year, by asset ID number, as reported per the ctcLink Asset Management submodule. We also obtained general ledger data by running ctcLink query 'QFS\_GL\_SNP\_DETAIL'. We compared total asset additions (by category) per the "AM Cost Transactions" tab of the PBC workbook, to general ledger data obtained by auditors. We excluded CIP additions from our comparison, as CIP does not represent a depreciable asset. Total FY24 asset additions per both reports agreed without exception, totaling \$1,369,331.46.

Using the sampling spreadsheet from the TeamStore, we randomly selected 9 FY24 asset additions for testing, including 1 individually significant asset, for a total of 10 testing selections. For each testing selection, we obtained copies of invoices, purchase orders, and receiving slips from Jennifer. Using this information, we determined whether:

Asset acquisition date, asset description, and recorded cost information traced to invoice and receiving slips.

Asset acquisition date was within FY24

Asset addition meets OFM capitalization criteria per SAAM 30.20

Our testing did not result in any exceptions. **No issues noted.**

# State of Washington

## **Substantive tests performed to meet the Valuation assertion:**

### *FY24 Asset Additions*

We obtained a workbook titled 'FY24 Summary Capital Asset Report' from Jennifer McMillan (Fiscal Reporting Manager). The workbook tab titled 'AM Cost Transactions by BU' detailed all capital asset additions during the year, by asset ID number, as reported per the ctcLink Asset Management submodule. We also obtained general ledger data by running ctcLink query 'QFS\_GL\_SNP\_DETAIL'. We compared total asset additions (by category) per the 'AM Cost Transactions' tab of the PBC workbook, to general ledger data obtained by auditors. We excluded CIP additions from our comparison, as CIP does not represent a depreciable asset. Total FY24 asset additions per both reports agreed without exception, totaling \$1,369,331.46. Using the sampling spreadsheet from the TeamStore, we randomly selected 9 FY24 asset additions for testing, including 1 individually significant asset, for a total of 10 testing selections. For each testing selection, we obtained copies of invoices, purchase orders, and receiving slips from Jennifer. Using this information, we determined whether the asset addition was recorded at cost, and included all ancillary charges. Our testing resulted in one exception, where an asset was overstated by \$922, which projected to a total overstatement of \$9.3K. The misstatement is beneath the floor, both individually and in aggregate. **No issues noted.**

### *FY24 Depreciation Expense*

We analyzed the balance composition of the College's FY24 capital assets, determining that we would focus depreciation expense testing on the 'Building' category of assets, for 82% balance coverage. Jennifer McMillan (Fiscal Reporting Manager) provided a ctcLink query ('QFS\_AM\_ASSET\_COST') detailed asset listing. Jennifer also ran another ctcLink query ('ASSET\_BOOK\_ROWS'), which provided useful life information. She joined these two datasets using VLOOKUP formulas and Excel Pivot tables, and provided results to auditors in a single spreadsheet. We filtered the results of these queries for the 'Building' category, and then filtered again for 'in service' assets. We compared the total of our results, to total 'Building' assets reported per the general ledger (GL detail obtained using query 'QFS\_GL\_SNP\_DETAIL'), noting no exceptions. We then re-calculated FY24 depreciation expense for in-service 'Building' assets, based on PBC acquisition date, historical cost, and useful life. We found a \$213,620 below the floor variance between our re-calculated depreciation expense amounts, and those reported per the College, which we determined to be due to changes in how depreciation was calculated previously in the DirectLine system, versus how it's currently calculated in the ctcLink system. **No issues noted.**

## **J.4.PRG - Community & Tech College Testing - Bellevue**

*Procedure Step:* Charges for Services - Controls

*Prepared By:* SRC, 10/25/2024

*Reviewed By:* CJG, 11/1/2024

# State of Washington

Purpose/Conclusion:

**Purpose:**

To gain an understanding of internal controls and assess control risk in order to help plan the nature, timing and extent of substantive testing.

**Conclusion:**

We have gained an understanding of internal controls and assessed control risk at **maximum**. Therefore, we **will not** place reliance on controls. Our understanding of internal controls and control risk assessment will be used to help plan the nature, timing and extent of substantive testing.

We noted **no** material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

**This workbook template was designed for tuition revenue system control audits at Community Colleges. Contact [Team IT Audit](#) with questions on information or steps contained in this template. The template assumes occurrence and valuation are relevant assertions and that controls over occurrence and valuation will be tested.**

The following procedures are **required** for all relevant systems:

**PUBLIC REQUEST EXEMPTION**

Some IT related information is protected by Public Request Exemption [RCW 42.56.420](#) for cyber security purposes. The details documented in the record of work and supporting workpapers may qualify for this exemption. Auditors must include this statement in workpapers: **"This record contains information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited "**.

**STEP 1: Control Understanding**

Gain an understanding of the internal control process, identify key controls over relevant assertion(s), and note any control weaknesses.

*See the **Client Resource Tab** to reference query tools and year end adjustment information applicable to community and technical colleges. The following are expected controls for and community technical colleges. If sufficient key controls are not in place, the government may be able to demonstrate compensating controls.*

*Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

## State of Washington

*In gaining an understanding of controls, consider the overall understanding of COSO elements as documented in the "Entity-wide COSO Evaluation" step as they relate to this particular system.*

When gaining an understanding of a college's tuition revenue system, the following specific steps should be considered:

### Admissions & Class Registration

Discuss admissions and class registration procedures with department representatives or registrars to gain an understanding of admissions and registration processes and policies. Consider the following:

How is a student's status validated?

How do they assure that a student's status has been accurately posted from Campus Solutions Core to Student Finance (SF)?

### Tuition calculation

The automated tuition calculation processed in the cTclink system has been identified as an automated control. When gaining an understanding of a college's software calculation controls, the following specific steps should be considered:

Gain an understanding of the college's procedures for updating Term Fees, Tuition Groups, Item Types, and Tuition Schedule tables, including any review they perform to ensure the changes made are correct.

Validation of Tuition Calculation at the College - Inquire with college staff to see if they test tuition calculations prior to rolling over term fees, and if so, whether they used the Production College Development (PCD) environment to do so. If they have saved supporting documentation for testing performed, observe testing results to verify that the respective tuition and fee values were actually calculated correctly for each category of mock student tested.

Identify individuals responsible for updating the tuition rates including any users who are authorized to modify the tables or access the screens which have been deemed critical to the tuition revenue calculation process (Term Fees, Tuition Groups, Tuition Calculation, Item Types, and Tuition Schedule)

Consider obtaining the following from college staff when testing calculation of tuition revenue for a sample students:

Approved tuition rates

**Customer Account** reports showing tuition/fee charges on the student accounts

**Customer Academic Information** and **Career Term** data showing the student's status/tuition group

**Enrollment Summary** showing evidence of the classes the student was enrolled in for the selected quarter.

### Tuition payment

Students typically pay tuition and fees by credit card. Credit cards are processed through CyberSource. State and community technical colleges must reconcile payments received, and each individual college establishes their own frequency to complete it. Each cashier closes out

## State of Washington

daily using a batch report from the cTcLink system. The daily batch report may not include daily transactions for EFT's and wires. The following steps should be considered when gaining an understanding of tuition payment:

Discuss cash receipting procedures with department staff and document procedures performed tuition payments paid with the following

- Cash or check
- Credit Card
- ACH/Wire

We expect colleges reconcile credit card payments made through CyberSource. Inquire and document the colleges process of tying credit card payments processed through CyberSource to entries made in the cTcLink system.

Inquire regarding how the college would address variances found when performing reconciliations.

### Posting to the GL

Receipts are posted to the GL through an evening automated batch process. Typically, cash receipts are reconciled daily to bank accounts, and bank account balances reconciled monthly to cTcLink. Consider the following:

- Gain an understanding of the GL posting process, and determine how they validate that their postings are accurate and complete.

- Inquire regarding how the college would know if the GL did not post accurately or completely. It is likely there will be variances in how each college performs their reconciliations, with some using spreadsheets or running queries or customized reports as tools to validate the GL postings.

### Distribution / Allocation to Revenue accounts

Review the procedures the college uses to assure that all tuition revenue payments from GL fund 840 were completely distributed. Consider the following:

Document the process used by the colleges to update/maintain the values in their Tuition Distribution table.

### Transfer to AFRS

Gain an understanding the college's reconciliation process of their cTcLink balances to those posted to AFRS. Consider the following:

Evaluate the college's procedures regarding the year-end closing entries recommended by the State Board (per their "Year End Closing" binder). While the key control is the reconciliation done by the SBCTC, the college still needs to provide oversight and monitoring of the adjustments that are recommended by the SBCTC (colleges should understand what the adjustments are for, that they are correct and properly supported).

*Note:* SBCTC System Accounting Coordinators handle all ctcLink uploads to AFRS. Every month, on AFRS cutoff date, a staff from SBCTC runs a query in ctcLink of all journal entries created. This is a summary level report that is downloaded into an Excel spreadsheet. Staff create two pivot tables; one by funds and amounts, another by general ledgers and amounts. Staff expects the

## State of Washington

pivot table by fund and amount to be zero. Staff then compares the second pivot table to another report, which is generated for the State Auditor's Office (SAO). Both reports are queried from the same database, the one for SAO contains a few more fields. When all the amounts agree, staff is ready to prepare the file to be uploaded into AFRS.

Staff then sort the file by fund, general ledger, and amount. The customization now generates the output files (flat files with transaction codes) and sends them to AFRS. There are usually 1600 to 2200 lines for each college each month. This file is saved as a flat file format and is uploaded into AFRS using the OFM's Financial Toolbox. Sue does a test run in what is known as the SUP environment (copy of previous day's production) to check for any major issues. Staff is able to capture a copy of the flat file and uses that to reconcile between what is in cTcLink and what was transmitted to AFRS. Staff makes any necessary corrections to the AFRS batch and releases the output file to AFRS.

Financial Adjusting Entries – the colleges are directed to use the adjusting entry forms to enter any required cTcLink adjustments, with each suggested adjusting entry denoted in this section. Additional explanations (from the SMARTER system) for each of the suggested adjusting entries are also provided.

SMARTER Queries used to reconcile Finance Sub Modules to the General Ledger. Not all State community and technical colleges use SMARTER Queries, however, use is encouraged by SBCTC.

*Note: Waivers are not included in data reported from cTcLink to AFRS*

Disclosure Forms – Copies of the college's general note disclosures and supporting documentation.

Payable/Receivable reporting reflecting any payables ("due to") and receivable ("due from") transactions with other state agencies.

*Note: Some reports and queries used by colleges may be built in-house and may be used alongside SMARTER queries that have been built by SBCTC. If the college does not have a good understanding of the reconciliation process done by the SBCTC then the auditor may want to consider reviewing the year-end adjustments for material errors. For example, the auditor could request the Year End Closing documentation from the State community or technical college and review it to determine the types of adjusting entries and exception items noted by SBCTC.*

### **STEP 2: Confirm Key Controls**

Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

### **Step 3: Preliminary Control Risk**

Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a*

## State of Washington

*control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls in step 4.A. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls. All potential material weaknesses and significant deficiencies should be discussed with the AIC or AAM, since they must be reported as findings.*

### **STEP 4: Test Controls**

If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency or material weakness likely exists. If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

***Since key controls for Tuition Revenue are automated, Auditors should add the "IT Control Testing - Tuition Calculation" step available in the Store to document automated and general control testing.***

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of COSO elements. In doing so, all of the following specific determinations must be documented:*

- A. Key controls – including personnel who affect the application of the control – have not changed since they were last tested. Automated controls should be tested the first year that colleges use the cTclink system.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2021, this work could potentially be relied upon for both the periods ending 2022 and 2023.*

### **Step 5: Final Control Risk**

Evaluate the results and document a final control risk assessment. Consider whether any internal control issues identified represent material weaknesses or significant deficiencies.

### **Recommendation Review Requirement**

IT Security related information is considered category 3 data protected by Public Request Exemption RCW 42.56.420. Issues related to IT Security

# State of Washington

require the following special handling:

[Instructions](#) are located in Team IT Audit's System's Sharepoint page.

Details of IT Security related issues should NOT be included in any emails or helpdesks.

Exit, ML and Findings should be separately communicated in an IT Security Results Document.

Findings will be referenced, but not included in the audit report.

All IT security-related recommendations must be reviewed by [Team IT Audit](#).

Template language for common IT related recommendations can be found in [ARS Part 5 Chapter 8](#).

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

## **SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

Record of Work Done:

**This record may contain information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited.**

## **Significant Balances and Assertions:**

Internal controls in the Community and Technical College System address the following balances:

Governmental Activities - Education - Higher Education Charges for Services - Occurrence, Valuation

Higher Education Special Revenue - Charges for Services - Occurrence, Valuation

See lead sheet here: [[Lead Sheet](#)]

## **STEP 1: Gain an Understanding of Internal Controls**

We spoke with Jennifer Mcmillan, Finance Manager, and Roselle Hay, Accounting Manager, on September 18, 2024 regarding controls over student tuition and fees in the ctcLink system.

Software used by community colleges to generate tuition revenue was developed and is maintained by State Board of Community and Technical Colleges (SBCTC). Student information is captured in the ctcLink system in Campus Solutions (CS) Core module. Tuition is **automatically calculated** and applied to student accounts within the Student Financials (SF) Module based on their class registration for the quarter. The rates and codes used in the tuition calculation process reside within several key system tables, which are maintained by SBCTC. Tuition and fee rate tables are updated annually and posted on the [SBCTC website](#).

# State of Washington

## **Admissions & Class Registration**

The Admissions office processes the student applications within Campus Solutions module. When the first billing record is generated for the student (i.e., for admissions or testing fees), an account is created for the student in the Campus Solutions Core module.

Students can register online through their ctcLink account or in person at the Admissions office. Critical information associated with tuition revenue is captured at this point regarding the student's status (i.e. resident, non-resident, veteran, etc.), and this data is posted to the Campus Solutions Core module.

Students typically register for classes on-line, but they can also do so in person. Classes are defined within the Campus Solutions Core module. The information captured in Campus Solutions Core during registration will be used in calculating the amount of tuition and associated fees owed by each student.

A student's tuition and fee liability is recorded in the Campus Solutions Core database when students register for classes, but revenue will not be recognized in the GL until a journal is created in Campus Solutions Core and automatically sent to Student Financials via nightly batch.

## **Tuition Calculation**

Item Types:

Item types are the basic work unit of the Student Financial application in ctcLink, they work like a fee code for charging tuition. Each item type defines and describes a unique action and has an associated fee table which breaks down the charge per credit for that item type. The system uses item types to transfer student account information to the general ledger based on the set up. SBCTC maintains item types for the college and has a ticketing system for any requested updates, changes or additions to the item type list. There are unique item types for tuition, different types of fees, payments, and financial aid, which are grouped by category. Jennifer let us know that only the SBCTC can approve, create, or make changes to item types GL distribution in the system.

The ctcLink system automatically calculates tuition for all students based their class registration and the tuition rate and fee tables set by the State Board (**Key Control 1- Valuation, AUTOMATED**). The result of this calculation is recorded in the SF database and will be netted against any financial aid awards or fee waivers in determining each student's final liability. The system is also programmed to split the charges between funds such as Operating, Building, and Services and Activities, all of which receive a pre-set percentage of the charges.

## **Financial Aid, Scholarships, Waivers and Scholarship Allowance (Tuition Discount Methodology)**

The College offers Tuition Discounts through Financial Aid, Scholarships, and Waivers.

### **Waivers:**

Waivers are regulated by SBCTC, who decides which waivers colleges are required to offer and which ones are optional. The Bellevue College

## State of Washington

Board of Trustees approves optional waivers, as well as the amount of the waiver and what the waiver affects (tuition or fees). Each waiver has unique guidelines. The College offers tuition and fee waivers for specific groups of students:

- Military and Service Related Waivers
- Space Available Waivers (Senior Citizens and State Employees)
- Nonresident Tuition Waivers

SBCTC configures the waivers to reduce the balance of the student's account by applying it like a payment. Waivers are applied quarterly, and the payment flows to the GL and hits a contra account. The chart strings it follows depends on if the waiver is paying for fees or tuition. During the first years of cTcLink implementation, Jennifer has been periodically reviewing waiver activity to ensure the payments are hitting the correct accounts.

### **Financial Aid and Scholarships:**

Students can apply for Financial Aid (FA) and Scholarships through the designated module in the Campus Solutions pillar of cTcLink. Once the student has been awarded FA, the data flows from the FA Module to the student's account. Like a Waiver, the FA disbursements are programmed to act like a payment on the student's account. Disbursements can be deposited on a weekly basis and are recorded in a journal entry overnight.

### **Scholarship Allowance (NACUBO)**

At the end of the year when the College prepares their financial statements, they perform a Tuition Waiver calculation in compliance with NACUBO (National Association of College and University Business Officers) standards. SBCTC provides the template to the College as an excel workbook. Jennifer McMillan, Finance Manager, completes the template using data pulled from cTcLink. The total "tuition waiver" is meant to represent the total amount of discounts provided to students throughout the year from both Federal sources and State, including non-monetary discounts which are assigned an estimated value. The workbook currently follows NACUBO's "Alternative Method". The calculated amount will reduce the reported revenue from student tuition and fees on the financial statements. The workbook was not yet completed for FY24 at the time of the audit, however, we were provided with the workbook for FY23 and noted that the scholarship allowance per NACUBO was valued at \$8,765,451 which was reduced by the amount of tuition waivers already booked as a reduction of tuition (\$2,981,861). The total reduced scholarship expense inserted into the notes of financial statements was reported as \$5,783,589.

### **Tuition payment**

Deadlines for tuition payments are posted on the College's website. Students are not permitted to start class until they have paid in full, have a payment plan set up through Nelnet, or have been approved for FA are awaiting disbursements. Tuition can be paid online through Cybersource or in person at the Cashier's office. Payments are captured by the cTcLink receipting module and recorded in the Student Financials (SF) module. Cybersource payments are integrated and post to the student's account immediately, cash and checks are processed and post 1-2 days later. Each college may use a tuition installment program allowing designated students to pay tuition in several installments. Outstanding balances are retained only in Student Financials (SF) and posted to the GL when payment is made. A student's tuition and fee liability is recorded in the SF

## State of Washington

module database when they register for classes, and revenue is recognized in the GL at the time of registration.

Cashiers receive payments and code receipts by student which automatically codes to item types set up in the system. Students can either pay at the office, or mail payments into a kiosk electronic that is collected and entered in the system by cashiers. If payment is not received by the payment deadlines set by the college (prior to start- registrations staff runs this office), the student is dropped. Registration staff identifies dropped students and gives cashiering department a list.

### **Posting to the GL**

Tuition revenue is recognized as a receivable when a student's enrollment is complete and student status is validated. Upon completion of the student's enrollment in classes for the term, a journal entry is created in Campus Solutions (CS) and sent to Finance via nightly an automated nightly batch process. If a student drops a course, the receivable is reversed.

Cash receipts are posted to the GL through the nightly batch process. If there are posting problems, the system notifies the user that the batch did not post. Corrections are made through a batch edit screen, and the corrected batch is remitted. Tuition payments result in revenue being posted to Fund 840 under the source codes 0424 (tuition) and 0430 & 0431 (supplemental fees).

Tuition payments result in revenue being posted to each fund associated with tuition (060, 149, 522, 561, 860) under the tuition GL Account codes: 4000020, 4000030, 4000040, 4000065. Note that Spring/Summer pre-payments for Fall Quarter tuition (deferred revenue) are moved to a deferred revenue GL Account 2040010 at FYE. This entry is reversed on July 1 of the next fiscal year.

### **Reconciliation**

Student financials batches are reconciled to the GL on a regular basis by a Fiscal Analyst 5 (FA5), though the college let us know that their FA5 position is currently being recruited. They do daily cash reconciliations and use system reports and queries to identify any discrepancies between the student financials module and the general ledger. An electronic report is downloaded from the bank each month that includes all of the check deposits, credit card payments and refunds for the prior month. An FA5 Accountant in Finance performs a bank reconciliation to ensure all funds received reconcile to the bank and are posted to the GL. Also, the FA5 Accountant in Finance performs a SF module to GL reconciliation to ensure all funds received are posted to the GL (**Key Control 2 - Occurrence**).

### **Distribution / Allocation to Revenue accounts**

An automated monthly process is run in ctcLink to allocate tuition revenue payments from GL fund 840 to the funds below. With the exception of Service & Activities fees (set by the Local Board of Trustees), the individual fund distribution percentages are determined by the Legislature. The local college manually posts and retains these percentages in the Tuition Schedule.

060 (Building fee portion; remitted back to the State)

149 (Operating fee portion)

## State of Washington

522 (Services & Activities portion)  
561 (Comm/Tech College Innovation portion)  
860 (Institutional Financial Aid portion)

Additionally, at year end, the Finance Manager reviews the amount collected for the upcoming Summer and Fall quarters and moves the tuition and related receivables by journal entry to the deferred revenue account to be recognized in the correct fiscal year (**Key Control 3 - Occurrence**).

### **Transfer to AFRS**

Bellevue College does not upload data into AFRS. SBCTC is responsible for pulling all relevant data from cTcLink and getting it into AFRS using the process as follows: System Accounting Coordinator handles all ctcLink uploads to AFRS. Every month, on the AFRS cutoff date, runs a query in ctcLink of all journal entries created. This is a summary level report that is downloaded into an Excel spreadsheet. The Coordinator then creates two pivot tables; one by funds and amounts, another by general ledgers and amounts. Staff expects the pivot table by fund and amount to be zero. Staff then compare the second pivot table to another report, which is generated for the State Auditor's Office (SAO). Both reports are queried from the same database, the one for SAO contains a few more fields. When all the amounts agree, staff prepare the file to be uploaded into AFRS.

Staff then sorts the file by fund, general ledger, and amount. The customization now generates the output files (flat files with transaction codes) and sends them to AFRS similar to how it is done in the Legacy system. There are usually 1600 to 2200 lines for each college each month. This file is saved as a flat file format and is uploaded into AFRS using the OFM's Financial Toolbox. A test run in what is known as the SUP environment (copy of previous day's production) is then used to check for any major issues. Staff is then able to capture a copy of the flat file and uses that to reconcile between what is in ctcLink and what was transmitted to AFRS. Staff makes any necessary corrections to the AFRS batch and releases the output file to AFRS.

### **Key Controls:**

**Key Control 1 – AUTOMATED (Valuation)** - The ctcLink system automatically calculates tuition for students when they register for classes based on their residency, division, registration, and the tuition rate and fee tables set by the State Board.

**Key Control 2 - (Occurrence)** - Receipted tuition payments are reconciled to the general ledger on a daily basis, which are then compiled to perform a monthly reconciliation, based on the payment receipt method. Also, the FA5 Accountant in Finance performs a SF module to GL reconciliation to ensure all funds received are posted to the GL.

**Key Control 3 - (Occurrence)** - At year end, the Finance Manager reviews the amount collected for the upcoming Summer and Fall quarters and moves the tuition and related receivables by journal entry to the deferred revenue account to be recognized in the correct fiscal year.

## **STEP 2: Confirm Key Controls**

## State of Washington

**Key Control 1 – AUTOMATED ( Valuation) - The ctcLink system automatically calculates tuition for students when they register for classes based on their residency, division, registration, and the tuition rate and fee tables set by the State Board.**

We confirmed the automated control at [Community & Tech College Testing - Bellevue] and tested it here: [Charges for Services Testing - CONFIDENTIAL] - *No issues noted.*

**Key Control 2 - (Occurrence) - Receipted tuition payments are reconciled to the general ledger on a daily basis, which are then compiled to perform a monthly reconciliation, based on the payment receipt method. Also, the FA5 Accountant in Finance performs a SF module to GL reconciliation to ensure all funds received are posted to the GL.**

We met with Jennifer McMillan on September 23, 2024 over Teams, and she walked us through her many types of reconciliations of the SF module in ctcLink to ensure the information is posted to the general ledger accurately and completely. Jennifer demonstrated to us how she performs a rolling reconciliation on a daily basis by pulling transaction by transaction data from Cybersource (Student ID, amount paid, and date paid) and pulling information from student accounts which lists the amount they we billed. The info is entered into the Workbook which is set up to compare the reports calculate the difference in a spreadsheet. At the end of the month, these daily reconciliations are compiled and used for the monthly reconciliation. During our Control walk-through, we focused on the "Book to Bank" Workbook for the month of June 2024 which holds tabs for the GL Payments in Transit by type, Deposits in Transit by type, Legacy Checks, and Daily Deposits by type. These feed into another tab that compares these totals with a tab that holds the current bank statement and highlights any differences between the two tabs. There is also a tab set aside as a placeholder for outstanding payments that have not cleared by the end of the month. Jennifer explained that the deposits received can be from many sources including Nelnet (payment plans), Bankmobile refunds (student aid), online credit card (Cybersource) payments, but the deposits all have different timing and can be received a few days from the collection date. The daily deposit totals are downloaded from bank reports and documented on another tab of the spreadsheet. Jennifer has a formula that combines the types of deposits and sorts them by date. Jennifer runs pivot tables from SF and GL reports to compare the totals by day - She uses the CTC All Cashier Receipts query and the GL account analysis query to compare item type totals by day and month. Jennifer noted that the Workbook is set up to keep everything balanced, and she is diligent about reviewing the it daily to make sure everything is matching.

There was also a column to identify final differences that need to be researched and corrected if necessary. Jennifer let us know that the Treasury module in the General ledger Finance pillar does not automatically post all SF transactions so "external Transactions" must be created in the treasury module using the summarized daily SF reports in order to tie out the final monthly bank reconciliations.

Jennifer also reconciles SF payments by tender type which feeds into the main reconciliation. She uses the E214 report form the SF module and compares it with the Key bank merchant log by month.

We noted that the recon was initialized on 6/30/24, and the status of the recon is "Finalized". There was a \$20 difference between Bank and Book, which was reconciled to "In-process errors". The reconciliation was signed by Jennifer on 8/29/24 and reviewed by Ty Bergstrom on the same day.

## State of Washington

*We determined that the finance department is performing regular reconciliations of the SF module to the General ledger to ensure that differences are identified and corrected, and the information reported in the general ledger is accurate and complete. No issues noted.*

**Key Control 3 - (Occurrence) - At year end, the Finance Manager reviews the amount collected for the upcoming Summer and Fall quarters and moves the tuition and related receivables by journal entry to the deferred revenue account to be recognized in the correct fiscal year.**

We requested the support for the journal entry related to unearned revenue collected during FY24 for summer and fall tuition of the next fiscal year. We were provided with three spreadsheets:

The first one was titled "Unearned Revenue- AR offset FY24" which was support for Journal entry 479645, dated 6/30/2024 during period 12. It contained a pivot table for accounts 1011010 (SF Tuition receivable) and 1011020 (SF Fees Receivable) from a detail report on the next tab.

The pivot table sorted the amounts from the two receivable accounts by fund and totaled them to \$9,524,497.30.

There was another pivot table from the report below the first one that totaled the information above by department.

Next to this was detail of debits to account 2040010 (unearned revenue ST) and credits to be made to the receivable accounts by department.

The next spreadsheet was titled "Unearned Revenue - Net Summary FY24" which contained pivot tables of the information above as applied to the revenue accounts and the net result of journal entry 479645 by fund to each revenue account.

The next spreadsheet was titled "Unearned Revenue FY24" and it contained pivot tables from the cTclink query QCS\_SF\_ACCTG\_LN\_TERM\_REV\_SRC. The report detailed SF Journals posted to GL accounts by fund, department, account, term, and item type by date for unit 080. The pivot tables summarized the information from the report by fund and account.

Jennifer also provided us with a SBCTC Memorandum title "Unearned Revenue/Accounts Receivable/Allowance for Doubtful Accounts" which details the process of recording and adjusting for those accounts.

*We determined that the college is analyzing general ledger accounts and moving amounts collected for the next fiscal year to unearned revenue to ensure that reported revenues were posted to the correct fiscal year. No issues noted.*

### **STEP 3: Preliminary Control Risk Assessment**

**MAX - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.**

### **STEP 4: Control Risk at LOW - Test Key Controls**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

# State of Washington

## **STEP 5: Final Control Risk Assessment**

**MAX - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.**

### **J.4.PRg - Community & Tech College Testing - Bellevue**

*Procedure Step:* IT Control Testing - Charges for Services

*Prepared By:* SRC, 10/24/2024

*Reviewed By:* CJG, 11/1/2024

#### **Purpose/Conclusion:**

##### **Purpose:**

To determine whether the automated control **(key control #1 for ctclink - Valuation)** was in place and operating effectively and to consider related general IT controls in order to assess control risk.

##### **Conclusion:**

Based on our understanding and test results, we concluded that the automated control **was** in place and operating effectively.

Based on our understanding, related general IT controls **were** in place and adequately designed to ensure that the control operated consistently during the audit period.

Our understanding and control risk assessment, which incorporates these conclusions, is documented at [\[Community & Tech College Testing - Bellevue\]](#).

#### **Testing Strategy:**

The following procedures are **required** for all automated key controls for financial and single audits:

##### **STEP 1: Understand Automated Key Control**

Gain an understanding of the automated key control. The understanding can either be documented in the control system step or could be documented here in this step. Auditors should consider the following aspects of the automated control when gaining an understanding:

# State of Washington

## Software Calculation:

Is there written documentation of the calculation, and/or the source rates and factors used in the calculation?

*We would expect written documentation that defines the calculation and is an official, approved source for the formulas, rates and factors. This may be an approved policy or could be system documentation.*

What formulas are used to make the calculation?

What values or factors are used to make the calculation? For example:

- Rate tables used by the calculation
- Profile fields (i.e., applicable transaction types)
- Programmed/set formulas and/or values
- Constraints (i.e., effective date, minimums/maximums, etc.)

How is the calculation triggered or initiated?

How is the calculation recorded in the accounting system (or used in an end result)?

## **STEP 2: Confirm and Test Automated Key Control**

Confirm and test the automated control. To test the automated control, consider the following procedures:

## Software Calculation:

Re-perform the calculation for selected transactions.

*Auditors would NOT normally use sampling for automated controls. Instead, auditors should judgmentally select one instance of each significant variation of the calculation. If the number of potential variations is large, auditors would judgmentally select based on risk factors (for example, the most common scenarios, or scenarios associated with identified risks, or scenarios that are not addressed by the entity's testing procedures).*

*In some cases, it may be possible for the auditor to reperform the calculation for the entire population.*

If any rate tables or values were updated during the period, view the current values (by observing the rate table or values in an admin menu or from a printed system report) and compare to approved sources.

*If no updates were made or there are only a few values, this risk could be addressed by re-performing the calculation. However, if source rate tables or values are large or complex, it may be more efficient to test these values directly than to recalculate a larger number of transactions.*

## State of Washington

Consider the use of analytical procedures such as trends or descriptive statistics on the population (like average, minimum and maximum values, or a graph of values across the population) and follow up on any unexpected values or trends. *Analytical procedures would normally also count as a substantive test.*

### **STEP 3: Understand General IT Controls**

Gain an understanding of the general IT controls that support the continued proper operation of the automated control. Identify key general IT controls and note any control weaknesses. Auditors should consider the following aspects of general IT controls when gaining an understanding:

#### **Software Calculation:**

Inquire if the entity has experienced any errors or irregularities with the calculation. Also how often changes are made to the calculation, and how many changes (if any) were made during the year.

How can the software calculation (formulas, rates/values, settings/configurations) be changed or customized?

*Software calculations will usually have one or more administrative menus that allow the government to modify rate tables or other calculation values, or to configure the calculation or apply settings.*

*In other cases, software calculation formulas and/or values may be hard-coded into the system and require programmers to make the changes. If the government has access to source code, then it needs internal procedures for program changes. If the program is controlled by vendors, we would expect program change procedures and expectations to be included in the contract.*

What are the procedures to authorize and make program changes or configuration/setting changes to the software calculation?

*Except for the most simple situations, we would normally expect program change procedures to be written. Best practices for change management procedures include: (1) assigning responsibility for authorizing changes and executing changes, (2) specifying communication for requested changes and completed changes, and (3) testing or acceptance procedures to review and verify changes.*

What are the procedures to test that program changes are properly working?

*If utilizing a test environment, there should be controls to ensure that the live environment is updated and is consistent with the live production environment. As management is responsible for the accuracy of their automated controls (i.e., in the live environment), we would expect there to be a procedure to confirm each key automated control once it is in the live environment. This could be manually re-performing the calculation, reviewing reports against known expectations, etc.*

How are program changes or configuration/setting changes monitored or reviewed?

*Except for the most simple situations, we would normally expect a secondary review of all changes. Review could entail periodically*

## State of Washington

*checking a change log (if the system logs changes), independent verification of changes (such as a secondary look at updated rate tables or admin menu after changes were applied), independent system testing, or reviewing change and/or test documentation on a periodic or per-change basis.*

If the entity relies on general controls performed by a third-party, determine whether they have a SOC report, contract, or other documentation that describes vendor responsibilities and any complementary user controls expected to be performed by the entity.

*For example, local governments may not have access to change programming, but they may be responsible for patch management, master table data, and/or configurations.*

### **STEP**

Confirm your understanding of key general IT controls to determine whether they have been placed in operation (*whether the entity has actually implemented key controls*).

### **STEP 5: Test Key General IT Controls**

Document whether general IT controls will be tested. Option 1 would result in control risk at MAX for the automated control. Either option 2 or 3 is necessary in order to set control risk at LOW. If general IT controls are tested, consider the following procedures:

#### **Software Calculation:**

If program changes or setting/configuration changes are logged, review the change log to verify the population of changes for the year.

*Verification that no changes were made, along with the auditor's evaluation that no changes are expected, would normally be sufficient evidence to conclude that no further testing of general IT controls is necessary.*

Review programming change documentation or the entity's test documentation for selected or sampled changes. Alternatively, re-performing the calculation may also provide this evidence if the re-performance tests address all states of the calculation during the period.

If limited access to the administrative menu is key (and changes are not logged), request a user access report and verify that access is limited to only authorized personnel.

If the entity relies on a SOC report for general controls performed by a third-party, review the report applicable to the audit period using the [SOC Report Reliance](#) workpaper in the Store.

### **STEP 6: Final Control Risk**

Evaluate the results and document a final control risk assessment in the control system step. Consider whether any deficiencies identified with either the automated control or related general IT controls represent material weaknesses or significant deficiencies.

# State of Washington

*Note: general IT control deficiencies do not necessarily mean the automated control is not properly functioning. General IT control deficiencies would normally be considered a significant deficiency or material weakness only if it caused an issue with the compliance requirement or assertion.*

## **Recommendation Review Requirement**

IT Security related information is considered category 3 data protected by Public Request Exemption RCW 42.56.420. Issues related to IT Security require the following special handling:

[Instructions](#) are located in Team IT Audit's System's Sharepoint page.

Details of IT Security related issues should NOT be included in any emails or helpdesks.

Exit, ML and Findings should be separately communicated in an IT Security Results Document.

Findings will be referenced, but not included in the audit report.

All IT security-related recommendations must be reviewed by [Team IT Audit](#).

Template language for common IT related recommendations can be found in [ARS Part 5 Chapter 8](#).

## **PUBLIC REQUEST EXEMPTION**

Some IT related information is protected by Public Request Exemption RCW 42.56.420 for cyber security purposes. The details documented in the record of work and support workpapers may qualify for this exemption. If so, auditors must include this statement in the record of work done and any related workpapers: **"This record contains information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited "**.

Guidance/Criteria:
--------------------

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

## **Information Technology Planning Guide**

Auditors may contact [Team IT Audit](#) with any testing strategy or control assessment questions or to request assistance from an IT Specialist.

**Software Calculation:** A **software calculation control** exists when the value of a transaction is determined by a software application. This process can be a key control when the entity relies on the system to generate calculations correctly to determine the amount of transactions (i.e., summarizing/account code allocation to post to general ledger, calculate student, utility, other charges, etc.).

## **AUDIT CRITERIA**

# State of Washington

Key criteria that auditors will likely use when testing this area.

**Statements on Auditing Standards AU-C 315 Understanding the Entity and Its Environment and Assessing the Risks of Material Misstatement** - paragraphs .A106-.A109 describe general and application controls and how they relate to audit risks

**Statements on Auditing Standards AU-C 330 Performaing Audit Procedures in Response to Assessed Risks and Evaluating the Audit Evidence Obtained** - paragraphs .10b and .A33-.A34 describe requirements and guidance for testing indirect controls in conjunction with tests of controls, that is, testing key general controls in conjunction with a test of a key automated control

Record of Work Done.

**This record may contain information considered exempt from public disclosure under RCW 42.56.420 of the Public Records Act. As such, distribution of this record is limited.**

## **STEP 1: Understand Automated Key Control**

**Significant System:** Tuition Revenue

**Key Automated Control:** The ctcLink system automatically calculates tuition for students when they register for classes based on their residency, division, registration, and the tuition rate and fee tables set by the State Board (Valuation).

A high level understanding of the automated control is documented as part of our overall understanding of controls over relevant assertions for the ctcLink system above at the "Charges for Services-Controls" step.

## **STEP 2: Confirm and Test Automated Key Control:**

We confirmed and tested the key automated control as follows, to determine whether the automated controls can be relied upon:

We recalculated a sample of ctcLink calculated student tuition & fees amounts on student accounts at: [Charges for Services Testing - CONFIDENTIAL]. *No issues noted.*

## **STEP 3: Understand General IT Controls**

The tuition revenue calculation processing resides within a third-party vendor application system, which cannot be modified by system users. The only way for college users to affect the calculation is through edits to associated data tables and screens and many of those tables are restricted to modification by State Board at the college level.

We met with Jennifer McMillan, Finance Manager, via Teams on October 11, 2024 to discuss General IT Controls around Tuition rate and calculation input and adjustments. Jennifer explained that SBCTC took over all duties regarding tuition data input to the ctcLink system sometime within FY24. Jennifer runs a query in ctcLink of Bellevue College employees who still have access to make changes. She maintains a list in spreadsheet called SACR Security Roles for Term Fee Updates (**General IT Control 1**). Employees must work with Security Administration at the College to be added to this list. However, there have been no instances of a College employee needing to go into the system to make changes since SBCTC took over that role. Instead, employees can submit a ticket through Solar Winds if there is an issue, and the Board will update

# State of Washington

ctcLink accordingly.

## **STEP 4: Confirm Key General IT Controls**

**General IT Control 1 - User access at the college level is limited to 3 employees and is monitored by Jennifer McMillan, Finance Manager, in the SACR Security System.**

During our meeting with Jennifer McMillan on October 11, 2024 we viewed a screenshare of authorizations in the security system. We also obtained the SACR Security Roles for Term Fee Updates spreadsheet that Jennifer maintains which contains a list of employees who have Student Financial Local Configuration access and a list of employees who have Student Financial Charges and Fees Configuration access. For the Charges and Fees list, there are three Bellevue College employees with access, and Jennifer was able to explain their roles and why access was granted to those individuals. The rest of the list contained 28 members of the Board who share the same privileges. ***No issues noted.***

## **STEP 5: Test Key General IT Controls**

Not applicable - we are not planning to rely on automated controls and therefore do not need to test general controls; control risk will be assessed at **MAX**.

## **J.4.PRG - Community & Tech College Testing - Bellevue**

*Procedure Step:* Charges for Services - Testing

*Prepared By:* SRC, 10/28/2024

*Reviewed By:* CJG, 11/1/2024

Purpose/Conclusion.
---------------------

### **Purpose:**

To determine whether reported revenues represent actual amounts relating to the period (Occurrence).

To determine whether revenues were reported at properly valued or calculated amounts (Valuation).

### **Conclusion:**

We determined revenues were reported at properly valued or calculated amounts (Valuation). We determined reported revenues represent actual amounts relating to the period (Occurrence). ***No issues noted.***

# State of Washington

## Testing Strategy:

The following is a list of **considerations** for testing the occurrence assertion for revenues. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

For revenues received from the State Treasurer, trace reported amounts to the State Treasurer confirmations available in LGCS.

Confirm intergovernmental revenues with the other government or grantor or by reviewing appropriate correspondence.

Trace selected or sampled revenues from the GL to supporting billings or subsequent receipts.

If revenue is receipted into a specific clearing account, or if third-party lockbox or receipting services are used, compare recorded revenue to a sum of monthly totals from bank, lockbox or service organization reports.

Develop sufficiently precise expectations for a substantive analytical to compare to reported revenue amounts.

Search for manual journal entries that credit (increase) revenues. Consider testing if any risk indicators are noted.

### **Cut-Off / Revenue Recognition**

Test a sample of underlying transactions to verify the revenue was recorded for the proper period. Note: transactions at the beginning and end of the period would generally be considered at highest risk of being improperly recorded in the current period.

If revenue is billed at a constant rate, calculate an expectation based on the average monthly billing or re-calculate the year-end accrual journal entry and compare to the reported receivable.

Evaluate revenue recognition against GAAP criteria for selected transactions or revenue streams.

### **Interfund Revenues**

For internal service fund charges, see testing strategies for internal service funds in the Accountability folder. For other types of internal charges, see testing strategies for Internal Activities.

### **Detail Roll-up**

Compare year-end totals from general ledger to subsidiary software modules for selected revenues.

Review the government's reconciliation of general ledger to subsidiary ledgers.

*Detail roll-up testing is not sufficient audit evidence by itself since it only entails comparing different sets of the entity's own accounting records. However, it may be combined with other substantive tests to address identified risks. For example, if substantive testing is performed at the subledger level, it may be combined with a test that the subledger detail accurately rolls up to the general ledger or financial statements.*

The following is a list of **considerations** for testing the valuation assertion for revenues. Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

### **- Calculation**

## State of Washington

Recalculate billed revenues on a check (one of each variation), CAATS or sample basis.  
For large populations of standard billings, perform CAATS tests to identify unexpected or outlier transactions for further review.  
Review related-party transactions to determine whether revenue transactions were correctly calculated.

### Realizable Value

Re-calculate a sample or selection of billings. If billings are calculated by software, the auditor could test and substantiate the automated control and also consider any risks associated with manual inputs used by software.

Evaluate the entity's calculation of the allowance amount for reasonableness. This evaluation should include comparing the entity's estimate to the entity's actual historical experience of collecting or writing-off receivables.

Trace the amount of bad debt approved by the governing body (per minutes) to reductions of receivables and bad debt expense to verify it was properly accounted for. *Note: approvals may be slightly more, as customers may pay after the bad debt has been approved but before it is written off.*

### Estimation / Recognition

Review calculation and support for assumptions of any estimated revenues.

Accounting research to verify that revenues were reported in conformity with revenue recognition policies reported in the financial statement notes.

Guidance/Criteria.:

Record of Work Done.:

### **Significant Balances and Assertions:**

Governmental Activities - Education - Higher Education Charges for Services - Occurrence, Valuation  
Higher Education Special Revenue - Charges for Services - Occurrence, Valuation

Controls are documented in the "Charges for Services - Controls" step.

### **Testing Population:**

We requested a list of all students by quarter from FY24 with amounts charged for tuition and fees. Jennifer McMillan, Finance Manager, provided us with a pivot table and raw data from cTcLink query (CTC\_SF\_ACCTNG\_LN\_BY\_TERM); containing student transaction level data (by student, quarter and GL account). We ran cTcLink query QFS\_GL\_ACCT\_ANALYSIS and filtered for accounts 4000010, 4000020, 4000030, 4000040, 4000050, which are used for Student Tuition revenue. We were able to tie this to the data provided by Jennifer, filtered for the same accounts.

## State of Washington

There was no variance, and we determined our population complete for testing.

We used the random number generation formula to randomly select students by term. Our sample contained 7 students from Summer 2023, 9 students from Fall 2023, 6 students from Winter 2024, and 8 students from Spring 2024, for a total of 30 students.

### **Substantive tests performed to meet the Occurrence assertion:**

We reviewed the account statement and schedule for each student and noted the quarter and date paid for tuition and fee charges were recorded in the correct period. See ctcLink tuition revenue testing at "FS Substantive Sample" at: [[Charges for Services Testing - CONFIDENTIAL](#)]. ***No issues noted.***

### **Substantive tests performed to meet the Valuation assertion:**

We recalculated tuition and fee amounts using the published tuition and fee amounts listed on the Bellevue College web site, and tuition rate workbooks provided by Jennifer, to ensure tuition and fee charges were correctly calculated on student accounts. Some charges did not initially tie out, and we had to request more information from the College. The inconsistencies were due to the student being a running start student where the tuition was covered by a running start waiver up to a certain amount of credits, the student dropping a course during the 50% refund period, or the student being classified as International where their tuition was listed as a Mandatory Fee. The college provided additional support as requested and all students tied out with no variances noted. See Valuation testing in the "TESTS -VALUATION AND IT CONTROL" tab at: [[Charges for Services Testing - CONFIDENTIAL](#)]. ***No issues noted.***

### **J.4.PRG - Community & Tech College Testing - Bellevue**

*Procedure Step:* Education Expenses - Controls

*Prepared By:* JLE, 10/17/2024

*Reviewed By:* CJG, 11/1/2024

Purpose/Conclusion.*
----------------------

### **Purpose**

To gain an understanding of internal controls and assess control risk in order to help plan the nature, timing and extent of substantive testing.

### **Conclusion**

We have gained an understanding of internal controls and assessed control risk at '**MAX**'. Therefore, we **will not** place reliance on controls. Our

## State of Washington

understanding of internal controls and control risk assessment will be used to help plan the nature, timing and extent of substantive testing.

We noted the following control weakness, which we **do not** consider to represent a significant deficiency or material weakness:

**Control Weakness 1** - We identified four individuals with unauthorized budget combo code user roles within the ctcLink system. **See issue at: [V: Bellevue College Confidential System User Access IT Controls].**

Testing Strategy:

The following procedures are **required** for all relevant systems:

*Optional:* List the financial statement balances and relevant assertions addressed by the understanding.

### **STEP 1: Understanding of Controls**

Gain an understanding of the internal control process, identify key controls over relevant assertion(s), and note any control weaknesses.

*The auditor's understanding should include:*

*Business processes relevant to financial reporting of the relevant assertion for the material balance. Processes should encompass automated and manual procedures by which transactions or events are identified or initiated, authorized as needed, recorded, processed and corrected as needed.*

*Original accounting records and how records are rolled-up to intermediary ledgers and transferred to the general ledger or financial statements.*

*Detailed descriptions of key controls. Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*In gaining an understanding of controls, consider the overall understanding of Entity-Level control elements as documented in the "Entity-Level Controls" step as they relate to this particular system.*

### **STEP 2: Confirm Key Controls**

Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walkthrough of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers,*

## State of Washington

*reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency or material weakness likely exists.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "IT Control Testing" step pulled down from the SAOStore and be hyperlinked with this step. Auditors should consider contacting Team IT Audit for assistance.*

### **STEP 3: Preliminary Control Risk**

Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls in step 4A. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls. **All potential material weaknesses and significant deficiencies should be discussed with the AIC or AAM, since they must be reported as findings.***

### **STEP 4: Control Testing**

If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency or material weakness likely exists. If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "IT Control Testing" step pulled down from the SAOStore and be hyperlinked with this step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it*

## State of Washington

*would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of Entity-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

### **STEP 5: Final Control Risk**

Evaluate the results and document a final control risk assessment. Consider whether any internal control issues identified represent material weaknesses or significant deficiencies.

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Policy/Standards tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency. **All potential material weaknesses and significant deficiencies should be discussed with the AIC or AAM, since they must be reported as findings.***

Guidance/Criteria:
--------------------

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits](#) Planning Guide**

# State of Washington

Record of Work Done:

## **Significant Balances and Assertions**

Internal controls in the Community and Technical College System address the following balances:

Governmental Activities- Education - Higher Education Expenses- Completeness, Classification

Higher Education Special Revenue - Charges for Expenses - Completeness, Classification

See lead sheet at: [[Lead Sheet](#)]

## **STEP 1: Gain an Understanding of Internal Controls**

We gained an understanding of internal controls over education expenses via Teams meeting with the following individuals:

Jennifer McMillan (Fiscal Reporting & Student Financial Services Manager) - meeting for general disbursements on 9/11/2024, meeting for payroll on 9/17/2024

Roselle Hay (Accounting Manager) - meeting for general disbursements on 9/11/2024

Olga Krichevskaya (Payroll Manager) - meeting for payroll on 9/12/2024

Sung Moon (Grants and Contracts Manager) - meeting for payroll on 9/17/2024

## **General Disbursements**

### *Background Information*

Purchases are initiated by decentralized departments across the College via electronic requisition requests in ctcLink. The requisition request triggers a notification to the centralized Purchasing department, which is tasked with generating Purchase Orders (PO) and ensuring that proper approvals are received for the expenditure. The Accounts Payable (AP) department becomes aware of outstanding POs in a variety of ways: most commonly, various College departments will submit POs with attached invoices to AP. AP also receives invoices directly from vendors via their departmental email inbox - when this occurs, AP contacts the applicable department to request a copy of the PO. Rarely, AP is unaware of an outstanding invoice until it becomes past due, at which point they are contacted directly by the vendor for payment; in this situation, once aware of the past-due payment request, AP contacts the applicable department to obtain a PO. To help mitigate the risk of missed invoices, AP periodically accesses the ctcLink sub-modules utilized by the Purchasing department in 'read-only' mode, and reviews to see what POs are past 30 days outstanding.

College departments (including Purchasing) are disincentivized from intentionally withholding invoices or POs due to controls within the ctcLink system; AP staff are the only users which have system authorization to create vouchers and execute payments. Additional controls include segregation of duties over payments; the only staff which have access to print and mail physical checks are separate from the AP department; other non-AP staff are responsible for dispatching ACHs which were executed by AP to destination banks. A positive pay file for ACH transactions is also sent automatically to the recipient banks in a 'behind the scenes' process.

# State of Washington

## *Expense Classification*

Appropriate classification of expenditures begins at the departmental level. All budget and expense coding (i.e., chartstrings) for expenditures are classified according to OFM guidelines and its published charts of accounts (as contained in SAAM chapter 75). The Colleges specifically follow the State Board CLAM manual, which is designed to comply with these OFM guidelines. The CLAM manual provides guidance on how to set up chartstrings based on department (i.e., whether departmental activity is student-related, a proprietary function, etc.). Budget chartstrings are required before expenses can be paid; ctcLink will not allow processing of transactions to invalid budget chartstrings. Chartstrings tell the ctcLink system how to record accounting information such as fund, department, and class code; AFRS classification is specifically driven by ctcLink fund designation. A list of AFRS fund definitions and Colleger roll-up fund information can be found on OFM's website at: <https://ofm.wa.gov/accounting/fund-reference-manual/definitions-fund-types-and-roll-funds> and <https://ofm.wa.gov/accounting/fund/rollup>.

Specifically, the AFSRS Higher Education Special Revenue Fund primarily accounts for tuition, student fees, and grants/contracts received for educational and research purposes. As such, there are approximately 35 ctcLink funds at the College-level, which roll up to this AFRS Higher Ed fund. Common examples of these ctcLink roll-up funds include: 145 (grants and contracts account), 148 (dedicated local account), and 149 (operating fees account). For the majority of expenses, College departments only have one associated ctcLink roll-up fund which they are billing to. Departmental budget managers are required to review and approve all expenses during the PO creation process, ensuring that the correct chartstring (including fund) was utilized in the transaction. Finally, when creating and approving vouchers, AP staff reviews that chartstrings (including fund) agree to approved PO information (**Key Control 1 - Classification**). As an additional control, departmental budget managers review month-end budget reports, ensuring that all expenses are expected, and are hitting the correct accounts, funds, etc. If corrections are necessary, they submit a revenue/expense transfer request to AP, and AP staff then create a correction JV within the AP sub-module of ctcLink.

## *Expense Recognition*

Expenses are recognized at the time that a voucher is approved by AP staff, resulting in an automatic credit to the generic AP liability account (general ledger account 2000010), and a debit to the appropriate expense account. During the daily AP pay cycle, when an invoice is subsequently paid, ctcLink then automatically debits the AP liability and credits cash. A transaction can be identified using JV prefix, to determine whether it was initiated via voucher approval versus the pay cycle.

To mitigate the risk of improper expense recognition, the AP department pro actively communicates end-of-year deadlines and reporting requirements to all College departments annually, beginning as early as March. These notifications are sent out multiple times up through year-end. AP also hosts several trainings on year-end requirements for budget managers and supervisors. Additionally, AP maintains a year-end "accrual spreadsheet", requiring that AP staff carefully track all vouchers which are approved beginning on July 1st, through the first week of August (**Key Control 2 - Completeness**). The purpose of the spreadsheet is to ensure that staff are carefully considering which fiscal year is applicable for payments occurring near year-end. If a payment made after year-end is applicable to the prior period, AP staff have two options. Prior to a mid-July cutoff date, AP staff can simply change the voucher dates. After this cutoff date, they must manually accrue the expense via JV.

# State of Washington

## *General Ledger Reconciliation*

As discussed above, general ledger entries are recorded automatically by ctcLink during AP processes. On a monthly and year-end basis, the Finance team runs approximately 40 SMARTER queries, to identify errors in general ledger reporting, through comparison to ctcLink reporting. The review looks for incorrect combinations of chart fields, bad chartstrings, unusual accounting entries (such as expenses with a credit balance), etc.

## Payroll Disbursements

### *Expense Classification*

As discussed above for general disbursements, appropriate classification of payroll expenditures relies on accurate budget and expense coding (i.e., combo codes) at the College level. AFRS classification is specifically driven by ctcLink fund designation, and the College develops combo codes (including fund) in accordance with the State Board CLAM manual and OFM guidelines, ensuring accurate ctcLink fund roll-up to the AFRS Higher Education Special Revenue Fund. Combo codes for employee salary expense is set-up within the ctcLink Human Capital Management submodule (HCM) at the time a new employee is hired, and edits are made on a as-needed basis.

The College provided the following examples of how it classifies payroll combo codes:

- Fund 145 - grant-funded employees
- Fund 149 - classified and non-exempt State-funded employees
- Fund 148 - self support employees (e.g., class fees and continuing education, which helps fund certain positions)
- Fund 001 - exempt State-funded employees
- Fund 569\* - food service employees
- Fund 524\* - student & activity fee funded positions
- Fund 846 - financial aid employees
- Fund 850 - work study employees
- Fund 448\* - printing service employees
- Fund 570\* - athletics and radio employees
- Fund 573\* - housing employees

*\*All 400-series and 500-series fund coding represents Enterprise (proprietary-type) funds.*

The College allows only three individuals with adequate training and experience to create or edit payroll combo codes in accordance with OFM guidelines, ensuring accurate fund roll-up to AFRS (**Key Control 3 - Classification**). For hires which receive salary grant funding, combo codes are created by an individual in the Grants & Contracts department. For non-contracted (i.e., State funded) hires, an individual from the Budget department creates the relevant combo codes. All combo codes contain the following information: fund, class, department, purpose, and account. Grant-funded employee codes also contain project and activity information.

# State of Washington

## *Expense Recognition and General Ledger Reconciliation*

Approximately 5 days after the end of a pay period, a Journal Voucher (JV) auto-generates from HR HCM data, and is set to auto-post, backdating to the last day of the pay period (i.e., the year-end 6/30 JV posts approx. 7/5, but backdates to 6/30, so that it's recognized within the correct fiscal year and accounting period). This process was set up by the State Board on behalf of all community colleges within their oversight; the colleges are not supposed to edit the JV, other than extremely rare occasions where it may be so fundamentally wrong, that it wouldn't post to the General Ledger (GL). For minor errors or adjustments, the College would create a correcting JV and post it separately.

The auto-posted JV credits AP net pay liabilities and benefits, and credits offsetting expense accounts. When the liability is subsequently paid, the College is then responsible for reviewing their bank statement and manually posting the payroll liability reversal (includes crediting cash), dating the manual reversal JV with the same date as the paydate (the 10th and 25th of each month). After each pay period (including at year-end), Jennifer McMillan (Fiscal Reporting Manager) performs a GL reconciliation, prior to completing the manual payroll liability reversal (**Key Control 4 - Completeness**). During her reconciliation she manually pulls HCM data queries and ensures that data agrees to the bank statement and GL accrual.

## Identified Weaknesses

None.

## **STEP 2: Confirm Key Controls**

**Key Control 1 (Classification) - All vouchers are reviewed and approved by AP staff, ensuring that chartstrings (including fund) agree to applicable Purchase Orders.**

We identified voucher 00014859 to vendor Sysco Seattle Inc. from the expenditure detail (QFS\_AP\_VCHR\_PYMT\_WIP) provided by Jennifer McMillan (Fiscal reporting Manager). We then accessed ctcLink, and utilized the following path: Menu-->Accounts Payable-->Review Accounts Payable Info-->Vouchers-->Voucher. We searched for voucher 0014859, and reviewed the following from "voucher details": Vendor: Sysco, Voucher ID: 00014859, PO Number: 0000002731, Amount: \$1,949.24, Account: 5030130, Fund: 569, Dept: 14420, Class: 262, Desc: cans, food, and beverage package, Accounting Date: 4/30/2024, Approval History: Roselle Hay (AP Specialist Approver) on 4/30/24 at 4:38PM. We additionally reviewed the attached invoice, noting: Date: 4/24/2024, Vendor: Sysco, Amount: \$1,949.24, For: fresh vegetables. We then viewed 'Review Accounting Entries', noting that the entry was recorded as follows: Accounts: 5030130 and 2000010, Dept: 14420, Class: 262, Fund: 569, Journal Date: 4/30/2024. Next, we utilized the following ctcLink path: Menu-->Purchasing-->Purchase Orders-->Review PO Information-->Purchase Orders. On the "Purchase Order inquiry" screen, we searched for PO 0000002731, and reviewed the following from the "details" tab and "Distributions for Schedule 1" attachment: Req ID: 0000002709, Requester ID: 101040671, Requisition Name: Sysco Seattle, Attention To: Food Services, Allocation: 100%, Chartfields: Account 5030130, Fund 569, Dept 14420, Class 262. We conclude that chartstrings are consistent across the AP voucher, Purchase Order, and accounting entries. The AP voucher was appropriately reviewed and approved by Roselle Hay. **No issues noted.**

**Key Control 2 (Completeness) - All vouchers approved from July 1st through the first week of August are required to be tracked**

## State of Washington

**by AP staff on a year-end 'accrual spreadsheet', to ensure proper expense recognition in the appropriate reporting periods.**

We obtained a copy of an Excel workbook titled "FY24 YE AP Accruals" from Roselle Hay (Accounting Manager). The workbook contained 3 tabs titled 'AP vouchers FY24', 'Deadline Dates', and 'Accrual instructions'. The 'Accrual instructions' tab showed that an AP Accruals account was authorized by Loanne Wang as of 6/30/2022, and that Roselle Hay was authorized to approve entries to this account. The 'Deadline Dates' tab gave instructions to post AP vouchers with June accounting dates through the July 10th cut-off date for sub-module close. The instructions also stated that such vouchers must be added to the AP accrual spreadsheet. The tab also contained a screenshot of communications which were pushed through to various College departments, instructing how to report and obtain approval for invoices received by AP past year-end. The 'AP vouchers FY24' tab contained 195 vouchers, received by AP between 7/1/2024 and 8/8/2024, totaling \$1,823,621.16. For each voucher, AP staff indicated whether the expense was approved as a FY24 period 13 accrual. **No issues noted.**

**Key Control 3 (Classification) - The College allows only three individuals with adequate training and experience to create or edit payroll combo codes (on an as-needed basis) in accordance with OFM guidelines, ensuring accurate fund roll-up to AFRS.**

We reviewed the ctcLink user access listing for budget combo code changes (user role 'ZZ HR Combo Code') on 10/17/2024, noting that three College individuals were granted access as expected: Sharon Kussy (Budget Director), Sung Moon (Grants and Contract Manager), and Loanne Wang (Budget Analyst 4). We specifically note that, as expected, at least one individual is from the Budget Department, and one is from the Grants and Contracts Department. We additionally note that these individuals are highly experienced, long-standing College employees, who are familiar with State Board and OFM classification requirements. However, during our review, we additionally noted four individuals with unexpected user access: Kelly Paustain (previous Budget Director), Natalyia Matkivska (Admin Services Manager), Jenifer Cook (Bookstore Buyer), and Chika Risteen (Program Coordinator). Per follow-up inquiry with Jennifer McMillan (Fiscal Reporting Manager), we found that these four individuals likely should not have this user access role; however, they may have access due to their work at other colleges. Jennifer has submitted an internal ticket to see if user access for these individuals can be removed from Bellevue, without affecting their other work **(Control Weakness 1). See issue in conclusion above.**

**Key Control 4 (Completeness) - After each pay period (including at year-end), the Fiscal Reporting Manager performs a reconciliation between ctcLink HCM data, monthly bank statements, and GL accrual entries, ensuring that data between these systems is accurate and complete.**

We obtained a copy of 2024 year-end payroll reconciliation from Jennifer McMillan (Fiscal Reporting Manager) in an Excel workbook titled "FY2024 06B Payroll Recon - HCM to GL". On the "Summary" tab, we could see from summary pivot tables that FY24 salary expense per HCM as of 6/30/2024 was \$84,539,200, and that FY24 salary expense per the GL as of 6/30/2024 was also \$84,539,200. On the 'HCM' tab, we could see the full population of HCM data (source data for the HCM pivot table), which was obtained through query 'CTC\_HR\_ACCTG\_LINE\_PAY\_PERIOD'. On the 'GL - PAY' tab, we could see the full population of GL data (source data for the GL pivot table), which was obtained through query 'QFS\_GL\_ACCOUNT\_ANALYSIS'. Within the pivot tables, Jennifer performed an account by account comparison at the fund level for HCM vs GL data, in order to identify the source of any variances (no variances noted).

Next, we obtained a copy of the June 2024 year-end payroll liability reversal workbook from Jennifer, titled "Reverse Liab 06B". This workbook

## State of Washington

specifically reconciled the last pay period of FY24 (pay period ending 6/30/24). We note that the HCM query 'QHC\_PY\_CR7020' was utilized and filtered for the pay period end date of 6/30/2024, and additionally filtered to separately present employee benefit liabilities from employee net payroll liabilities. The auto-JV net pay liability for 6/30/24 totaled \$(2,299,466.99). Jennifer's workbook verified that this exact amount was debited from their bank account on 7/10/24. Her workbook additionally compared these amounts to GL data using query 'QFS\_GL\_ACCOUNT ANALYSIS' for account 2011015. All amounts agreed without exception. **No issues noted.**

### **STEP 3: Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at '**MAX**' because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **STEP 4: Control Risk at LOW - Test Key Controls**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at '**MAX**'.

### **STEP 5: Final Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at '**MAX**' because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **J.4.PR.G - Community & Tech College Testing - Bellevue**

*Procedure Step:* Education Expenses - Testing

*Prepared By:* JLE, 10/9/2024

*Reviewed By:* CJG, 11/1/2024

Purpose/Conclusion:

Testing Strategy:

### **COMPLETENESS**

The following is a list of **considerations** for testing the completeness assertion for expenses/expenditures.

# State of Washington

Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

## **Detail Roll-Up**

Compare totals from general ledger to accounts payable, payroll or other subsidiary software modules.  
Review the government's reconciliation of general ledger to subsidiary systems.

*Detail roll-up testing is not sufficient audit evidence by itself since it only entails comparing different sets of the entity's own accounting records. However, it may be combined with other substantive tests to address identified risks.*

*For example, if substantive testing is performed at the subledger level, it may be combined with a test that the subledger detail accurately rolls up to the general ledger or financial statements.*

## **Cut off / Improper Expense Recognition**

Scan expenditures recorded 1-3 months before and/or after fiscal year end (expenditures not charged to the current period). Based on the scan, test selected or sampled expenditures to determine if the expense should have been reported in the current period.  
Inquire with AP clerks regarding invoices held, but not entered as of year-end (ie: due to pending litigation or disputes).

## **Unrecorded Expenses**

If the entity reconciles recorded revenues and expenses to bank activity, then reviewing monthly reconciliations and evaluating or testing reconciling items.

## **Accounts Payable**

If entity uses a warrant clearing account for vendor payments, review the entity's year-end reconciliation of recorded vendor payments with disbursements from the clearing account.  
Review edit check reports from the AP system that might indicate missing payments.

## **Payroll**

If entity uses a payroll clearing account, review the entity's year-end reconciliation of recorded payroll with disbursements from the payroll clearing account.

Perform an expected payroll test by taking the prior audited payroll amount and adjusting it for expected changes.

*The analysis should consider changes in employees, COLA increases, salary scale increases if automatic, changes wages or benefits due to changes in policy or union negotiations changes, etc. Sources for these expectations should be obtained apart from the payroll records that are being tested. Since the auditor would not expect to be able to precisely predict payroll, the auditor should document a reasonable range within which actual payroll is expected to vary from the auditor's prediction.*

If the board directly approves salaries for a significant amount of employees, verify whether the actual salaries for these employees is within an expected reasonable range of the approved salary.

# State of Washington

For small entities, compare payroll by employee to known employees per observation, organization charts or a phone list. Review edit check reports from the payroll system that might indicate missing payments.

## **Unrecorded Liabilities**

Evaluate liabilities directly related to expenses for completeness. See the completeness steps for current and non-current liabilities for testing considerations.

*For example, if the entity reports a self-insurance liability, the auditor might evaluate whether the change in the liability (and related expense) was determined and recorded. If no liability was reported, then the auditor might determine whether such a liability (and associated expense) should have been reported.*

**OPEB** - auditors should use the OPEB Testing Strategy workpaper available in the Store for auditing OPEB expenses.

**Pollution Remediation** - auditors should use the Pollution Liability Testing Strategy workpaper available in the Store for auditing pollution remediation expenses.

## **Removing Expenses from Accounting Records**

Search for manual journal entries that credit (decrease) expenditures. Consider testing selected transactions.

Identify transactions that void, cancel, or manually adjust transactions in subsidiary AP or payroll systems. Auditors may conclude that the total amount of such transactions are trivial or otherwise reasonably small. Or auditors may sample or select transactions for testing.

*Also see considerations under the "Not recording expenses" section.*

## **Interfund Expenses**

For internal service fund charges, see testing strategies for internal service funds in the Accountability folder. For other types of internal charges, see testing strategies for Internal Activities.

## **CLASSIFICATION**

The following is a list of **considerations** for testing the classification assertion for expenses/expenditures.

Results from planning procedures (inherent and control risk assessments) are the basis for the auditor's design of substantive tests.

Sample transactions for correct classification. *Use the "Sampling for FS Substantive Testing" spreadsheet available in the Store to calculate sample size and make any projection of likely misstatement to the population.*

If planning has identified a limited population that is high risk (ex: certain transaction types and/or line items within an opinion unit), scan these populations and test selected transactions.

# State of Washington

## Journal Vouchers

Search for manual journal entries that reclassify expenses/expenditures from one opinion unit to another without recording a balance sheet transaction, other than a direct charge to fund balance (debit and credit to expenditure and fund balance for each opinion unit, respectively). Test selected journal entries based on risk.

Search for manual journal entries that reclassify expenses/expenditures from one line item to another. Test selected journal entries based on risk.

## Vendor Payments

Review the top vendors paid by opinion unit or line item (preferably as a multi-year trend) and evaluate whether the vendor meets expectations in relation to the activities of the fund. Test transactions for each unexpected vendor based on risk.

Test selected or sampled transactions for correct classification.

*NOTE: this test may be combined with expenditure tests for other attributes. For example, expenditure testing for accountability or single audit purposes may also be used for classification testing.*

## Payroll

Scan totals charged to each opinion unit by employee (preferably as a multi-year trend) and evaluate whether the allocation of employee's time to that opinion unit meets expectations based on job titles, organization charts, observation or the phone list. Follow up on unexpected allocations by review of timesheets or employee interviews.

Perform an expected payroll test by opinion unit.

Test a sample of pay periods for salaried and hourly employees to ensure that expenditures are being classified to the correct opinion unit. This test should verify both the correct allocation of direct charges and that leave and benefit costs are allocated in the same proportion as direct charges.

## Cost Allocation Plans / Internal Service Fund Allocations

Review cost allocation plans or internal service fund charges to confirm that the classification of joint costs to different opinion units is supported.

*See example testing strategies for these areas located in the Accountability cabinet .*

## Significant Balances and Assertions

Governmental Activities- Education- Higher Education Expenses - Completeness, Classification

# State of Washington

## Higher Education Special Revenue- Charges for Expenses - Completeness, Classification

Controls are documented in the "Education Expenses - Controls" step, see: [[Education Expenses - Controls](#)]. See testing at: [[Education Expense Testing](#)].

### **Substantive tests performed to meet the Completeness assertion**

We performed an analysis of the expense balance composition for Bellevue, utilizing SAO DARS queries to examine makeup by AFRS object coding, determining we would focus testing on objects A (payroll) and E (accounts payable).

Payroll - we considered completeness of the entire year's payroll expense by performing a detailed roll-up from ctcLink's Human Capital Management (HCM) submodule to the College's general ledger, comparing an HCM gross payroll expense detail (provided by Jennifer McMillan, Fiscal Reporting Manager) to ctcLink query 'QFS\_GL\_SRECNP\_DETAIL' (obtained directly by auditor). We found a \$26,165 variance between these two reports, which is beneath the floor of materiality. We tested for completeness at year-end (i.e., expense recognition) by filtering the HCM gross payroll expense detail for the 7/10/24 paydate, which relates to the last pay period of the fiscal year (6/15 - 6/30). As this report provides gross pay detail, we additionally filtered to remove tax and benefit deductions, arriving at a year-end net pay liability amount. We then compared this amount to payroll liability per the general ledger (account 2011015) using query 'QFS\_GL\_ACCOUNT ANALYSIS' (obtained directly by auditor). We found a \$14,120 variance, which is beneath the floor. Finally, we traced the year-end payroll liability amount to the U.S. Bank statement for July, considering whether the 7/10 payment matched recorded liability amounts. We found that the payment matched recorded liability amounts without exception. **No issues noted.**

Accounts Payable - we obtained a detailed voucher listing of AP vouchers paid to vendors during Qtr 1 of FY25. Using the sampling spreadsheet from the TeamStore, we randomly sampled 21 testing selections, plus 3 individually significant selections, for a total of 24 testing selections. For each selection, we examined vendor invoices, general ledger data (from FY24 and FY25), and a year-end accrual detail, to determine whether the expense was recognized in FY24 or FY25. We found 6 exceptions totaling \$8,757 where the expense was recognized in an improper accounting period. This misstatement projected to \$966,838, which is beneath the floor. **No issues noted.**

### **Substantive tests performed to meet the Classification assertion**

We performed an analysis of the expense balance composition for Bellevue, utilizing SAO DARS queries to examine makeup by AFRS object coding, determining we would focus testing on objects A (payroll) and E (accounts payable).

Payroll - using the sampling spreadsheet from the TeamStore, we randomly sampled 21 testing selections from FY24 payroll expenditures recorded within Higher Education Special Revenue Fund roll-up funds. For each selection, we obtained Personnel Action Forms or HR contracts from Olga Krichevskaya (Payroll Director). We examined each employee's position description and department,

## State of Washington

determining whether the associated payroll for these employees appropriately represents education-type expenses per the OFM fund definition. **No issues noted.**

Accounts Payable - using the sampling spreadsheet from the TeamStore, we randomly sampled 21 testing selections from AP vouchers paid to vendors during FY24 which were recorded within Higher Education Special Revenue Fund roll-up funds. For each selection, we examined vendor invoices, determining whether the associated expense appropriately represents education-type expenses per the OFM fund definition. **No issues noted.**

### J.4.PRG - Community & Tech College Testing - Bellevue

*Procedure Step:* Federal Grants in-Aid - Controls

*Prepared By:* SRC, 10/24/2024

*Reviewed By:* CJG, 11/1/2024

Purpose/Conclusion:

**Purpose:**

To gain an understanding of internal controls and assess control risk in order to help plan the nature, timing and extent of substantive testing.

**Conclusion:**

We have gained an understanding of internal controls and assessed control risk at **maximum**. Therefore, we **will not** place reliance on controls. Our understanding of internal controls and control risk assessment will be used to help plan the nature, timing and extent of substantive testing.

We noted no material weaknesses or significant deficiencies in internal controls.

Testing Strategy:

The following procedures are **required** for all relevant systems:

*Optional:* List the financial statement balances and relevant assertions addressed by the understanding.

# State of Washington

## **STEP 1: Understanding of Controls**

Gain an understanding of the internal control process, identify key controls over relevant assertion(s), and note any control weaknesses.

*The auditor's understanding should include:*

*Business processes relevant to financial reporting of the relevant assertion for the material balance. Processes should encompass automated and manual procedures by which transactions or events are identified or initiated, authorized as needed, recorded, processed and corrected as needed.*

*Original accounting records and how records are rolled-up to intermediary ledgers and transferred to the general ledger or financial statements.*

*Detailed descriptions of key controls. Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*In gaining an understanding of controls, consider the overall understanding of Entity-Level control elements as documented in the "Entity-Level Controls" step as they relate to this particular system.*

## **STEP 2: Confirm Key Controls**

Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walkthrough of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency or material weakness likely exists.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "IT Control Testing" step pulled down from the SAOStore and be hyperlinked with this step. Auditors should consider contacting Team IT Audit for assistance.*

# State of Washington

## **STEP 3: Preliminary Control Risk**

Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls in step 4A. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls. **All potential material weaknesses and significant deficiencies should be discussed with the AIC or AAM, since they must be reported as findings.***

## **STEP 4: Control Testing**

If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency or material weakness likely exists. If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "IT Control Testing" step pulled down from the SAOStore and be hyperlinked with this step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of Entity-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year*

## State of Washington

*audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

### **STEP 5: Final Control Risk**

Evaluate the results and document a final control risk assessment. Consider whether any internal control issues identified represent material weaknesses or significant deficiencies.

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Policy/Standards tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency. **All potential material weaknesses and significant deficiencies should be discussed with the AIC or AAM, since they must be reported as findings.***

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits](#) Planning Guide**

Record of Work Done:

### **Significant Balances and Assertions:**

Internal controls in the Community and Technical College System address the following balances:

Governmental Activities - Education - Higher Education Operating Grants and Contributions - Occurrence  
Higher Education Special Revenue - Federal Grants-In-Aid - Occurrence

See lead sheet here: [[Lead Sheet](#)]

## **1. Gain an Understanding of Internal Controls**

# State of Washington

On September 19, 2024, we met with Jennifer McMillan, Finance Manager, and Sung Moon, Grant and Contract Compliance Manager, to gain an understanding of internal controls over Grant revenue and expense as it relates to significant balances reported to AFRS by SBCTC on behalf of the College. We identified that we would be focusing on Department of Education (DOE) revenue, including Title III, Trio, and Pell Grants, which make up 91% of federal grants in aid.

## **Department of Education-Title III, TRIO, and Pell Grants**

### **Pell Grant**

Students can apply for Federal Pell grants using the free application for federal student aid (FAFSA), and they are awarded aid based on their need and responses to the questions on the form. The student award information is sent to the financial aid (FA) department at the college where FA staff award students in the ctclink system so it can be applied to tuition & fees. Amounts in excess of this can be refunded to the student.

When tuition is due, the student financials (SF) staff run a "group post" to post the Pell award amounts to student accounts. FA Disbursements occur every Thursday - beginning the Thursday before the Quarter starts (only applies for the FAFSA year of application). The FA Disbursement pays off the student's eligible charges - what is left over of the FA is now a credit on the student's account. The financial Aid department reconciles the Federal Pell grant awards as applied to student accounts to ensure that all eligible student awards paid out or refunded properly.

### **TRIO and Title III**

The TRIO Grant is awarded to the College by the DOE to help fund Student Support Services. TRIO is a program that provides individualized support services to students with limited income, first-generation college students, and students with disabilities to assist them with their academic success. To apply for TRIO, students meet with TRIO Staff and fill out an application electronically. Once approved, the Student goes through an intake process and is then able to make appointments with an Advisor to receive assistance services in a number of areas, such as Financial Literacy and Academic Advising.

A Title III Grant in the amount of \$2,094,323 was awarded to Bellevue College in October 2019, to be distributed over a five year period (2019-2024). The grant has been used to improve retention, completion and transfer rates of all students while also closing achievement gaps experienced by underserved populations. The College has used the grant to fund numerous projects, including Lead Peer Educators, BC Pathways, and First-Year Seminar.

TRIO and Title III grants are both Cost Collect grants, which means that the College is reimbursed for Grant related expenses via draw-downs, up to the award amount. On a monthly basis, Sung runs a query in ctclink to generate a report of grant related expenditures, she then generates a grants interface for the duration of the draw, which only pulls billable expenses, and compares the reports to ensure the numbers tie out. For cost collect grants, ctclink automatically generates an invoice when Sung pushes a button to confirm that the numbers are balanced. She then logs

## State of Washington

into the DOE Portal to initiate a draw for the funds. The revenue is then recorded in a special CAPC account until the funds have processed, after which the CAPC is cleared out and the revenue is credited to a regular AR.

### **Washington College Grants**

The Fiscal Analyst 5 (FA5) (vacant) compares the expense data from ctcLink with the award data from the WSAC website, to ensure the amounts match, prior to making a draw-down from WSAC. After the draw-down has occurred, the FA5 creates billing (new: requests billing to Billing dept) for actual revenue drawn and submits for approval. Within a week after funds are requested, WSAC sends an email confirmation to Jennifer McMillan and the FA5, notifying them the money has been wired directly to the College's bank. The FA5 then forwards this email to relevant Accounting staff for processing with appropriate Billing info. A Fiscal Analyst posts the revenue receipted in the ctcLink system.

The Washington College Grant funds are drawn for each student individually. Jennifer explained that they reconcile student accounts with WSAC and Federal Aid on daily basis because WSAC draws must match the student's account balance exactly, and the data often does not match in all of the systems due to timing and account activity.

### **Running Start & CEO Programs (Not Updated for 2024)**

Roselle Hay, Accounting Manager, and Agnieszka Skoczylas, Travel Coordinator/Student Accounts, handle the billing and receipting of the Running Start & Continuing Education Opportunity (CEO) program revenues. Invoices for the Running Start & CEO programs are generated in the High School Programs (HSP) office and are sent out to the school districts participating in the Running Start and/or CEO programs. A copy of the invoice is emailed to Agnieszka; she prints out each of the districts quarterly (Fall, Winter and Spring) Running Start and/or CEO program invoices and sets up a receivable for each school district in the ctcLink system. An A/R code is generated and Agnieszka writes the code on the corresponding invoice. If an invoice has been corrected, the HSP office will provide Agnieszka with an updated copy of the invoice and she will make the update to the system to reflect the new invoice amount.

The school districts send running start payments via a physical check, which includes the program name, invoice amount, and the school's quarter term. When the checks arrive in the Finance office, a "**Daily Check Log**" is passed around for staff to initial the receipt of the (two) check copies. Agnieszka writes the A/R code (RS-abbreviated school district) on both copies; she retains one copy and attaches it to the corresponding invoice. She passes the other copy on to Vicky Kazachenko, Fiscal Analyst, who posts the payment into the ctcLink system under the customer account previously set up by Agnieszka.

If there is an outstanding payment, Agnieszka emails the HSP office on a monthly basis and includes the Director and Program Specialist. A list of outstanding invoices is provided to HSP to follow up with the school districts requesting payment for past due. On a quarterly basis, Roselle Hay, Accounting Manager, reviews the accounts receivable subledger to ensure the Running Start and/or CEO payments are current. Roselle's subledger takes in data from all third-party payees; she can see the customer, the amount paid for the "year-qtr", and whether the invoice has been paid. She pulls in current data from the PeopleSoft system into her receivable subledger to scan for any outstanding payments, including

## State of Washington

Running Start and/or CEO. From her knowledge of the coding for year-qtr, Roselle can identify whether an invoice has been paid out and if there are any outstanding payments. Roselle checks in with Agnieszka on invoices outstanding for more than 90 days.

### **Local Grants & Contracts (Not updated for 2024)**

The College has a local grant committee that reviews potential grants submitted by the College's various departments. After the grant has been applied for and approved, Sung sets up the grant in the system with the budgeted amount. She reviews the proposal, award letter, the amount of award, and the contract to ensure the information in the system is input correctly.

On a monthly basis, Sung performs a reconciliation for each grant and sends an email notification to the department that received the grant indicating if the funds are not being used or if they are over spending. She will meet with departments as needed to discuss the grant, funding, and/or review the remaining balance. The department responsible for the grant creates the invoice for reimbursement and submits it to the grantor. Sung is responsible for creating some of the grant invoices. Sung receives a copy of the invoice from the department and enters the invoice into the College's receivables system. She then enters the grantor's information and invoice amount into her "Grant Accounts Receivables" tracking spreadsheet. To ensure she has received all related grant invoices, she utilizes the OBIS website on a monthly basis and reconciles to her tracking spreadsheet. As the funds are received (either EFT or physical check) they are included in the Financial Daily check/bank log that goes around the finance office each day.

Sung receives two copies of the checks (or print out of EFT received), and notes the receivable information on each copy. She retains one for her grant folder, and passes along the second copy to Vicky Kazachenko, Accounts Receivable Accountant, to enter as a receivable in the system. Sung makes a note on the Grant Accounts Receivable spreadsheet with the check number, or the EFT date. At the end of each month, Sung uses a grant report to show all grants to reconcile the grant money received against what was budgeted.

The local contracts specify when payments are to be made to the College (monthly, quarterly, etc). Sung noted some of the payments related to local contracts have invoices, and some do not as the payment is based on the agreement. For local contracts with invoices, the same process as described above is followed. Payments related to local contracts without invoices are received at the College and entered into PeopleSoft by Vicky Kazachenko, Accounts Receivable Accountant.

### **Posting to the GL**

Financial aid is posted to the GL via a "second journal set" which posts the financial aid item types to the correct expense accounts to ensure the expense and revenue match up in the general ledger. Every Monday, SBCTC will run the process for the 2nd Journal Set (Monday – Sunday) - as an excel file Summary to the item type, put on or coming off the student's account (only activity during that time frame is captured). This makes it easier to do weekly reconciliations of the revenue and expense posted by FA item types. The Finance team will post this second Journal Set to the General Ledger on the same day (Monday) so that FA team is able to see GL expenses and post them properly using an offset with the internal cash account.

# State of Washington

Draw downs of federal grant funds from the Department of Education (DOE): The Grant and Contract Compliance Manager takes total grants expenses posted for the time period, less total revenue posted to ascertain the amount to be drawn down. This ensures they only draw down the revenue related the period. They then receive the funds through an EFT to the bank. They post the DOE revenue to the same chartstring or budget account code (department, fund, and class) as the expenses are reported to ensure that the amounts remain equal and balanced (**Key Control 1 - Occurrence**).

## **Summary of Key Control(s):**

**Key Control #1: The Grant and Contract Compliance Manager takes total grants expenses posted for the time period, less total revenue posted to ascertain the amount to be drawn down. This ensures they only draw down the revenue related the period. DOE Revenue ties to the same chart string or budget account code (department, fund, and class) as the expenses are reported to ensure that the amounts remain equal and balanced for the period (Occurrence).**

## **Noted Weaknesses are as follows:**

None.

## **2. Confirm Understanding**

**Key Control #1: The Grant and Contract Compliance Manager takes total grants expenses posted for the time period, less total revenue posted to ascertain the amount to be drawn down. This ensures they only draw down the revenue related the period. DOE Revenue ties to the same chart string or budget account code (department, fund, and class) as the expenses are reported to ensure that the amounts remain equal and balanced for the period (Occurrence).**

We reviewed the support for the Draw down and corresponding ACH deposit to the Bellevue bank account ending in \*2980 that occurred on 4/25/2024 in the amount of \$341,550.51. The recipient reference was PELL 23-24 for award No. P063P232396, which was authorized in an amount up to \$5,757,931.60 and had a remaining balance of \$1,396,482.51 at the time of the draw. The workbook also included a pivot table totaling the Pell item type expenditures by term (\$341,550.51) along with expenditures by term for the Supplemental Education Opportunity Grant (\$6,300), Subsidized Direct Loans (\$78,832), Unsubsidized Direct Loans (\$124,272), and Parent PLUS Loans (\$1,794), and a screenshot of a Federal Work Study salary draw (\$12,325.22) that was included in the total draw. We identified that these amounts combined were equal to the total Draw Request of \$565,073.73 submitted to the DOE. We also noted the deposit of the draw on the College's US Bank statement dated 4/26/2024. *No issues noted.*

## **STEP 3: Preliminary Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or

## State of Washington

material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

### **STEP 4: Control Risk at LOW - Test Key Controls**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

### **STEP 5: Final Control Risk Assessment**

**MAX** - We noted no matters involving internal control over financial reporting and its operation that we consider to be significant deficiencies or material weaknesses. However, we have assessed control risk at max because we have determined that substantive procedures alone will be effective to reduce detection risk to an acceptable level.

#### **K.1.PRG - Rely on Work of Other Auditors**

*Procedure Step:* External Auditor performs PART of audit

*Prepared By:* RKM, 12/10/2024

*Reviewed By:* SHW, 12/16/2024

Purpose/Conclusion.*
----------------------

#### **Purpose:**

To identify and evaluate work done by external auditors and determine if our Office can rely on audit reports issued by external auditors for significant components.

#### **Conclusion:**

Based on our evaluation, we determined that our Office can rely on the work of external auditors for the University of Washington (UW), State Investment Board (SIB), Department of Retirement Systems (DRS), Local Government Investment Pool (LGIP), Fred Hutchinson Cancer Center, Washington Health Benefit Exchange, Valley Medical Center and Washington State Housing Finance Commission.

Results of the work of other auditors was identified and incorporated into other sections as described in the ROWD below.

We noted **no** concerns with the work of other auditors to bring to the attention of management at the exit conference.

# State of Washington

## Testing Strategy:

Group audit procedures are required for all components audited by other CPAs, with certain additional procedures required only for significant components. This work should be charged to time code CPAR. If significant components are audited by CPAs in lieu of an SAO audit, a CPA Audit Report Review will also be needed in accordance with Policy 3510 and charged to time code CPAP - in such cases, some procedures in this section may be documented as part of the report review. Contact your supervisor and Assistant Director if you have any questions about necessary procedures or any concerns about the external auditor's professional reputation, independence, or quality of work.

### **Procedures for ALL components audited by external auditors:**

The following procedures are **required** for planning purposes as referenced in the "Audits Performed by Others" step and by Audit Policy 6240 to identify relevant work done by external auditors and consider results:

**STEP 1: Determine Significance to the applicable opinion unit.** Evaluate each component audited by others to determine whether - individually or in aggregate - it is significant or insignificant to the applicable opinion unit.

*Auditors should consider both quantitative and qualitative materiality factors. For example, a component may be significant based on the quantitative materiality threshold for the applicable opinion unit or because it may include significant risk of material misstatement of the primary government's financial statements due to its specific nature or circumstances. When a component represents an entire opinion unit, it is considered to be significant (with the possible exception of foundations – see special guidance for GASB 39 situations in FYI 2016-02).*

*Qualitative factors may include that a waiver to perform the review has been used in recent audits, increasing the risk where we decide it is appropriate to review the CPA workpapers to sufficiently reduce audit risk.*

*Important Note: If a component is significant, communication with the other auditor (Step 5), must be done on a timely basis. In that case, Steps 2 and 3 may need to be done before the primary government's audit, as well. The results should be documented and placed in the FAWF pending the start of the SAO audit, and then brought into the TeamMate audit file.*

**STEP 2: Meetings. Consider** attending key meetings between the external auditor and the government.

**STEP 3: Obtain Report.** Include a copy of the external auditor's report in TeamMate. Make sure to get both the report on compliance and internal controls (SAO's "I-report"), as well as the financial statement report (SAO's "F-report").

*NOTE: If the other auditor performs the audit and reports in accordance with GAAS rather than GAGAS, then the I-report content will be in a letter to management rather than a report. This is possible for audits of component units (e.g. foundations or tax credit partnerships), but is not expected for divisions or funds of primary governments.*

## State of Washington

**STEP 4: Review Report.** For insignificant components, review the report issued by external auditors and consider whether any information in the report changes our planning decisions or would have an impact on our audit, if the report is available before our report date. If questions or potential red flags are noted, **consider** additional inquiry, analysis or other steps to follow up. For significant components, the report must be reviewed and incorporated into our audit as described in step 9 below.

**ADDITIONAL procedures for SIGNIFICANT components:**

The following additional procedures are **required** only for significant components audited by external auditors:

**STEP 5: Communication with Other Auditor.** Using the External Audit Coordination email template in the TeamStore (be sure to add your formal signature to the bottom of the email prior to sending), communicate with the external auditor to:

Confirm the external auditor's independence, cooperation and understanding of how we intend to use their work.

Share related parties and significant risks we have identified for the primary government and request the same from the external auditor.

Request the external auditor's materiality and performance materiality thresholds used to determine whether thresholds are sufficient for purposes of our audit.

Request the external auditor's report and other results in order to incorporate these into our results for the audit of the group.

Confirm our commitment to inform the external auditor of any matter that comes to our attention that may be relevant to their audit and request the external auditor's commitment to do the same.

*Auditors should initiate this communication as early in the audit as possible and continue to communicate with the external auditor as necessary to follow-up on these matters throughout the audit.*

Note: if the CPA Audit Report Review is being done in step 6 below, information from the CPA can be documented when completing the CPA workpaper review checklist rather than as a response to the letter.

**STEP 6: CPA Audit Report Review (if applicable under Policy 3510).** For significant components that are audited by an external auditor in lieu of an SAO audit, perform a CPA Audit Report Review in a separate TM file as required by Policy 3510. This work is performed to carry out SAO's statutory mandate but will also provide additional support for our reliance on the work of the other auditor. As such, the review should be completed prior to concluding on the audit of the primary government. If a review is applicable, reference this work and summarize relevant results.

**STEP 7: Audit Plan.** Document in the Audit Plan the effect of the work of external auditors on our audit report and substantive testing. Identify which opinion units and/or balances we plan to rely on the work of other auditors in the plan and mark these rows or columns on the Material

## State of Washington

Balance spreadsheet to indicate our reliance on the work of external auditors.

**STEP 8: Evaluate the Firm's Professional Competence.** Evaluate the professional competence of the external audit firm by considering our Office's experience with the firm, the results of communications and review, and by checking the [CPA License and Peer Review SharePoint page](#) to obtain the firm's last peer review report.

Note: if the CPA Audit Report Review was completed using step 6 above, this evaluation can be documented when completing the CPA workpaper review checklist.

**STEP 9: Internal Controls.** Document an understanding of controls over the consolidation process to incorporate components into the financial statements in the Controls - FS Preparation step in the permanent file (or a separate step if the process is identified as its own control system due to risk or complexity).

**STEP 10: Incorporate Results.** In addition to the external auditor's report, obtain and review any letter to management and the governing body about internal controls, the aggregation of misstatements, any audit recommendations made and any other relevant results.

Items included in the external auditor's aggregation of misstatements should also be included in our aggregation for the primary government.

Reported amounts and disclosures audited by the external auditor per their report should be traced to the financial statements of the primary government.

Any potential fraud, noncompliance, abuse or other matters identified by the external auditor should be re-evaluated for the primary government.

Our report may need to reflect any modifications made to the external auditor's report (that is, if the opinion is not unmodified or includes explanatory paragraphs) and any significant deficiencies or material weaknesses reported by the external auditor. Such issues should be repeated in our report to the extent they are material to an opinion unit.

*REMINDER: When external auditors conduct their audit in accordance with GAGAS, any findings will be communicated in their audit report. Otherwise, if conducted in accordance with GAAS, any findings will be communicated to management and the governing body in a separate letter that we will need to request.*

Auditors should conclude on whether the work, materiality, performance materiality and floor thresholds used are acceptable for our purposes, based on our communication with the component auditor and other procedures performed.

**STEP 11: Conditions for Referencing the Other Auditor's Report.** Determine if the following conditions are met. If so, we will be able to reference the work of the external auditor in our report. If not, contact TAS for assistance.

The audit is completed prior to our report on the primary government.

## State of Washington

There are no concerns about the component auditor's professional competence or independence, and the component auditor has passed its prior peer review.

Component financial statements are prepared using the same financial reporting framework as the group, or one permitted by that framework. For example, GASB provides for inclusion of FASB components.

Component auditor has performed the audit in accordance with GAAS or GAGAS.

Component auditor's report is not restricted as to use.

*If the work of the external auditor is material to any opinion unit, our financial report must refer to the external auditors - please refer to the Audit Report Standards (ARS) Manual for opinion modifications. If the external auditor performed their audit in accordance with GAAS, rather than GAGAS, our audit report will need to be further modified as shown in the ARS example.*

Guidance/Criteria:

Record of Work Done:

**Step 1** - We determined the significance of components audited by external auditors to the applicable opinion unit at [\[Final Planning Significant Balance Spreadsheet\]](#) and [\[External CPA Audit Significance\]](#).

**Step 2** - We considered attending key meetings between the external auditor and the government. We elected not to attend the exit meetings for the CPA audits.

**Steps 3 through 6 and 8 through 11** - See summary at [\[Work of Other Auditors - Summary\]](#).

**Step 4** - See audit plan at [\[ACFR Audit Plan\]](#).

### K.1.PRG - Rely on Work of Other Auditors

*Procedure Step:* Percent of Work Performed by Other Auditors

*Prepared By:* SHW, 12/12/2024

*Reviewed By:* RKM, 12/12/2024

## State of Washington

Purpose/Conclusion.:

**Purpose / Conclusion:**

Determine the percentage of total assets and revenues/additions audited by other auditors by opinion unit for our report.

**Source:**

OFM draft Financial Statements (12/6/24)

Access queries run on ACFR File (12/6/24)

Testing Strategy.:

Auditors are **required** to calculate percentages of total assets, net assets, and revenues covered by other auditors on whom we are relying in order to properly reference their work in our report. Auditors should use final financial statement figures for these calculations and only include the work of other auditors deemed material in the calculation

Guidance/Criteria.:

Record of Work Done.:

We preformed this analysis at: [Percent Audited by Others FY24].

For purposes of our financial statement opinions, we calculated the percentage of assets, net position and revenues/additions audited by others on whom we are placing reliance.

The first tab on the spreadsheet above contains total state assets, net assets/fund balance, and revenues/additions by opinion unit taken from the basic financial statements. The first tab also contains the associated amounts audited by others on whom we are placing reliance, by opinion unit. Total assets, net assets/fund balance, and revenues/additions audited by others are divided by the state totals to obtain the percentages to be placed in the audit report. The remaining tabs show the detail balances by agencies and associated ACFR Access queries that were used to obtain the information from the ACFR file. The final tab shows the table to be used for the F-Report.

**K.2.PRG - Work of Other Auditors - UW**

*Procedure Step:* Controls - UW Workday GL to AFRS

# State of Washington

*Prepared By:* BM2, 11/22/2024

*Reviewed By:* SHW, 12/10/2024

## Purpose/Conclusion.

### **Purpose:**

To gain an understanding of internal controls and assess control risk in order to help plan the nature, timing and extent of substantive testing.

### **Conclusion:**

We have gained an understanding of internal controls and assessed control risk at **maximum**. Therefore, we **will not** place reliance on controls. Our understanding of internal controls and control risk assessment will be used to help plan the nature, timing and extent of substantive testing.

We noted the following material weakness in internal controls:

During FY24, UW financial reporting did not complete fund level reconciliations to adequately support balances reported in the ACFR. UW does not verify that all financial statement balances are translated appropriately for state reporting. OFM did not perform sufficient procedures to verify UW balances in AFRS were accurate. See issue [F: UW consolidation, reconciliation and adjustment of balances].

## Testing Strategy.

The following procedures are **required** for all relevant systems:

*Optional:* List the financial statement balances and relevant assertions addressed by the understanding.

### **STEP 1: Understanding of Controls**

Gain an understanding of the internal control process, identify key controls over relevant assertion(s), and note any control weaknesses.

*The auditor's understanding should include:*

*Business processes relevant to financial reporting of the relevant assertion for the material balance. Processes should encompass automated and manual procedures by which transactions or events are identified or initiated, authorized as needed, recorded, processed and corrected as needed.*

*Original accounting records and how records are rolled-up to intermediary ledgers and transferred to the general ledger or financial statements.*

*Detailed descriptions of key controls. Effective key controls provide reasonable assurance that material misstatements in relevant assertions will be prevented or detected and corrected timely. If there is not a key control designed to address a relevant assertion, a*

## State of Washington

*significant deficiency likely exists. Depending on the magnitude and likelihood of potential effects and any compensating controls, the deficiency may represent a material weakness.*

*In gaining an understanding of controls, consider the overall understanding of Entity-Level control elements as documented in the "Entity-Level Controls" step as they relate to this particular system.*

### **STEP 2: Confirm Key Controls**

Confirm your understanding to determine whether key controls have been placed in operation (*whether the entity has actually implemented key controls*).

*A walkthrough of a transaction is considered the most effective way of corroborating your understanding of internal controls. Inquiries, inspection of records and observation are other acceptable methods. However, inquiry alone is not sufficient to determine a control has been implemented. For key controls confirmed, indicate any documents (include title of document used by the government), journals ledgers, reports, or other information you examined during the confirmation process, including automated reports or documentation. Describe the manual and automated processing that you observed or performed and responses to your inquiries.*

*Indicate the name and position of the employee who performed the procedure. Consider the competence and understanding of the person performing the control.*

*When a key control is discovered to not actually be placed in operation, a significant deficiency or material weakness likely exists.*

*If a key control is automated, the confirmation of our understanding should be documented in the appropriate "IT Control Testing" step pulled down from the SAOStore and be hyperlinked with this step. Auditors should consider contacting Team IT Audit for assistance.*

### **STEP 3: Preliminary Control Risk**

Evaluate the results and document a preliminary control risk assessment. Consider whether internal control weaknesses identified represent material weaknesses or significant deficiencies.

*Control risk is the risk that material misstatements would not be prevented or detected timely by internal controls. In order to support a control risk assessment that is less than MAX, the auditor must test the operating effectiveness of controls in step 4A. Regardless of this decision, the auditor must report any significant deficiencies or material weaknesses discovered in either the design or operation of controls. All potential material weaknesses and significant deficiencies should be discussed with the AIC or AAM, since they must be reported as findings.*

### **STEP 4: Control Testing**

## State of Washington

If the auditor plans to support a control risk assessment of less than MAX, test the operating effectiveness of key controls (*whether controls were consistently and effectively applied*).

*If a key control is not consistently or effectively applied, a significant deficiency or material weakness likely exists. If exceptions are noted, auditors should follow up to understand why the exception occurred and the potential consequences. Additional testing or changes to the audit plan may be needed, based on auditor evaluation and follow up of exceptions.*

*If a key control is automated, the auditor must also test related general controls. General control testing should be documented in the appropriate "IT Control Testing" step pulled down from the SAOStore and be hyperlinked with this step. Auditors should consider contacting Team IT Audit for assistance.*

*An optional IC Cycling Matrix is available in the SAOStore to document the history of key control testing for material systems. Evidence about the operating effectiveness of controls obtained in prior audits may be used so long as the auditor documents a conclusion that it would be appropriate to rely on prior audit work, based on review of prior control testing and evaluation of Entity-Level control elements. In doing so, all of the following specific determinations must be documented:*

- A. Controls have not changed significantly since they were last tested. In making this judgment, auditors should consider whether any key controls or key staff who apply key controls have changed. Auditors should also consider whether the process surrounding the key controls has changed significantly, including policies, IT systems, processing steps, data sources, etc.*
- B. Controls are not related to a "significant risk" identified in the audit plan.*
- C. Controls are tested in the current audit for at least one other system, so that we are not relying on prior audit work for all control testing.*
- D. The prior work is from an audit performed within the last two cycles in an annual audit; or within the last cycle for a two or three-year audit. For example, on an annual audit if controls were tested for the period ending 2022, this work could potentially be relied upon for both the periods ending 2023 and 2024.*

### **STEP 5: Final Control Risk**

Evaluate the results and document a final control risk assessment. Consider whether any internal control issues identified represent material weaknesses or significant deficiencies.

*A material weakness exists when the design or operation of controls results in a "reasonable possibility" that controls will not prevent or detect material misstatements. A significant deficiency is a control deficiency that is less severe than a material weakness, yet important enough to merit the attention of the governing body. See the Policy/Standards tab for more guidance on evaluating whether an identified issue represents a material weakness or significant deficiency. **All potential material weaknesses and significant deficiencies should be discussed with the AIC or AAM, since they must be reported as findings.***

# State of Washington

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [2310](#) - Reporting Identified Audit Issues**

**SAO Audit Policy [6230](#) – Understanding Internal Control and Assessing Control Risk**

**[Financial Statement Audits](#) Planning Guide**

## **AUDIT CRITERIA**

Key criteria that auditors will likely use when testing this area.

**BARS [3.3.9](#) Capital Asset Management System Requirements**

**BARS [3.3.11](#) Controls Over Capital Assets**

Record of Work Done:

## **Significant Balance(s) and Assertion(s)**

Risks identified during brainstorm:

Although the Universities financial statements are audited by a CPA firm, there is a risk that the adjustments made to AFRS for state reporting may be incomplete, inappropriate or inaccurate, potentially affecting assertions in the higher special revenue, higher student services and higher endowment opinion units. In addition the UW implemented a new ERP (Workday) in FY24 potentially increasing risk.

There is a risk that the data converted from Workday to AFRS is not accurate and complete.

## **STEP 1: Gain an Understanding of Internal Controls**

We met with Anna Quichocho, OFM Financial Reporting Manager, on September 4, 2024 to gain an understanding of controls related to importing UW Workday GL data to AFRS.

We met with Susan Stolle, Associate Controller, Tina Young, Senior Financial Reporting Analyst, and Erick Winger, Controller, on September 17, 2024 to discuss controls related to data integration and reconciliation from WD to AFRS.

# State of Washington

## Background

University of Washington's financial statements are audited by external auditors. Our office evaluates the work done by external auditors and determines if we can rely on the audit reports issued by external auditors for significant components. **See the External Auditor performs PART of the audit step** [[External Auditor performs PART of audit](#)]. We perform additional procedures to ensure that audited balances from UW's financial statements are properly adjusted and transferred into AFRS for state reporting.

The Financial Accounting System (FAS) was University of Washington's primary financial accounting system and was implemented in 1974. In fiscal year 2024 (starting July 1, 2023) Workday Finance (WD) has replaced FAS as UW's primary financial accounting system. UW's financial systems are comprised of a variety of separate systems that have been integrated.

Closing UW's books at year-end requires data to be manually captured, analyzed, and adjusted for reporting in the State's legacy system. Anna Quichocho is the main contact for UW to assist in importing data from UW's system to AFRS.

## Workday Interface with AFRS

Monthly and at year-end, UW accounting and financial management staff oversee the electronic transmission of accounting data and transmit it to align with the State's legacy system. University of Washington prepares a crosswalk document at the end of each month to map workday coding appropriately to AFRS. There are 4 separate mapping documents (this includes one for spend category, ledger, revenue, and fund). See all 4 mapping documents as of 8/12/2024 at [[UW Workday to AFRS Mapping Documents](#)]. Eric Darst, UW Business Intelligence Engineer, runs a "Summary of Journal Lines" report from Workday Finance at the end of each month that includes raw data of all financial activity to be recorded. The data is provided via a text file through OFM's Secure file transfer site, MFT. The file uses the required AFRS 950 layout to ensure the data is integrated accurately and completely. Qing Gao, OFM IT Architecture Specialist, will export the summary of journal lines report from the MFT site and use the mapping documents to crosswalk Workday coding to AFRS coding. He uses SQL queries to append the raw data with additional AFRS coding from the mapping documents to allow the file to import properly with AFRS. Anna Quichocho, OFM Statewide Accountant, will scan the summary of journal lines report with AFRS coding to determine if there are any obvious systematic errors from the SQL query that will not allow the file to process in AFRS. Once Anna has reviewed, the import file is first processed through AFRS QE, a testing environment, to identify processing errors before posting to the production environment. AFRS QE will automatically generate an error report which will display an error code on each line that could not be processed (**Key Control 1**). OFM maintains an [error code manual](#) that explains each error code along with a suggestion to correct the error. OFM will provide the list of errors to UW to make corrections. OFM will process everything else from the import file that could be posted. Generally, a month's worth of transactions is about 2,000 lines and OFM will regularly see about 90 transactions that have errors and do not post. Tina Young, Senior Financial Reporting Analyst, will make corrections for error codes, as practicable.

The portion attributable to the discretely presented component units (Valley Medical Center and Fred Hutchinson Cancer Center) are sent to OFM, who includes the information in the State ACFR as a Major Component Unit. This portion is not recorded in AFRS, instead UW provides financial statements and an assigned statewide accountant inputs balances directly to the component unit financial statement. See financial statement

## State of Washington

controls for preparation of component unit financial statements at [\[Financial Statement Preparation\]](#) and [\[Understanding Methodology\]](#). Any blended components maintained by UW are included in their financial data that is imported to AFRS on a monthly basis.

We inquired with Anna Quichocho about differences between the new process for Workday interfaces and how FAS interfaced with AFRS. Per Anna:

- FAS would only import summary level data, Workday Finance allows for the reports to be transaction level

- Monthly import files include balance sheet and income statement activity. FAS import files only included income statement data throughout the year and balance sheet data was imported at year end.

- Monthly close is more timely. Files are typically fully integrated to AFRS 2 days before AFRS closes.

### Monthly Reconciliations

Susan explained the normal process for reconciling at month end includes preparing a reconciliation at the fund level from Workday (previously FAS) to AFRS. This reconciliation ensures that all amounts posted to AFRS are supported by Workday GL detail with any adjustments and reconciling items. With Workday's ability to import revenue/expense data at a detail level, UW no longer has to prepare an additional revenue and expense reconciliation. Revenue and expense accounts are included in fund level reconciliations. During FY24, these fund reconciliations were not in place. Susan stated that mapping workday GL to AFRS GL took a majority of the time this year and resulted in obvious errors that had to be corrected. In April 2024, UW began their fund level reconciliation process, however, there is no documentation that all fund reconciliations were completed at this time.

To prepare fund level reconciliations, UW Financial Reporting obtains trial balance detail from AFRS to Workday GL amounts. The reconciliation spreadsheets for each fund are used to reflect the audit trail from WD balances to final AFRS balances. The first step is to record a journal voucher in AFRS to "true up" all balance sheet activity in AFRS based on WD ending balances. The journal entries are converted through an mapping documents to establish AFRS coding, see [\[UW Workday to AFRS Mapping Documents\]](#). Reconciling items are entered into AFRS using a journal voucher to adjust the balances to the trial balances, and MJV's which are used to do adjustments strictly related to the presentation for UW's financial statements. UW financial reporting identifies reconciling items in fund level reconciliations provides them to OFM. Staff in UW's Financial Reporting unit prepare the fund level reconciliations for each fund and the controller reviews **(Key Control 2)**. The reconciliation uses Workday balance sheet and income statement GL in detail by GL account and then summarizes in total for each OFM GL account. OFM GL data is obtained via running an AFRS trial balance. Differences were categorized by reconciling item (potential errors or posted to category that UW doesn't agree with) or exceptions (items reviewed by UW that are not reconciling items but UW is comfortable with the difference). Exceptions can include things like timing variances or differences in detail of presentation from UW statements and ACFR.

UW financial reporting could not provide completed fund level reconciliations to OFM or SAO for 47 reported funds until November 2024. The resulting variances and reconciling items could not be adjusted by OFM like the standard process from prior years. **See control weakness reported here** [\[F: UW consolidation, reconciliation and adjustment of balances\]](#) **and in the conclusion.**

## State of Washington

At the request of SAO, UW also performs reconciliation of UW financial statement balances to identified significant ACFR balances in what is called a "natural class reconciliation." UW financial reporting will run AFRS queries and use internal balance sheet/income statement templates to compare GL amounts between AFRS and Workday (**Key Control 3**). We use the natural class reconciliations to assist in our testing procedures to trace UW financial statement balances to the ACFR. Although UW prepares reconciliations at SAO's request, UW does not verify that all financial statement balances are translated appropriately for state reporting. **We will include this in the weakness reported [F: UW consolidation, reconciliation and adjustment of balances].**

### Adjustments (Post Close Entries)

Adjusting JV entries (post close entries) are required to reconcile the differences between WD and AFRS for various reasons. The most common reasons for these JV entries are as follows:

- Certain account balances are recorded in one GL account in WD but need to be allocated to each fund for AFRS (e.g., Internal Lending Program (ILP) debt and payments, Vacation accruals, etc.)

- WD has a hard closing date of July 31 each year where AFRS is open through September 15th. Some transactions are adjusted in AFRS after July 31 for the fiscal year that ended, but not recorded in WD until the next fiscal year (e.g. Assets, depreciation expense, etc.).

- WD reports accounts as total balance, however AFRS requires certain account balances to show current and noncurrent portions.

- Reclassification JV entries are needed in order to break out the current and noncurrent portions of an account balance in AFRS (e.g. liability payments, debt payments, etc.).

- Total number of journal entries made to complete the adjustments and reconciliations may exceed 100 annually. Per Susan, she expects this to be higher for FY24 due to system conversion.

UW performs a series of post close entries to ensure that the balances in AFRS agree to the balances reported from the financial statements of the University. UW will create post close entries to adjust amounts, respond to error codes, and ensure accuracy of data from WD to AFRS. Post close entries are batched and integrated into AFRS in the same process as monthly data integration files (**Key Control 1**). For FY24, UW financial reporting processed 4 batches of post close entries.

### Key Controls:

**Key Control 1 - UW financial reporting imports Workday financial data to AFRS on a monthly basis using text files. AFRS automatically generates error reports to identify any financial data lines that would not appropriately post. UW financial reporting will review and correct error codes to ensure data from workday is accurately uploaded.**

**Key Control 2 - UW financial reporting identifies reconciling items in fund level reconciliations provides them to OFM. Staff in UW's Financial Reporting unit prepare the fund level reconciliations for each fund and the controller reviews**

**Key Control 3 - UW financial reporting performs reconciliations of UW financial statement balances to significant ACFR balances (at request of SAO).**

### Identified Weaknesses:

# State of Washington

During FY24, UW financial reporting did not complete fund level reconciliations to adequately support balances reported in the ACFR. UW does not verify that all financial statement balances are translated appropriately for state reporting. OFM did not perform sufficient procedures to verify UW balances in AFRS were accurate [F: UW consolidation, reconciliation and adjustment of balances].

## **STEP 2: Confirm Key Controls**

**Key Control 1 - UW financial reporting imports Workday financial data to AFRS on a monthly basis using text files. AFRS automatically generates error reports to identify any financial data lines that would not appropriately post. UW financial reporting will review and correct error codes to ensure data from workday is accurately uploaded.**

### Posted Transaction

To confirm Workday financial data is imported to AFRS accurately, we obtained an example of an integration file for the fiscal year 2024, for the month of May titled "FM11-MAY-Combined\_UW\_AFRS\_Transaction\_Coding-May-0708-new.xlsx". The batch was posted 6/17/2024. We selected one transaction to ensure AFRS coding was appropriately applied based on mapping documents at [UW Workday to AFRS Mapping Documents]. The transaction with linekey 15786 and accounting date of 5/1/2024 was originally posted as a credit to ledger account 10100 (claim on cash) with a ledger account summary (LAS) reference ID of LAS12135, fund reference ID of FD200, amount of \$16,877.51.

Per mapping documents, in AFRS this would be designated as:

GL 1353 due from other governments amount

Fund 145 Institutions of Higher Education - Grant and Contracts Account

We reviewed the combined data (UW Workday with appended OFM AFRS coding) and noted the transaction was posted to the expected GL and fund based on mapping documents. AFRS GL and fund appeared appropriate based on the type of transaction. We reviewed the "results" column in the integration data and noted the transaction was successfully posted. ***No issues noted.***

### Errored Transaction

To confirm error reports are reviewed by OFM and UW on a monthly basis, we obtained an example of an error report and review performed by Tina Young, Senior Financial Reporting Analyst. Error code reports are obtained by Qing Gao, OFM IT Architecture Specialist, and modified from text file to an excel file with detailed transaction data to provide to UW for their review. We obtained UW's review of error codes for the error report ran 10/08/2024. The error report, RPT DWP8002, identified 40 instances where transactions had various error codes, including E68, Subobject required.

We reviewed one transaction with error code E68 in the "summary review" tab of "ErrorCOASummaryWithUWCoding - 2024 PC4 w Descriptions." The transaction was posted to fund 148, institutions of higher education in GL account 6510, amount of \$2,367,198.43. Per UW coding this was a credit amount to 61010 for scholarships paid by 3rd party. UW identified the solution for this error code to add subobject EZ (other goods and services). The transaction was successfully posted with the solution. The solution appeared reasonable based on the error code. ***No issues noted.***

## State of Washington

We also reviewed the mapping of funds between AFRS and UW Workday to ensure that funds appeared to be appropriately mapped between the two systems. We reviewed the 90 mapped funds as of 8/12/2024 at [\[Fund Mapping Review\]](#). Fund mapping appeared reasonable. *No issues noted.*

### **Key Control 2 - UW financial reporting identifies reconciling items in fund level reconciliations provides them to OFM. Staff in UW's Financial Reporting unit prepare the fund level reconciliations for each fund and the controller reviews**

We performed a walkthrough of UW Financial Reporting's fund level reconciliation process on November 20, 2024 with Tina Young, Senior Financial Reporting Analyst. She showed us the fund level reconciliation that was in process for fund 001. Reconciling items included descriptions such as "mapping difference between rev and exp." Per OFM and UW, they do not expect to make any adjusting entries for variances or errors identified during the reconciliation since reconciliations were not completed timely. **See issue documented in conclusion above.**

### **Key Control 3 - UW financial reporting performs reconciliations of UW financial statement balances to significant ACFR balances (at request of SAO).**

We obtained natural class reconciliations for our identified significant ACFR balances included in the significant account matrix [\[Final Planning Significant Account Matrix\]](#) from Susan Stolle, Associate Controller. We reviewed the capital assets reconciliation, which included AFRS trial balance data, UW financial statement data, and a summary tab that compared the two. Per the UW financial report (note 6), buildings were reported at a net balance of \$4,105,180,000. Reported amounts in AFRS GL (2210 and 2220) totalled 4,105,178,671. The difference is due to rounding in UW's report. *No issues noted.*

We utilized UW's prepared natural class reconciliations for our testing to determine if ACFR amounts are representative UW balances from their financial report at [\[Substantive Test - AFRS Recons to UW Statements\]](#). Although UW prepares reconciliations at SAO's request, UW does not verify that all financial statement balances are translated appropriately for state reporting. **See issue in conclusion above.**

## **STEP 3: Preliminary Control Risk Assessment**

**MAX** - Internal controls are not in use. **Accordingly, we are reporting the following material weakness:**

During FY24, UW financial reporting did not complete fund level reconciliations to adequately support balances reported in the ACFR. UW does not verify that all financial statement balances are translated appropriately for state reporting. OFM did not perform sufficient procedures to verify UW balances in AFRS were accurate. See issue [\[F: UW consolidation, reconciliation and adjustment of balances\]](#).

## **STEP 4: Control Risk at LOW - Test Key Controls**

Not applicable - we are not planning on relying on controls and therefore do not need to test controls; control risk will be assessed at maximum.

## **STEP 5: Final Control Risk Assessment**

# State of Washington

**MAX** - Internal controls are not in use. **Accordingly, we are reporting the following material weakness:**

During FY24, UW financial reporting did not complete fund level reconciliations to adequately support balances reported in the ACFR. UW does not verify that all financial statement balances are translated appropriately for state reporting. OFM did not perform sufficient procedures to verify UW balances in AFRS were accurate [F: UW consolidation, reconciliation and adjustment of balances].

## K.2.PRG - Work of Other Auditors - UW

*Procedure Step:* External Auditor performs PART of audit

*Prepared By:* RKM, 11/14/2024

*Reviewed By:* SHW, 12/10/2024

### Purpose/Conclusion:

#### **Purpose:**

To identify and evaluate work done by external auditors and determine if our Office can rely on audit reports issued by external auditors for significant components.

#### **Conclusion:**

Based on our evaluation, we determined that our Office can rely on the work of external auditors for University of Washington.

Results of the work of other auditors was identified and incorporated into other sections as described in the ROWD below.

We noted **no** concerns with the work of other auditors to bring to the attention of management at the exit conference.

### Testing Strategy:

Group audit procedures are required for all components audited by other CPAs, with certain additional procedures required only for significant components. This work should be charged to time code CPAR. If significant components are audited by CPAs in lieu of an SAO audit, a CPA Audit Report Review will also be needed in accordance with Policy 3510 and charged to time code CPAP - in such cases, some procedures in this section may be documented as part of the report review. Contact your supervisor and Assistant Director if you have any questions about necessary procedures or any concerns about the external auditor's professional reputation, independence, or quality of work.

# State of Washington

## **Procedures for ALL components audited by external auditors:**

The following procedures are **required** for planning purposes as referenced in the "Audits Performed by Others" step and by Audit Policy 6240 to identify relevant work done by external auditors and consider results:

**STEP 1: Determine Significance to the applicable opinion unit.** Evaluate each component audited by others to determine whether - individually or in aggregate - it is significant or insignificant to the applicable opinion unit.

*Auditors should consider both quantitative and qualitative materiality factors. For example, a component may be significant based on the quantitative materiality threshold for the applicable opinion unit or because it may include significant risk of material misstatement of the primary government's financial statements due to its specific nature or circumstances. When a component represents an entire opinion unit, it is considered to be significant (with the possible exception of foundations – see special guidance for GASB 39 situations in FYI 2016-02).*

*Qualitative factors may include that a waiver to perform the review has been used in recent audits, increasing the risk where we decide it is appropriate to review the CPA workpapers to sufficiently reduce audit risk.*

*Important Note: If a component is significant, communication with the other auditor (Step 5), must be done on a timely basis. In that case, Steps 2 and 3 may need to be done before the primary government's audit, as well. The results should be documented and placed in the FAWF pending the start of the SAO audit, and then brought into the TeamMate audit file.*

**STEP 2: Meetings. Consider** attending key meetings between the external auditor and the government.

**STEP 3: Obtain Report.** Include a copy of the external auditor's report in TeamMate. Make sure to get both the report on compliance and internal controls (SAO's "I-report"), as well as the financial statement report (SAO's "F-report").

*NOTE: If the other auditor performs the audit and reports in accordance with GAAS rather than GAGAS, then the I-report content will be in a letter to management rather than a report. This is possible for audits of component units (e.g. foundations or tax credit partnerships), but is not expected for divisions or funds of primary governments.*

**STEP 4: Review Report.** For insignificant components, review the report issued by external auditors and consider whether any information in the report changes our planning decisions or would have an impact on our audit, if the report is available before our report date. If questions or potential red flags are noted, **consider** additional inquiry, analysis or other steps to follow up. For significant components, the report must be reviewed and incorporated into our audit as described in step 9 below.

## **ADDITIONAL procedures for SIGNIFICANT components:**

## State of Washington

The following additional procedures are **required** only for significant components audited by external auditors:

**STEP 5: Communication with Other Auditor.** Using the External Audit Coordination email template in the TeamStore (be sure to add your formal signature to the bottom of the email prior to sending), communicate with the external auditor to:

- Confirm the external auditor's independence, cooperation and understanding of how we intend to use their work.

- Share related parties and significant risks we have identified for the primary government and request the same from the external auditor.

- Request the external auditor's materiality and performance materiality thresholds used to determine whether thresholds are sufficient for purposes of our audit.

- Request the external auditor's report and other results in order to incorporate these into our results for the audit of the group.

- Confirm our commitment to inform the external auditor of any matter that comes to our attention that may be relevant to their audit and request the external auditor's commitment to do the same.

*Auditors should initiate this communication as early in the audit as possible and continue to communicate with the external auditor as necessary to follow-up on these matters throughout the audit.*

Note: if the CPA Audit Report Review is being done in step 6 below, information from the CPA can be documented when completing the CPA workpaper review checklist rather than as a response to the letter.

**STEP 6: CPA Audit Report Review (if applicable under Policy 3510).** For significant components that are audited by an external auditor in lieu of an SAO audit, perform a CPA Audit Report Review in a separate TM file as required by Policy 3510. This work is performed to carry out SAO's statutory mandate but will also provide additional support for our reliance on the work of the other auditor. As such, the review should be completed prior to concluding on the audit of the primary government. If a review is applicable, reference this work and summarize relevant results.

**STEP 7: Audit Plan.** Document in the Audit Plan the effect of the work of external auditors on our audit report and substantive testing. Identify which opinion units and/or balances we plan to rely on the work of other auditors in the plan and mark these rows or columns on the Material Balance spreadsheet to indicate our reliance on the work of external auditors.

**STEP 8: Evaluate the Firm's Professional Competence.** Evaluate the professional competence of the external audit firm by considering our Office's experience with the firm, the results of communications and review, and by checking the [CPA License and Peer Review SharePoint page](#) to obtain the firm's last peer review report.

Note: if the CPA Audit Report Review was completed using step 6 above, this evaluation can be documented when completing the CPA workpaper review checklist.

## State of Washington

**STEP 9: Internal Controls.** Document an understanding of controls over the consolidation process to incorporate components into the financial statements in the Controls - FS Preparation step in the permanent file (or a separate step if the process is identified as its own control system due to risk or complexity).

**STEP 10: Incorporate Results.** In addition to the external auditor's report, obtain and review any letter to management and the governing body about internal controls, the aggregation of misstatements, any audit recommendations made and any other relevant results.

Items included in the external auditor's aggregation of misstatements should also be included in our aggregation for the primary government.

Reported amounts and disclosures audited by the external auditor per their report should be traced to the financial statements of the primary government.

Any potential fraud, noncompliance, abuse or other matters identified by the external auditor should be re-evaluated for the primary government.

Our report may need to reflect any modifications made to the external auditor's report (that is, if the opinion is not unmodified or includes explanatory paragraphs) and any significant deficiencies or material weaknesses reported by the external auditor. Such issues should be repeated in our report to the extent they are material to an opinion unit.

*REMINDER: When external auditors conduct their audit in accordance with GAGAS, any findings will be communicated in their audit report. Otherwise, if conducted in accordance with GAAS, any findings will be communicated to management and the governing body in a separate letter that we will need to request.*

Auditors should conclude on whether the work, materiality, performance materiality and floor thresholds used are acceptable for our purposes, based on our communication with the component auditor and other procedures performed.

**STEP 11: Conditions for Referencing the Other Auditor's Report.** Determine if the following conditions are met. If so, we will be able to reference the work of the external auditor in our report. If not, contact TAS for assistance.

The audit is completed prior to our report on the primary government.

There are no concerns about the component auditor's professional competence or independence, and the component auditor has passed its prior peer review.

Component financial statements are prepared using the same financial reporting framework as the group, or one permitted by that framework. For example, GASB provides for inclusion of FASB components.

Component auditor has performed the audit in accordance with GAAS or GAGAS.

Component auditor's report is not restricted as to use.

*If the work of the external auditor is material to any opinion unit, our financial report must refer to the external auditors - please refer to the Audit*

# State of Washington

*Report Standards (ARS) Manual for opinion modifications. If the external auditor performed their audit in accordance with GAAS, rather than GAGAS, our audit report will need to be further modified as shown in the ARS example.*

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

### **SAO Audit Policy [6240](#) – Group Audits**

### **[Review Work of Others](#) Planning Guide**

**[CPA Workpaper Review Resources](#)** - more background and resources for this area

Contact the CPA Audit Coordinator or TAS with any questions or advice on required procedures or if the team is uncertain whether a CPA Report Review is applicable.

Record of Work Done:

## **Evaluating Significance of Components Audited by Others**

We evaluated each component audited by others to determine whether - individually or in aggregate - it is significant or insignificant to the applicable opinion units. We determined that the external CPA audit of the University of Washington is significant to the FY2024 State of Washington ACFR audit. See our analysis of which opinion units are impacted by the external audit here: [\[Rely on Work of Other Auditors\]](#).

KPMG, LLP, performed a group audit over the University of Washington and its component units. This includes the discretely presented Valley Medical Center [\[Work of Other Auditors - Valley Medical\]](#) and Fred Hutchinson Cancer Center [\[Work of Other Auditors - Fred Hutch\]](#) and a number of blended component units. The overall impact of the University of Washington audit applies to multiple opinion units in the Government Wide Financial Statements.

## **Meetings**

We determined it was not necessary to attend key meetings between KPMG and the University of Washington. We introduced ourselves to Paige Hagen, KPMG Audit Managing Director, and Casey Byers, KPMG Senior Manager, on September 17, 2024.

## **Review of SIGNIFICANT Components**

During planning, we documented in the Audit Plan and Significant Balances spreadsheet our expected reliance on the work of other auditors for

## State of Washington

significant components and the effect on our audit report and substantive testing.

### Communication with Other Auditor

As documented in [Audit Request - External Audit Coordination], we communicated with the external auditor to confirm an understanding with them, share relevant information, and provide a basis for cooperation. We received a response on August 21, 2024 from Chris Ray, Partner [KPMG Response to SAO Letter]. We determined this response was reasonable. We arranged with Casey Byers, KPMG Senior Audit Manager, to obtain access to KPMG workpapers. Access was through the Citrix Workplace App from November 13, 2024 to November 14, 2024.

### CPA Audit Report Review

SAO Audit Policy 3510 requires a CPA Audit Report Review when significant audit work is done in lieu of an SAO audit. The auditor's work did not cover all of the State of Washington activities and was isolated to University of Washington activities only. We determined the external auditor's work was **not** done in lieu of an SAO audit. See: [Review Checklist - CPA Workpapers]. **The audit work and documentation was sufficient to allow our Office to rely on KPMG's work.**

### Evaluation of Professional Competence

We evaluated the professional competence of the other auditor by considering our Office's experience with the firm, communication and review procedures as described above, and reading the firm's last peer review report. Based on these procedures, we determined that the professional competence of the other auditor was sufficient enough to rely on their work.

### Understanding of Consolidation Process

We gained an understanding of controls over the consolidation process as documented in [Financial Statement Preparation]. We considered this understanding when assessing risk and in procedures performed to incorporate the results of the other audit.

### Incorporation of Results of Other Audit

We reviewed the auditor's reports [UW 2024 Audit Report], the aggregation of misstatements, any audit recommendations made and any other relevant results. To incorporate results, we:

- Traced reported amounts and disclosures audited by the external auditor per their report to the financial statements of the primary government as documented [UW GL to AFRS Testing]. **See issues identified in the spreadsheet.**

- Looked for any uncorrected misstatements identified by the other auditor. We added these to our aggregation for the primary government. See: [Aggregation of Misstatements (GAAP)].

- Looked for any potential fraud, noncompliance, abuse or other matters identified by the other auditor. We noted no such matters.

- Looked for any modifications or explanatory paragraphs. We determined there were modifications or explanatory paragraphs, but this did not impact KPMG's work or our audit conclusions.

- We determined that the work, materiality, performance materiality and floor thresholds used are acceptable for our purposes, based on our communication with the component auditor and other procedures performed.

# State of Washington

## Making Reference to Work of Other Auditors

Finally, we determined that conditions for making reference to the work of other auditors was met as follows:

The audit was dated November 8, 2024, which is prior to our report on the primary government.

There are no concerns about the component auditor's professional competence or independence. We specifically noted that the component auditor has passed its prior peer review.

Component financial statements are prepared using a GASB financial reporting framework.

Component auditor has performed the audit in accordance with GAGAS.

Component auditor's report is not restricted as to use.

## K.2.PR.G - Work of Other Auditors - UW

*Procedure Step:* Substantive Test - AFRS Recons to UW Statements

*Prepared By:* BM2, 12/10/2024

*Reviewed By:* RKM, 12/10/2024

Purpose/Conclusion:

### **Purpose:**

To review the Workday to AFRS roll-up of the University of Washington financial balances.

### **Source:**

Susan Stolle, Associate Controller

### **Conclusion:**

We reviewed the Workday to AFRS roll-up of the University of Washington financial balances and identified several errors due to misclassification and reconciliation variances. See issue at: [\[F: UW consolidation, reconciliation and adjustment of balances\]](#).

Testing Strategy:

Obtain the University of Washington audited financial statements.

## State of Washington

Obtain the UW performed line item reconciliations for selected balances (natural class reconciliations). Compare balances reported in the reconciliation to AFRS data, and determine if explanations are reasonable and complete for reconciling items. Determine if the reconciliations meet a reasonable threshold as to not present a risk of a material difference between the balances at UW and the AFRS balances reported.

Identify any unreconciled balances over the floor and carry them to the aggregation of misstatements as a possible error.

Guidance/Criteria:

Record of Work Done:

Risk(s) identified during planning:

Although the Universities financial statements are audited by a CPA firm, there is a risk that the adjustments made to AFRS for state reporting may be incomplete, inappropriate or inaccurate, potentially affecting assertions in the higher special revenue, higher student services and higher endowment opinion units. In addition the UW implemented a new ERP (Workday) in FY24 potentially increasing risk.

There is a risk that the data converted from Workday to AFRS is not accurate and complete.

Planned Audit Procedures from ACFR Brainstorm [[ACFR Brainstorm](#)]:

**Obtain an understanding of the process of adjusting UW accounting records and reporting in AFRS at a summary level** [[Controls - UW Workday GL to AFRS](#)]

See controls reviewed at [[Controls - UW Workday GL to AFRS](#)].

**Identify and confirm key controls over the financial reporting process and note any control weaknesses** [[Controls - UW Workday GL to AFRS](#)]

We identified a material control weakness as part of our controls related to the consolidation of UW data. See issue [[F: UW consolidation, reconciliation and adjustment of balances](#)].

We reviewed the mapping of funds from UW Workday and AFRS at [[Fund Mapping Review](#)]. Based on our review of fund descriptions and rollup funds, we determined the mapping of funds appears reasonable. *No issues noted.*

We also reviewed adjustments made after phase II close as part of our adjustment testing at [[FY24 Greater than \\$5M Adjustment Testing](#)]. **See issue in the spreadsheet.**

**Agree select line items from the UW financial statements to the state ACFR** [[UW GL to AFRS Testing](#)]

## State of Washington

We obtained natural class reconciliations from Susan Stolle, UW Associate Controller, for 23 of the 44 selected line items (from significant account matrix at B.3.1). Due to the complexity of mapping data from AFRS to Workday and our limited access to UW financial statement data, we utilized UW's reconciliations to trace UW financial statement balances back to the applicable ACFR balance. We used the ACFR database to verify amounts reported in the ACFR were representative of UW's financial statement balances reported at [\[UW 2024 Audit Report\]](#).

Based on our procedures, we identified unreconciled balances of \$2.2 billion and variances of \$3.3 million across opinion units for the 23 balances. There were 10 balances that reported variances above their applicable floor. We will carry these issues to the aggregation of misstatements [\[Aggregation of Misstatements \(GAAP\)\]](#). See issue at [\[F: UW consolidation, reconciliation and adjustment of balances\]](#).

The \$2.2 billion in unreconciled balances were mainly due to cash and investments so we performed additional procedures here: [\[Cash and Investments\]](#).

Tab 1: We ran an AFRS query to obtain the total cash and investments reported amount by UW. We compared this query to the UW reported amount per their FY24 financial statements. We determined the total cash and investments tied with an insignificant variance.

Tab 2: We ran an AFRS query to obtain the cash and investments reported amount by UW for rollup funds FBG, FEA and FFH (major funds). We assessed whether year over year cash and investment changes for rollup funds FBG, FEA and FFH appear reasonable. The balances did not significantly change so we determined they appeared reasonable.

Tab 3: We ran an AFRS query to obtain the cash and investments reported amount by UW for rollup funds FBG, FEA and FFH (major funds). We assessed whether classification of cash and investments appeared reasonable by examining year over year changes by rollup fund and GL sort code. We determined there were significant fluctuations and were unable to quantify the error for classification of cash and investment for rollup funds FBG, FEA and FFH.

### K.3.PR.G - Work of Other Auditors - SIB

*Procedure Step:* External Auditor Performing PART of Audit

*Prepared By:* JLE, 10/30/2024

*Reviewed By:* RKM, 11/5/2024

Purpose/Conclusion:

#### **Purpose**

To identify and evaluate work done by external auditors and determine if our Office can rely on audit reports issued by external auditors for significant components.

# State of Washington

## **Conclusion**

Based on our evaluation, we determined that our Office can rely on the work of external auditors for the following components: The Washington State Investment Board.

Results of the work of other auditors was identified and incorporated into other sections as described in the ROWD below.

We noted no concerns with the work of other auditors to bring to the attention of management at the exit conference.

SAO will add an Emphasis of Matter paragraph to the final ACFR report, disclosing the fair value estimation method for Retirement Funds investments.

## **No issues noted.**

Testing Strategy:

Group audit procedures are required for all components audited by other CPAs, with certain additional procedures required only for significant components. This work should be charged to time code CPAR. If significant components are audited by CPAs in lieu of an SAO audit, a CPA Audit Report Review will also be needed in accordance with Policy 3510 and charged to time code CPAP - in such cases, some procedures in this section may be documented as part of the report review. Contact your supervisor and Assistant Director if you have any questions about necessary procedures or any concerns about the external auditor's professional reputation, independence, or quality of work.

## **Procedures for ALL Components Audited by External Auditors:**

The following procedures are **required** for planning purposes as referenced in the "Audits Performed by Others" step and by Audit Policy 6240 to identify relevant work done by external auditors and consider results:

**STEP 1: Determine Significance to the applicable opinion unit.** Evaluate each component audited by others to determine whether - individually or in aggregate - it is significant or insignificant to the applicable opinion unit.

*Auditors should consider both quantitative and qualitative materiality factors. For example, a component may be significant based on the quantitative materiality threshold for the applicable opinion unit or because it may include significant risk of material misstatement of the primary government's financial statements due to its specific nature or circumstances. When a component represents an entire opinion unit, it is considered to be significant (with the possible exception of foundations – see special guidance for GASB 39 situations in FYI 2016-02).*

*Qualitative factors may include that a waiver to perform the review has been used in recent audits, increasing the risk where we decide it is appropriate to review the CPA workpapers to sufficiently reduce audit risk.*

*Important Note: If a component is significant, communication with the other auditor (Step 5), must be done on a timely basis. In that case, Steps 2 and 3 may need to be done before the primary government's audit, as well. The results should be documented*

## State of Washington

*and placed in the FAWF pending the start of the SAO audit, and then brought into the TeamMate audit file.*

**STEP 2: Meetings. Consider** attending key meetings between the external auditor and the government.

**STEP 3: Obtain Report.** Include a copy of the external auditor's report in TeamMate. Make sure to get both the report on compliance and internal controls (SAO's "I-report"), as well as the financial statement report (SAO's "F-report").

*NOTE: If the other auditor performs the audit and reports in accordance with GAAS rather than GAGAS, then the I-report content will be in a letter to management rather than a report. This is possible for audits of component units (e.g. foundations or tax credit partnerships), but is not expected for divisions or funds of primary governments.*

**STEP 4: Review Report.** For insignificant components, review the report issued by external auditors and consider whether any information in the report changes our planning decisions or would have an impact on our audit, if the report is available before our report date. If questions or potential red flags are noted, **consider** additional inquiry, analysis or other steps to follow up. For significant components, the report must be reviewed and incorporated into our audit as described in step 9 below.

### **ADDITIONAL procedures for SIGNIFICANT components:**

The following additional procedures are **required** only for significant components audited by external auditors:

**STEP 5: Communication with Other Auditor.** Using the External Audit Coordination email template in the TeamStore (be sure to add your formal signature to the bottom of the email prior to sending), communicate with the external auditor to:

- Confirm the external auditor's independence, cooperation and understanding of how we intend to use their work.

- Share related parties and significant risks we have identified for the primary government and request the same from the external auditor.

- Request the external auditor's materiality and performance materiality thresholds used to determine whether thresholds are sufficient for purposes of our audit.

- Request the external auditor's report and other results in order to incorporate these into our results for the audit of the group.

- Confirm our commitment to inform the external auditor of any matter that comes to our attention that may be relevant to their audit and request the external auditor's commitment to do the same.

*Auditors should initiate this communication as early in the audit as possible and continue to communicate with the external auditor as necessary to follow-up on these matters throughout the audit.*

Note: if the CPA Audit Report Review is being done in step 6 below, information from the CPA can be documented when completing the CPA

## State of Washington

workpaper review checklist rather than as a response to the letter.

**STEP 6: CPA Audit Report Review (if applicable under Policy 3510).** For significant components that are audited by an external auditor in lieu of an SAO audit, perform a CPA Audit Report Review in a separate TM file as required by Policy 3510. This work is performed to carry out SAO's statutory mandate but will also provide additional support for our reliance on the work of the other auditor. As such, the review should be completed prior to concluding on the audit of the primary government. If a review is applicable, reference this work and summarize relevant results.

**STEP 7: Audit Plan.** Document in the Audit Plan the effect of the work of external auditors on our audit report and substantive testing. Identify which opinion units and/or balances we plan to rely on the work of other auditors in the plan and mark these rows or columns on the Material Balance spreadsheet to indicate our reliance on the work of external auditors.

**STEP 8: Evaluate the Firm's Professional Competence.** Evaluate the professional competence of the external audit firm by considering our Office's experience with the firm, the results of communications and review, and by checking the [CPA License and Peer Review SharePoint page](#) to obtain the firm's last peer review report.

Note: if the CPA Audit Report Review was completed using step 6 above, this evaluation can be documented when completing the CPA workpaper review checklist.

**STEP 9: Internal Controls.** Document an understanding of controls over the consolidation process to incorporate components into the financial statements in the Controls - FS Preparation step in the permanent file (or a separate step if the process is identified as its own control system due to risk or complexity).

**STEP 10: Incorporate Results.** In addition to the external auditor's report, obtain and review any letter to management and the governing body about internal controls, the aggregation of misstatements, any audit recommendations made and any other relevant results.

Items included in the external auditor's aggregation of misstatements should also be included in our aggregation for the primary government.

Reported amounts and disclosures audited by the external auditor per their report should be traced to the financial statements of the primary government.

Any potential fraud, noncompliance, abuse or other matters identified by the external auditor should be re-evaluated for the primary government.

Our report may need to reflect any modifications made to the external auditor's report (that is, if the opinion is not unmodified or includes explanatory paragraphs) and any significant deficiencies or material weaknesses reported by the external auditor. Such issues should be repeated in our report to the extent they are material to an opinion unit.

## State of Washington

*REMINDER: When external auditors conduct their audit in accordance with GAGAS, any findings will be communicated in their audit report. Otherwise, if conducted in accordance with GAAS, any findings will be communicated to management and the governing body in a separate letter that we will need to request.*

Auditors should conclude on whether the work, materiality, performance materiality and floor thresholds used are acceptable for our purposes, based on our communication with the component auditor and other procedures performed.

**STEP 11: Conditions for Referencing the Other Auditor's Report.** Determine if the following conditions are met. If so, we will be able to reference the work of the external auditor in our report. If not, contact TAS for assistance.

The audit is completed prior to our report on the primary government.

There are no concerns about the component auditor's professional competence or independence, and the component auditor has passed its prior peer review.

Component financial statements are prepared using the same financial reporting framework as the group, or one permitted by that framework. For example, GASB provides for inclusion of FASB components.

Component auditor has performed the audit in accordance with GAAS or GAGAS.

Component auditor's report is not restricted as to use.

*If the work of the external auditor is material to any opinion unit, our financial report must refer to the external auditors - please refer to the Audit Report Standards (ARS) Manual for opinion modifications. If the external auditor performed their audit in accordance with GAAS, rather than GAGAS, our audit report will need to be further modified as shown in the ARS example.*

Guidance/Criteria:
--------------------

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6240](#) – Group Audits**

**[Review Work of Others](#) Planning Guide**

**[CPA Workpaper Review Resources](#)** - more background and resources for this area

Contact the CPA Audit Coordinator or TAS with any questions or advice on required procedures or if the team is uncertain whether a CPA Report Review is applicable.

# State of Washington

Record of Work Done:

## **Evaluating Significance of Components Audited by Others**

We identified the following other auditors who performed a portion of the financial statement audit, and determined the significance of those components, as follows:

We evaluated each component audited by others to determine whether their work was, individually or in aggregate, significant or insignificant to applicable opinion units. See: [\[Interim Planning Significant Balance Spreadsheet\]](#).

We determined the audit of the State Investment Board (SIB) performed by external auditors **was significant** to the FY24 State of Washington ACFR audit.

We identified the following other auditors who performed a portion of the ACFR financial statement audit (i.e., the audit of SIB):

Firm Name: Eide Bailly, LLP

Audit Supervisor: Abbie Belthoff, CPA

Email: [abelthoff@eidebailly.com](mailto:abelthoff@eidebailly.com)

Phone: (208) 383-4784

Engagement Partner: Brad Berls

## **Meetings**

We determined that attending meetings between Eide Bailly and SIB was **not necessary**.

## **Review of SIGNIFICANT Components:**

During planning, we documented our expected reliance on the work of other auditors for significant components and the effect of such reliance on our audit report and substantive testing. See planning documentation at: [\[Final Planning Significant Balance Spreadsheet\]](#) and [\[External CPA Audit Significance\]](#).

## **Communication with Other Auditor**

We communicated with the external auditor to confirm an understanding with them, share relevant information, and provide a basis for cooperation. See documentation of correspondence at: [\[Audit Request - External Audit Coordination\]](#).

We received a response on 9/26/2024 from Brad Berls, CPA (Eide Bailly Partner). See documentation of the external auditor's response at: [\[Response Letter WSIB\]](#).

We evaluated the external auditor's response, noting **no issues** relating to their understanding, cooperation, and willingness to share relevant information. Their response was complete and reasonable.

## **CPA Audit Report Review**

# State of Washington

SAO Audit Policy 3510 requires a CPA Audit Report Review when significant audit work is done in lieu of an SAO audit. See our report review here: [\[FY24 Review Checklist\]](#).

We concluded that the external auditor's work was reasonable, sufficient, conforms to relevant Standards, and can be relied upon. **No issues noted.**

## Evaluation of Professional Competence

We evaluated the professional competence of the other auditor by considering our Office's experience with the firm, communication and review procedures as described above, and reading the firm's last peer review report.

Based on these procedures, we determined that the professional competence of the other auditor **was sufficient** enough to rely on their work.

## Understanding of Consolidation Process

We gained an understanding of controls over the consolidation process as documented in: [\[Financial Statement Preparation\]](#).

We considered this understanding when assessing risk and in procedures performed to incorporate the results of the other audit.

## Incorporation of Results of Other Audit

We reviewed the auditor's reports, the aggregation of misstatements, any audit recommendations made, and any other relevant results.

To incorporate results, we:

Traced reported amounts and disclosures audited by the external auditor per their report to the financial statements of the primary government as documented at: [\[FY24 Reconciliation to AFRS\]](#) and [\[FY24 DRS Retirement Strategy Funds Reconciliation\]](#).

Looked for any uncorrected misstatements identified by the other auditor. We noted there were **no uncorrected misstatements** identified by the other auditor.

Looked for any potential fraud, noncompliance, abuse or other matters identified by the other auditor. **We noted no such matters.**

Looked for any modifications or explanatory paragraphs, noting one Emphasis of Matter paragraph added to the report for Retirement Funds, see: [\[WSIB Annual Report 2024\]](#), page 20.

"Total investments in the Retirement Funds include investments valued at \$93.9 billion (55.5% of total investments) as of June 30, 2024, whose fair values have been estimated by management in the absence of readily determinable fair values.

Management's estimates are based on information provided by the fund managers or the general partners. Our opinion is not modified with respect to this matter."

**We will add an Emphasis of Matter paragraph to the ACFR report. See conclusion above.**

We determined that the work, materiality, performance materiality and floor thresholds used **are acceptable** for our purposes, based on our communication with the component auditor and other procedures performed.

## Making Reference to Work of Other Auditors

Finally, we determined that conditions for making reference to the work of other auditors **was met** as follows:

The audit was dated 9/26/2024, which is **prior** to our report on the primary government.

## State of Washington

There are **no concerns** about the component auditor's professional competence or independence; we specifically note that the component auditor has **passed** its most recent peer review.  
Component financial statements are prepared using a **GASB** financial reporting framework.  
Component auditor has performed the audit in accordance with **GAGAS**.  
Component auditor's report **is not** restricted as to use.

**SAO will make reference to the attestation work of other auditors as performed for the State Investment Board (a significant component of the FY24 Washington State ACFR). No issues noted.**

### K.4.PRG - Work of Other Auditors - DRS

*Procedure Step:* External Auditor performs PART of audit  
*Prepared By:* BFW, 11/4/2024  
*Reviewed By:* RKM, 11/5/2024

#### Purpose/Conclusion:

##### **Purpose:**

To identify and evaluate work done by external auditors and determine if our Office can rely on audit reports issued by external auditors for significant components.

##### **Conclusion:**

Based on our evaluation, we determined that our Office can rely on the work of external auditors for Department of Retirement Systems.

Results of the work of other auditors was identified and incorporated into other sections as described in the ROWD below.

We noted **no** concerns with the work of other auditors to bring to the attention of management at the exit conference.

#### Testing Strategy:

Group audit procedures are required for all components audited by other CPAs, with certain additional procedures required only for significant components. This work should be charged to time code CPAR. If significant components are audited by CPAs in lieu of an SAO audit, a CPA Audit

# State of Washington

Report Review will also be needed in accordance with Policy 3510 and charged to time code CPAP - in such cases, some procedures in this section may be documented as part of the report review. Contact your supervisor and Assistant Director if you have any questions about necessary procedures or any concerns about the external auditor's professional reputation, independence, or quality of work.

## **Procedures for ALL components audited by external auditors:**

The following procedures are **required** for planning purposes as referenced in the "Audits Performed by Others" step and by Audit Policy 6240 to identify relevant work done by external auditors and consider results:

**STEP 1: Determine Significance to the applicable opinion unit.** Evaluate each component audited by others to determine whether - individually or in aggregate - it is significant or insignificant to the applicable opinion unit.

*Auditors should consider both quantitative and qualitative materiality factors. For example, a component may be significant based on the quantitative materiality threshold for the applicable opinion unit or because it may include significant risk of material misstatement of the primary government's financial statements due to its specific nature or circumstances. When a component represents an entire opinion unit, it is considered to be significant (with the possible exception of foundations – see special guidance for GASB 39 situations in FYI 2016-02).*

*Qualitative factors may include that a waiver to perform the review has been used in recent audits, increasing the risk where we decide it is appropriate to review the CPA workpapers to sufficiently reduce audit risk.*

*Important Note: If a component is significant, communication with the other auditor (Step 5), must be done on a timely basis. In that case, Steps 2 and 3 may need to be done before the primary government's audit, as well. The results should be documented and placed in the FAWF pending the start of the SAO audit, and then brought into the TeamMate audit file.*

**STEP 2: Meetings. Consider** attending key meetings between the external auditor and the government.

**STEP 3: Obtain Report.** Include a copy of the external auditor's report in TeamMate. Make sure to get both the report on compliance and internal controls (SAO's "I-report"), as well as the financial statement report (SAO's "F-report").

*NOTE: If the other auditor performs the audit and reports in accordance with GAAS rather than GAGAS, then the I-report content will be in a letter to management rather than a report. This is possible for audits of component units (e.g. foundations or tax credit partnerships), but is not expected for divisions or funds of primary governments.*

**STEP 4: Review Report.** For insignificant components, review the report issued by external auditors and consider whether any information in the report changes our planning decisions or would have an impact on our audit, if the report is available before our report date. If questions or potential red flags are noted, **consider** additional inquiry, analysis or other steps to follow up. For significant components, the report must be

## State of Washington

reviewed and incorporated into our audit as described in step 9 below.

### **ADDITIONAL procedures for SIGNIFICANT components:**

The following additional procedures are **required** only for significant components audited by external auditors:

**STEP 5: Communication with Other Auditor.** Using the External Audit Coordination email template in the TeamStore (be sure to add your formal signature to the bottom of the email prior to sending), communicate with the external auditor to:

- Confirm the external auditor's independence, cooperation and understanding of how we intend to use their work.

- Share related parties and significant risks we have identified for the primary government and request the same from the external auditor.

- Request the external auditor's materiality and performance materiality thresholds used to determine whether thresholds are sufficient for purposes of our audit.

- Request the external auditor's report and other results in order to incorporate these into our results for the audit of the group.

- Confirm our commitment to inform the external auditor of any matter that comes to our attention that may be relevant to their audit and request the external auditor's commitment to do the same.

*Auditors should initiate this communication as early in the audit as possible and continue to communicate with the external auditor as necessary to follow-up on these matters throughout the audit.*

Note: if the CPA Audit Report Review is being done in step 6 below, information from the CPA can be documented when completing the CPA workpaper review checklist rather than as a response to the letter.

**STEP 6: CPA Audit Report Review (if applicable under Policy 3510).** For significant components that are audited by an external auditor in lieu of an SAO audit, perform a CPA Audit Report Review in a separate TM file as required by Policy 3510. This work is performed to carry out SAO's statutory mandate but will also provide additional support for our reliance on the work of the other auditor. As such, the review should be completed prior to concluding on the audit of the primary government. If a review is applicable, reference this work and summarize relevant results.

**STEP 7: Audit Plan.** Document in the Audit Plan the effect of the work of external auditors on our audit report and substantive testing. Identify which opinion units and/or balances we plan to rely on the work of other auditors in the plan and mark these rows or columns on the Material Balance spreadsheet to indicate our reliance on the work of external auditors.

**STEP 8: Evaluate the Firm's Professional Competence.** Evaluate the professional competence of the external audit firm by considering our Office's experience with the firm, the results of communications and review, and by checking the [CPA License and Peer Review SharePoint page](#) to

## State of Washington

obtain the firm's last peer review report.

Note: if the CPA Audit Report Review was completed using step 6 above, this evaluation can be documented when completing the CPA workpaper review checklist.

**STEP 9: Internal Controls.** Document an understanding of controls over the consolidation process to incorporate components into the financial statements in the Controls - FS Preparation step in the permanent file (or a separate step if the process is identified as its own control system due to risk or complexity).

**STEP 10: Incorporate Results.** In addition to the external auditor's report, obtain and review any letter to management and the governing body about internal controls, the aggregation of misstatements, any audit recommendations made and any other relevant results.

Items included in the external auditor's aggregation of misstatements should also be included in our aggregation for the primary government.

Reported amounts and disclosures audited by the external auditor per their report should be traced to the financial statements of the primary government.

Any potential fraud, noncompliance, abuse or other matters identified by the external auditor should be re-evaluated for the primary government.

Our report may need to reflect any modifications made to the external auditor's report (that is, if the opinion is not unmodified or includes explanatory paragraphs) and any significant deficiencies or material weaknesses reported by the external auditor. Such issues should be repeated in our report to the extent they are material to an opinion unit.

*REMINDER: When external auditors conduct their audit in accordance with GAGAS, any findings will be communicated in their audit report. Otherwise, if conducted in accordance with GAAS, any findings will be communicated to management and the governing body in a separate letter that we will need to request.*

Auditors should conclude on whether the work, materiality, performance materiality and floor thresholds used are acceptable for our purposes, based on our communication with the component auditor and other procedures performed.

**STEP 11: Conditions for Referencing the Other Auditor's Report.** Determine if the following conditions are met. If so, we will be able to reference the work of the external auditor in our report. If not, contact TAS for assistance.

The audit is completed prior to our report on the primary government.

There are no concerns about the component auditor's professional competence or independence, and the component auditor has passed its prior peer review.

Component financial statements are prepared using the same financial reporting framework as the group, or one permitted by that framework. For example, GASB provides for inclusion of FASB components.

## State of Washington

Component auditor has performed the audit in accordance with GAAS or GAGAS.  
Component auditor's report is not restricted as to use.

*If the work of the external auditor is material to any opinion unit, our financial report must refer to the external auditors - please refer to the Audit Report Standards (ARS) Manual for opinion modifications. If the external auditor performed their audit in accordance with GAAS, rather than GAGAS, our audit report will need to be further modified as shown in the ARS example.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6240](#) – Group Audits**

**[Review Work of Others](#) Planning Guide**

**[CPA Workpaper Review Resources](#)** - more background and resources for this area

Contact the CPA Audit Coordinator or TAS with any questions or advice on required procedures or if the team is uncertain whether a CPA Report Review is applicable.

Record of Work Done:

### **Evaluating Significance of Components Audited by Others**

We identified the following other auditors who performed a portion of the financial statement audit and determined the significance of those components as follows: UHY LLP

We determined that the external CPA audit of the Department of Retirement Systems is significant to the FY24 State of Washington ACFR. See our analysis of which opinion units are impacted by the external audit here: [\[External CPA Audit Significance\]](#)

### **Meetings**

We considered participation in meetings between the external auditor (UHY LLP) and the Department of Retirement systems and determined it was not necessary.

### **Review of SIGNIFICANT Components**

During planning, we documented in the Audit Plan and Significant Balances spreadsheet our expected reliance on the work of other auditors for

## State of Washington

significant components and the effect on our audit report and substantive testing.

### Communication with Other Auditor

As documented in [\[Audit Request - External Audit Coordination\]](#), we communicated with the external auditor to confirm an understanding with them, share relevant information, and provide a basis for cooperation. We received a response on August 15, 2024 from Jason Ostroski, Principal [\[RE Audit Request - External Audit Coordination\]](#). We determined the response was reasonable.

We arranged with Ivana Ritz, Manager, to obtain access to UHY LLP workpapers. Access was through the Splashtop browser from October 28, 2024 to October 30, 2024.

### CPA Audit Report Review

SAO Audit Policy 3510 requires a CPA Audit Report Review when significant audit work is done in lieu of an SAO audit. The auditor's work did not cover all of the State of Washington activities and was isolated to DRS funds only. We determined the external auditor's work was **not** done in lieu of an SAO audit. We determined a CPA audit report review required under SAO Audit Policy 3510 was not applicable. See our review of the CPA workpapers here: [\[Review Checklist - CPA Workpapers\]](#). **We determined the work and documentation was sufficient to allow our Office to rely on the work of UHY LLP.**

### Evaluation of Professional Competence

We evaluated the professional competence of the other auditor by considering our Office's experience with the firm, communication and review procedures as described above, and reading the firm's last peer review report. Based on these procedures, we determined that the professional competence of the other auditor was sufficient enough to rely on their work.

### Understanding of Consolidation Process

We gained an understanding of controls over the consolidation process as documented in [\[Financial Statement Preparation\]](#). We considered this understanding when assessing risk and in procedures performed to incorporate the results of the other audit.

### Incorporation of Results of Other Audit

We reviewed the auditor's reports [\[2024-ACFR\]](#), [\[FY24 DRS Report\]](#), [\[DRS Internal Control Report\]](#), the aggregation of misstatements, any audit recommendations made and any other relevant results. To incorporate results, we:

- Traced reported amounts and disclosures audited by the external auditor per their report to the financial statements of the primary government as documented [\[FY24 DRS Reconciliation to AFRS\]](#).

- We noted there were no uncorrected misstatements identified by the other auditor.

- Looked for any potential fraud, noncompliance, abuse or other matters identified by the other auditor. We noted no such matters.

- Looked for any modifications or explanatory paragraphs. We noted no such matters.

- We determined that the work, materiality, performance materiality and floor thresholds used are acceptable for our purposes, based on our communication with the component auditor and other procedures performed.

# State of Washington

## Making Reference to Work of Other Auditors

Finally, we determined that conditions for making reference to the work of other auditors was **met** as follows:

The audit was dated October 24, 2024, which is prior to our report on the primary government.

There are **no** concerns about the component auditor's professional competence or independence. We specifically noted that the component auditor has **passed** its prior peer review.

Component financial statements are prepared using a GASB financial reporting framework.

Component auditor has performed the audit in accordance with GAGAS.

Component auditor's report **is not** restricted as to use.

## Auditor Note:

In the fall of 2021, DRS Retirement Strategy Funds (RSFs) began incorporating a sliver of the TAP into their various vintages. RSFs are provided by WSIB. DRS has always recorded the RSFs (in total) in their records. WSIB has to account for their ownership and allocates income from the TAP to maintain the pool of owners and reports this on their financial statements. They do not book these balances in AFRS. DRS pools DC and DCP funds, including total RSF balances, and books them to AFRS. We documented this change in our review of the WSIB audited financial statements [[FY24 Reconciliation to AFRS](#)] and the rely on work of others step here: [[Work of Other Auditors - SIB](#)]. This change does not affect our ability to rely on the other auditor's work for either WSIB or DRS.

## K.4.PRG - Work of Other Auditors - DRS

*Procedure Step:* Reivew of PEFI

*Prepared By:* BFW, 10/30/2024

*Reviewed By:* RKM, 11/5/2024

Purpose/Conclusion.*
----------------------

## **Purpose:**

To identify and evaluate work done by external auditors and determine if our Office can rely on audit reports issued by external auditors for significant allocations.

## **Conclusion:**

Based on our evaluation, we determined that our Office can rely on the work of external auditors.

## State of Washington

We noted **no** concerns with the work of other auditors to bring to the attention of management at the exit conference.

### Testing Strategy:

We will identify and evaluate work done by external auditors and determine if our Office can rely on audit reports issued by external auditors for significant allocations.

### Guidance/Criteria:

### Record of Work Done:

#### **Review of PEFI Workpapers**

We reviewed the workpapers for the 06/30/2024 PEFI report [2024 PEFI] prepared by DRS and audited by UHY LLP. The PEFI audit report was prepared under AU-C section 805, *Special Considerations* – Audits of Single Financial Statements and Specific Elements, Accounts, or Items of a Financial Statement. Due to the nature of AU-C 805 engagement, we elected to not use the CPA workpaper review checklist to ensure we gained sufficient understanding over testing performed over census data and allocations (unique elements of an AU-C 805 engagement). Our review included documenting the following:

- Review planning,
- Control work,
- Substantive work,
- Work performed on the report, and
- Conclusion over workpapers.

See the checklist used and documentation of our workpaper review at [PEFI Review Checklist - CPA Workpapers]. We also noted materiality was considered for each pension balance by plan. See documentation of planning materiality, performance materiality, individually significant items threshold, and each floor at [PEFI Materiality Threshold 2024]. We noted the following:

- Conclusions at the workpaper level supported the opinion,
- Engagement risks were appropriately addressed,
- Sufficient procedures were performed over census data, allocation basis and percentages reported, and

We determined we can rely on the auditors' work for the FYE 2024 PEFI.

#### **K.5.PR.G - Work of Other Auditors - LGIP**

# State of Washington

*Procedure Step:* External Auditor performs PART of audit  
*Prepared By:* EJB, 11/5/2024  
*Reviewed By:* RKM, 11/7/2024

## Purpose/Conclusion:

### **Purpose:**

To identify and evaluate work done by external auditors and determine if our Office can rely on audit reports issued by external auditors for significant components.

### **Conclusion:**

Based on our evaluation, we determined that our Office can rely on the work of external auditors for the Local Government Investment Pool.

Results of the work of other auditors was identified and incorporated into other sections as described in the ROWD below.

We noted no concerns with the work of other auditors to bring to the attention of management at the exit conference.

## Testing Strategy:

Group audit procedures are required for all components audited by other CPAs, with certain additional procedures required only for significant components. This work should be charged to time code CPAR. If significant components are audited by CPAs in lieu of an SAO audit, a CPA Audit Report Review will also be needed in accordance with Policy 3510 and charged to time code CPAP - in such cases, some procedures in this section may be documented as part of the report review. Contact your supervisor and Assistant Director if you have any questions about necessary procedures or any concerns about the external auditor's professional reputation, independence, or quality of work.

### **Procedures for ALL components audited by external auditors:**

The following procedures are **required** for planning purposes as referenced in the "Audits Performed by Others" step and by Audit Policy 6240 to identify relevant work done by external auditors and consider results:

**STEP 1: Determine Significance to the applicable opinion unit.** Evaluate each component audited by others to determine whether - individually or in aggregate - it is significant or insignificant to the applicable opinion unit.

*Auditors should consider both quantitative and qualitative materiality factors. For example, a component may be significant based on*

## State of Washington

*the quantitative materiality threshold for the applicable opinion unit or because it may include significant risk of material misstatement of the primary government's financial statements due to its specific nature or circumstances. When a component represents an entire opinion unit, it is considered to be significant (with the possible exception of foundations – see special guidance for GASB 39 situations in FYI 2016-02).*

*Qualitative factors may include that a waiver to perform the review has been used in recent audits, increasing the risk where we decide it is appropriate to review the CPA workpapers to sufficiently reduce audit risk.*

*Important Note: If a component is significant, communication with the other auditor (Step 5), must be done on a timely basis. In that case, Steps 2 and 3 may need to be done before the primary government's audit, as well. The results should be documented and placed in the FAWF pending the start of the SAO audit, and then brought into the TeamMate audit file.*

**STEP 2: Meetings. Consider** attending key meetings between the external auditor and the government.

**STEP 3: Obtain Report.** Include a copy of the external auditor's report in TeamMate. Make sure to get both the report on compliance and internal controls (SAO's "I-report"), as well as the financial statement report (SAO's "F-report").

*NOTE: If the other auditor performs the audit and reports in accordance with GAAS rather than GAGAS, then the I-report content will be in a letter to management rather than a report. This is possible for audits of component units (e.g. foundations or tax credit partnerships), but is not expected for divisions or funds of primary governments.*

**STEP 4: Review Report.** For insignificant components, review the report issued by external auditors and consider whether any information in the report changes our planning decisions or would have an impact on our audit, if the report is available before our report date. If questions or potential red flags are noted, **consider** additional inquiry, analysis or other steps to follow up. For significant components, the report must be reviewed and incorporated into our audit as described in step 9 below.

### **ADDITIONAL procedures for SIGNIFICANT components:**

The following additional procedures are **required** only for significant components audited by external auditors:

**STEP 5: Communication with Other Auditor.** Using the External Audit Coordination email template in the TeamStore (be sure to add your formal signature to the bottom of the email prior to sending), communicate with the external auditor to:

Confirm the external auditor's independence, cooperation and understanding of how we intend to use their work.

Share related parties and significant risks we have identified for the primary government and request the same from the external auditor.

## State of Washington

Request the external auditor's materiality and performance materiality thresholds used to determine whether thresholds are sufficient for purposes of our audit.

Request the external auditor's report and other results in order to incorporate these into our results for the audit of the group.

Confirm our commitment to inform the external auditor of any matter that comes to our attention that may be relevant to their audit and request the external auditor's commitment to do the same.

*Auditors should initiate this communication as early in the audit as possible and continue to communicate with the external auditor as necessary to follow-up on these matters throughout the audit.*

Note: if the CPA Audit Report Review is being done in step 6 below, information from the CPA can be documented when completing the CPA workpaper review checklist rather than as a response to the letter.

**STEP 6: CPA Audit Report Review (if applicable under Policy 3510).** For significant components that are audited by an external auditor in lieu of an SAO audit, perform a CPA Audit Report Review in a separate TM file as required by Policy 3510. This work is performed to carry out SAO's statutory mandate but will also provide additional support for our reliance on the work of the other auditor. As such, the review should be completed prior to concluding on the audit of the primary government. If a review is applicable, reference this work and summarize relevant results.

**STEP 7: Audit Plan.** Document in the Audit Plan the effect of the work of external auditors on our audit report and substantive testing. Identify which opinion units and/or balances we plan to rely on the work of other auditors in the plan and mark these rows or columns on the Material Balance spreadsheet to indicate our reliance on the work of external auditors.

**STEP 8: Evaluate the Firm's Professional Competence.** Evaluate the professional competence of the external audit firm by considering our Office's experience with the firm, the results of communications and review, and by checking the [CPA License and Peer Review SharePoint page](#) to obtain the firm's last peer review report.

Note: if the CPA Audit Report Review was completed using step 6 above, this evaluation can be documented when completing the CPA workpaper review checklist.

**STEP 9: Internal Controls.** Document an understanding of controls over the consolidation process to incorporate components into the financial statements in the Controls - FS Preparation step in the permanent file (or a separate step if the process is identified as its own control system due to risk or complexity).

**STEP 10: Incorporate Results.** In addition to the external auditor's report, obtain and review any letter to management and the governing body about internal controls, the aggregation of misstatements, any audit recommendations made and any other relevant results.

## State of Washington

Items included in the external auditor's aggregation of misstatements should also be included in our aggregation for the primary government.

Reported amounts and disclosures audited by the external auditor per their report should be traced to the financial statements of the primary government.

Any potential fraud, noncompliance, abuse or other matters identified by the external auditor should be re-evaluated for the primary government.

Our report may need to reflect any modifications made to the external auditor's report (that is, if the opinion is not unmodified or includes explanatory paragraphs) and any significant deficiencies or material weaknesses reported by the external auditor. Such issues should be repeated in our report to the extent they are material to an opinion unit.

*REMINDER: When external auditors conduct their audit in accordance with GAGAS, any findings will be communicated in their audit report. Otherwise, if conducted in accordance with GAAS, any findings will be communicated to management and the governing body in a separate letter that we will need to request.*

Auditors should conclude on whether the work, materiality, performance materiality and floor thresholds used are acceptable for our purposes, based on our communication with the component auditor and other procedures performed.

**STEP 11: Conditions for Referencing the Other Auditor's Report.** Determine if the following conditions are met. If so, we will be able to reference the work of the external auditor in our report. If not, contact TAS for assistance.

The audit is completed prior to our report on the primary government.

There are no concerns about the component auditor's professional competence or independence, and the component auditor has passed its prior peer review.

Component financial statements are prepared using the same financial reporting framework as the group, or one permitted by that framework. For example, GASB provides for inclusion of FASB components.

Component auditor has performed the audit in accordance with GAAS or GAGAS.

Component auditor's report is not restricted as to use.

*If the work of the external auditor is material to any opinion unit, our financial report must refer to the external auditors - please refer to the Audit Report Standards (ARS) Manual for opinion modifications. If the external auditor performed their audit in accordance with GAAS, rather than GAGAS, our audit report will need to be further modified as shown in the ARS example.*

Guidance/Criteria:
--------------------

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

# State of Washington

## SAO Audit Policy [6240](#) – Group Audits

### [Review Work of Others](#) Planning Guide

[CPA Workpaper Review Resources](#) - more background and resources for this area

Contact the CPA Audit Coordinator or TAS with any questions or advice on required procedures or if the team is uncertain whether a CPA Report Review is applicable.

Record of Work Done:

#### **Evaluating Significance of Components Audited by Others**

We evaluated each component audited by others to determine whether - individually or in aggregate - it is significant or insignificant to the applicable opinion units.

We determined that the external CPA audit of the Office of the State Treasurer - Local Government Investment Pool is significant to the FY24 State of Washington ACFR audit. See our analysis of which opinion units are impacted by the external audit here: [\[External CPA Audit Significance\]](#).

#### **Meetings**

We concluded that it was not necessary to attend meetings.

#### **Review of SIGNIFICANT Components**

During planning, we documented in the Audit Plan and Significant Balances spreadsheet our expected reliance on the work of other auditors for significant components and the effect on our audit report and substantive testing.

#### **Communication with Other Auditor**

As documented in [\[Audit Request - External Audit Coordination\]](#), we communicated with the external auditor to confirm an understanding with them, share relevant information, and provide a basis for cooperation. We received a response from Kory Hoggan, Partner [\[WA SAO Letter 7.30.24\]](#).

We arranged with Kory Hoggan, Partner, to obtain access to Moss Adams LLP workpapers. Access was through the Citrix Gateway Desktop browser on November 5, 2024.

#### **CPA Audit Report Review**

SAO Audit Policy 3510 requires a CPA Audit Report Review when significant audit work is done in lieu of an SAO audit. See workpaper review at

## State of Washington

[[Review Checklist - CPA Workpapers](#)]. The auditor's work did not cover all of the State of Washington activities and was isolated to LGIP only. We determined the external auditor's work was **not** done in lieu of an SAO audit. **We noted no concerns and determined we could rely on the auditor's work.**

### Evaluation of Professional Competence

We evaluated the professional competence of the other auditor by considering our Office's experience with the firm, communication and review procedures as described above, and reading the firm's last peer review report. Based on these procedures, we determined that the professional competence of the other auditor was sufficient enough to rely on their work.

### Understanding of Consolidation Process

We gained an understanding of controls over the consolidation process as documented at [[Financial Statement Preparation](#)]. We considered this understanding when assessing risk and in procedures performed to incorporate the results of the other audit.

### Incorporation of Results of Other Audit

We reviewed the auditor's reports [[LGIP Audited FS - 2024](#)], [[WA LGIP AU 260 Memo 6.30.24](#)], [[WA LGIP GAGAS IC Report 6.30.24](#)], the aggregation of misstatements, any audit recommendations made and any other relevant results. To incorporate results, we:

- Traced reported amounts and disclosures audited by the external auditor per their report to the financial statements of the primary government as documented at [[LGIP Reconciliation to AFRS - 2024](#)].

- Looked for any uncorrected misstatements identified by the other auditor. We noted there were no uncorrected misstatements identified by the other auditor.

- Looked for any potential fraud, noncompliance, abuse or other matters identified by the other auditor. We noted no such matters.

- Looked for any modifications or explanatory paragraphs. There is an emphasis of matter paragraph in the audit report. This paragraph notes that the audit report covers the LGIP only, and not the Office of the State Treasurer or the State of Washington. No other modifications to the report were noted.

- We determined that the work, materiality, performance materiality and floor thresholds used are acceptable for our purposes, based on our communication with the component auditor and other procedures performed.

### Making Reference to Work of Other Auditors

Finally, we determined that conditions for making reference to the work of other auditors was **met** as follows:

- The audit was dated October 15, 2024, which is prior to our report on the primary government.

- There are **no** concerns about the component auditor's professional competence or independence. We specifically noted that the component auditor has **passed** its prior peer review.

- Component financial statements are prepared using a GASB financial reporting framework.

- Component auditor has performed the audit in accordance with GAGAS.

- Component auditor's report **is not** restricted as to use.

# State of Washington

## K.6.PRG - Work of Other Auditors - Fred Hutch

*Procedure Step:* External Auditor performs PART of audit

*Prepared By:* EZM, 11/18/2024

*Reviewed By:* RKM, 11/19/2024

### Purpose/Conclusion:

#### **Purpose:**

To identify and evaluate work done by external auditors and determine if our Office can rely on audit reports issued by external auditors for significant components.

#### **Conclusion:**

Based on our evaluation, we determined that our Office can rely on the work of external auditors for Fred Hutchinson Cancer Center.

Results of the work of other auditors was identified and incorporated into other sections as described in the ROWD below.

We noted no concerns with the work of other auditors to bring to the attention of management at the exit conference.

### Testing Strategy:

Group audit procedures are required for all components audited by other CPAs, with certain additional procedures required only for significant components. This work should be charged to time code CPAR. If significant components are audited by CPAs in lieu of an SAO audit, a CPA Audit Report Review will also be needed in accordance with Policy 3510 and charged to time code CPAP - in such cases, some procedures in this section may be documented as part of the report review. Contact your supervisor and Assistant Director if you have any questions about necessary procedures or any concerns about the external auditor's professional reputation, independence, or quality of work.

#### **Procedures for ALL components audited by external auditors:**

The following procedures are **required** for planning purposes as referenced in the "Audits Performed by Others" step and by Audit Policy 6240 to identify relevant work done by external auditors and consider results:

# State of Washington

**STEP 1: Determine Significance to the applicable opinion unit.** Evaluate each component audited by others to determine whether - individually or in aggregate - it is significant or insignificant to the applicable opinion unit.

*Auditors should consider both quantitative and qualitative materiality factors. For example, a component may be significant based on the quantitative materiality threshold for the applicable opinion unit or because it may include significant risk of material misstatement of the primary government's financial statements due to its specific nature or circumstances. When a component represents an entire opinion unit, it is considered to be significant (with the possible exception of foundations – see special guidance for GASB 39 situations in FYI 2016-02).*

*Qualitative factors may include that a waiver to perform the review has been used in recent audits, increasing the risk where we decide it is appropriate to review the CPA workpapers to sufficiently reduce audit risk.*

*Important Note: If a component is significant, communication with the other auditor (Step 5), must be done on a timely basis. In that case, Steps 2 and 3 may need to be done before the primary government's audit, as well. The results should be documented and placed in the FAWF pending the start of the SAO audit, and then brought into the TeamMate audit file.*

**STEP 2: Meetings. Consider** attending key meetings between the external auditor and the government.

**STEP 3: Obtain Report.** Include a copy of the external auditor's report in TeamMate. Make sure to get both the report on compliance and internal controls (SAO's "I-report"), as well as the financial statement report (SAO's "F-report").

*NOTE: If the other auditor performs the audit and reports in accordance with GAAS rather than GAGAS, then the I-report content will be in a letter to management rather than a report. This is possible for audits of component units (e.g. foundations or tax credit partnerships), but is not expected for divisions or funds of primary governments.*

**STEP 4: Review Report.** For insignificant components, review the report issued by external auditors and consider whether any information in the report changes our planning decisions or would have an impact on our audit, if the report is available before our report date. If questions or potential red flags are noted, **consider** additional inquiry, analysis or other steps to follow up. For significant components, the report must be reviewed and incorporated into our audit as described in step 9 below.

## **ADDITIONAL procedures for SIGNIFICANT components:**

The following additional procedures are **required** only for significant components audited by external auditors:

**STEP 5: Communication with Other Auditor.** Using the External Audit Coordination email template in the TeamStore (be sure to add your formal signature to the bottom of the email prior to sending), communicate with the external auditor to:

## State of Washington

Confirm the external auditor's independence, cooperation and understanding of how we intend to use their work.  
Share related parties and significant risks we have identified for the primary government and request the same from the external auditor.  
Request the external auditor's materiality and performance materiality thresholds used to determine whether thresholds are sufficient for purposes of our audit.  
Request the external auditor's report and other results in order to incorporate these into our results for the audit of the group.  
Confirm our commitment to inform the external auditor of any matter that comes to our attention that may be relevant to their audit and request the external auditor's commitment to do the same.

*Auditors should initiate this communication as early in the audit as possible and continue to communicate with the external auditor as necessary to follow-up on these matters throughout the audit.*

Note: if the CPA Audit Report Review is being done in step 6 below, information from the CPA can be documented when completing the CPA workpaper review checklist rather than as a response to the letter.

**STEP 6: CPA Audit Report Review (if applicable under Policy 3510).** For significant components that are audited by an external auditor in lieu of an SAO audit, perform a CPA Audit Report Review in a separate TM file as required by Policy 3510. This work is performed to carry out SAO's statutory mandate but will also provide additional support for our reliance on the work of the other auditor. As such, the review should be completed prior to concluding on the audit of the primary government. If a review is applicable, reference this work and summarize relevant results.

**STEP 7: Audit Plan.** Document in the Audit Plan the effect of the work of external auditors on our audit report and substantive testing. Identify which opinion units and/or balances we plan to rely on the work of other auditors in the plan and mark these rows or columns on the Material Balance spreadsheet to indicate our reliance on the work of external auditors.

**STEP 8: Evaluate the Firm's Professional Competence.** Evaluate the professional competence of the external audit firm by considering our Office's experience with the firm, the results of communications and review, and by checking the [CPA License and Peer Review SharePoint page](#) to obtain the firm's last peer review report.

Note: if the CPA Audit Report Review was completed using step 6 above, this evaluation can be documented when completing the CPA workpaper review checklist.

**STEP 9: Internal Controls.** Document an understanding of controls over the consolidation process to incorporate components into the financial statements in the Controls - FS Preparation step in the permanent file (or a separate step if the process is identified as its own control system due to risk or complexity).

## State of Washington

**STEP 10: Incorporate Results.** In addition to the external auditor's report, obtain and review any letter to management and the governing body about internal controls, the aggregation of misstatements, any audit recommendations made and any other relevant results.

Items included in the external auditor's aggregation of misstatements should also be included in our aggregation for the primary government.

Reported amounts and disclosures audited by the external auditor per their report should be traced to the financial statements of the primary government.

Any potential fraud, noncompliance, abuse or other matters identified by the external auditor should be re-evaluated for the primary government.

Our report may need to reflect any modifications made to the external auditor's report (that is, if the opinion is not unmodified or includes explanatory paragraphs) and any significant deficiencies or material weaknesses reported by the external auditor. Such issues should be repeated in our report to the extent they are material to an opinion unit.

*REMINDER: When external auditors conduct their audit in accordance with GAGAS, any findings will be communicated in their audit report. Otherwise, if conducted in accordance with GAAS, any findings will be communicated to management and the governing body in a separate letter that we will need to request.*

Auditors should conclude on whether the work, materiality, performance materiality and floor thresholds used are acceptable for our purposes, based on our communication with the component auditor and other procedures performed.

**STEP 11: Conditions for Referencing the Other Auditor's Report.** Determine if the following conditions are met. If so, we will be able to reference the work of the external auditor in our report. If not, contact TAS for assistance.

The audit is completed prior to our report on the primary government.

There are no concerns about the component auditor's professional competence or independence, and the component auditor has passed its prior peer review.

Component financial statements are prepared using the same financial reporting framework as the group, or one permitted by that framework. For example, GASB provides for inclusion of FASB components.

Component auditor has performed the audit in accordance with GAAS or GAGAS.

Component auditor's report is not restricted as to use.

*If the work of the external auditor is material to any opinion unit, our financial report must refer to the external auditors - please refer to the Audit Report Standards (ARS) Manual for opinion modifications. If the external auditor performed their audit in accordance with GAAS, rather than GAGAS, our audit report will need to be further modified as shown in the ARS example.*

Guidance/Criteria.*
---------------------

# State of Washington

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6240](#) – Group Audits**

**[Review Work of Others](#) Planning Guide**

**[CPA Workpaper Review Resources](#)** - more background and resources for this area

Contact the CPA Audit Coordinator or TAS with any questions or advice on required procedures or if the team is uncertain whether a CPA Report Review is applicable.

Record of Work Done:

## **Evaluating Significance of Components Audited by Others**

We evaluated each component audited by other auditors to determine whether their work was, individually or in aggregate, significant or insignificant to applicable opinion units, see: [\[Rely on Work of Other Auditors\]](#) and [\[External CPA Audit Significance\]](#). We determined the audit of the Fred Hutchinson Cancer Center (FHCC) performed by external auditors **was significant** to the fiscal year end June 30, 2024 State of Washington ACFR audit.

We identified the following other auditors who performed a portion of the financial statement audit (audit of FHCC):

KPMG

Parker Olinger

Email: polinger@KPMG.com

Phone: (360) 597-8198

Engagement Partner: Brad Berls

## **Meetings**

We did not find it necessary to attend the meetings between FHCC staff and KPMG.

## **Review of SIGNIFICANT Components**

During planning, we documented in the Audit Plan and Significant Balances spreadsheet our expected reliance on the work of other auditors for significant components and the effect on our audit report and substantive testing.

# State of Washington

We noted no red flags for consideration in our financial statement audit

## Communication with Other Auditor

As documented in [\[Audit Request - External Audit Coordination\]](#), we communicated with the external auditor to confirm an understanding with them, share relevant information, and provide a basis for cooperation. We received a response on September 12, 2024 from Parker Olinger, Senior Audit Manager at KPMG LLP [\[RE Audit Request - External Audit Coordination\]](#). We arranged with Parker to obtain access to KPMG workpapers. Access was through the Citrix Workplace App from October 29, 2024 through October 30, 2024.

Response received was within our expectation.

## CPA Audit Report Review

SAO Audit Policy 3510 requires a CPA Audit Report Review when significant audit work is done in lieu of an SAO audit. The auditor's work did not cover all of the State of Washington activities and was isolated to Fred Hutchinson Cancer Center activities only. We determined the external auditor's work was **not** done in lieu of an SAO audit. See our review of the CPA workpapers here: [\[Review Checklist - CPA Workpapers\]](#). **We determined the work and documentation was sufficient to allow our Office to rely on the work of KPMG LLP.**

## Evaluation of Professional Competence

We evaluated the professional competence of the other auditor by considering our Office's experience with the firm, communication and review procedures as described above, and reading the firm's last peer review report. Based on these procedures, we determined that the professional competence of the other auditor was sufficient enough to rely on their work.

## Understanding of Consolidation Process

We gained an understanding of controls over the consolidation process as documented in [\[Controls - FS Preparation\]](#). We considered this understanding when assessing risk and in procedures performed to incorporate the results of the other audit.

## Incorporation of Results of Other Audit

We reviewed the auditor's reports [\[FHCC Audit Report\]](#), and letter to management and the governing body about internal controls (pg. 39), the aggregation of misstatements, any audit recommendations made and any other relevant results. To incorporate results, we:

- Traced reported amounts and disclosures audited by the external auditor per their report to the financial statements of the primary government as documented [\[Component Unit Financial Statements\]](#).

- We noted there were no uncorrected misstatements identified by the other auditor.

- Looked for any potential fraud, noncompliance, abuse or other matters identified by the other auditor. We noted no such matters.

- Looked for any modifications or explanatory paragraphs. We noted no such matters.

- We determined that the work, materiality, performance materiality and floor thresholds used are acceptable for our purposes, based on our communication with the component auditor and other procedures performed.

# State of Washington

## Making Reference to Work of Other Auditors

Finally, we determined that conditions for making reference to the work of other auditors was **met** as follows:

The audit was dated October 16, 2024, which is prior to our report on the primary government.

There are **no** concerns about the component auditor's professional competence or independence. We specifically noted that the component auditor has **passed** its prior peer review.

Component financial statements are prepared using a GASB financial reporting framework.

Component auditor has performed the audit in accordance with **GAGAS**.

Component auditor's report **is not** restricted as to use.

## K.7.PRG - Work of Other Auditors - Health Benefit Exchange

*Procedure Step:* External Auditor performs PART of audit

*Prepared By:* EJB, 11/13/2024

*Reviewed By:* RKM, 11/19/2024

Purpose/Conclusion:

### **Purpose:**

To identify and evaluate work done by external auditors and determine if our Office can rely on audit reports issued by external auditors for significant components.

### **Conclusion:**

Based on our evaluation, we determined that our Office can rely on the work of external auditors for the Washington Health Benefit Exchange.

Results of the work of other auditors was identified and incorporated into other sections as described in the ROWD below.

We noted no concerns with the work of other auditors to bring to the attention of management at the exit conference.

Testing Strategy:

Group audit procedures are required for all components audited by other CPAs, with certain additional procedures required only for significant components. This work should be charged to time code CPAR. If significant components are audited by CPAs in lieu of an SAO audit, a CPA Audit

# State of Washington

Report Review will also be needed in accordance with Policy 3510 and charged to time code CPAP - in such cases, some procedures in this section may be documented as part of the report review. Contact your supervisor and Assistant Director if you have any questions about necessary procedures or any concerns about the external auditor's professional reputation, independence, or quality of work.

## **Procedures for ALL components audited by external auditors:**

The following procedures are **required** for planning purposes as referenced in the "Audits Performed by Others" step and by Audit Policy 6240 to identify relevant work done by external auditors and consider results:

**STEP 1: Determine Significance to the applicable opinion unit.** Evaluate each component audited by others to determine whether - individually or in aggregate - it is significant or insignificant to the applicable opinion unit.

*Auditors should consider both quantitative and qualitative materiality factors. For example, a component may be significant based on the quantitative materiality threshold for the applicable opinion unit or because it may include significant risk of material misstatement of the primary government's financial statements due to its specific nature or circumstances. When a component represents an entire opinion unit, it is considered to be significant (with the possible exception of foundations – see special guidance for GASB 39 situations in FYI 2016-02).*

*Qualitative factors may include that a waiver to perform the review has been used in recent audits, increasing the risk where we decide it is appropriate to review the CPA workpapers to sufficiently reduce audit risk.*

*Important Note: If a component is significant, communication with the other auditor (Step 5), must be done on a timely basis. In that case, Steps 2 and 3 may need to be done before the primary government's audit, as well. The results should be documented and placed in the FAWF pending the start of the SAO audit, and then brought into the TeamMate audit file.*

**STEP 2: Meetings. Consider** attending key meetings between the external auditor and the government.

**STEP 3: Obtain Report.** Include a copy of the external auditor's report in TeamMate. Make sure to get both the report on compliance and internal controls (SAO's "I-report"), as well as the financial statement report (SAO's "F-report").

*NOTE: If the other auditor performs the audit and reports in accordance with GAAS rather than GAGAS, then the I-report content will be in a letter to management rather than a report. This is possible for audits of component units (e.g. foundations or tax credit partnerships), but is not expected for divisions or funds of primary governments.*

**STEP 4: Review Report.** For insignificant components, review the report issued by external auditors and consider whether any information in the report changes our planning decisions or would have an impact on our audit, if the report is available before our report date. If questions or potential red flags are noted, **consider** additional inquiry, analysis or other steps to follow up. For significant components, the report must be

## State of Washington

reviewed and incorporated into our audit as described in step 9 below.

### **ADDITIONAL procedures for SIGNIFICANT components:**

The following additional procedures are **required** only for significant components audited by external auditors:

**STEP 5: Communication with Other Auditor.** Using the External Audit Coordination email template in the TeamStore (be sure to add your formal signature to the bottom of the email prior to sending), communicate with the external auditor to:

- Confirm the external auditor's independence, cooperation and understanding of how we intend to use their work.

- Share related parties and significant risks we have identified for the primary government and request the same from the external auditor.

- Request the external auditor's materiality and performance materiality thresholds used to determine whether thresholds are sufficient for purposes of our audit.

- Request the external auditor's report and other results in order to incorporate these into our results for the audit of the group.

- Confirm our commitment to inform the external auditor of any matter that comes to our attention that may be relevant to their audit and request the external auditor's commitment to do the same.

*Auditors should initiate this communication as early in the audit as possible and continue to communicate with the external auditor as necessary to follow-up on these matters throughout the audit.*

Note: if the CPA Audit Report Review is being done in step 6 below, information from the CPA can be documented when completing the CPA workpaper review checklist rather than as a response to the letter.

**STEP 6: CPA Audit Report Review (if applicable under Policy 3510).** For significant components that are audited by an external auditor in lieu of an SAO audit, perform a CPA Audit Report Review in a separate TM file as required by Policy 3510. This work is performed to carry out SAO's statutory mandate but will also provide additional support for our reliance on the work of the other auditor. As such, the review should be completed prior to concluding on the audit of the primary government. If a review is applicable, reference this work and summarize relevant results.

**STEP 7: Audit Plan.** Document in the Audit Plan the effect of the work of external auditors on our audit report and substantive testing. Identify which opinion units and/or balances we plan to rely on the work of other auditors in the plan and mark these rows or columns on the Material Balance spreadsheet to indicate our reliance on the work of external auditors.

**STEP 8: Evaluate the Firm's Professional Competence.** Evaluate the professional competence of the external audit firm by considering our Office's experience with the firm, the results of communications and review, and by checking the [CPA License and Peer Review SharePoint page](#) to

## State of Washington

obtain the firm's last peer review report.

Note: if the CPA Audit Report Review was completed using step 6 above, this evaluation can be documented when completing the CPA workpaper review checklist.

**STEP 9: Internal Controls.** Document an understanding of controls over the consolidation process to incorporate components into the financial statements in the Controls - FS Preparation step in the permanent file (or a separate step if the process is identified as its own control system due to risk or complexity).

**STEP 10: Incorporate Results.** In addition to the external auditor's report, obtain and review any letter to management and the governing body about internal controls, the aggregation of misstatements, any audit recommendations made and any other relevant results.

Items included in the external auditor's aggregation of misstatements should also be included in our aggregation for the primary government.

Reported amounts and disclosures audited by the external auditor per their report should be traced to the financial statements of the primary government.

Any potential fraud, noncompliance, abuse or other matters identified by the external auditor should be re-evaluated for the primary government.

Our report may need to reflect any modifications made to the external auditor's report (that is, if the opinion is not unmodified or includes explanatory paragraphs) and any significant deficiencies or material weaknesses reported by the external auditor. Such issues should be repeated in our report to the extent they are material to an opinion unit.

*REMINDER: When external auditors conduct their audit in accordance with GAGAS, any findings will be communicated in their audit report. Otherwise, if conducted in accordance with GAAS, any findings will be communicated to management and the governing body in a separate letter that we will need to request.*

Auditors should conclude on whether the work, materiality, performance materiality and floor thresholds used are acceptable for our purposes, based on our communication with the component auditor and other procedures performed.

**STEP 11: Conditions for Referencing the Other Auditor's Report.** Determine if the following conditions are met. If so, we will be able to reference the work of the external auditor in our report. If not, contact TAS for assistance.

The audit is completed prior to our report on the primary government.

There are no concerns about the component auditor's professional competence or independence, and the component auditor has passed its prior peer review.

Component financial statements are prepared using the same financial reporting framework as the group, or one permitted by that framework. For example, GASB provides for inclusion of FASB components.

# State of Washington

Component auditor has performed the audit in accordance with GAAS or GAGAS.  
Component auditor's report is not restricted as to use.

*If the work of the external auditor is material to any opinion unit, our financial report must refer to the external auditors - please refer to the Audit Report Standards (ARS) Manual for opinion modifications. If the external auditor performed their audit in accordance with GAAS, rather than GAGAS, our audit report will need to be further modified as shown in the ARS example.*

Guidance/Criteria:

## **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

### **SAO Audit Policy [6240](#) – Group Audits**

### **[Review Work of Others](#) Planning Guide**

**[CPA Workpaper Review Resources](#)** - more background and resources for this area

Contact the CPA Audit Coordinator or TAS with any questions or advice on required procedures or if the team is uncertain whether a CPA Report Review is applicable.

Record of Work Done:

## **Evaluating Significance of Components Audited by Others**

We evaluated each component audited by others to determine whether - individually or in aggregate - it is significant or insignificant to the applicable opinion units.

We determined that the external CPA audit of the Washington Health Benefit Exchange (WHBE) is significant to the FY24 State of Washington ACFR audit. See our analysis of which opinion units are impacted by the external audit here: [\[External CPA Audit Significance\]](#).

## **Meetings**

We concluded that it was not necessary to attend meetings.

## **Review of SIGNIFICANT Components**

During planning, we documented in the Audit Plan and Significant Balances spreadsheet our expected reliance on the work of other auditors for

## State of Washington

significant components and the effect on our audit report and substantive testing.

### Communication with Other Auditor

As documented in [\[Audit Request - External Audit Coordination\]](#), we communicated with the external auditor to confirm an understanding with them, share relevant information, and provide a basis for cooperation. We received a response from Mark LaPrade, Partner [\[RE Audit Request - HBE External Audit Coordination\]](#).

We arranged with Nathan Dunlap, Senior Manager, to obtain access to BerryDunn's workpapers. Access was through Zoom on November 11, 2024 and November 13, 2024.

### CPA Audit Report Review

SAO Audit Policy 3510 requires a CPA Audit Report Review when significant audit work is done in lieu of an SAO audit. See workpaper review at [\[Review Checklist - CPA Workpapers\]](#). The auditor's work did not cover all of the State of Washington activities and was isolated to WHBE only. We determined the external auditor's work was **not** done in lieu of an SAO audit. **We noted no concerns and determined we could rely on the auditor's work.**

### Evaluation of Professional Competence

We evaluated the professional competence of the other auditor by considering our Office's experience with the firm, communication and review procedures as described above, and reading the firm's last peer review report. Based on these procedures, we determined that the professional competence of the other auditor was sufficient enough to rely on their work.

### Understanding of Consolidation Process

We gained an understanding of controls over the consolidation process as documented at [\[Financial Statement Preparation\]](#). We considered this understanding when assessing risk and in procedures performed to incorporate the results of the other audit.

### Incorporation of Results of Other Audit

We reviewed the auditor's reports [\[Washington Health Benefit Exchange 2024 Financial Statements FINAL\]](#), the aggregation of misstatements, any audit recommendations made and any other relevant results. To incorporate results, we:

- Traced reported amounts and disclosures audited by the external auditor per their report to the financial statements of the primary government as documented at [\[Component Unit Financial Statements\]](#).

- Looked for any uncorrected misstatements identified by the other auditor. We noted there were no uncorrected misstatements identified by the other auditor.

- Looked for any potential fraud, noncompliance, abuse or other matters identified by the other auditor. We noted no such matters.

- Looked for any modifications or explanatory paragraphs.

## State of Washington

There is a "Other Reporting Required by *Government Auditing Standards* paragraph at the bottom of the audit report. This paragraph details another report issued on the consideration of the Exchange's internal control over financial reporting and on their tests of its compliance with certain provisions of laws, regulations, contracts, and grant agreements and other matters. There was no opinion issued on the effectiveness of internal control or on compliance.

We determined that the work, materiality, performance materiality and floor thresholds used are acceptable for our purposes, based on our communication with the component auditor and other procedures performed.

### Making Reference to Work of Other Auditors

Finally, we determined that conditions for making reference to the work of other auditors was **met** as follows:

The audit was dated October 29, 2024, which is prior to our report on the primary government.

There are **no** concerns about the component auditor's professional competence or independence. We specifically noted that the component auditor has **passed** its prior peer review.

Component financial statements are prepared using a GASB financial reporting framework.

Component auditor has performed the audit in accordance with GAGAS.

Component auditor's report **is not** restricted as to use.

### K.8.PR.G - Work of Other Auditors - Valley Medical

*Procedure Step:* External Auditor performs PART of audit

*Prepared By:* DRR, 10/14/2024

*Reviewed By:* RKM, 11/19/2024

Purpose/Conclusion.*
----------------------

#### **Purpose:**

To identify and evaluate work done by external auditors and determine if our Office can rely on audit reports issued by external auditors for significant components.

#### **Conclusion:**

Based on our evaluation, we determined that our Office can rely on the work of external auditors for Valley Medical Center.

Results of the work of other auditors was identified and incorporated into other sections as described in the ROWD below.

# State of Washington

We noted no concerns with the work of other auditors to bring to the attention of management at the exit conference.

## Testing Strategy:

Group audit procedures are required for all components audited by other CPAs, with certain additional procedures required only for significant components. This work should be charged to time code CPAR. If significant components are audited by CPAs in lieu of an SAO audit, a CPA Audit Report Review will also be needed in accordance with Policy 3510 and charged to time code CPAP - in such cases, some procedures in this section may be documented as part of the report review. Contact your supervisor and Assistant Director if you have any questions about necessary procedures or any concerns about the external auditor's professional reputation, independence, or quality of work.

### **Procedures for ALL components audited by external auditors:**

The following procedures are **required** for planning purposes as referenced in the "Audits Performed by Others" step and by Audit Policy 6240 to identify relevant work done by external auditors and consider results:

**STEP 1: Determine Significance to the applicable opinion unit.** Evaluate each component audited by others to determine whether - individually or in aggregate - it is significant or insignificant to the applicable opinion unit.

*Auditors should consider both quantitative and qualitative materiality factors. For example, a component may be significant based on the quantitative materiality threshold for the applicable opinion unit or because it may include significant risk of material misstatement of the primary government's financial statements due to its specific nature or circumstances. When a component represents an entire opinion unit, it is considered to be significant (with the possible exception of foundations – see special guidance for GASB 39 situations in FYI 2016-02).*

*Qualitative factors may include that a waiver to perform the review has been used in recent audits, increasing the risk where we decide it is appropriate to review the CPA workpapers to sufficiently reduce audit risk.*

*Important Note: If a component is significant, communication with the other auditor (Step 5), must be done on a timely basis. In that case, Steps 2 and 3 may need to be done before the primary government's audit, as well. The results should be documented and placed in the FAWF pending the start of the SAO audit, and then brought into the TeamMate audit file.*

**STEP 2: Meetings. Consider** attending key meetings between the external auditor and the government.

**STEP 3: Obtain Report.** Include a copy of the external auditor's report in TeamMate. Make sure to get both the report on compliance and internal controls (SAO's "I-report"), as well as the financial statement report (SAO's "F-report").

*NOTE: If the other auditor performs the audit and reports in accordance with GAAS rather than GAGAS, then the I-report content will be in a*

## State of Washington

*letter to management rather than a report. This is possible for audits of component units (e.g. foundations or tax credit partnerships), but is not expected for divisions or funds of primary governments.*

**STEP 4: Review Report.** For insignificant components, review the report issued by external auditors and consider whether any information in the report changes our planning decisions or would have an impact on our audit, if the report is available before our report date. If questions or potential red flags are noted, **consider** additional inquiry, analysis or other steps to follow up. For significant components, the report must be reviewed and incorporated into our audit as described in step 9 below.

### **ADDITIONAL procedures for SIGNIFICANT components:**

The following additional procedures are **required** only for significant components audited by external auditors:

**STEP 5: Communication with Other Auditor.** Using the External Audit Coordination email template in the TeamStore (be sure to add your formal signature to the bottom of the email prior to sending), communicate with the external auditor to:

- Confirm the external auditor's independence, cooperation and understanding of how we intend to use their work.

- Share related parties and significant risks we have identified for the primary government and request the same from the external auditor.

- Request the external auditor's materiality and performance materiality thresholds used to determine whether thresholds are sufficient for purposes of our audit.

- Request the external auditor's report and other results in order to incorporate these into our results for the audit of the group.

- Confirm our commitment to inform the external auditor of any matter that comes to our attention that may be relevant to their audit and request the external auditor's commitment to do the same.

*Auditors should initiate this communication as early in the audit as possible and continue to communicate with the external auditor as necessary to follow-up on these matters throughout the audit.*

Note: if the CPA Audit Report Review is being done in step 6 below, information from the CPA can be documented when completing the CPA workpaper review checklist rather than as a response to the letter.

**STEP 6: CPA Audit Report Review (if applicable under Policy 3510).** For significant components that are audited by an external auditor in lieu of an SAO audit, perform a CPA Audit Report Review in a separate TM file as required by Policy 3510. This work is performed to carry out SAO's statutory mandate but will also provide additional support for our reliance on the work of the other auditor. As such, the review should be completed prior to concluding on the audit of the primary government. If a review is applicable, reference this work and summarize relevant results.

## State of Washington

**STEP 7: Audit Plan.** Document in the Audit Plan the effect of the work of external auditors on our audit report and substantive testing. Identify which opinion units and/or balances we plan to rely on the work of other auditors in the plan and mark these rows or columns on the Material Balance spreadsheet to indicate our reliance on the work of external auditors.

**STEP 8: Evaluate the Firm's Professional Competence.** Evaluate the professional competence of the external audit firm by considering our Office's experience with the firm, the results of communications and review, and by checking the [CPA License and Peer Review SharePoint page](#) to obtain the firm's last peer review report.

Note: if the CPA Audit Report Review was completed using step 6 above, this evaluation can be documented when completing the CPA workpaper review checklist.

**STEP 9: Internal Controls.** Document an understanding of controls over the consolidation process to incorporate components into the financial statements in the Controls - FS Preparation step in the permanent file (or a separate step if the process is identified as its own control system due to risk or complexity).

**STEP 10: Incorporate Results.** In addition to the external auditor's report, obtain and review any letter to management and the governing body about internal controls, the aggregation of misstatements, any audit recommendations made and any other relevant results.

Items included in the external auditor's aggregation of misstatements should also be included in our aggregation for the primary government.

Reported amounts and disclosures audited by the external auditor per their report should be traced to the financial statements of the primary government.

Any potential fraud, noncompliance, abuse or other matters identified by the external auditor should be re-evaluated for the primary government.

Our report may need to reflect any modifications made to the external auditor's report (that is, if the opinion is not unmodified or includes explanatory paragraphs) and any significant deficiencies or material weaknesses reported by the external auditor. Such issues should be repeated in our report to the extent they are material to an opinion unit.

*REMINDER: When external auditors conduct their audit in accordance with GAGAS, any findings will be communicated in their audit report. Otherwise, if conducted in accordance with GAAS, any findings will be communicated to management and the governing body in a separate letter that we will need to request.*

Auditors should conclude on whether the work, materiality, performance materiality and floor thresholds used are acceptable for our purposes, based on our communication with the component auditor and other procedures performed.

**STEP 11: Conditions for Referencing the Other Auditor's Report.** Determine if the following conditions are met. If so, we will be able to

## State of Washington

reference the work of the external auditor in our report. If not, contact TAS for assistance.

The audit is completed prior to our report on the primary government.

There are no concerns about the component auditor's professional competence or independence, and the component auditor has passed its prior peer review.

Component financial statements are prepared using the same financial reporting framework as the group, or one permitted by that framework. For example, GASB provides for inclusion of FASB components.

Component auditor has performed the audit in accordance with GAAS or GAGAS.

Component auditor's report is not restricted as to use.

*If the work of the external auditor is material to any opinion unit, our financial report must refer to the external auditors - please refer to the Audit Report Standards (ARS) Manual for opinion modifications. If the external auditor performed their audit in accordance with GAAS, rather than GAGAS, our audit report will need to be further modified as shown in the ARS example.*

Guidance/Criteria:

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

### **SAO Audit Policy [6240](#) – Group Audits**

### **[Review Work of Others](#) Planning Guide**

### **[CPA Workpaper Review Resources](#) - more background and resources for this area**

Contact the CPA Audit Coordinator or TAS with any questions or advice on required procedures or if the team is uncertain whether a CPA Report Review is applicable.

Record of Work Done:

### **Evaluating Significance of Components Audited by Others**

We evaluated each component audited by others to determine whether - individually or in aggregate - it is significant or insignificant to the applicable opinion units. We determined that the external CPA audit of the Valley Medical Center (VMC) is significant to the FY2024 State of Washington ACFR audit. See our analysis of which opinion units are impacted by the external audit here: [[Interim Planning Significant Balance Spreadsheet](#)].

## State of Washington

We identified the following other auditors who performed a portion of the financial statement audit (Valley Medical Center Audit):

KPMG, LLC:

Casey Byers, Audit Manager

Phone: (206) 913-4147

Email: jamesbyers@kpmg.com

### **Meetings**

We did not find it necessary to attend the meetings between Valley Medical staff and KPMG.

### **Review of SIGNIFICANT Components**

During planning, we documented in the Audit Plan and Significant Balances spreadsheet our expected reliance on the work of other auditors for significant components and the effect on our audit report and substantive testing.

We noted no red flags for consideration in our financial statement audit

### **Communication with Other Auditor**

As documented in [[Audit Request - External Audit Coordination](#)], we communicated with the external auditor to confirm an understanding with them, share relevant information, and provide a basis for cooperation. We received a response on July 26, 2024 from Casey Byers, Audit Manager at KPMG, LLC [[RE Audit Request - External Audit Coordination](#)]. We arranged with Casey Byers, Audit Manager, to obtain access to KPMG workpapers. Access was through the Citrix Workplace App from October 2, 2024 through October 3, 2024.

Response received was within our expectation.

### **CPA Audit Report Review**

SAO Audit Policy 3510 requires a CPA Audit Report Review when significant audit work is done in lieu of an SAO audit. The auditor's work did not cover all of the State of Washington activities and was isolated to Valley Medical Center activities only. We determined the external auditor's work was **not** done in lieu of an SAO audit. See our review of the CPA workpapers here: [[Review Checklist - CPA Workpapers](#)]. **We determined the work and documentation was sufficient to allow our Office to rely on the work of KPMG LLC.**

### **Evaluation of Professional Competence**

We evaluated the professional competence of the other auditor by considering our Office's experience with the firm, communication and review procedures as described above, and reading the firm's last peer review report. Based on these procedures, we determined that the professional competence of the other auditor was sufficient enough to rely on their work.

### **Understanding of Consolidation Process**

## State of Washington

We gained an understanding of controls over the consolidation process as documented in [\[Controls - FS Preparation\]](#). We considered this understanding when assessing risk and in procedures performed to incorporate the results of the other audit.

### Incorporation of Results of Other Audit

We reviewed the auditor's reports, [\[VMC - Financial Statements\]](#) and letter to management and the governing body about internal controls [\[VMC - Report on Internal Controls\]](#), the aggregation of misstatements, any audit recommendations made and any other relevant results. To incorporate results, we:

Traced reported amounts and disclosures audited by the external auditor per their report to the financial statements of the primary government as documented [\[Component Unit Financial Statements\]](#).

Looked for any uncorrected misstatements identified by the other auditor and we noted there were no uncorrected misstatements identified by the other auditor.

Looked for any potential fraud, noncompliance, abuse or other matters identified by the other auditor. We noted no such matters.

Looked for any modifications or explanatory paragraphs. We noted no such matters.

We determined that the work, materiality, performance materiality and floor thresholds used are acceptable for our purposes, based on our communication with the component auditor and other procedures performed.

### Making Reference to Work of Other Auditors

Finally, we determined that conditions for making reference to the work of other auditors was met as follows:

The audit was dated **September 20, 2024**, which is prior to our report on the primary government.

There are no concerns about the component auditor's professional competence or independence. We specifically noted that the component auditor has **passed** its prior peer review.

Component financial statements are prepared using a GASB financial reporting framework.

Component auditor has performed the audit in accordance with GAGAS.

Component auditor's report is **not** restricted as to use.

### K.9.PRG - Work of Other Auditors - WA Housing Finance

*Procedure Step:* External Auditor performs PART of audit

*Prepared By:* BFW, 11/13/2024

*Reviewed By:* RKM, 11/19/2024

# State of Washington

## Purpose/Conclusion.

### **Purpose:**

To identify and evaluate work done by external auditors and determine if our Office can rely on audit reports issued by external auditors for significant components.

### **Conclusion:**

Based on our evaluation, we determined that our Office can rely on the work of external auditors for WA Housing Finance.

Results of the work of other auditors was identified and incorporated into other sections as described in the ROWD below.

We noted **no** concerns with the work of other auditors to bring to the attention of management at the exit conference.

## Testing Strategy.

Group audit procedures are required for all components audited by other CPAs, with certain additional procedures required only for significant components. This work should be charged to time code CPAR. If significant components are audited by CPAs in lieu of an SAO audit, a CPA Audit Report Review will also be needed in accordance with Policy 3510 and charged to time code CPAP - in such cases, some procedures in this section may be documented as part of the report review. Contact your supervisor and Assistant Director if you have any questions about necessary procedures or any concerns about the external auditor's professional reputation, independence, or quality of work.

### **Procedures for ALL components audited by external auditors:**

The following procedures are **required** for planning purposes as referenced in the "Audits Performed by Others" step and by Audit Policy 6240 to identify relevant work done by external auditors and consider results:

**STEP 1: Determine Significance to the applicable opinion unit.** Evaluate each component audited by others to determine whether - individually or in aggregate - it is significant or insignificant to the applicable opinion unit.

*Auditors should consider both quantitative and qualitative materiality factors. For example, a component may be significant based on the quantitative materiality threshold for the applicable opinion unit or because it may include significant risk of material misstatement of the primary government's financial statements due to its specific nature or circumstances. When a component represents an entire opinion unit, it is considered to be significant (with the possible exception of foundations – see special guidance for GASB 39 situations in FYI 2016-02).*

*Qualitative factors may include that a waiver to perform the review has been used in recent audits, increasing the risk where we decide it is appropriate to review the CPA workpapers to sufficiently reduce audit risk.*

# State of Washington

*Important Note: If a component is significant, communication with the other auditor (Step 5), must be done on a timely basis. In that case, Steps 2 and 3 may need to be done before the primary government's audit, as well. The results should be documented and placed in the FAWF pending the start of the SAO audit, and then brought into the TeamMate audit file.*

**STEP 2: Meetings. Consider** attending key meetings between the external auditor and the government.

**STEP 3: Obtain Report.** Include a copy of the external auditor's report in TeamMate. Make sure to get both the report on compliance and internal controls (SAO's "I-report"), as well as the financial statement report (SAO's "F-report").

*NOTE: If the other auditor performs the audit and reports in accordance with GAAS rather than GAGAS, then the I-report content will be in a letter to management rather than a report. This is possible for audits of component units (e.g. foundations or tax credit partnerships), but is not expected for divisions or funds of primary governments.*

**STEP 4: Review Report.** For insignificant components, review the report issued by external auditors and consider whether any information in the report changes our planning decisions or would have an impact on our audit, if the report is available before our report date. If questions or potential red flags are noted, **consider** additional inquiry, analysis or other steps to follow up. For significant components, the report must be reviewed and incorporated into our audit as described in step 9 below.

## **ADDITIONAL procedures for SIGNIFICANT components:**

The following additional procedures are **required** only for significant components audited by external auditors:

**STEP 5: Communication with Other Auditor.** Using the External Audit Coordination email template in the TeamStore (be sure to add your formal signature to the bottom of the email prior to sending), communicate with the external auditor to:

- Confirm the external auditor's independence, cooperation and understanding of how we intend to use their work.

- Share related parties and significant risks we have identified for the primary government and request the same from the external auditor.

- Request the external auditor's materiality and performance materiality thresholds used to determine whether thresholds are sufficient for purposes of our audit.

- Request the external auditor's report and other results in order to incorporate these into our results for the audit of the group.

- Confirm our commitment to inform the external auditor of any matter that comes to our attention that may be relevant to their audit and request the external auditor's commitment to do the same.

*Auditors should initiate this communication as early in the audit as possible and continue to communicate with the external auditor as*

# State of Washington

*necessary to follow-up on these matters throughout the audit.*

Note: if the CPA Audit Report Review is being done in step 6 below, information from the CPA can be documented when completing the CPA workpaper review checklist rather than as a response to the letter.

**STEP 6: CPA Audit Report Review (if applicable under Policy 3510).** For significant components that are audited by an external auditor in lieu of an SAO audit, perform a CPA Audit Report Review in a separate TM file as required by Policy 3510. This work is performed to carry out SAO's statutory mandate but will also provide additional support for our reliance on the work of the other auditor. As such, the review should be completed prior to concluding on the audit of the primary government. If a review is applicable, reference this work and summarize relevant results.

**STEP 7: Audit Plan.** Document in the Audit Plan the effect of the work of external auditors on our audit report and substantive testing. Identify which opinion units and/or balances we plan to rely on the work of other auditors in the plan and mark these rows or columns on the Material Balance spreadsheet to indicate our reliance on the work of external auditors.

**STEP 8: Evaluate the Firm's Professional Competence.** Evaluate the professional competence of the external audit firm by considering our Office's experience with the firm, the results of communications and review, and by checking the [CPA License and Peer Review SharePoint page](#) to obtain the firm's last peer review report.

Note: if the CPA Audit Report Review was completed using step 6 above, this evaluation can be documented when completing the CPA workpaper review checklist.

**STEP 9: Internal Controls.** Document an understanding of controls over the consolidation process to incorporate components into the financial statements in the Controls - FS Preparation step in the permanent file (or a separate step if the process is identified as its own control system due to risk or complexity).

**STEP 10: Incorporate Results.** In addition to the external auditor's report, obtain and review any letter to management and the governing body about internal controls, the aggregation of misstatements, any audit recommendations made and any other relevant results.

Items included in the external auditor's aggregation of misstatements should also be included in our aggregation for the primary government.

Reported amounts and disclosures audited by the external auditor per their report should be traced to the financial statements of the primary government.

Any potential fraud, noncompliance, abuse or other matters identified by the external auditor should be re-evaluated for the primary government.

## State of Washington

Our report may need to reflect any modifications made to the external auditor's report (that is, if the opinion is not unmodified or includes explanatory paragraphs) and any significant deficiencies or material weaknesses reported by the external auditor. Such issues should be repeated in our report to the extent they are material to an opinion unit.

*REMINDER: When external auditors conduct their audit in accordance with GAGAS, any findings will be communicated in their audit report. Otherwise, if conducted in accordance with GAAS, any findings will be communicated to management and the governing body in a separate letter that we will need to request.*

Auditors should conclude on whether the work, materiality, performance materiality and floor thresholds used are acceptable for our purposes, based on our communication with the component auditor and other procedures performed.

**STEP 11: Conditions for Referencing the Other Auditor's Report.** Determine if the following conditions are met. If so, we will be able to reference the work of the external auditor in our report. If not, contact TAS for assistance.

The audit is completed prior to our report on the primary government.

There are no concerns about the component auditor's professional competence or independence, and the component auditor has passed its prior peer review.

Component financial statements are prepared using the same financial reporting framework as the group, or one permitted by that framework. For example, GASB provides for inclusion of FASB components.

Component auditor has performed the audit in accordance with GAAS or GAGAS.

Component auditor's report is not restricted as to use.

*If the work of the external auditor is material to any opinion unit, our financial report must refer to the external auditors - please refer to the Audit Report Standards (ARS) Manual for opinion modifications. If the external auditor performed their audit in accordance with GAAS, rather than GAGAS, our audit report will need to be further modified as shown in the ARS example.*

Guidance/Criteria:
--------------------

### **ADDITIONAL BACKGROUND**

Auditors should consider the following background information and resources when performing work on this area.

**SAO Audit Policy [6240](#) – Group Audits**

**[Review Work of Others](#) Planning Guide**

**[CPA Workpaper Review Resources](#)** - more background and resources for this area

# State of Washington

Contact the CPA Audit Coordinator or TAS with any questions or advice on required procedures or if the team is uncertain whether a CPA Report Review is applicable.

Record of Work Done:

## **Evaluating Significance of Components Audited by Others**

We identified the following other auditors who performed a portion of the financial statement audit and determined the significance of those components as follows: Eide Bailly LLP

We determined that the external CPA audit of the WA Housing Finance is significant to the FY24 State of Washington ACFR. See our analysis of which opinion units are impacted by the external audit here: [\[External CPA Audit Significance\]](#)

## **Meetings**

We considered participation in meetings between the external auditor (Eide Bailly LLP) and the WA Housing Finance and determined it was not necessary.

## **Review of SIGNIFICANT Components**

During planning, we documented in the Audit Plan and Significant Balances spreadsheet our expected reliance on the work of other auditors for significant components and the effect on our audit report and substantive testing.

## **Communication with Other Auditor**

As documented in [\[Audit Request - External Audit Coordination\]](#), we communicated with the external auditor to confirm an understanding with them, share relevant information, and provide a basis for cooperation. We received a response on September 13, 2024 from Kevin Smith, Audit Partner [\[RE Audit Request - External Audit Coordination\]](#). No issues noted.

We arranged with Kevin Smith, Audit Partner, to obtain access to Eide Bailly workpapers. Access was through the Citrix browser from November 12, 2024 to November 13, 2024.

## **CPA Audit Report Review**

SAO Audit Policy 3510 requires a CPA Audit Report Review when significant audit work is done in lieu of an SAO audit. The auditor's work did not cover all of the State of Washington activities and was isolated to WSHFC funds only. We determined the external auditor's work was **not** done in lieu of an SAO audit. See our review of the CPA workpapers here: [\[Review Checklist - CPA Workpapers\]](#). **We determined the work and documentation was sufficient to allow our Office to rely on the work of Eide Bailly LLP.**

## **Evaluation of Professional Competence**

## State of Washington

We evaluated the professional competence of the other auditor by considering our Office's experience with the firm, communication and review procedures as described above, and reading the firm's last peer review report. Based on these procedures, we determined that the professional competence of the other auditor was sufficient enough to rely on their work.

### Understanding of Consolidation Process

We gained an understanding of controls over the consolidation process as documented in [\[Financial Statement Preparation\]](#). We considered this understanding when assessing risk and in procedures performed to incorporate the results of the other audit.

### Incorporation of Results of Other Audit

We reviewed the auditor's reports [\[WSHFC Report\]](#), letter to management and the governing body about internal controls [\[WSHFC Governance Letter\]](#), the aggregation of misstatements, any audit recommendations made and any other relevant results. To incorporate results, we:

Traced reported amounts and disclosures audited by the external auditor per their report to the financial statements of the primary government as documented [\[Component Unit Financial Statements\]](#). **See issues identified in the O.6.PRG.**

We noted there were no uncorrected misstatements identified by the other auditor.

Looked for any potential fraud, noncompliance, abuse or other matters identified by the other auditor. We noted no such matters.

Looked for any modifications or explanatory paragraphs. We noted no such matters.

We determined that the work, materiality, performance materiality and floor thresholds used are acceptable for our purposes, based on our communication with the component auditor and other procedures performed.

### Making Reference to Work of Other Auditors

Finally, we determined that conditions for making reference to the work of other auditors was met as follows:

The audit was dated October 31, 2024, which is prior to our report on the primary government.

There are **no** concerns about the component auditor's professional competence or independence. We specifically noted that the component auditor has **passed** its prior peer review.

Component financial statements are prepared using a GASB financial reporting framework.

Component auditor has performed the audit in accordance with **GAAS**.

We will modify our audit report to state that the Washington State Housing Finance Commission was not audited in accordance with Government Auditing Standards.

Component auditor's report **is not** restricted as to use.

### L.1.PRG - Rely on Work of Other SAO Audits

*Procedure Step:*      Summary of Other SAO Work

# State of Washington

*Prepared By:* CJM, 11/19/2024

*Reviewed By:* CJG, 12/5/2024

## Purpose/Conclusion:

### **Purpose:**

To determine needed coordination of work performed as separate SAO financial audits.

### **Conclusion:**

The Workers Compensation Program (Fund of the Department of Labor & Industries) audit is significant to the State financial statements and will be evaluated and relied upon in the following step [Rely on Other SAO Work]. No reliance will be placed on the other audits noted because they were insignificant, did not cover FY24 or won't be completed by the state ACFR opinion date. Planned audit procedures for agencies and accounts balances selected for audit in the planning lead sheet and material account matrix will provide sufficient evidence without considering the results of these audits. **No issues noted.**

## Testing Strategy:

Perform the following procedures to determine areas of the State audited by other SAO auditors and perform additional procedures to ensure these audits can be relied upon:

- Perform a search of state agencies receiving financial statement audits as separate SAO engagements by searching for financial statement audit reports of state agencies issued after 7/1/2023.

- For each identified engagements, refer to planning steps to determine whether it is a material component using qualitative and quantitative considerations.

## Guidance/Criteria:

## Record of Work Done:

We performed the following procedures to determine areas of the State audited by other auditors and performed the referenced procedures to ensure these audits can be relied upon:

### **Identify all financial statement audits performed on ACFR components as separate SAO engagements**

We performed a search of state agencies receiving financial statement audits as separate SAO engagements by searching for financial statement audit reports of state agencies issued after 7/1/2023. See: [FY24 Other SAO Audits]

# State of Washington

**For each identified engagements, refer to planning steps to determine whether it is a material component using qualitative and quantitative considerations**

Using the materiality worksheet prepared in the planning phase of the audit at: [[Final Planning Significant Balance Spreadsheet](#)] and the major fund determination spreadsheet at: [[Major Fund Calculation](#)]. We determined only the Workers Compensation Fund (Department of Labor & Industries) was significant to the state financial statements.

For the Workers Compensation Program audit see the following procedure: [[Rely on Other SAO Work](#)]. For other agencies noted, we are not aware of any issues or uncertainties that existed as of the opinion date that could be significant to the ACFR audit.

## **L.1.PRG - Rely on Work of Other SAO Audits**

*Procedure Step:* Rely on Other SAO Work

*Prepared By:* CJM, 11/20/2024

*Reviewed By:* CJG, 12/5/2024

Purpose/Conclusion:

**Purpose:**

To ensure adequate communication and coordination on work performed separately by SAO on a component of the primary government.

**Conclusion:**

We ensured adequate communication and coordination on work performed separately by SAO on a component of the primary government. We tied the Workers' Compensation fund in the 2024 State ACFR to the audited FY24 Workers' Compensation Fund financial statements. **No issues noted.**

Testing Strategy:

To ensure adequate communication and coordination of work performed as a separate engagement by SAO on components, auditors are

## State of Washington

**required** to perform the following procedures:

Document in the Audit Plan the effect of the work performed as a separate engagement by SAO. Identify which opinion units and/or balances we plan to rely on this other work and mark the applicable rows or columns on the Material Balance spreadsheet to indicate our reliance.

Ensure communication of the following:

Related parties identified

Significant risks and any other relevant matters identified

Materiality and tolerable misstatement thresholds used.

Any indicators of possible management bias regarding accounting estimates and the application of accounting principles.

Other matters that may be relevant to the primary government's audit, such as exceptions noted in the component's management representation letter.

Audit results

Review the results of separately performed work and incorporate results into the audit of the primary government, including the following, as applicable:

Aggregation of misstatements

Significant difficulties or disagreements

Reported amounts and disclosures audited in other work traced to the financial statements of the primary government.

Any potential fraud, noncompliance, abuse or other matters identified should be re-evaluated for the primary government.

Any report modifications, significant deficiencies or material weaknesses to the extent they are material to the primary government.

*We will not make reference to other SAO audits in our audit report.*

Guidance/Criteria.:

### **ADDITIONAL BACKGROUND**

# State of Washington

Auditors should consider the following background information and resources when performing work on this area.

## SAO Audit Policy [6240](#) – Group Audits

Record of Work Done:

### **Labor and Industries ACFR - Workers' Compensation Fund (WCF)**

The FY24 SAO audit of Workers' Compensation Program (WCP) financial statements will be relied upon to provide audit coverage for the Workers' Compensation major fund opinion unit. Significant account balances and all audit tests are documented within the WCP audit. See: [TeamMate file - S1WorkersCompensation Funds-FS24]. The audit was performed by Team Financial Audit.

We documented in the Audit Plan the effect of the work performed as a separate engagement by SAO. We identified the opinion units and/or balances we planned to rely on the work of others for and marker the applicable rows or columns on the Significant Balance spreadsheet to indicate our reliance.

We noted there was adequate communication of the following:

- Related parties identified.

- Significant risks and any other relevant matters identified.

- Materiality and tolerable misstatement thresholds used.

- Any indicators of possible management bias regarding accounting estimates and the application of accounting principles.

- Other matters that may be relevant to the primary government's audit, such as exceptions noted in the component's management representation letter.

- Audit results.

We reviewed the results of separately performed work and incorporated the results into the audit of the primary government, including the following, as applicable:

- Aggregation of misstatements. – We noted one uncorrected misstatement that led to cash and cash equivalents being understated by \$4,481,520, the misstatement is documented in [TeamMate file - S1WorkersCompensation Funds-FS24] we included this misstatement in the AOM here [[Aggregation of Misstatements \(GAAP\)](#)]. Other misstatements in the WCP audit were related to minor formatting issues, presentation errors in the notes to the financial statements and RSI. These will not impact the state ACFR.

- Significant difficulties or disagreements. - No issues noted.

- Reported amounts and disclosures audited in other work traced to the financial statements of the primary government. - No issues noted.

- Any potential fraud, noncompliance, abuse or other matters identified should be re-evaluated for the primary government. - No issues noted.

## State of Washington

Any report modifications, significant deficiencies or material weaknesses to the extent they are material to the primary government. - No issues noted.

We will **not** make reference to other SAO audits in our audit report.

### **State ACFR to Workers' Compensation ACFR Tie Out**

We performed the following procedures to tie the Workers' Compensation fund in the 2024 State ACFR to the audit Workers' Compensation Program Financial Statements:

We compared the balances in the WA State ACFR for the Workers' Compensation Fund to the Workers' Compensation Fund financial statements.

See the Workers' Compensation Fund FY24 audited report at: [FY24 WCP Audit Report](#)

See conclusions for each statement below:

Statement of Net Position [[FY24 WCP Tie Out](#)] **No issues noted.**

Statement of Revenue, Expenses and Changes in Net Position [[FY24 WCP Tie Out](#)] **No issues noted.**

Statement of Cash Flows [[FY24 WCP Tie Out](#)] **No issues noted.**
